SERENISSIMO POTENTISSIMO, LITERATISSIMOQ, Principi ac Domino Nostro Iacobo,

Dei Gratia Magnæ Britanniæ, Franciæ, & Hiberniæ Regi, Fidei Defensori, &c.

VT suscepti moles operis, cui vix cuiusuis nostrorum hominum vires respondent, & inassueta scriptioni manus, merito me dum rem pararem deteruêre quo minus Augusto tuo nomini inscriptam vellem; (Rex sereniſſime & tui seculi longe literatiſſime) ita demum conscientia animi integri, sed quorundam, quos minime decuit, obtrectatione tentati, ad eam me impulit rectè factorum fiduciam, vt primum libenter ad tuam Maiestatem prouocauerim, quem fælicitas publica cum primis Literaria, non Orbis modo nostri sed & Βρεττανικὴν Imperio admouit. Etenim ero vt taceam eam quam exteræ Gentes in Tuis egregiè scriptis amant & admirantur πολυγραφίαν; interior illa πολυμαθία quam ante annos aliquot in altera, nouissimè in Cantabrigiensi Academia publicisq; Comitijs sub tuis Auspicijs habitis, signatam exhibuit Maiestas tua; nondinit me dubitare litem hanc de re literaria Tuo Tribunali ordinariè competituram. Duo igitur sunt quæ huic operi affigunt si non affinguat crimina, mihi ipsi tertium. Primum idq; maximum nefas esse ducunt Artis Mysteria ignobili vulgo prostituisse. Secundum velamen Naturæ reuelare, & Pudicitiam quasi in propatulo ponere. Tertium illiberalis esse ingenij arguunt in aliena quercu lignari. Quæ singula quidé amoliri vt mea plurimum interesse sentio, ita supplex obtestor Maiestatem tuam, pro eo, quo coronatæ inedunt virtutes tuæ, Candore vt tantisper tua tempora demorer dum totidé momentis molumenta isthæc diruam. Atq; primum me mouit non modo scriptorum veterum Græcorum, Latinorum, Arabum recepta consuetudo, qui ad vnum omnes, Artes quisq; suas cuiusuis generis indigitarunt; sed & Neotericorum schola Medicorum, qui Patrio Idiomate vel primum donarunt inventa Anatomica vel postea traduxerunt; cuius rei locuples mihi testis est pars quæq; Europæ maxime

literata, Hiſpaniam dico, Gallias, Italiam & vtramq; Germaniam. Neq; vero in noſtra Anglia ſiluit hæc Muſa, aut poſtliminio tantum recepta eſt; ſed ſuperiori ſeculo nata, ſub Patre, Filio, Filia potentiſſimis & literatiſſimis Principibus ter quidem inſtaurata, ſed deſtituta fomentis in Cunis adhuc vagire deprehenditur: ſiquidem vt vrbium Imperiorumq; ita literarum ſua ſunt & lenta tempora quibus oriuntur, florent, ſeneſcunt & tandem intereunt. Taceo illa, maxima quidem, ſed commemorata nobis libro primo rationum momenta, quibus ab vtilitate, a voluptate, a neceſſitate ipſa, quotquot mortalium ſumus, cogimur, trahimur, allicimur in Communionem Naturalis Sacramenti ſummæ Magni Opificis ſapientiæ & bonitatis. Quis ora erecta dedit & oculos verſi-colores? quis narium perforationes & ſinuoſas aurium tornauit Cochleas? quis venarum arteriarumq; riuos & aquæ-ductus diſtribuit, neruorum tetendit rigiditates, oſſium θημέλιον poſuit, cutis efflореſcentiam & membranarum expanſa dilatauit? quis artus artuumq; digitos diviſit, firmauit pedes, poros & ſpiracula terebrauit? quis excavavit pulmonum Bronchos ſpirituſq; reciprocationes inſtituit? quis motus cordis geminos, intermediam quietem, & concluſæ vitæ ſubſultationes pulſuſq; limitavit? quis viſcerum coagulavit conglomerata Parenchymata? quis Senſuum ἀισθητήρια Animæ Regiam ſtipavit, Cerebrum Falce diviſit, arctatam Concamerationem medullæ, ſpeculumq; lucidum diſpoſuit? quis ſpirituum Animalium diſterminauit conceptacula, reticulum mirable plexumq; Choroidem innexvit. Dies me deficeret ſi ventriculi Chyloſin, inteſtinorum volumina, meſaraicarum ſuctus, hepatis ſanguificationem & Anaſtomoſes mirabiles; ſi lienis defæcationem, renum emulctus, veſicarum collectiones, teſtium irradiationes, vteri ſenſus, & mille artes Naturæ minimis particulis ingenitas prædicem: quæ ſi non ſinguła, at præcipua tamen nouiſſe, cuius Deus bone! non intererit? Circumgerimus ignota miracula & ſectamur quiſquilias, extra nos querentes dum domi peregrinamur.

At obſignata inquiunt Myſteria Arti reverentiam, Artifici dignitatem pariunt. Scilicet is ſemper mos fuit hominum vel illiteratorum, vel queſtui inhiantium, Religiones Arteſq; tanquam ſcrinio concluſas gerere, ne vel fœdæ argui poſſint inſcitiæ, vel emolumenti tantillum ſibi detrahi ſinant: quanquam ſi legitima virtutis præmia ſpectent, non aliunde cumulatius noſtri ordinis hominibus ſubminiſtrari ſentiant, quam ab ijs, qui vel leuiter initiati vanos etiam metus expaueſcunt, vel altius inſtituti fidam Artem vt agnoſcunt, ita cum opus eſt expoſcunt & amplectuntur. Sed ſi neq; veterum calcare viam, nec recentium laudabili inſtituto inſiſtere velint, vt illorum obſequi poſſint voluntati, quos vel diuerſa ſtudia vel occupationes a literis alienæ minus idoneos rediderunt qui rigidam Anatomicorum orationem percipiant; at certe juventuti Chyrurgicæ ne invideant, qui cum de noſtra Repub. Colonia ſint, equum eſt eas leges, ea jura teneant quibus & ſibi decori & nobis, dum res eſt, vſui eſſe poſſint. Qui idcirco non ingenio Stromatico inſtituendi, aut Cothurnatis Ciſſonijſq; crepidis induendi, ſed per genuina Artis præcepta facili methodo deducendi, vt quæ domi vel ſuo marte, tẽporum injuria, vix conſequi poſſunt, noſtra opera ſibi abundè ſuppeditata cognoſcant, eaq; ita mitigata vt poſſint concoqui. Neq; enim vbi-

uis

uis terrarum Doctores Medici adsunt, aut Cuiusvis fortunæ est stipendium medicum numerare; an igitur necessum habeant perire eos omnes quorum, vel res angusta vel habitatio a Medicorum frequentia secluſa est.

At saltem secreta Naturæ reuelanda non sunt, neq; auribus oculisue obijcienda quæ male feriatorum mentes & pascant & incendant. Veniunt hic mihi primo loco repetenda quæ dudum adduxi de consilio omnium Seculorum, Nationum, Hominum, quorum nemo harum partium Historiam detrectauerit; de admiranda Diuini Creatoris in his ijsdem partibus sapientia; de Administration[illegible] circa easdem necessitate; quæ eo magis vrgere soleat quo symptomata plerumq; inducunt vt graviora & tristiora ita maxime frequentia. Quid quod Scriptura Sacra *Rachaelis* Menses, puerpearum profluvia, Carnis saliuationem in Gonorrhœa, semen Concubitus. *Saræ κατὰ τὰς ὡρας τῶν γυναικῶν* quam admodum violenter, inquit *Stephanus*, seminis Conceptionem pro emissione interpretantur, describere non erubuit? Quid quod ipsi publicis Dissectionibus non delineatas imagines, sed ipsum Corpus humanum vtriusq; sexus spectandum palpandumq; exhibent, parteſq; pbscœnas secant resecantq; in Corona populi, & patrio idiomate singula explicant: quo minus alteri vitio vertant quæ sibi laudi ducunt. At tribuendum est aliquid pudicitiæ. Certe quidem & nos non parum tribuimus, & quoad fieri potuit, re non neglecta quæ sub manibus erat, honestis Circumlocutionibus argumentum molle exasperatum reddimus; vbi proposito insistendum erat, Philosophica disputatione Lectoris mentem in diuersum trahimus *Ne vati noceat mala lingua futuro.* At Icones sunt plusquam Aretinæ; ita in Theatro Anatomico publicè ad invidiam conciliandam nuperrime nominabantur; quæ non aliæ quam quæ nostro hoc seculo Centies impressæ vbiq; terrarum circumferuntur, pijs Principibus & Rebuspub. approbatæ; non aliæ quam quæ virgini castissimæ *Elizabethæ* sacro-sanctæ memoriæ principi Dedicatæ & in manus traditæ sunt. *Crimine ab vno disce omnes* & frontem tristi censura striatam.

Deinq; dignitatem mihi exprobant Academicam quod aliorum vestigijs insistens de alieno prodigus de proprio parcus fuerim. Neq; sane diffitebor me sanguinem succumq; hausisse ex alijs; at Methodum, Limina, Limamq; nostra voco; in super quæ sæpenumero in Disquisitionibus occurrunt partes meas. Addidi etiam plurimorum Anatomicorum *διαχωρίσμους*, suffragia, retractationes, demonstrationes, *ἐξηγήσεις*; quæ omnia vel colligere, vel collecta repetere vnde desumpta sunt & suis quæq; locis disponere non nudi est Tralatoris; quanquam fuerunt & inter nos sunt viri valde docti quorum diuina ingenia *longe sequor & vestigia semper adoro* quibus transferendi munus fastidio non fuit.

——— Etiam Parnassia Laurus
Parua, sub ingenti matris se subijcit vmbra.

Neq; hoc mihi jure quis audaciæ loco imputauerit si remigem prius esse me velim quam ad gubernacula manus admouerim, neq; socordiæ si proprio vtar remigio. Atq; nisi ego fallor, si quis in hoc curriculo mecum desudauerit & pedem pedi contulerit; sentiet profecto se *τοι ὁλισθηρᾶς ὁδοὺς παλινδρομεῖν*

ita

ita præcipitijs & præruptis anfractibus totus hic ager ſcatet. Mitto viſcerum viam perplexam & ſpinis obſitam, quæ tot artis proceres colliſit: quas vaſorum Conjugationes, quæ diuortia, quam implicitas divaricationes, rimari ſequi, & in ſuos alueos deducere oportet? Muſculorum nomina, origines, progreſſus, implantationes; Subſtructorum oſſium appendices, proceſſus, perforationes, ſuturæ, harmoniæ, gomphoſes, diarthroſes, ſynarthroſes, enarthroſes, arthroidæ, ginglymoi; eorundem ſynchondroſis, ſynſarcoſis, ſyndeſmoſis, & mille tedia ſuperanda ſunt; immenſũ æquor arandum, antequam fugientem oram prehenderis. Ne igitur mihi fraudi ſit eaſdem horas his ſtudijs inſumere & publicæ vtilitati conſecrare, quas alij, qui magnæ potius quam bonæ famæ ſunt, inter globulos & fumum prolixe diſperdunt. Artem tracto tentatam quidem ante me, ſed ſubſultim & leui pede, ab ijs quorum voluntates probaveris potius quam facultates, qui tamen cum primum ad vexillum fuerunt, merito ſuo Primipili a me audient. In noſtro opere fidem invenies & indefeſſam diligentiam; orationem, non illam quidem ornatam, qui poteram in abrupta re? ſed evidentem & dilucidam; verborum etiam delectum, ſed non tam quæ delectent quam quæ inſtruant, quamquam & ipſa Artis vocabula adiunximus, ſed reddita, vt apud me lector ſeipſum, apud alios iſtos ipſos intelligat.

Atq; hactenus conſilij mei rationem ita vt teneor expoſui, quod vt Majeſtatis tuæ bona cum venia ſit humillimè & obnixè contendo. Faueas primitijs creſcentis indolis; quæ ſi sub tuo Sole adoleverit & iuſtam tandem maturitatem conſequuta fuerit, non indignos fructus retributuram confido. Interim a Te pro meo opere ἄδυτα, pro Te a Deo Opt. Max. πολλοπλασιονδαιμονίαν ſupplex efflagitabo.

Sereniſsimæ Majeſtati tuæ

Subditus Deuotiſsimus,

HELKIAH CROCVS.

TO THE VVORSHIPFVLL Company of the Barber-Chyrurgeons, the *Maiſter, Wardens, Aſſiſtants, and Comminalty of the ſame;*

HELKIAH CROOKE, Phyſitian and Profeſſor in Anatomy and Chirurgery to His MAIESTIE,

wiſheth Happie and proſperous Succeſſe in Your PROFESSION.

MY Maiſters and Worſhipfull Friends. As from the firſt I intended this Labor vnto your behoofe; ſo now hauing by Gods aſsiſtance brought it to an end, I offer it vnto you as a token of my Loue: Not that I doubt but there are ſome among you who as themſelues ſtand in no neede of my helpe, ſo they are alſo able to haue ſet out this Banquet with greater variety and to haue Cooked it fitter for you as being better acquainted with your diet and appetites. But becauſe it is now a long time ſince your *Baniſter* (that good old man) firſt preſented you with a ſeruice of this kinde, and no man hath ſecouded him; I haue aduentured to commit vnto you theſe firſt fruites of my vntainted fame: which if you ſhall kindly entertaine and make ſuch vſe thereof as I may not think my labour misbeſtowed, you ſhall encourage me cheerefully to run on that courſe which I haue propounded to my ſelfe to further your profiting in that Noble Art which you haue taken vpon you to profeſſe. For when I firſt began, I intended the Anatomy to be but an entrance into a worke of Chyrurgerie, which I had digeſted into a forme fit, as I thinke, firſt to ground and eſtabliſh you in the Principles and Theory or Contemplatiue part of your profeſsion, and after to builde you vp vnto the practiſe of the ſame. And becauſe the Body of Man is the Subiect of your Art, without the knowledge whereof it is impoſsible for a Chirurgeon to work with any confidence or certainty of ſucceſſe, I began with Anatomy.

In the next place ſhall follow a Diſcourſe of the conſtitution of mans body, as he enioyeth a perfect or apportionated health by a due Mixture of the principles whereof he conſiſteth; of the Temperament of each part ariſing from that mixture; of the Offices or Functions proceeding from that temperament, and ſuch other things as will fall in with the ſame. For as it is a rule in Geometry, that *Rectum eſt index ſui & obliqui, That which is Right meaſureth both it ſelfe and that which is crooked*; ſo in our Art, he that knowes what ſhould bee the naturall diſpoſition of euerie part will be beſt able to iudge when Nature declineth from that integrity, and how far the declination is from the true and genuine conſtitution. This part indeede is Philoſophicall, but I ſhall make it ſo plaine, if God will, that a very reaſonable capacity ſhall be able to apprehend it. After you haue knowledge of the healthfull and ſound conſtitution which is the rule of the reſt, I teach the Natures, Differences, Signes and Prognoſticks of diſeaſes, ſo farre as it neceſſarie a Chyrurgeon ſhould know, that is to ſay, of Tumours or Apoſtemations, of Woundes, Vlcers, Fractures, and the like. Then followeth the Method of Curing by Indications, which are many and intricate, but I haue referred them (not without great labour) to outward diſeaſes and illuſtrated all by examples to make the better impreſsion in your minds. In the next place I handle the Operations of Chyrurgery in generall, where you haue all the Inſtruments of your Art; Engines, Swathes, Ties, Bands and Ligatures, deſcribed by *Hippocrates, Galen, Oribaſius*, and thoſe alſo of the new Chyrurgeons inuentions, with their Figures, interpretations, and manner of application. Afterward I deſcend to the operations in particular, as to Diuiſion, Simple & Componnd; Simple in Section & Vſtion; Compound with Extraction and Extirpation. To Iunction alſo, Simple and Compound, Simple in Adduction, Adaptation, and the way how to Conteine them ſo fitted together. Compound with Addition of ſuch decayed Naturall parts as may bee reſtored or imitated by Art. Then I come to the cure of Tumors of all kindes both Simple and Compound: of Wounds whether they bee made *Cæſim* or *punctim*, by Contuſion, by Arrowes, Engines or Bullets, with Laceration or without: of the bytings or ſtinging of venomous Creatures, with their ſeuerall Antidotes: of burnings, ſcaldings, and ſuch like.

Next I proceed to Vlcers, putride, ſordide, fiſtulated, caneerous, gangrenated, ſphacelated

and such as are virulent, with the Accidents that vse to accompany them: to Luxations also and Fractures with their kinds and accidents. Afterward I handle those generall diseases which belong to the whole body, as the Gowt, the Leprosie, the Meazels, the Pox of both kindes, the Plague and such like: and then proceede to the particular diseases from the Head to the Foote, wherein the Chirurgeons helpe is required. Finally, I intreat of the Matter of Chyrurgery, that is, of the Nature of those Drugs, Hearbs and Minerals which he hath neede to vse; of their correction and preparation, of the manner of compounding his Medicines both for outward applications and such inward as may conduce thereunto. And so I thinke I shall haue finished the Art of Chyrurgery throughout.

I acknowledge that which I haue promised to be a great labor, and more then any man whom I haue yet seene hath accomplished: but the ground being long agoe laide in my priuate studies and references continually now for these sixteene yeares accommodated vnto those groundes, haue brought it to such forwardnesse as I can be content to finish it with as much haste as my occasions will giue leaue, if I see that this Anatomicall labour is acceptable and of vse vnto you. I know well there are some who thinke and do not sticke to affirme, euen before your publique Assemblies, that you haue meanes enow already, & haply more then they would you had. Their reason can be no other, but because they would holde you alwayes obnoxious to themselues. For my part I conceiue of the Art of Chyrurgery as of a part of Physick; and therefore of Chyrurgeons as Citizens of the Physitians Commonwealth: the difference is, that wee hauing most-what better meanes by education to aduantage our wittes, apply them vnto the more abstruse part of the Art separated from the sense and consisting in contemplation and collection; the Chyrurgeon worketh by his eye and with his hand, and dwelleth as it were in the Confines of that Countrey whose inner part we inhabit. If therefore they warrant the frontiers and keepe their Stations well and duly therein, may not we better attend to improoue the portion that is allotted vnto vs? But wee are both like couetous Farmers, who incroach vppon and get more grounds into their hands then they can well manage, forgetting that wholesome counsel of the wise Poet:

Laudato ingentia rura—Exiguum colito. *Praise a great Farme but occupy a small.*

For surely if we aduise well with our selues, Physitians shall find work enough (though they meddle not with the labour of the hand) to minde the subiect of their Art, I mean Anatomy, wherein too many of vs are wanting to our selues and others; the causes of diseases; the signes of the part affected; the skill of prædiction; the method of curing and the choise of Medicines, with a world of intricate worke beside in apprehending occasions, expecting and imitating the motions and endeauors of Nature, remouing her obstacles, strengthning her operations & the like. And if we want imployment in these, it seemeth to me more fit to fit our selues thereunto, then casting behinde our backes the care of such needfull studies to take vp our precious time in dressing or attending broken heads, strained or luxed ioynts, new wounds or old Vlcers, or in playing the Apothecaries as some do, who vnder the name of Cordials of x.li. an ounce, Potable Golde, precious Quintessences and preparations of Minerals, do obtrude vpon the worlde either notable impostures or dangerous poysons, ayming indeede at nothing so much (if at any thing else) as at their priuate gaine and the concealing of their ignorance which would necessarily be detected if they should communicate their practise to Apothecaries as other ingenuous Physitians doe. But of these I haue spoken more largely in an Animaduersion vpon *Crolius* his Admonitory preface in Latine, and shall haue fitter occasion to speake more elswhere, when I shall be very plaine against those that come in my way.

To returne whence I haue digressed. *Hippocrates* the Father and Author of *Physicke*, the true paterne of ingenuity, put that for one clause in the Oath which himselfe solemnly tooke, and which he would haue all Physitians take, that they should not cut any man for the Stone, but leaue that worke for them that accustome themselues to performe it; by that one instance according to his custome, interdicting a Physitian all manuary labour as knowing he should finde worke enough to fit his minde for greater difficulties. On the other side the Chyrurgean should content himselfe with the limits of his profession and not vsurpe vppon the possession of the Physitian, which he doth (somtimes indeede for his profit) but seldome without the detriment of the patient, especially if there be any difficulty in the businesse. I do not deny, but that a Chyrurgeon, yea a Diuine, or Gentleman, if he lay good foundations and build therafter vpon them may be a Physitian as well and as good as the best of vs: but it is not ordinary for men of Manuary Trades or other professions to be so qualified: the more honour it is for them that bee. But certainly if euery man would containe himselfe within his own tether, and presse no further then he is guided by right reason and his reason warranted by experience, we should not heare of so many solœcismes and notable incongruities which are daily committed, nor some (otherwise worthy men) be marked with the blacke coale of filthy auarice, the baasest and most preiudiciall vice that is incident to learned men.

Neither yet do I thinke it fit, that the Physitian should be ignorant in the Chyrurgical part, but able to guide the Chyrurgeon that is not able to guide himselfe, to assist and confirme him that is, and to amend a fault when it is committed: but for the work of the hand, I take it to be more lawfull for him then expedient, more honourable to be able and not to do it, then profitable to do it though he be neuer so well able. Albeit to say the truth, the fault is more common on the Chyrurgeans part then on the Physitians; and by so much the greater, by how much the danger

of

of not doing well is more in very many, then the disreputation or disaduantage can be to a few (and very few they be indeede of the better sort) who do all they can.

Notwithstanding, because some men are importunately bolde aboue their skill, shall it not be thought fit that all may learne that they ought to haue skill in and is an essentiall part of their profession? Let them then learne it (saith the Physitian) as we do. As much as if he should say to his patient that is not able to helpe himselfe: There is an excellent Medicine for your malady in *Galen* I pray you seeke it out. It is indeede a disease in our common-wealth, that Chyrurgeons haue no better meanes to instruct themselues; but such a disease as (among the rest) is verie behouefull for the Physitian. For sure I am, if they had those meanes that wee haue, they would easily (as it is in the prouerbe) wipe the fat from our beards; not only because of their numbers, but especially because they are interessed alwaies in a part of our profession: so that if they were as wel able as willing to take vpon thē the whole, we should be faine either to conuert our studyes some other way, or feed vpon their leauings which would be but short Commons. If therefore you will say they meddle so much now, what will they not vndertake when they are better prouided? Surely not so much: for who are those that busy themselues most in the matter of physicke, but such as are least able. The able and discreet Chyrurgeon when hee hath learned anie thing hath also learned the difficulty of physicke, and will bee readier to pray in aide of the learned Physitian, then he that runs boldly headlong without foresight of danger.

Seeing therefore it is necessary Chyrurgeons should be instructed for the behoofe of the Commonwealth, whose generall good is to be preferred before all particulars; why should we not be rather willing to instruct them our selues when we may holde them within the compasse of their owne Art, then driue them to seeke other helpes to our preiudice? Now then, among all the parts of our Art there is none that the Chyrurgeon hath more need of, or that is of more vse for himself then Anatomy, none that doth lesse inable him to practise physick, it being a mere Natural study, teaching him where to seek the Veine hee must open; how the ioynt should bee reposed which he findeth luxed; what parts are nere the wound which he searcheth and therefore may be offended with it; which way the Fibres, Vessels and Tendous run that in his incisions he may not violate them; how to cast on his Bands to conteine a Fracture or Luxation; how to auoide the most sensible & vsefull parts in Trepaning, Cauterizing, dismembring and such like: but of medicine and the cure of inward diseases in Anatomy not a word. The inward parts are also indeed Historified, whose position at least (you will grant vnasked) it is fit the Chyrurgeon should know; else when we appoint a plaister to the Liuer he may lay it to the left side, when for the Spleen on the right. But he may be directed. That is not perpetual; Physitians are not in all places, nor al men fit to entertaine them when they are to be had. Beside, a Chyrurgeon should not alwaies bee an apprentice, but at length a Maister of his Art, fit to instruct others not alwaies standing in need of instruction himselfe, vnlesse it be in difficulties, when I know no Physitian but will be glad of assistance. Add hereto, that al Physitians in all ages, kingdoms and free states, haue written their Anatomy and Art of Chirurgery in their mother-tongues, or afterward translated them for the vse of Chyrurgeons; which is so wel known that it were in vaine to make repetition of particulars. To come to our selues; we finde many examples of learned men and good Patriots, who haue bene willing to take great paines and to be at great Charge for this purpose.

Amongst the rest D. *Caswel* sometimes President of the Colledge of Physitians in *London*, first translated *Moores Tables*, and (a learned man though he were) was not ashamed to do that seruice to his country as to make himselfe, as some vnworthily and scornfully terme it, *A bridge for asses to passe ouer by*. He also promised *Oribasius de Laquais*, which his labor seemeth to haue bene interrupted by his death or otherwise lost, to the great detriment of Chyrurgery. But for Anatomy he did not onely take paines in it, but was also at great cost to cut the Figures in Brasse, which he left remaining in your hands (my Maisters of Chyrurgery) as a testimony of his great desire to further your profiting in that part. Moreouer that honorable person the Lord *Lumley* erected a Chyrurgery Lector in the Colledge of Physitians, allowing liberall maintenance to a Doct. of Physick to read the same twice a weeke, partly in Latine, and partly also in English for the vse of the Chyrurgeans, and to go ouer the whol body of Anatomy euery year a part: which Lecture is not so duly followed and frequented, as it is performed at this time by D. *Dauies*, of whom I cannot but make worthy mention hauing receiued not onely great contentment but profit also by his learned readings. You haue also among you a laudable custome to procure a Doctor of Physick to read vnto you, and to prouide that his Lectures be duly attended by those of your society: and the Physitians, I doubt not, thinke they haue done wel in singling out a learned man to instruct you. Onely your care must be, to feed vpon that rather which is τὸ ἄσσον then vpon that which is τὸ ἥδυσμα, vpon that which is good for nourishment rather then vppon that which will delight and fill but not feed your minds: to attend the plaine-song rather then the diuision or descant, which doth ostentimes corrupt the Musick if the auditors eare be not careful to distinguish them. Finally, you haue Anatomies both priuate for your profiting & publick for the honor & reputation of your Company read in your Mother-toong. And truly me thoght it did me good to see so graue a company of gowned Chyrurgeons attending vpon it, so good order, so great a Crowne of worthy Auditors, so liberal entertainment at it: which I do not mention to flatter you, for flattery is to attribute more then desert, but partly to commend your praise-worthy care; partly if it were possible to stir vp our selues to a lawfull emulation.

To returne. These many paternes, these worthy presidents first warranted me, after perswaded me to spend those houres which I might spare from my employments in these & the like labors.

For

For which as I esteeme my owne profiting to be a sufficient & answerable reward, so I did & do hope that my paines being communicated to others would returne vpon me with aduantage; that aduantage I meane, which is most welcom to honest minds, that is, a conscience of hauing improued though but a single talent. It were in vaine to Apologize for my selfe that I haue not had that time, those opportunities, those meanes which are required to an exquisit Anatomist, because (it may be answered) I might then haue held my hand and giuen way vnto such as had them. There is indeed a time when a man should stand much vpon the consideration of his strength. There is also a time wherin it is lesse dishonor to want power then will, ability then good endeuour. He that first scales the battlements of a Castle or Citadel though his body bee not sufficient to oppose against a whole squadron, yet if hee win the wall and make way for the victor, deserues a Murall Crown. Whilst other men (put case) more able, haue looked on & pittied themselues, I haue giuen the onset, with courage enough if not too much, *& vini peruenimus*; but with what dextery is in you to iudge. Many obiections are made against me. First, that being a professed Scholler I should haue written in Latine. That indeed had bene easier for me by far, hauing the words made to my hands, the passages chalked out, and plenty of Authors to haue gleaned from and a litle latine, such as it is to haue varied my discourse: but it had bin most ydle, my purpose being to better them who do not so wel vnderstand that language. I shold, said another, haue made an Anatomy of my owne. Such Guls little know what it is to write an Anatomy; thirtie yea forty yeares practise (which are more then the daies of my life) in dissection, and a hundred bodies more or lesse, small and great euery yeare, hath bin thought little enough to make an Anatomist fit to teach this learned age; for which I dare boldly say, no man amongst vs that knowes himselfe can esteeme himselfe sufficient, because we want those meanes which other Countries affoord their professors. Another closeth more cunningly with me, *Surely it is well done if it were well to do it.* Such limited and reserued commendations I disavow: my reason is, because whilst they commend the beautie of the wall they vndermine and demolish the foundation. My counsell and end that by my right I require should be approued, my performance not so: what greater tort or wrong can there be, then to take a man by the beard with the one hand to kisse him, and to smite him vnder the fift rib with the other & spil his bowels vpon the earth. The Figures are obscœne as *Aretines*. A shameless accusation; for they are no other then those of *Vessalius*, *Plantinus*, *Platerus*, *Laurentius*, *Valuerdus*, *Bauhinus*, and the rest; no other then those which were among our selues dedicated to three famous Princes, the last a Mayden-Queene. For my adding the History of the partes of Generation, I haue already giuen account, partly to his Maiesty, partly in my Prefaces to the fourth and fift bookes. To leaue these men to their contradictory and detracting spirits, I returne vnto my selfe. My present worke is for the most part out of *Bauhine* for the History, Figures, and the seuerall Authors quoted in his Margents. The Controuersies are most what out of *Laurentius*, with some additions, substractions and alterations as I thought fit and my wit would serue. The Method I haue altered throughout, transported the Tables as seemed best vnto me, reuised and made choise of the quotations in *Bauhine*, and interposed them in their owne places. I also added Præfaces to euery booke conteining the argument and purport thereof: & in the subsequent discourse many passages partly out of my owne obseruations, partly as I met with them in approued authors. The streame and current of *Bauhines* discourse because it is very hard, intricate, and full of long continued sentences, I haue broken off and parted as it might best be vnderstoode, which was one thing that made the volume to swell. The words of Art most what I haue kept that you might not be vnacquainted with them, yet haue I also rendred them as well as I could into our language.

The first booke is almost wholy out of *Laurentius* sauing for some passages, so is the fift, and had not the bulke of the volume growne too great, and so too chargeable to the Printer, I intended beside these thirteene Bookes; one of the Dissecting of Liuing Creatures; another of those things which happen rarely in Anatomy: a third of the method of Anatomy, the grounds whereof I had from that excellent and oculate Anatomist *Petrus Pauius* of *Leyden* my Maister and moderator in Anatomy, intreating of the choise and preparation of the bodye to be Dissected, of the Complements and endowments required in an Anatomist, of the place fit to make Dissection in, the manuarie Instruments named onelie in the first booke; the manner and order of dissection; how the parts do arise, where to finde them, and againe to repose them in their owne places before they be offered to the spectators and Auditors, and finally howe to prepare and compose the Scheleton; all which you may haply light vpon hereafter. Heere you haue the worke perfected, not onely as *Bauhine* hath it in three Venters & the loynts, but also after those, the kinds of Flesh, Simple, musculous, with the exact story of the Muscles thoroughout the whole bodie, the flesh of the Bowels and the Glandules. In the next place, the Vessels, Veines, Arteries and Sinnewes, with their diuarications and diuisions from their originals euen to the extreme parts. Then the Membranes Ligaments, Gristles and Fibres. And lastly, that cragged and rockie treatise of the Bones. In all which I haue added the Natures and Definitions of euery particular and the explications of them: their differences and diuisions with their Vses and Actions; all which are omitted by *Bauhine* in his Theater, but supplyed by me, partly out of *Laurentus*, partly out of those Dictates I gathered from *Petrus Pauius* before named. Finally, betwixt the 7 booke which contained the history of the vpper Venter that is the Head, and the ninth of the loyntes, I haue interposed a Booke of the Senses, collected out of *Bauhine*, *Laurentius*, and *Iulius Casserius Placentinus*, who wrote very accurately of that subiect, many of whose disputations I haue also added. One thing I craue pardon for aboue all the rest, and that is *Placentinus* his Præface before the Controversies of the eight booke, which indeede was not done by me, & the matter it selfe, to say truth, I do not so well like. Again, although I reuised the Presse, or rather the sheets & proofes, as they call them, my selfe; yet being sometimes out of Towne about my practise, & oftner though in towne yet necessarily called away from attending the correction, many literall faults haue escaped, especially in the Greeke, and some more then literall, yet few such as will stumble the Reader, and fewer, it may be, then could be imagined should escape a worke of such vncouth argument to the Compositors, and written besides in a Schollers running hand. Thus much I thought good to advertise you of, my kinde and VVorshipful Friends, and so to commend my labor to your good acceptance and your honest endeavors and studyes in this and other parts of your Art to Gods blessing.

From my house in S. Annes Lane, this last of May, 1615.

By your Loving Friend HELKIAH CROOKE.

The Contents of the ſeuerall Bookes *contained in this Volume.*

I. Booke. OF the Excellency of Man, together with the Profite, Neceſsitie, Antiquity and Method of Anatomy.

II. Booke. Of the partes Inueſting and Conteyning the whole Bodie,& alſo the Lower Belly in particular.

III. Booke. Of the partes belonging vnto Nutrition and nouriſhment.

IIII. Booke. Of the naturall parts belonging to Generation.

V. Booke. Of the Hiſtory of the Infant, moſt accurately deſcribed,according to the opinion of *Hippocrates*.

VI. Booke. Of the Middle Region, called the Cheſt, contayning the vitall parts.

VII. Booke. Of the third & vppermoſt *Venter*,called the Head wherein are deſcribed the Animall organs.

VIII. Booke. Of the Senſes and their Inſtruments, and alſo of the voyce.

IX. Booke. A briefe deſcription of all the Joynts.

X. Booke. Of Fleſh,that is,of the Muſcles, the Bowelles,and the Glandules.

XI. Booke. Of the veſſelles containing three parts, namely, Veines, Arteries,and Sinewes.

XII. Booke. Containing foure parts, viz: Griſtles, Ligaments, Membranes, and Fibres.

XIII. Booke. Of the Bones.

TH'vntainted Sun on * EGLONS dung can ſtare,
And Sacred writ doth * RACHELS Months declare
The Babe though nak'd, and * ADAM dreads no ſhame,
To gaze with Babe-like minde, can breed no blame.
Nor Leches lore, nor MOSES Law can bide,
Or ſinnes, or Natures hidden parts to hide.
To him that holds the keyes thou'lt ſhew thy ſin.
BRACTAN thy Caſe, HIPPOCRATES thy skin.
The Tree of *Knowledge* Magicke did deuiſe,
And errors gin, and Florentizing guize
Yet fruit of *Life* they bring, which theſe reueale,
That armed poyſons we may ſhun or heale.
Nought needed ADAM, but we firſt muſt cut,
Next know, laſt teach, how euery member's put.
Ioy *England*, rich as *Greece* by CROOKES long toyle,
All Flowers budding in thy bleſſed ſoyle.
Fit words, ſmooth order, many mindes in ſhort
Be here compris'd, and what their proofes import.
Mount hence O Muſes child to higher wonders,
Nor feare HIPPOLITVS * three forked thunders.

Ambroſe Fiſher.

The Table of the seuerall Chapters and Questions contayned in this *whole Volume.*

The first Booke.

CHAP. I.

THE Excellency of Man is declared by his parts, namely the Minde and the Body, and first what is the dignity of the Soule. Folio 3.
Chap. 2. Of the wonderfull frame of Mans body. Folio 4.
Chapter 3. *Epicurus, Momus, Pliny* and other, the malicious and false detracters from nature are censured, &c. 8.
Chap. 4. Wherein the body of Man differeth from other creatures, &c. 10.
Chap. 5. How profitable Anatomy is vnto euery mans selfe. 12.
Chap. 6. How profitable Anatomy is to the knowledge of God. 14.
Chap. 7. Howe profitable Anatomy is to Philosophers, Artificers, and Handy-craftsmen. 15
Chap. 8. The necessitie of Anatomy for Physitians and Chyrurgions. 15
Chap. 9. With what method Anatomy may be best demonstrated. 17
Chap. 10. Who haue writ of Anatomy. 20
Chap. 11. What *Galen* hath written of Anatomy, and how he was vniustly accused by *Vesalius*. 22
Chap. 12. How far *Aristotles* skill stretched in Anatomy. 24
Chap. 13. What other Greeke authours haue written of Anatomy. Ibid.
Chap. 14. Who haue bin the chiefe authours of anatomy in our times. 25
Chapter 15. The instruments necessary to anatomy. 26
Chap. 16. What is the subiect or immediate obiect of anatomy. 27
Chap. 17. What an Anatomist must consider in euery part. 28
Chap. 18. The differences of parts, &c. 30
Chap. 19. A diuision of parts, &c. 31
Chap. 20. An elegant diuision of parts into similar & dissimilar, &c. 32
Chap. 21. The other differences of the parts vnfolded. 34

The Controuersies of the *first Booke.*

QVEST. I.

THe *definition of a part.* Folio 38
Quest. 2. The principality of the parts against the Peripateticks. 39
Qu. 3. How many principall parts there are. 43
Qu. 4. Of the noblest principall part. 45
Qu. 5. Of Similar and Dissimilar parts. 47
Qu. 6. Whether a Similar part may be called Organicall. 48
Qu. 7. Whether the Spermaticall parts be generated of Seede. 50
Quest. 8. Whether the Spermaticall parts can reioyne againe after they be violated & seuered. 54
Qu. 9. Whether the spermaticall parts be hotter then the flesh. 57
Quest. 10. Whether the solid parts become dryed can be made moyst againe. 59

The second Booke.

CHAP. I

THE diuision of the body of man. Folio 62
Chap. 2. The diuision of the lower belly. 64
Chap. 3. Of the composition or frame of the lower belly. 65
Chap. 4. Of the haires of the whole body. 66
Chap. 5. Of the cuticle or scarse-skin. 70
Chap. 6. Of the Skinne. 71
Chap. 7. Of the Fat. 73
Chap. 8. Of the fleshy membrane. 74
Chap. 9. Of the inuesting or containing parts proper to the lower belly. 76
Chap. 10. Of the *Peritoneum* or rim of the belly. 77
Chap. 11. Of the vmbilicall or Nauell vessels. 78

The Controuersies of the *second Booke.*

QVEST. I.

HOw the hayres are nourished. Folio 82
Quest. 2. Whether the skinne bee the organ of touching. 84

¶ *Quest. 3*

3. Of the temper of the Skin. 85
4. Whether the skin performe any common and officiall action. Ib.
5. Whether it be heat or cold wherby fat is congealed. 87
6. Whether fat be a liuing and animated part of the body. 90
7. Of the membranes, vse and production of the Peritoneum. 91
8. A new kinde of compunction of dropsie bodies through the Nauell. Ibid

The third Booke.

CHAP. I.

Of the Naturall partes contayned in the lower belly. 95
2. Of the *Omentum* or kall. 96
3. A briefe description of the gate veine and his branches. 99
4. The arteries of the stomacke and the mesentery, which accompany the braunches of the Gate-veine. 101
5. Of the Guts. 103
6. Of the mesentery. 111
7. Of the *Pancreas* or sweet-bread. 113
8. The branches of the hollow veine and great artery. 114
9. Of the stomacke. 116
10. Of the *œsophagus* or gullet. 122
11. Of the spleene or milt. 124
12. Of the Liuer. 129
13. Of the bladder of gall. 135
14. Of the Kidneyes. 139
15. Of the *vreters* or passages of vrine. 149
16. Of the bladder. 150
17. Of the Fundament. 154
18. The muscles and nerues situated in the lower belly. Ib.
19. The bones of the lower belly. 155
20. Of the breast or paps. 156

The Controuersies of the third Booke.

QVEST. I.

VVHether the Guts haue any common attractiue faculty. 161
2. Whether the guttes haue any common intractiue faculty. 163
3. Whether the guts haue any concocting faculty. 164
4. Of the expulsiue vertue of the guts. 165
5. Whether Clisters can passe vpward vnto the Stomack. Folio. 166
6. Of the euill sauour of the excrements. 167
7. Of the substance and scite of the Guts. 168
8. Whether the vpper mouth of the stomacke be the seate of appetite. 169
9. The situation of the vppermost mouth of the stomack. Fol. 170
10. Whether the Chilus be made by heat or by the forme of the stomacke. Ibid
11. Whether the stomacke bee nourished by the Chylus or by bloud. 171
12. What is the nature of a spirit, &c. 173
13. Whether the bladder doe drawe the Choller vnto it for nourishment. 176
14. The passages by which the Choller is purged, against Falopius. 170
15. The vse of the Spleene against the slaunderous calumniations of Galens aduersaries. 181
16. How the melancholy iuice passeth from the spleene to the bottom of the stomacke. 185
17. How those that are splenitick are purged by vrine, &c. 186
18. Vse of the Kidneyes, and matter of the vrine. 187
19. That the reasons of diuers Symptones which followe such as are afflicted with the stone are to bee required for Anatomy. 189
20. Whether the bladder do draw the vrine. 191
21. Of the Retention and Excretion of the vrine, &c. Fol. 192
22. Of the action and vse of the Paps. Ibid.
23. Whether milke can bee generated before conception. Fol. 193
24. Certaine Problemes vnfolded concerning the generation of milke. 194

The fourth Booke.

CHAP. I

OF the necessity of the parts of Generation. Folio. 199
2. Of the preparing spermaticke or seed vessels. 200
3. Of the *Parastatæ*. 202
4. Of the Testicles. 204
5. Of the vesselles called *vasa deferentia*, or leading vessels. 207
6. Of the bladders of seed. 208
7. Of the *Prostatæ*. 209
8. Of the virile member. 210
9. Of the proportion of these parts both in men & women. 216
10. Of the preparing spermaticall vessels. 217
11. Of the Testicles. 218
12. Of the *vasa deferentia* or leading vessels. 220
13. Of the wombe or matrix. 221
14. Of the simple or similar parts of the wombe, & particularly of the bottom and orifice. 230
15. Of the necke of the wombe and of the *Hymen*. Fol. 234
16. Of the Priuities. 237
17. Of the wombe of a sheepe and a dog. 239

The Controuersies of the fourth Booke.

QVEST. I.

VVHether the Testicles be principall partes or no. 241
2. Of the vse of the Testicles. 243

3. The opinion of Physitians concerning the true vse of the Testicles. 245
4. Of the substance and coates of the Testicles. 246
5. The consent betweene the chest and the Testicles. Ib.
6. The situation of the Prostata. 247
8. How the parts of generation in men and women doe differ. 249
9. The motions of the wombe. 250
10. How the wombe is affected with smels and with sauours. 251
11. The wonderfull consent betwen the wombe, and almost all the parts of womens bodies. 252
12. Concerning the Acetabula, the hornes and coates of the wombe. 255
13. The membrane called Hymen and the markes of virginity. Ib.

The fifth Booke.

CHAP. I

WHat thinges are necessary toward a perfect generation. 259
2. The principles of generation, seede, & the mothers bloud. Ibid.
3. The mothers bloud the other principle of generation. 261
4. Of Conception. 262
5. The conformation of the parts. 263
6. The nourishment of the Infant, and how it exerciseth the naturall faculties. 266
7. How the Infant exerciseth his vitall faculties, folio. 267
8. The motion and scituation of the Infant in the wombe which are animall faculties. 268
9. The exclusion or birth of the child. ibid
10. The causes of the periodicall euacuation of the menstrua. 293
13. The vicious or faulty Conceptions, and especially of the Mola. 297
14. Of Monsters and Hermophradites. 299
15. Whether all the parts are framed together. 300
16 Whether the membranes which encompasse the Infant bee first formed, and whether they bee made by the forming faculty and seed of the woman. 304
17. The number of the vmbilicall vessels. 305
18. The originall of the vmbilicall vessels. 306
19. The times of the conformation of a man & of a woman childe. 307
20. Whence it commeth that children are like their Parents. 308
21. How Twinnes or more Infants are generated. 312
22. How superfatation is made, why only a woman whē she hath conceiued, desireth the company of the male. Folio. 313
23 Whether the Infant draweth his nourishment at his mouth. 316
24. Whether the Infant bee nourished onely with bloud, and whether he accompl sh onely one concoction. Folio. 317
25 Of the communion of the foure vesselles of the heart in the Infant. Ib
26. Whether the Infant in the wombe doe respire, and stand in need of the labour of his Lungs. 326
27. Whether the vitall faculty which procreateth the spirits is idle in the Infant, and whether his heart is moued by his owne proper power. 327
A Paradox.
28. Whether there be in the Infant any generation of animall spirites, and what position the Infant hath in the wombe. 337
29. Of the nature and differences of the birth. 332
30. How many times there be of a mans birth, & what they are. 334
31. What are the vniuersall and particular causes of the birth. 338
32. Whether in a desperate birth the Caesarian Section be to be attempted. 343
33. Whether in the birth the share and the haunch bones depart asunder. 344

The Controuersies of the fifth Booke.

QVEST. I.

OF the differences of the sexes. 270
2 Of the temperament of women, whether they are colder or hotter then men. 272
3. What Seed is. 277
4. Whether Seed fall from all the parts of the body. 279
6. The excretion of the seed, by what power or faculty it is accomplished. 286
8. Whether the Menstruall bloud haue any noxius or hurtfull quality therein. 288
9. Whether the menstruall bloud because of the meazels and small pox, which are wont once in a mans life to trouble him. 290

The sixt Booke.

CHAP. I.

OF the Thorax or Chest, and the diuision of it. Fol. 347
2. The Skinne and Fatte of the Chest and the necke. 348
3. The muscles of the middle belly, and parts of the necke. 349
4. Of the muscle between the ribbes, called Intercostale. 350

5. Of the midriffe called *diaphragma*. 352
6. Of the membrane called *pleura*. 355
7. Of the *Mediastinum*. 356
8. Of the Sweet-bread and purse of the heart. 358
9. The ascending trunke of the hollow veine. 361
10. Of the nerues in the Chest and neck. 365
11. Of the Heart. 367
12. Of the substance, ventricles and eares of the heart. 371
13. Of the vessels of the heart and their values. 374
14. Of the great artery and his values. 379
15. Of the vnion of the vessels of the heart in the Infant vnborne. Ibid
16. Of the great artery in the Chest and in the necke. 382
17. Of the Lungs. 384
18. Of the weazon or winde-pipe. 388
19. The muscles and nerues in the cauity of the Chest. 391
20. Of the clauicles, breast bone and Ribs. 392
21. The bones of the chest. 394
22. Of the shoulder blade & racks of the neck. 396

The Controuersies of the sixt Booke.

QVEST. I.

AN Anatomicall demonstration concerning the phrensie of the Midriffe. 399
2. *Of the motion of the heart and Arteries.* 400
3. *Of the manner of the motion of the heart.* 403
4. *By what power the arteries are moued.* 405
5. *Whether the arteries be dilated with the heart.* 407
6. *Of the generation of the vitall spirits.* 410
7. *How the matter of the* Empyici *is purged.* 414
8. *The Temperament, Nourishment and Flesh of the heart.* 417
9. *Whether the hart wil beare any grieuous disease.* 419
10. *Of the nature of Respiration and the causes thereof.* 420
11. *Of the temperament and motion of the Lungs.* 423
12. *Of the Cough & the drink falling into the lungs.* 426

The seuenth Booke.

CHAP. I.

OF the names, situation, forme and partes of the head. 432
2. Of the common containing partes of the head. 434
3. Of the muscles about the head. 436
4. Of the figure and sutures of the head. 437
5. Of the bones proper to the scull. 441
6. Of the bones common to the scull and the vpper Iaw. 442
7. Of the *Meninges* or membranes of the head. 443
8. The vessels disseminated through the brain. 450
9. The excellency, situation, figure substance, and temperament of the braine. 452
10. Of the substance and parts of the braine. 455
11. The ventricles of the braine, the Arch, and the *Plexus Choroides*. 460
12. Of the resemblances in the brain, & the fourth ventricle. 466
13. Of the vse of the braine. 469
14. Of the *Cerebellum* or After briane. 475
15. Of the spinall marrow or pith of the back. 479
16. Of the organs of smelling. 483
17. Of the opticke nerues. 485
18. Of the third and fourth Coniugations of the braine. 486
19. Of the nerue of hearing, &c. 487
20. The 6. seuen and eight coniugations of the sinewes. Ibid.
21. Of the nerues of the spinal marrow. 488
22. *Varolius* his maner of dissecting the head. 493

The Controuersies of the seauenth Booke.

QVEST. I.

WHether the Braine be the seate of the principall faculties. 502
2. *Of the marrow of the backe.* 504
3. *Whereupon the principall faculties depend.* 505
4. *The vse of the Braine against Aristotle.* 507
5. *Why the contrary side of the wounded head suffers conuulsion.* 509

CHAP. I.

OF the Face his vessels and muscles. 532
2. Of the Eye and parts thereof. 535
3. Of the Eie browes and eye lids. 540
4. Of the fat and muscles of the eies. 547
5. Of the vessels of the eies. 551
6. Of the membranes of the eies. 553
7. Of the grapy membrane. 559
8. Of the Cobweb, &c. 564
9. The humers of the eies. 565
10. The vse of the humors of the eye. 568
11. Of the outward eares. 573
12. The parts of the outward eare. 578
13. The muscles of the outward eares 580
14. The gristle of the eare. 581
15. Of the inward eare. 582
16. The canale out of the eare into the mouth. 586
17. The membrane of the Tympane or drum. 588
18. The small bones of the chord. 593
19. The muscles of the inward eare. 597
20. The cauities of the stony bone. 601
21. Of the windowes and watercourse in the first cauity. 602

22. Of the Labyrinth and Cochlea. 603
23. The nerue which ariueth at the eares. 605
24. Of the implanted or inbred ayre. 608
25. The maner of hearing & nature of ſounds. 609
26. Of the Noſe. 613
27. Of the coate and vſe of the noſe. 614
28. Of the inner noſe and maner of ſmelling. 616
29. The lower parts of the Face. 620
30. Of the mouth, palat and *vuula*. 621
31. Of the Fauces, or Chops and Almonds. 624
32. Of the tongue and his muſcles. 626
33. Of the ſenſe of taſting. 631
34. The *Larynx* or throttle. 633
35. Of the *Glottis* and cleft of the *Larynx*. 644
36. Of the *Epiglottis* and his muſcles. Ibid.
37. Of the membrane of the *Larynx*. Ibid.
38. Of the ſound and the voyce. 645

The Controuerſies of the eight Booke.

CHAP. I

WHat Senſe is. 646
2. *What Action is.* 653
3. *The end of action.* 654
4. *How manifold Action is.* 655
5. *That Senſe is not a pure paſſion.* 656
6. *That Senſe is not a ſimple action.* 657
7. Placentinus *his opinion.* *Ibid.*
8. *How the faculty is wrought in the Senſe.* 658
9. *Where Senſation is perfecteſt.* 659
10. *That by our outward Senſes we do not know that we haue ſenſe.* *Ibid*
11. *Whece it is that we perceiue that we haue ſenſe.* 660

53. *After what maner an odour affecteth or changeth the medium.* 711
54. *What is the true organ of ſmelling.* 712
55. *Whether taſte be the chiefe action of the toung.* 715
56. *Whether the taſte differ from the touch.* *Ib.*
57. *Of the obiect of taſting.* 718
58. *Of the matter of ſapours.* *Ibid.*
59. *Of the efficient cauſe of ſapors.* 719
60. *Of the number of ſapors.* *Ibid.*
61. *Of the medium or meane of taſting.* 722
62. *Of the organ of taſting.* 723
63. *Whether the tongue alone do taſte.* 724
64. *In what part of the tongue the taſte is moſt exact.* *Folio* 725

The ninth Booke.

CHAP. I.

A Briefe deſcription of the Ioynts. 728
2. Of the parts of the Ioynts in generall. Ibid.
3. Of the excellency of the hands. 729
4. Of the vſe, figure, and ſtructure of the hand, properly ſo called. 730
5. Wherein is declared the reaſons of the framing of all the ſimilar partes, whereof the hand is compounded. 731
6. Of the diſtincter parts of the hand, of the wreſt, and of the afterwreſt. 732
7. Of the fingers of the hand. Ibid.
8. Of the Foote in generall, his excelency, figure, ſtructure and vſe. 733
9. The ſimilar parts of the Foot in the large acception. 734
10. An explication of the diſimilar partes of the whole foote. 735

The 10. Booke.

CHAP. I.

VVHat flesh is, and how many sorts of flesh there be. 737
2. Of the flesh of the muscles, and what a muscle is. 738
3. How many and what bee the partes of a muscle. Fol. 739
4. What is the action of a muscle, and the differences of the motion thereof. 741
5. Wherein all the differences of muscles are shown. 742
6. Of the number of the muscles. 743
7. Of the muscles which moue the skinne of the head. 745
8. Of the muscles of the eye lids. 746
9. Of the muscles of the eyes. 747
10. Of the muscles of the outward eare. 750
11. Of the muscles within the eares. 752
12. Of the muscles of the nose. 753
13. Of the common muscles of the Cheekes and Lips. 754
14. Of the proper muscles of the Lips. 755
15. Of the muscles of the lower law. 757
16. Of the muscles of the choppes which serue for diglutition or swallowing. 760
17. Of the muscles of the bone called *Hyois*. Ib
18. Of the muscles of the tongue. 761
19. Of the muscles of the *Larynx*. 763
20. Of the muscles of the *Epiglottis* or of the ouer-tongue. 766
21. Of the muscles which moue the head. 767
22. The muscles of the necke. 771
23. The muscles of the shoulder-blade called *Omoplata* or *Scapula*. 772
24. Of the muscles of the arme. 775
25. Of the muscles of the Cubit. 780
26. The muscles of the *Radius* or wand. 782
27 Of the muscles of the hand in general. 785
28 The muscles of the palme, and 2 or three other ysſuing from the fleshy membrane. 786
29 The substance which commeth betweene the skin of the palme, and of the fingers & their tendons. Ibid.
30 The muscles which bend and extend the fore-fingers. 787
31 Of the muscles that bend & extend the thumb. Fol. 789
32 Of the muscles of the afterwrest and the wrest. Fol. 791
33 The muscles of Respiration. 793
34. Of the muscles of the *Abdomen* or panch. 796
35 The muscles of the back. 801
36 The muscles of the fundament, the bladder, the testicles, and the yarde. 803
37. The muscles of the Leg. 804
38. The muscles of the thigh. 807
39. The muscles of the foote. 813
40. The muscles of the Toes. 817
41. The flesh of the entrals or bowels. 820
42. What a glandule is, and how many kinds there be of them. 821
43 A briefe enumeration of the Glandules in the whole body. 823

The eleuenth Booke.

CHAP. I.

VVHat a veine is. 825
2. Of the vse and action of the veines. 827
3. The differences of veines. 828
4 The description of the gate veine and his braunches. 831
5. Of the descending Trunke of the hollow veine Fol. 835
6 Of the ascending Trunke of the hollowe veine. Fol. 839
7 The veines of the Face, the eyes, the nose, the teeth, and the throttle. 843
8 Of the veines disseminated thorough the brayne. Fol. 844
9 Of the veines of the whole hand in the large acceptation. 845
10 Of the veines of the whole foot in the large acceptation. 849
11 The values and floudgates of the veines. 852
12 Of the arteries in generall. 856
13 Of the vse of the arteries. 859
14 Of the ascending trunk of the great artery. 860
15 The descending trunke of the great artery, accompanying the hollow veine. 862
16 The arteries accompanying the braunches of the gate veine, through the lower belly. 864
17 Of the arteries of the veine. 865
18 The arteries of the Face, the eyes, the nose, the teeth, and the *Larynx*. 867
19 Of the arteries of the hand in the large acceptation. Ib.
20 Of the arteries of the foote in the large acceptation. 869
21 Of nerues in generall. 871
22 The nerues of the eyes, or of the first & second coniugation. 876
23 Of the third and the fourth coniugations of the braine. 889
24 Of the Auditory nerue of the fift Coniugation. 891
25. Of the sixt seuenth & eight Coniugations. 892
26 Of the nerues which ysſue from the spinall marrow in the necke. 894
27 Of the nerues of the Chest. 897
28 Of the nerues of the Loynes. 898
29 Of the nerues of the Holy-bone. 899
30 Of the nerues of the hand in the large acception. 900
31 Of the nerues of the foote in the large acception. 904

OF the definition, vſe, and difference of griſtles. Folio. 907
2. Of the griſtles of the Face. 909
3. Of the *Epiglottis*, the Griſtles of the *Larynx*, and of the weazon. 910
4. Of the griſtles in the trunke or bulke of the body. 612
5. Of the griſtles of the Ioynts. 913
6. Of the nature, vſe, and differences of Ligaments. Fol. Ibid.
7. Of the ligaments of the head. 915
8. Of the ligaments of the ſpine and the cheſt. Ibid
9. Of the ligaments of the ſhoulder blade, the arme the cubit, and the wand. 916
10. Of the ligaments of the wreſt, afterwreſt & the fingers. 917
11. Of the ligaments of the Holy-bone, the haunches, and the whole leg and foot. 918
12. What a membrane is, their vſes and differences. 920
13. A briefe enumeration of all the mẽbranes. 922
14. The nature of fibres. 923
15. Of the differences of fibres. Ibid.

The 13. Booke.

CHAP. I.

OF the definition and difference of bones. 926
2. Of the partes of bones and their appellations. 928
3. Of the ſtructure and connexion of bones in generall. 930
4. A briefe definition and enumeration of all the bones in the body. 935
5. Of the ſutures or ſeames of the ſcull, and of the ſubſtance thereof. 936
6. Of the proper bones of the ſcull. 940
7. Of the bones that are common to the head & the vpper Iaw, that is to ſay, of the wedge & ſpongy bones. 946
8. Of the bones of the noſe, & of the yoke bone 950
9. Of the ſutures and ſeames of the vpper Iaw. 951
10. Of the bones of the vpper Iaw, 953
11. Of the lower Iaw. 956
12. Of the ſockets of the teeth. 958
13. Of the name, definition, figure, magnitude, nũber, ſite, and articulation of the teeth. 959
14. Of the ſhearers and Dog-teeth. 961
15. Of the grinding teeth. 962
16. Of the veſſels and ſence of the teeth. 964
17. Of the inward cauity and membrane of the teeth. 967
18. Of the generation and vſe of the teeth. 968
19. Of the bone *Hyois* called *os gutturis*. 971
20. Of the ſpine in generall. 973
21. Of the rackebones of the necke. 975
22. Of the rackes of the backe, the loynes and the holy-bone. 976
23. Of the bones of the cheſt in generall. 980
24. Of the clauicles or coller-bones. Ib.
25. Of the breaſt bone. 982
26. Of the Ribbes. 983
27. Of the ſhoulder blade. 984
28. The hip, hanch and ſharebones. 985
29. The bones of the arme and the cubit. 987
30. Of the bones of the hand properly ſo called, that is, of the wreſt and afterwreſt. 991
31. Of the bones of the fingers. 994
32. Of the Seed-bones. 995
33. The bones of the thigh. 996
34. The two bones of the leg. 999
35. The whirlebone of the knee. 1003
36. The bones of the Foote properly ſo called, and particularly of the wreſt of the foot. 1004
37. The bones of the afterwreſt, & the Toes of the feet. 1008
38. Of the Seede bones and the nayles. 1009

OF THE EXCELLENCIE OF MAN.

Together with { *Profite, Neceſsitie,* } { *Antiquitie, & Method* } *of* ANATOMY.

As alſo, of the *Authors, Subiect,* and *generall Precepts* of the ſame.

THE FIRST BOOKE.

The Præface.

THE worth and Excellencie of an Art, is greater or leſſe, according to the dignity or baſeneſſe of the Obiect, whereabout it is conuerſant. So in the ἐγκυκλοπαιδείᾳ, that is, the Orbe or Circle of the Arts, *Logicke* is worthily eſteemed the firſt in order, becauſe the obiect thereof is *Reaſon*; whereby (as by *Ariadnes* clew) wee are directed through all the intricate Labyrinths and Mazes of Nature; and *Diuinity* the laſt and moſt excellent, as beeing the end and conſummation of all the reſt, teaching vs how to liue bleſſedly both heere and for euer: and therefore though all Arts are indeed originally from God, yet this is ſaide more properly to be ἄνωθεν καταίχομένη, becauſe it is immediately deliuered, and that by inſpiration from heauen. Betwixt theſe two, there are manie Arts full of ſecret and abſtruſe notions, deepe myſteries, and high contemplations, yet none me thinkes, that can ſtand in competition with this we haue in hand concerning the frame of Man. For to let paſſe the reſt; if it ſhall be obiected, That the infinite extent, the abſolute & circular figure, the perpetuall and rapid motions of the Heauens, the glorious bodies wherewith they are ſpangled, the ſweete harmony of their Spheares, the powerfull influences of euery Starre, the leaſt of which is ſaide to be eighteen times as big as the earth; as they are in heighth and magnitude, ſo they are in dignity farre aboue the nature of man. If for the earth it ſhall bee ſaide, that it is the rich matter and Matrixe, the great Mother and Nurſe of all creatures, the ſpouſe of heauen, in whoſe onely boſome (as in their proper center) all the influences of the heauenly bodies, doe concurre and vnite themſelues, leſſe ſubiect to alteration then heauen it ſelfe if we beleeue Aſtronomers, immooueable, and yet in perpetuall motion, by the continuall corruption and generation of things, alwayes conſuming, yet neuer diminiſhed. If a Commonwealths man ſhall preferre the Art of Policy, whereby not onely particular men, but Cities, kingdomes, Empires, yea and the whole world is kept in order which otherwiſe would run head-long to confuſion, which is an image of Gods gouernment, and the very Character of his admi-

adminiſtration in puniſhing vice,& rewarding vertue: if I ſay, any man ſhal prefer the knowledge of any of theſe to the myſtery of the humane Nature, I would haue him know; that there is nothing either in heauen or on earth, or in the adminiſtratiõ of them both, not only on mans part, but which is more, on Gods alſo, that is not equalled, yea the diuine hiſtory giueth vs warrant to ſay, exceeded in the frame of man. For, wheras in the creation of the Heauens and the Earth, and the furnitures and armies of them both, the great Architect wrought them all by his thought, worde, and deede, all falling into one inſtant of time: when he was to make Man, he holds a Councell, *Come let vs make Man according vnto our*
Geneſ. 1,23. *owne Image*; ſummoning thereunto, not only himſelfe and all his atributes, as his power, his wiſedome, his iuſtice, his loue and mercy, if not to caſt in ſome part, yet to lend ſome influence of their diuine Natures toward his creation, but alſo his Son and the bleſſed Spirit: as if Man were a kinde of production of the whole Deity, or as the Poet ſaith, *Magnum Io-*
Virg. Eclog. 4. uis incrementum; which I am the rather bolde to ſay, becauſe the learned Apoſtle vſurpeth the very words of another Poet to the ſelfe-ſame purpoſe, αὐτοῦ γὰρ καὶ γένος ἐσμέν, wee
Actes 17, 27. are alſo of his off-ſpring; not that I conceiue (as ſome blaſphemouſly haue done) that hee
Rhembam. was made out of the very eſſence of God, but becauſe the image of the diuine nature, is moſt liuely imprinted in his ſoule and in his body, and in the ſubſtance & qualities of them both. For the Soule, it carrieth a deepe ſtampe of diuinity in the ſimplicity, inuiſibility, & immortality thereof: That it is incorporeall and diffuſiue, quickning, ſuſtaining, gouerning and mooving the whole body, and euery part thereof, euen as God ſupporteth and ruleth the whole world, being by a diffuſiue nature, or rather infinite omni-preſence, at all times, in euery place: That as the Deity is but one in eſſence, yet diſtinct in perſons, according to the Relatiue qualities therein, which yet hath neither different matters, nor formes (as we ſay) but are all one and the ſame eſſence; ſo the ſoule of man is but one, yet that one, conſiſting of three eſſentiall and diſtinct Faculties or powers, intellectual, ſenſitiue, and vegetatiue; which yet make no difference in the ſubſtance thereof, that it ſhould not bee one and an entire ſoule. Againe, in the intellectuall part or power, there are two eſſentiall attributes reſembling their prototype or originall in God, to wit, Knowledge and Will. As for the qualities of the ſoule, they are either internall, or externall. The internall, carry the
Coloſ. 3,10. image of the Creator, as S. *Paul* interpreteth it, in heauenly wiſedome, iuſtice, and ſanctity; the externall, in maieſty, dominion, and ſoueraignty ouer the creatures; both which, the Poet hath excellently put together, where he ſpeaketh of mans creation, after the reſt of the creatures.

Sanctius his Animal, mentiſque capacius altæ
Deerat adhuc, & quod dominari in cetera poſſet,
Natus homo eſt.

Ouids Metam.

A creature holyer then the reſt, and better fram'd to holde
A ſoule infuſed from aboue was wanting yet; So borne
At length was Man, the reſt in bands of awefull power to folde.

Audius. The body alſo, as far as it was poſsible, carieth the image of God, not in figure as *Audius* & his followers the *Anthropomorphites* haue ſottiſhly dream't, hee being an infinite Ocean of eſſence, tranſcendent, and aboue all comprehenſion of nature or time: which himſelfe expreſſeth to *Moſes* in the future tenſe of the ſubſtantiue verbe, *Ero*; ſignifying thereby, the preſent and eternall ſubſiſtence of a ſubiect, without any prædicate as we ſay in Schooles; but becauſe the admirable ſtructure, and accompliſhed perfection of the body, carrieth in it a repreſentation of all the moſt glorious and perfect workes of God, as being an Epitome or compend of the whole creation, by which he is rather ſignified then expreſſed. And hence it is, that man is called a *Microcoſme* or little worlde, as in the following diſcourſe will more at large appeare; to which with this ſhort preamble as a Preface of Honour, wee referre the Reader.

CHAP.

The first Chapter.

The Excellency of Man is declared by his parts, Namely, the minde and the bodie, and first what is the dignity of the Soule.

IN the inauguration or Coronation of a Prince, there is nothing more ſtately or magnificent, then to haue his ſtile rehearſed by men of greateſt Nobility, euery one adding ſomewhat thereto, till the whole number of his Seigniories and Honors are heaped vpon him: if therefore, wee liſt to ſearch what and how magnificent haue been the acclamations of all ages, we ſhall finde in the Records of Antiquity, that man in whom the ſparkes of heauenly fire, & ſeeds of the diuine Nature are, (as appeareth both by the Maieſtie imprinted in his face, and by the frame of his body, which was made vpright and looking toward heauen) was of the wiſe and prudent Prieſts of the Egyptians, ſtyled a reuerend & admirable creature. That thrice-worthy *Mercury* cals him a *great Myracle, a Creature like the Creator, the Ambaſſador of the Gods*. *Pythagoras*, μέτρον ἁπάντων, *the Meaſure of all things*. *Plato* θαῦμα θαυμάτων, *the wonder of Wonders*. *Theophraſtus*, the *patterne of the whole vniuerſe*. ἀντίμιμον παράδειγμα. *Ariſtotle, A politicke creature framed for ſociety*. *Syneſius, the Horizon of Corporeal and Incorporeall things*. *Tully, a Diuine creature, full of reaſon and iudgement*. *Pliny the worlds Epitome, and Natures Darling*. Finally, all men with one conſent, call him μικρόκοσμον, or, *The little world*. For his body is, at it were, a Magazine or Store-houſe of all the vertues and efficacies of all bodies, and in his ſoule is the power and force of all liuing and ſenſible things. That ancient *Zoroaſter*, hauing long admired the ſingular workemanſhippe ſhining in the frame of man, at length cried out, Ὦ Ἄνθρωπε, τολμηρότης τῆς φύσεως ἄγαλμα. *O Man, the glory of Nature, euen in her cheefeſt ruffe and pride, and her Maiſter peece, when ſhe durſt contend with heauen it ſelfe*. *Abdolas* the Barbarian, beeing asked what hee thought was the moſt admirable thing in Nature, is reported to haue anſwered not Barbarouſly, but wiſely; *That it is onely Man who far ſurpaſſeth all admiration*, for that beeing the Image and reſemblance of the whole world, he can ſuddenly (*Proteus*-like) transform himſelfe into any particular thing. *Fauorinus* did acknowledge nothing great vpon earth, but Man.

Mans ſtile or titles.
Mercurius Triſmeg.
Pythagoras.

Μικρόκοσμος.
Why hee is called, *The little world.*
Zoroaſter.
Abdolas.
Fauorinus.

The Diuines call him *Omnem Creaturam, euery Creature*, becauſe he is in power (in a manner) *All things*; not for matter and ſubſtance, as *Empedocles* would haue it, but *Analogically* by participation or reception of the ſeuerall ſpecies or kinds of thinges. Others, call him, the Royall Temple and Image of God. For as in Coin the picture of *Caeſar*, ſo in Man the image of God is apparantly diſcerned. Others cal him, the End of all things (which in Nature is the firſt cauſe,) to whom all ſublunarie created Bodies and Spirites are obedient, yet he himſelfe ſubiect vnto none, vnleſſe peraduenture one man come vnder the lee and ſubiection of another. The Kingly Prophet *Dauid*, ful of heauenly inſpiration, deſciphereth the dignity of man on this manner; *Thou haſt made him little lower then the Angels, thou haſt crowned him with glory and honor, and giuen him dominion ouer the workes of thy hands*.

How man is all Creatures.
Empedocles
Pſal. 8.

Theſe are excellent, that I may not ſay diuine commendations, which man hath, partly from his ſoule, the moſt excellent of all formes, partly from his body, which is as it were the meaſure and exemplary patterne of all corporeall things. The ſoule indeede is ſo diuine, that raiſing and mounting it ſelfe ſometimes aboue all naturall formes, it comprehendeth by an admirable, abſolutely-free, and incompulſiue power, all incorporeall things ſeuered

The ſignes of Mans honour referred partly to his ſoule, partly to his body.
The excellency of the ſoule

The soule alone is continually created

seuered and diuided from all matter and substance. This Soule, if it could bee discerned with the eye, or but conceyued by the minde, how would it rauish vs and leade vs into an excessiue loue of it selfe? Onely this is created, not generated; and albeit (as the Philosophers speake) there be a subiect supponed in her production, yet it is not produced out of the power of that supponed matter, but rather absolueth and perfecteth the same.

It alone is indiuisible. Immateriall.

This onely is indiuisible, for all other Naturall formes receiue augmentation, diminution and diuision, together with their subiects; but the Soule of man *Is wholly in the whole, and wholly in euery particular part*. This onely is immateriall, heerein alone participating with the Matter, that it is capeable of all species or kindes, euen as the first Matter admitteth all impressions and formes; and yet the manner of reception is not alike in them both. For that first matter receiueth but particular and indiuiduall formes, and that without vnderstanding: in the Soule are imprinted the vniuersall formes of things, and it hath also vnderstanding to iudge of them.

How the reception of formes differs in the first matter, and in the soule.

The matter admitteth those particular formes materially, and withall obliterateth or blotteth out the contrary forme whereof it was before possessed: the soule of man receiues and entertaines the generall and vniuersall notions of things, free from all contagion or touch of Matter, not abolishing the contrary, or diuers formes whereof before it was possessed. This alone is incorporeall, immortall, ἀναλοίωτος or immutable. This may be called the receptacle, promptuary, or store-house of all the species or kinds of things.

The soule is the place of the species or formes. *Aristotle.* *Plato.*

Aristotle in his third Booke *De Anima*, calleth it *After a manner all things*, *Because* (saith he) *In an Organe of sence, the sensible species or Images of things are blotted out, and as it were drowned, but the Soule retaineth them.* The *Platonists* do range it in the midst, as hauing God aboue it, & the *Intelligences* or Angels: below it, all bodies and all qualities that so it might be partaker of them both. According to Diuines, it approacheth very neere to the Nature of Angels, by reason of her vnderstanding or intellectuall power, of her originall, eternity, image, apprehension and beatitude.

The soule is in the middle degree of all things. The Nature of the soule is Angellicall.

To conclude, there is in the soule of Man something Metaphysicall, transcendent aboue Nature, vnknowne to the ancient Philosophers, who groaped but in the darke, and were inwrapped in a mystie or clowdy veile of ignorance; and is reuealed onely to Christians, to whom the light of the Gospell hath shined. For in it is a liuely resemblance of the ineffable Trinity, represented by the three principall faculties, *Memorie, Vnderstanding*, and *Will*. But stay: Why should I presume to describe the essence of the Soule, seeing it partaketh of so much Diuinity? for of diuine things *Symonides* hath sayde well, We can onely say what they are not, not what they are. Why should I paine my selfe to open that shrine which *Nature* her selfe hath veyled and sealed vp from our sences, least it should bee prophaned therewith?

In the soule appeareth the Image of the Trinity. *Symonides.*

Hipocrates.

Hence it is, that *Hipocrates* calleth it φύσιν ἀφανέα, *The inaspectible or inuisible Nature*, which can no more be described by vs, then our eye is able to see it selfe. These thinges therefore belong to a higher contemplation, and require a more skilfull Workman to draw but the lines, or euen to shadow them out. Let vs content our selues to handle that that may be handled, or at least is subiect vnto some of our sences, and so proceede to the other part of Man, namely, the Bodie, which more truely and properlie is the subiect of our Discourse.

Of the Dignity and wonderfull frame of Mans Body.
CHAP. II.

The excellency of mans body is sette forth by foure things.

AS the soule of man is of all sublunary formes the most noble, so his Body, the house of the soule, doth so farre excell, as it may well be called μέτρον, the measure and rule of all other bodies. There be many things which set foorth the excellency of it, but these especially among others. The frame and composition which is vpright and mounting toward heauen, the moderate temper, the equal and iust proportion of the parts; and lastly, their wonderfull consent & mutuall concord as long as they are in subiection to the Law & rule of Nature: for so long in them we may behold the liuely Image of all this whole Vniuerse, which wee see with our eyes (as it were) shadowed in a Glasse, or desciphered in a Table.

1. An vpright frame.

And first for the Figure. Man onely is of an vpright frame and proportion, whereupon hee is called of some ὀρθανθρώπος, vsually ἄνθρωπος, as it were ἄνω θεωρῶν looking vpwards; althogh

Plato

Plato in *Cratylo* is of opinion, that man is called ἄνθρωπος, as it were ἀναθρῶν ἃ ὄπωπε, that is, contemplating those things which hee seeth. The reason of this forme or Figure, is meerely Philosophicall, as depending vpon the efficient, materiall, and finall causes. The efficient is two-folde, Primary and Secondary: The primary, is the soule, which comming from without, and being infused into the body from heauen, whilst she is building of her selfe a mansion fit for such functions and offices as shee hath to performe, as mindfull of her owne Originall, lifteth her building vp on high. The Secondary efficient of mans bodie is heate, wherewith man aboue other creatures aboundeth, especially the parts about his heart. *Plato in Cratylo*

Of this vpright frame the efficient cause is two-fold. Primary. Secondary.

The Nature therefore of heate preuailing, forceth the increment or growth, vp from the middle part, according to his impetuous strength and nimble agility, that is, it striueth and driueth toward that part of the world, toward which heate is naturally mooued, that is to say, vpwards. For the matter of mans body, it is soft, pliable and temperate, readie to follow the Workeman in euery thing, and to euery purpose; for man is the moysteſt and most sanguine of all Creatures. The finall cause of the frame of mans body is manifolde. Firſt, man had an vpright frame & proportion, that he might behold and meditate on heauenly things. And for this cause, *Anaxagoras* being asked wherefore he was born, he made answere, to behold the heauens and the Starres. Secondly, that the functions and offices of the outward sences, which are all placed as it were a guard in pension, in the pallace of the head, and in the view and presence Chamber of Reason, which is their soueraigne, might in a more excellent manner be exercised and put in practise: for they were not ordained onely to auoide that which is hurtfull, and to followe and prosecute that which is profitable; but moreouer also for contemplation: and therefore they were to be placed in the highest contabulation or Story of the body. And by this meanes, speech, which is the messenger of the minde, is the better heard from on high; the Smell doth more commodiously receyue and entertaine the vapor that ascendeth: the Eyes being as it were spies or Centinels, day and night to keepe watch for vs, & being beside giuen vs, that we should take view of those infinite Distances and glorious bodies in them, which are ouer our heads, did therefore require an vpright frame and composition of the body.

The material cause.

The finall cause three-fold. *Firſt.* *Anaxagoras.* *Second.*

Finally, to conclude this point, man onely had an vpright frame of bodie, because hee alone amongst all Creatures had the Hand giuen him by God, an Organ or Instrument before all organs, and indeede in stead of all. Now, if the figure of man had been made with his face downward, that Diuine Creature should haue gone groueling vpon his handes, as well as vpon his feete, and those worthy and noble actions of his Hand, had been forfeited, or at least disparaged. For, who can write, ride, liue in a ciuill and sociable life, erect Altars vnto God, builde shippes for warre or trafficke, throwe all manner of Darts, and practise other infinite sorts of excellent Artes; eyther groueling with his face downward, or sprawling on his backe with his face vpward? Wherefore, onely man had the frame of his body erected vpward towards heauen. *Third.*

For this cause also, onely man amongst all other creatures, was framed according to the fashion of the whole vniuerse, because he hath his parts distinct, the vpper, the neather, the fore, the backe parts, those on the right hand, and those on the left hand; the rest of the Creatures either haue them not at al, or very confused. The right parts and the left, are altogether alike, sauing that the left are the weaker, but the fore parts are very vnlike the back parts: the lower in some sort carrie a resemblance of the vpper. And so much of the figure.

Man alone framed according to the fashion of the whole world.

Man hath likewise a moderate temper, and is indeed the most temperate of all bodies, as being the μέτρον, measure, and rule of all others. The bodies of other Creatures, are either too Earthy, or too Watery: but to Mans, the temperature of all things liuing, both plants and Creatures is referred, as to the *Medium generis*, as we vse to say, that is, to the *middle of the vvhole kind*, so that they are sayde to bee hot, colde, moyst, and drie πρός τι, that is, according to reference, their temperature being compared with Mans. Againe, Man alone hath encluded in himselfe the temperature of all liuing things; all other creatures are in their seuerall kindes for the most part, of one and the same temper. But if you looke vnto mankinde, you shall finde manie that haue the stomacke of an Estrich; Others, that haue the heart of a Lyon; Some are of the temper of a Dogge, many of a Hog, and an infinite number of as dull and blockish a temper as an Asse.

The excellency of the body, is likewise set forth in the temperature. It is the middle of the whole kinde. Man alone hath in himselfe the temperature of al liuing things.

Moreouer, this also declareth the εὐκρασία or absolute temper of mans bodie, that it is subiect to many diseases, and is equally endamaged, as well by one extreme, as by another;

Why the body of Man was not made of an heauenly matter, but of an elementary.

becauſe it is equally diſtant from both extreames. There might indeede of the heauenly matter, being the moſt noble, haue beene made, a body moſt noble alſo; but it was of neceſsity it ſhould be made of ſublunarie and elementary matter, that it might bee capeable and apprehenſiue of the ſeuerall ſpecies and formes of things which mooue the ſences, becauſe from them all our knowledge is deriued. For man being borne to vnderſtand, & hee that vnderſtandeth, muſt apprehend thoſe viſions and fantaſies which are obiected eyther to the inward or outward ſence; and that there is no perception of any ſuch viſion or immagination, but by the miniſtry of the outwarde ſences, which are the intelligencers betweene the body and the ſoule; it was neceſſary that the body of man ſhould be compoſed of ſuch a matter as might bee capeable of theſe ſences; but of all ſences the foundation is *Touching*, which hath his eſſence and being in the temper and moderation of the four firſt qualities: whence it is, that the foure firſt ſubſtances wherein thoſe qualities do reſide, were neceſſarily to be the matter of the body, and thoſe are the foure Elements. And ſo much of the temperature of mans bodie.

3. the admirable proportiõ of the parts.

Now the συμμετρία or due proportion, compoſition, or correſpondency of the parts of mans body, with reſpect each to other, and of them all to the whole, is admirable. This alone for a patterne do all workemen and Artſ-maiſters ſet before them: to this, as to *Polycletus* rule, do the Surueighers, Maiſter Carpenters and Maſons, referre all their plottes and proiects; they builde Temples, Houſes, Engines, ſhipping, forts, yea and the Arke of *Noah*, as it is recorded, was framed after the meaſure and proportion of mans body; for, as the body of a man is in length three hundred minutes, in bredth fifty, in heighth thirtie; ſo the length of the Arke was three hundred cubites, the bredth fifty, and the heighth thirtie.

The circular and ſquare figure appearing in Mans body.

Moreouer, in this proportion of his parts, you ſhall finde both a circular figure, which is of all other the moſt perfect; and alſo a ſquare, which in the reſt of the creatures you ſhall not obſerue. For the Nauell being placed in the middle of the whole bodye, and as it were in the centre; if you lay a man vpon his back, and as much as may be labour to ſpred both his hands and feete, and keeping one end of the Compaſſe vnmooued and ſet vppon his nauill, doe turne about the other end, you ſhall come vnto both the thumbes, toes of the feete, and the middle finger of the handes: and if in any part this proportion fayle, you may immagine there is a defect in that part. Alſo, if you conceiue a meaſure betweene the feete ſpread abroad, and likewiſe betweene the hande and the foote on either ſide, you ſhal haue a perfect quadrate drawne and portrayed within a circle. And this is the true quadrature of the circle, not thoſe immaginary lines whereof *Archimedes* wrote, and which haue troubled the heades of all our Mathematicians for many ages, when as euerie one might haue found it in himſelfe. Theſe be excellent things which we haue obſerued, touching the figure and frame of mans body, the temperature thereof, and the proportion of the parts; but this laſt exceedeth all admiration, that in it ſelfe alone, it ſhould containe all whatſoeuer this whole world in his large and ſpacious boſome doth comprehend; ſo as it may worthily be called a Litle world, and the patterne and Epitome of the whole vniuerſe.

Archimedes quadrature of the circle found in mans body.

4. Man containeth in him ſelfe al things in the whole world.

The ancient Magitians (for ſo naturall Philoſophers were of olde tearmed,) as alſo the great wiſe Prieſts of the Egyptians, did make of this whole vniuerſe, three parts: the one, vppermoſt or ſuperiour, which they tearmed the intellectuall and Angelical part, the ſeate of the *Intelligentiæ*, (ſo they called the Spirits, which by tradition from the Hebrues, they vnderſtood were in the heauen) by whoſe direction and command, the inferiour or lower world is guided and gouerned: another middle, which they tearmed the heauenly part, in the middeſt whereof, the Sun ruleth, as the leader and moderater of the reſt of the Stars: the 3. ſublunary or Elementary, which is admirable & abundantly fertile, in procreating, increaſing and nouriſhing of creatures and plants. The Images and reſemblances of which three partes, who ſeeth not plainly expreſſed, and as it were portrayed out with a curious penſill in the body of man? The head, the Caſtle and tower of the ſoule, the ſeate of reaſon, the manſion houſe of wiſedome, the treaſury of memory, iudgement, and diſcourſe, wherein mankinde is moſt like to the Angels or intelligencies, obtaining the loftieſt and moſt eminent place in the body; doth it not elegantly reſemble that ſupreame and Angelicall part of the worlde? The middle and celeſtiall part, is in the breaſt or middle venter, moſt exactly, and euen to the life expreſſed. For as in that celeſtiall part, the Sun is predominant, by whoſe motion, beames, and light, all things haue their brightneſſe, luſter, and beauty; ſo in the middeſt of the cheſt, the heart reſideth, whoſe likeneſſe and proportion with the Sun, is ſuch and ſo great, as the ancient writers haue beene bolde to call the Sun,

Three partes of the world.

The Collatiõ of man with the world.

The elegant Analogie betweene the Sun and mans heart.

The

The hart of the world, and the heart the Sunne of mans bodie. For euen as by the perpetuall and continuall motion of the Sun, and by the quickning and liuely heat thereof, al things are cheered and made to flouriſh; the earth is decked and adorned, yea crowned with flowers, brings foorth great varietie of fruites, and yeelds out of her boſome innumerable kinds of Hearbes, the ſhrubs thruſt forth their buds or Iems, and are cloathed with greene leaues in token of iollity, all creatures are pricked forward with the goades and prouocations of luſte, and ſo ruſhing into venereall embracements, do ſtore and repleniſh with a large and abundant encreaſe, both Cities, Land, and Seas; (for which cauſe, *Ariſtotle* calleth this *Ariſtotle.* proſperous, refreſhing, and comfortable Starre γενεσιουργον, as beeing the procreator of all things,) and on the contrary, the ſame Starre of the Sunne, being departed farre from our Coaſts, the earth begins to be horrid and looke deformed, the ſhrubs are robbed and diſpoyled of their leaues, berries and verdure, and a great part of thoſe things, which the fertility of Nature had brought foorth, is weakened and waſted: ſo in like manner, by the perpetuall motion of the heart, and by the vitall heate thereof, this litle world is refreſhed, preſerued, and kept in vigor and good life: neither can any thing therein be either fruitfull, or fit and diſpoſed to bring foorth, vnleſſe that mighty and puiſſant power of the heart, do afford and yeelde an effectuall power of fœcundity. The Vital faculty floweth from the heart as from the fountaine, the Celeſtiall faculty from heauen. This latter, is ſaide to be the preſeruer of all inferiour things: the former kindleth, nouriſheth, and refreſheth the Naturall heate of euery part. The Heauen workes vpon the inferiour world by his motion and light; the Heart by his continual motion and æthereall ſpirit, as it were a bright light, cleareth and beautifieth all the parts of the body. The motion and light are in the ſuperiour bodies, the inſtruments of the intelligencies and of the heauens; of the intelligencies, as of the firſt mouers vnmooued, of the heauens, as of the firſt mooued mooued. The vital ſpirits and pulſation or beating of the heart, are inſtruments of the ſoule, and of the heart: Of the ſoule, as of a mooued not mooued; of the heart, as of a mooued mooued by the ſoule. *The excellēt ſimilitude of the vitall and celeſtial faculties.*

Now further, who ſeeth not the ſublunary part of the world expreſſed in the inferiour venter or lower belly? for in it are contained the parts that are ordained for nouriſhment & procreation; ſo as we neede not make any doubt to profeſſe and affirme, that all things are found in the body of man, which this vniuerſall world doth embrace & comprehend. Wilt thou ſee in this *Microcoſme* or little world, the wandering Planets? The moyſt and watrie power of the Moone, is reſembled by the ſtreaming marrow and pith of the back & braine. The power of *Venus* is proportioned in the generatiue parts: To *Mercurie* ſo variable, and withall ſo ingenuous, the inſtruments of eloquence and ſweet deliuery are anſwereable. Of the Sun and the heart, the admirable proportion and agreement, we haue already declared. To the beneuolent and beneficiall Starre *Iupiter*, the Liuer of man, the well-ſpring of moſt ſweete and gratefull humors is fitly compared. The fire and fury of *Mars*, the little bladder of the gaul gathers into it ſelfe. The cold and harmfull Starre *Saturne*, that looſe and flaggy fleſh of the Spleene, being the receptacle of melancholike humors, dooth liuely reſemble. And thus in like numbers, and equall proportion, both Arithmeticall and Geometricall, do theſe Celeſtiall particles (as they are tearmed) of either worlde, the greater of heauen, and the leſſer of man, anſwere one another. The xii. ſignes of the Zodiake, by the Aſtrologers elegantly depictured in the body of a man, I paſſe ouer with ſilence: for theſe are thinges ancient and commonly knowne, as being ſung in the corners of our ſtreets: wee chooſe rather to meditate of more ſublime and profound matters, and to bend the eye of our minde at a higher marke. The *Peripatetikes* do diuide the world into bodies ſimple & mixt; ſimple, they make fiue, the heauen, and the foure Elements; of the mixt bodies, they will haue ſome to be imperfect, which they call Meteors, and thoſe Fiery, Aiery, Watry, Earthy: other ſome perfect, as thoſe things that haue life. All which, how and after what manner they be in man, becauſe it is an excellent and beautifull ſpeculation, I pray you marke and obſerue with me diligently. Of this little world, the ſimple bodies are fiue, the ſpirits and the foure humors. The Spirit is the quinteſſence or fift eſſence, æthereal, in proportion (as ſayth the Philoſopher) anſwering to the element of the ſtarres; the foure humors are called the foure ſenſible elements of the bodie. Choler in temper the moſt hot and raging, reſembles fire. Blood hot and moyſt, reſembles the ayre. Flegme cold & moyſt, reſembles the water. Melancholy, cold and dry, is fitly compared vnto earth. Behold alſo, the wonderfull Analogie of the Meteors of this little world. The terrible Lightning and fiery flaſhes and impreſſions, are ſhewed in the ruddie ſuffuſions of our eyes when we are in a heate and furie, as alſo by thoſe

The wandering Planets in the little world.

The compariſon of both worlds according vnto the doctrin of the Peripatetikes.

The ſimple bodies of Mā.

The Meteorologie of the litle world.

thoſe ἐκλάμψεις or darting beames which we throw from the ſame. The rumbling of the guts, their croaking murmurs, their rapping eſcapes, and the hudled and redoubled belchings of the ſtomacke, do repreſent the faſhion and manner of all kindes of thunders. The violent and gathering rage of bluſtering windes, tempeſtuous ſtormes and guſtes, are not onely exhibited, but alſo foreſhewed by exhaled crudities, and by the hiſsing, ſinging, and ringing noiſes of the eares. The humor and moiſtneſſe that fals like a Current or ſtreame into the empty ſpaces of the throate, the throtle and the cheſt, reſembleth raine and ſhowers. Thicke and concocted Flegme, that comes vp round and roundly when we Cough, carries the likeneſſe of Haileſtones; teares do repreſent the Dew: ſhaking, ſhrinking, trembling, & throbbing motions, reſemble the Earth-quakes. There are alſo found in our bodies, Mines and quarries, out of which, Mettals and ſtones are digged, not to builde, but to pull downe the houſe; ſo the ſtones of the Kidneyes and bladder do carry a reſemblance of Mines and Mineralles.

This is the Meteorology of this Little worlde, this is the demonſtration of thoſe things therein that are imperfectly mixed. And if you require in man an example of a bodye perfectly mixed, behold and conſider the whole body; in which, there is that concord and agreement of the foure diſagreeing qualities, and ſo iuſt & equal a mixture of the elements, as that it is the very middle and meane amongſt all liuing and animated things. This Little World therefore, which we call Man, is a great miracle, and his frame and compoſition is more to be admired and wondered at, then the workemanſhip of the whole Vniuerſe. For, it is a farre eaſier thing to depaint out many things in a large and ſpacious Table, ſuch as is the world; then to comprehend all things in one ſo little and narrow, as is the compaſſe of mans body.

Epicurus, Momus, Pliny, and other the malicious and falſe detractors from Nature are cenſured, and the Excellency of Man is demonſtrated by his Nakedneſſe. Cap. III.

LEt that beaſtly *Epicure* now lay his hand vpon his mouth, & keepe ſilence, who was not aſhamed to affirme, that the bodies of men were made by chance and fortune, out of a turbulent concourſe (forſooth) of a number of Atomies or Motes, ſuch as we ſee in the Sunne. Let *Momus* be hiſſed and exploded, but firſt mark't with a blacke brand of ignorance and infamy, who preſumptuouſly blamed in the frame of mans body many things, as lame, maimed, and vnperfect. Let *Plinie* and all the whole rabble of falſe and counterfet Philoſophers, be baniſhed out of the Schoole of Nature, who ceaſe not to wrong and traduce her, for caſting foorth man naked and vnarmed on the bare ground vpon his Birth day, to begin the world with crying and lamentation. For to begin with the *Epicure*: Thoſe things which come by chance (O *Epicure*) happen but ſildome, and of ſuch thinges neither any certaine, nor any proſperous euent, can conſtantly be expected or hoped for: but if thou doeſt heedfully obſerue ten thouſand men, thou ſhalt finde all their bodies made and framed with equall skill and vnmatcheable Art, the ſame ſtructure of bones, cartelages, ligaments, ſinewes, veines, arteries, and enterals, the ſame context and compoſition, figure or faſhion, number and ſcituation: the right ſide like vnto the left, and all the body within one and the ſame circle and compaſſe equally poyſed; ſo that nothing in the frame of mans body, doth thruſt it ſelfe in by chance, nothing there is, that doth not exhibite and repreſent vnto vs the maieſty of the higheſt & moſt heauenly wiſedome.

The error of the Epicures conuinced.

Galen, to conuince the error of this beaſtly *Epicure* ſaide, Hee would giue him a hundred yeare to alter or change the ſcituation, figure, or compoſition of any one part, and hee did not doubt, but it would come to paſſe in the end, that he would be forced to confeſſe, that the ſame could by no meanes haue bin made after any other or more perfect manner. I will ſpeake ſomewhat more boldly; If all the Angels ſhould haue ſpent a thouſand yeares in the framing & making of man, they could not haue caſt him in ſo curious a mold; or made him like to that he is, much leſſe could they haue ſet him forth in any better maner. Let the *Epicure* therfore be packing with this falſe fiction & feigned inuention of his own addle brain.

Galen.

The ſlander of *Momus* condemned.

As for *Momus*, he is to be ſcorned for his dotage & ſimplicity, who wiſhed mens bodies had bin made ful of windowes, that the affections of the mind might haue appeared. Why *Momus*? Do not all the paſsions of the minde appeare plainly characterized in the face, in the countenance, & in the eyes, ſo that he which runnes may reade them? The eyes are the diſ-

couerers of the mind, as the countenance is the Image of the ſame; by the eyes as by a window, you may looke euen into the ſecret corners of the Soule: ſo that it was well ſayde of *Alexander*, ὀφθαλμὸς τῆς ψυχῆς κατοπτρον εἶναι, that the eyes are the mirror or Looking-glaſſe of the Soule. The Eyes wonder at a thing, they loue it, they deſire it; they are the bewrayers of loue, anger, rage, mercie, reuenge: in a worde; The eyes are fitted and compoſed to all the affections of the minde, expreſsing the very Image thereof in ſuch a manner, as they may ſeeme to be euen another Soule; & therefore when we kiſſe the eyes, we ſeem to reach and diue euen to the verie ſoule. And for the face, how many ſignes are there in it, and thoſe very manifeſt and apparant, of a ſorrowing, fearing, couetous, wrathfull and pleaſant minde? In the countenance, audaciouſneſſe, ſhamefaſtneſſe, and Maieſty are euident and conſpicuous. For in the eyebrowes dwelleth pride, in the cheekes ſhamefaſtneſſe, in the chinne maieſty: all theſe are bred in the Heart, but heere they haue their ſeate and reſidence, hither they betake themſelues, heereupon they depend. *Alexander.*

Their vnbrideled inſolencie is alſo to bee reſtrained, that call Nature a cruell Steppemother, becauſe ſhee caſts foorth Man into the world altogether naked and vnarmed both in ſoule and bodie; and therefore holde him to bee of all Creatures the moſt imperfect. And of the Nakednesſe of the Soule, thus they diſcourſe. Other Creatures (ſay they,) do perceyue and vnderſtand their owne Nature; ſome betake themſelues to the ſwiftneſſe of their feete, ſome truſt to the loftineſſe of their flight, ſome to ſwimme in the Waters; Man knoweth nothing, neyther how to ſpeake, nor how to goe, nor how to feede: and in a word, that Creature which is borne to rule and gouerne all the reſt, is enclined by Nature to nothing elſe but mourning and lamentation; beginning his life with puniſhment, and that onely for one fault, to wit, becauſe he is borne. How vniuſtly Nature is called a ſowre ſtep-dame to Man. The ſoule of Man naked.

Moreouer, many go beyond him (ſay they) in perfection of the ſences. For, in the piercing ſight of the eyes, the Eagle; in the quickneſſe of ſmelling and ſent the Dogge; in hearing, the Foxe and Mole are quicker then wee; in taſting, the Henne is ſharper; in touching, the Spider is more exquiſite then wee: and ſo the Soule of man is more imperfect then that of other creatures.

Let vs heare alſo the complaints they make of his body. Nature hath giuen other creatures diuers couerings, ſhelles, rindes, haire, briſtles, feathers, ſcales, fleeces, hornes, teeth and nailes, whereby they are able both to defend themſelues, and offend others; onely Man ſhe hath proſtituted in his very natiuitie, altogether vnarmed, naked, and vnable to helpe himſelfe. They complaine alſo, that in bigneſſe of body we are not equall vnto the Elephants, in ſwiftneſſe to the Harts, in lightneſſe to the Birds, in ſtrength and might vnto Bulles, in length of life to the Crowes: that the beaſts of prey, haue a skinne more ſolide; the Doe more ſlicke and comely, the Beares a skinne thighter then ours; and to ſhut vp all, they ſay no creature hath a life more fraile and brittle then Man. But how ill they reaſon, & how vniuſt and vnequall valuers they be of the diuine bleſsings, let all men heare and vnderſtand. Surely God euen for this purpoſe created Man naked, that hee might be the Prince and ruler of all thoſe things, that are comprehended within, or ſubiected to the Law and dominion of *Nature*. For as the organes or inſtruments of the ſenees, are void of all ſtrange and externall qualities, that they may receiue and entertaine the ſeuerall ſpecies and ſhapes of all other things; no particular colour in the Criſtalline humour of the eyes, no naturall and inbred ſound in the eare, the tongue not falſified with any taſte or ſauor, the noſethrils haue no proper or particular ſmell, touching is not poſſeſſed of any one extreame; right ſo it was not meet, that the minde or ſoule of man, which as the Philoſopher teacheth, *Was in power in a manner all things*, ſhould be adorned and taken vp with any particular Art and induſtrie. The bodye of Man naked. An elegant demonſtratiō why the body is naked. *Ariſtotle.*

The body alſo behooued to be naked and vnarmed, that ſuch a creature as was to gouern all the reſt, ſhould not be tied onely to one kinde of armor or weapon: and how incommodious and vnſeemely had it bin for man, being made for contemplation, alwaies to haue borne armes? Now, he can at his owne will and pleaſure, both girt himſelfe in all manner of armour, and againe preſently lay it aſide: and therefore, man is naked, and ſo it beehooued him to be. But yet God hath not left him deſtitute euen in this kinde, hauing armed him with three ſeuerall muniments, which hee hath denyed to other liuing Creatures; Reaſon to inuent, Speech to call for aſsiſtance, and Hands to bring his will to acte and perfection. Reaſon, is the hand of the vnderſtanding, Speech the hand of Reaſon, and the Hand it ſelfe, is the hand of Speech. Why the bodie is naked. God hath armed man with three defences.

The

The hand executeth thoſe things which are commanded, our commandements are ſubiect and obedient to reaſon, and reaſon it ſelfe, is the power, force, and efficacie of the vnderſtanding. So that in recompence of the nakedneſſe of the ſoule, he hath two helpes giuen him, Reaſon, which is an Art before all Arts; and Speech, the Ambaſſador or interpreter of the minde. For the nakedneſſe of the bodie, he hath the Hand, the great Organ before all Organes, the inſtrument of all inſtruments. By the power of Reaſon and of the Hand, albeit man be borne weake and naked, yet is he ſecured from all dumbe creatures; whereas all creatures whatſoeuer they be, that are borne and brought forth more firme, yea & more fierce too; howſoeuer they are able ſtoutly to endure the force and violence of the heauens, yet they cannot be ſecure and free from Man. See now and behold thou, whatſoeuer thou art, that art a traducer and ſlanderous detractor of Nature, how bounteous and liberall bequeſts and Legacies this Mother of ours hath beſtowed vpon vs; how farre more puiſſant creatures, by the aide of Reaſon and of our Hands, wee haue ſubdued and brought vnder the yoake; how farre ſwifter we haue ouertaken; neither is there any mortall thing that is not ſubiected vnder our will and obedience. So then we ſee, that Reaſon dooth more auaile man, then any naturall gift doth the dumbe creature; the volubility and readineſſe of the tongue and ſpeech, more then the lightneſſe and nimble vſe of the winges and Feathers; the induſtry of the hands, more then the impetuous force and violence of Bulles, or the teeth or hooues of wilde and rauenous beaſtes, becauſe they cannot redeeme or free themſelues from being oppreſſed by vs, or acquit themſelues from the ſoueraigntie of our authoritie.

How behoue full Reaſon & the Hand isto man, & what he performes by them.

What the Body of Man differeth from other Creatures, and what it hath proper and peculiar in the compoſition and frame thereof. Chap. IIII.

AND now, leaſt thoſe that are skilfull and learned, ſhould want any thing in our diſcourſe that belongeth to the dignity of Man, and his admirable and wonderfull frame and compoſition; let vs proceede vnto ſuch other things, as the diuine wiſedome, the Mother and Gouernor of all things hath vouchſafed only to man, and ſee in what and how much the body of man differeth from the reſt of the creatures. As in man & other creatures there is the ſame manner of life and nouriſhment, ſo the frame and ſtructure of the vitall & naturall organes or inſtruments is not vnlike in them both; but as for the ſences and power of motion, wherein the Nature of the Animality (you muſt giue leaue to a Philoſopher to vſe his owne tearmes) or liuelyhood conſiſteth, foraſmuch as in man they do attend vpon, and ſerue a more noble Forme, and are prepared to more diuine vſes, then for the auoiding of euill, and ſuch other obiects of the appetite; it was therefore requiſite, that they ſhould haue Organs framed and made with more curious and exquiſite workemanſhip. There are therefore in man, ouer and beſides thoſe things that are already handled, namely, his vpright figure, and his Hands, which no other creatures haue; there are I ſay, many things in the ſtructure and compoſition of the animall organes, proper and peculiar to man, which do yet more demonſtratiuely prooue, yea and expreſſe alſo the dignity of his bodie. For to run through all, from the head to the feet. Firſt, of al liuing creatures, only man hath a head made into a round and circular forme, as it were turned on a wheele, both that it might be the more capeable to receiue a greater quantity of braynes, and leſſe apt to be ouer-taken with danger either from without or within; as alſo, for the more eaſe in mooving and turning about; and laſtly, becauſe it was to be the manſion houſe of Reaſon, that is, the ſoule. Now we know, that the Soule was infuſed into vs from Heauen, which euen to our ſence is round and circular: ſeeing then her heauenly habitation is round before ſhee be infuſed, it was likewiſe requiſite, that her manſion heere below ſhould bee orbicular alſo; yet is the head of man not exquiſitely round as a Bowle is, but after a ſort ſomewhat long alſo, riſing vp in the two crownes, and on the ſides it becommeth depreſſed and flatted. Onely Man of all liuing creatures, hath for his bigneſſe, a braine very large and ſpacious, and alſo very moyſt and watery, the better to performe the varietie of the Animal functions and offices; for the Soule doth not execute hir offices without the helpe of the Spirits: the matter and the ſubſtance of the Spirits is blood, now plenty of blood is not conteyned, nor cannot be concluded within a little and ſmall body.

What there is in mans body, proper & peculiar to Man.

1. A round head

2. A large brain

The

The face is ſaide alſo to bee proper vnto man alone, whereupon the Greekes call it πρόσωπον, by a name deriued from the thing it ſelfe, becauſe προσώπεν ὄπωπε, it ſeeth and is ſeene a farre off; to other creatures *Nature* hath giuen onely a mouth or a beake: but in the face of man, courage, ſhamefaſtneſſe, and maieſty, haue their abode, and therefore man alone is baſhfull & ſhamefaſt. At the beholding of this face, all creatures are affrighted, becauſe in it there ſhine foorth more beames of the diuine Nature, then in all the body beſides. 3. Man onely hath a face.

Furthermore, this one thing is admirable therein, that whereas in our face and countenance there are ten particles, or not many moe, yet you ſhall not finde any two among many thouſands of men, that haue their countenance in all parts alike, but there is ſome diuerſity, both in the lines, and in the proportion.

Man alone hath his eyes enamelled with diuers colours, & that in great variety; whereas other Creatures (the horſe excepted) are in their kinds alwayes alike; ſo ſhall you finde oxen to haue all blacke eyes, Sheepe watry, other creatures red. 4. Eyes of diuers colours.

The eyes of Man are diſtant one from the other but a very little ſpace, in reſpect of our proportion of magnitude with other creatures, that ſo the ſpirits might bee the more nimble, and more ſpeedily tranſmitted from one eye to another. 5. The diſtance of the eyes.

Man alone of all creatures (ſaith *Pliny*) hath his eyes vitiated and corrupted, yea, and ſomtimes one or both wanting; whereupon came the names or nick-names of *Strabo*, one that is ſquint-eyed or goggle-eyed, and *Paetus* for one that hath rouling eyes, or ſquinted vpward. 6. The depraua-tion of the eyes. *Plin. lib. 11. ca. 37.*

The haires of the eye-lids are in four-footed Beaſts only on the vpper lid, in Birds on the neather; Man onely (the Eſtrich excepted) hath haires on both ſides, both on the vpper and neather lid. 7. Hairs on both ſides the eies.

The noſe of a man is higher, and ſtandeth further out then the reſt of his face for decency and comelineſſe; in other creatures it is not ſo, but is flatted with the ſcull. 8. A noſe ſtanding out.

Onely in man the eares are fixed and immooueable, and placed on either ſide in a right line with the eyes: only in Man (except it be Apes, which are neereſt to the proportion of mans body) are thoſe bones we call *Clauiculæ* or Cannell bones, which ſerue to eſtabliſh the arme, that in the diuers and ſudden motions thereof, it might not be diſlocated. 9. Eares imoueable. Cãnell bones.

There is no creature but Man hath Dugges in the forepart of his body, the Elephants haue indeed two dugs or paps, but not in their breaſt. 10. Dugges.

Thoſe parts which in Man are foremoſt, that is, on the forepart, as the breaſt, the belly, the wezon, &c. foure-footed Beaſts haue them below next vnto the ground, and thoſe that man hath on the hinder part, as the backe, the loynes, and the buttockes, Beaſts haue them in their vpper part. 11 The diuerſity of ſcituation of the parts.

Man of all creatures is couered with the feweſt haires, vnleſſe it be in his head, which as it is the moyſteſt part of his body, ſo alſo it is the moſt repleniſhed with haires. 12 Fewes haires.

Againe, in creatures that are couered with haires, thoſe parts are moſt hairy that bend downward toward the ground, the reſt are either ſmooth without haire, or not ſo full of them. On the contrary, Man is moſt hairy on the forepart, becauſe haires were made for a couering; the prone or bending parts of Beaſts, ſtand in need to be couered, yet the foreparts are indeede more noble, but they are cheriſhed and in ſome ſort couered by the bowing and bending of the body: But in Man by reaſon of his lofty and vpright frame & compoſition of bodye, the forepart is alike expoſed to outward iniury as the hinder part, and therefore it was meete the more noble part ſhould bee couered, and (as it were) defended with haires. 13 A difference in thoſe parts that are couered with hairs. 14 Haire vnder the arm holes

Onely Man hath haires growing vnder the arme-holes, and about the priuie members.

Man alone growes hoarie haired, and bald-headed. 15 Man alone hoary hayred.

The legs or haunches of all foure-footed Beaſtes, are abundantly full of bones and ſinnewes, but very ſcantie of fleſh; on the contrary, Man hath almoſt no part of his bodie, more fleſhy then his hips, legs, and thighes. 16 Hips, legs, & thighes full of fleſh.

Four-footed beaſts do bow both their fore-legs and their hinder legs contrary to man, for he bowes his armes backward, and his legs forward. 17 The maner of bowing of the parts vnlike to other creatures.

Man, when he is come to his full growth hath his vpper part leſſer then his nether part; but before hee bee growne, his vpper part is the greater; ſo is it not with the reſt of the creatures; and therefore his manner of going is not at all times alike, but at firſt in his infancy he creepes on all foure, afterwards by little and little hee raiſeth vp himſelfe, and at length

length goes vpon his two feete.

19 The diffrence of the bones. In other creatures there is no difference of the bones, but they doe all appeare perfect, euen from their beginning; but in Children the fore-part of the head is soft and tender, & long before it be hardned. And whereas all other creatures come toothed into the world, Man begins not to haue teeth till the seauenth month after his birth.

20 Man alone two footed. *Plato* derided by *Diogenes*. Furthermore, of all creatures (excepting birds) that liue vpon the land, Man alone is two-footed, which mooued *Plato* to define him, *Animal bipes implume*; which definition *Diogenes* worthily derided, when hee flung a Cocke whose feathers he had pluckt off, into the Schoole, and cried out, *Behold Platoes Man.*

21 Man alone goeth vpright. Onely Man by the straitnesse of his legges goes exactly vpright.

22 Man alone sitteth. Onely Man vseth to sit, both because he cannot stand long, as the brute beastes may, which haue foure feete, and besides do lye vsually to rest themselues, prostrate vppon the ground; for that two feet cannot long beare the weight of the whole body: as also because it is necessary for more noble and excellent vses, to wit, for the practising and exercising of Arts, and for contemplation.

23 Man alone hath a smooth and slick skin. Onely Man hath a skin polished, smooth, cleare, and very temperate; other creatures haue either a shelly or scaly skin, or altogether hairy, or els too soft, because Touching is the ground and foundation of all the sences; and therefore the more simple and pure the touching is, the clearer also and the purer is the sence, and the phantasmes or imaginations the more subtle: by meanes whereof, the operation of the soule, is so much the more lofty and profound. And for this cause, *Aristotle* in his second Booke *De Anima*, is of opinion, that the strength and vigor of the wit and vnderstanding, are to bee iudged of by the courseneſse or fineneſse of the touch.

Aristotle.

How profitable and behouefull Anatomy is to the knowledge of Mans selfe. CHAP. V.

He that knowes himselfe, knowes all things. SEeing then that Man is a Litle world, and containes in himselfe the seeds of all those things which are contained in the most spacious and ample bosom of this whole Vniuerse, Starres, Meteors, Mettals, Minerals, Vegetables, Animals, and Spirits; whosoeuer dooth well know himselfe, knoweth all things, seeing in himselfe he hath the resemblances and representations of all things. First, he shall know God, because hee is fashioned and framed according to his Image, by reason whereof, hee is called among the Diuines, The Royall and Imperiall Temple of God; he shall know also the Angels, because hee hath vnderstanding as they haue; he shall know the brute Beasts, because he hath the faculties of sence and appetite common with them; he groweth as the plants do, hee hath being and existence as stones haue, and in a word, he is the rule and square of all bodies.

Plato in Alcibiade. Wisely therefore did the Oracle of *Apollo*, incite and stirre vp euery man to the knowledge of himselfe, as *Plato* hath it in his *Alcibiade*. This by the iudgement and consent of all men, is true and sound Philosophy. For *Demonax* being asked, When he beganne to professe Philosophy, made answere, *When I began to know my selfe*. *Socrates* held it the next point to fury and madnesse, to enquire into high matters, and to search into strange and vncouth businesses, and bee ignorant in the meane while of those things that bee in our selues. This preposterous skill was once very merrily and wittily by an old wife cast in the teeth of *Thales* the Philosopher of *Miletum*; who as he inconsiderately cast vp his eyes to behold the Heauens, fell into a pit; the old wife cried out, *Thou Foole, thou prieſt into matters that are aboue thee, & art ignorant of those things that are below thee, nay euen within thee.* Surely it was a worthy speech, and not beseeming an olde Beldame but a Philosopher. But this same knowledge of a mans selfe, as it is a very glorious thing, so it is also very hard and difficult. And yet by the dissection of the body, and by Anatomy, wee shall easily attaine vnto this knowledge. For seeing the soule of man being cast into this prison of the body, cannot discharge her offices and functions without a corporeall Organ or instrument of the body; whosoeuer will attaine vnto the knowledge of the soule, it is necessarie that hee know the frame and composition of the body.

How profitable it is to knowe our selues. *Demonax.* *Socrates.* *Thales.*

Anatomy the most sure guide to the knowledge of our selues.

Democritus After this manner, *Democritus* of *Abdera*, that he might finde out the seate of anger and melancholy, cut in peeces the bodies of beasts, and when he was taxed of the Citizens for madnesse in so doing, he was by the censure and determination of *Hippocrates*, adiudged to

be

be very wise and prudent. Go too then, Is not he saide to know himselfe, who can tell how to temper and order the state and condition of his minde, howe to appease those ciuill tumults within himselfe, by the stormes and waues whereof he is pittifully tossed, and how to suppresse and appease those varieties of passions wherewith as it were with so manie furies he is vexed and tormented? But all this Anatomy doth verie plainly teach vs. For he that seeth and obserueth the whole body, which by the structure and putting together of sundry parts of diuers sorts and kinds, is (as it were) manifold & full of variety, to be made one by the continuation and ioyning of those parts; he that considereth the admirable sympathy of the parts, their mutuall consent and agreement, their common offices, or officiall administrations one for the helpe of another, how they make not any couetous reseruation to themselues, but do freely communicate each with other; such a man no doubt will so moderate and order the conditions and affections of his minde, as all things shal accord and ioyne in a mutuall agreement, and the inferiors shall obey the superiors, the passions obey the rule of right reason. He that shall diligently weigh and consider the vse of euery part, the fashion, scituation, and admirable workemanship of them all, as also, the Organs and Instruments of the outward fences, he shall easily perceiue how and after what manner he is to make vse of euery part; then which thing, what can be more excellent, what more profitable?

Anatomy teacheth how to order the state of the minde.

How to vse our fences.

Thou hast an vpright frame and posture of body, that remembring thy beginning, thou shouldst not like the brute beasts grouell vpon the ground, or dote vpon earthly things, but lift vp thy selfe towards heauen, and say with the Diuines, *Our conuersation is in Heauen.* Thy eyes are set in a high place, that thou mightst take notice, they are giuen thee to be aduanced to the contemplation of Heauenly things.

Why the eies are set in the top of the body.

Two eares, and those wide open, hath Nature ordained for thee; to teach thee that thou must heare, and by hearing, learne twice as much as thou must speake. Nature hath giuen thee but one tongue, tied with ten Muscles, and reyned with a very strong ligament, besides, as it were with a bridle, shut vp and enclosed within the mouth and teeth, as it were within a grate or Lattice, that the minde might first discerne and iudge of a thing before it vtter it, and that our words might first passe by the file, before they passe by the tongue. If you looke into the seats and residence of the faculties of the minde, you shall finde the rationall faculty in the highest place, namely in the brain, compassed in on euery side with a scull; the faculty of anger, in the Heart; the faculty of lust or desire in the Liuer: & therefore we may gather these lower and inferiour faculties, must bee seruiceable and obedient to the higher, as to the Queene and Prince of them all. And if both Princes and Peasants would weigh and consider the mutuall offices betweene the principall and the ignoble parts, Princes might vnderstand how to rule, and Peasants how to obey. Princes may learne of the braine how to make Lawes, to gouerne their people; of the heart, how to preserue the life, health, and safety of their Citizens; of the Liuer, they may learn bounty and liberality. For the braine sitting in the highest place, as it were in a Tribunall, distributeth to euery Organ or Instrument of the sences, offices of dignity: the Heart like a King maintaineth and cherisheth with his liuely and quickning heate, the life of all the partes: the Liuer the fountaine and well-spring of most beneficall humidity or iuice, nourisheth and feedeth the whole family of the bodie, and that at her owne proper costs and charges, like most a bountifull Prince. As for the meaner sorr of people, they may easilie vnderstand by the ministering and seruile organs, what bee the limits of seruice and subiection. For the parts that are in the lower bellie do all serue the Liuer; the Stomacke dooth concoct the meate, the Guts distribute and diuide it, the veines of the *Meſentarie* prepare it; the bladder of Gall, the Milt and the Reines, do purge and clense the princely Pallace, & thrust as it were out of the Kitchin, downe the sinke, all the filth and garbage. The parts that are included within the Chest, do serue the Heart; those that are in the head, do attend the Braine, and so each to others, doe affoord their mutuall seruices. And if any one of them do at any time faile of their duty, presently the whole Houshold gouernment goes to ruine and decay.

Why two eares.

Why but one tongne.

How much the knowledg of Anatomy auaileth kings and Princes.

The euidence of which truth, being by way of *Apologe* or Parable, seasonably represented to the people of Rome, *Menenius Agrippa* reuoked them, and laide as it were a Lawe vpon their furie, when they had gathered themselues into the Mount, (which afterwardes was thereupon called *Sacer*) hardly brooking the gouernment of the Senate. So that anatomy is as it were a most certaine and sure guide to the admirable and most excellent knowledge

of our ſelues, that is, of our owne proper nature. And therefore we reade, that valiant and couragious Princes, worthy and renowned Nobles, yea, and inuincible Emperors, being mooued and incited with this deſire of the knowledge of themſelues, did moſt ſtudiouſly practiſe this worke of Anatomy, euen in the noyſe and clattering of weapons and armour, and in the verie medly and tumult of warre.

What Kinges and Princes, haue practiſed Anatomy.

Alexander the Great, among all the maine and great triumphes of his ſo excellent atchieuments, gloried that hee had diligently obſerued vnder his Maiſter *Ariſtotle*, the Nature and ſeuerall parts of liuing creatures. And it is found in the Records and Monuments of ancient Hiſtories, that the Kings of the Egyptians, did make diſſection of bodies with their owne hands. *Marcus Antonius* that great Commander, affirmed that he had learned his owne conſtitution by the diſſection of other bodies. We haue alſo read, that *Boetius* and *Paulus Sergius*, two *Romane* Conſuls, were Auditors of *Galen*, when he publikely practiſed this diſſection in the City of Rome. And ſo much ſhall ſuffice for the firſt profit and commodity that wee may reape by Anatomy.

Antonius.
Boetius.
Paul. Serg.

How profitable and helpefull Anatomy is to the knowledge of God. CHAP. VI.

How profitable Anatomy is to the knowledge of God.

IT is no doubt an excellent thing for a man to attaine to the knowledge of himſelfe, which thing Anatomy and diſſection of bodies doth teach vs, and as it were point out vnto vs with the finger; but there is another farre more Diuine and vſefull profit of Anatomy then the former, proper and peculiar to vs to whom the light of the Goſpell hath ſhined, namely the knowledge of the immortall God. That high Father and creator of all things, who onely by himſelfe hath immortality, dwelling in that light that is clearer then all lights, vnto which there is no acceſſe, whom no man can either ſee with his eyes, or comprehend with his minde, that eternall Father (I ſay) cannot be knowne but by his effects; and all the knowledge of God that can be had, muſt be deriued not *à priori*, but *à poſteriori*, not from any cauſe or matter preceding, but from the effects and thinges ſubſequent.

Moyſes.
Paul ad Rom.

So we reade in the ſacred Scriptures, that *Moſes* could not endure the bright ſhyning face of God, his eyes were ſo dazled therewith. *The inuiſible things of God* (ſaith the Apoſtle) *are knowne by thoſe things that are viſible.* Who is it therefore, that will not honor, reuerence, and admire the author and workeman of ſo great a worke, if he do attentiuely aduiſe with himſelfe, how wonderfull the fabricke and ſtructure of mans body is? *I will praiſe thee, O Lord*, (ſaith that Kingly Prophet) *becauſe I am wonderfully made.* *Phidias* his *Minerua*, *Apelles* his *Venus*, *Polycletus* his Rule, are admired by antiquity; and therefore great and high honours haue beene decreed vnto them. *Cteſicles* is commended for making a marble Image with ſuch excellent art and cunning, that the *Samian* young men in deſire to obtaine the ſame, were contented to lodge night by night in the Temple. And wilt not thou admire the arch-type and patterne of all theſe, I meane the body of Man? They did imitate in the workes of Nature that which is of leaſt reſpect and regard, namely, the outward face and feature: for their workes are but dumbe, without motion or life. But by the view of Anatomicall diſſection, we ſee and are able to diſtinguiſh the variable and diuers motions of mans body, and thoſe alſo very ſtrange, and ſometime vncouth.

The frame of man is Gods Booke.
Heraclitus.

Some of the ancient Writers, haue dignified the frame of mans body with the name & title of *The Booke of God*. For indeede, in all men there appeareth certaine ſparkes of a Naturall diuinity, or diuine nature; as *Heraclitus* witneſſeth, who ſitting in a Bakers ſhop, and perceiuing ſome of his Auditors which deſired to ſpeake with him, would not come vnto him into ſo homely a place, *Come in* (ſaith he) *for euen heere there be Gods* alſo. *Ioui is omnia plena, All things* (ſaith the Poet) *are full of Iupiter.* For euen in the ſmalleſt and moſt contemptible creature, there is matter enough of admiration; but yet in the frame of mans body, there is (I know not what) ſomething more diuine, as wherein appeareth not onely the admirable power of God, but his wiſedome euen paſt all beleefe, and his infinite and particular goodneſſe and bounty to Man.

Gods admirable power ſhineth in the frame of man.

For his power, it is not onely viſible but palpable alſo, in that of ſo ſmall a quantitie of ſeede, the parts whereof ſeeme to be all homogenie or of one kinde; and of a few droppes of blood, he hath framed ſo many and ſo diuers particles, aboue two hundred Bones, Cartilages yet more, many more Ligaments, a number of Membranes numberleſſe, the Pipes

or

Pipes or trunkes of the Arteries, millions of veines, sinnewes more then thirty paire, Muscles almost foure hundred; and to conclude, all the bowels and inward parts. His incredible wisedome appeareth in the admirable contabulation or composition of the whole, made of so many parts, so vnlike one to another. Enter thou whosoeuer thou art (though thou be an Atheist, and acknowledgest no God at all,) enter I beseech thee, into the Sacred Tower of *Pallas*, I meane the braine of Man, and behold and admire the pillars and arched Cloysters of that princely pallace, the huge greatnesse of that stately building, the Pedistals or Bases, the Porches & goodly frontispice, the 4. arched Chambers, the bright and cleare Mirrour, the Labyrinthæan Mazes and web of the small arteries, the admirable trainings of the Veines, the draining furrowes and watercourses, the liuing ebullitions and springings vp of the sinnewes, and the wonderfull fœcundity of that white marrow of the back, which the wiseman in the Book of the Preacher or *Ecclesiastes* calleth the Siluer cord. From the braine, turne the eye of thy minde to the gates of the Sun, and Windowes of the soule, I meane the eyes, and there behold the brightnesse of the glittering Cristall, the purity and neate cleannesse of the watery and glasy humors, the delicate and fine texture of the Tunicles, and the wonderfull and admirable volubility of the Muscles, in turning and rowling of the eyes. Marke and obserue also, the art and curious workmanship appearing in the inward part of the eare, how exquisitely it is made and trimmed with Labyrinths, windings, little windowes, a sounding Timpane or timbrill; three small bones, a stirrop, an anuile, and a hammer; the small Muscles, the Nerue or sinnew of hearing, and the Carteleginious or gristle passage, prepared for conueying all sounds vnto the sense. Looke vpon the vnwearable and agile motions, the conquering power, the frame and composition, the Muscles, the proper and peculiar kinde of flesh, the Membranes, the Veynes and sinnewes, and the bridle as it were, all easily distinguished within the compasse of that little body, or rather little member of the bodie, the Tongue, wherewith we blesse God, and wherewith we curse men.

The wisedom of God in the workmanship of the parts.

The elegant workmanship of the whole frame.

Consider and obserue the Heart, his two ventricles, eares as many, foure notable Vessels, which as *Hippocrates* sayth, are as it were πηγαὶ καὶ πλυγὲς φύσιος ἀνθρώπου, the fountaines and well-springes of the humane Nature, and the riuers and sourses whereby the whole body is watered and refreshed: besides eleauen gates or entrances; the admyrable and intricate Textures of the vessels of the Liuer, the separation and diuision of the currents of the Arteries and the Veynes; and in a word, consider the admirable structure of all the parts, Animall, Virall, and Naturall; wilt thou not cry out, though it bee against thy will, O admirable Architect! O vnimitable workeman! And wilt thou not with the inspired Prophet sing vnto the Creator this Hymne, *I praise thee (O Lord) because thou hast shewed the greatnesse of thy wisedome in fashioning of my body?*

Hippocrates in his Booke of the Heart.

Lastly, the infinite goodnesse and bounty of God shineth in this excellent workemanship, inasmuch as he hath so well prouided for all the parts, that euery one hath her proper and peculiar vse, and yet all are so fitted and knit together in such an harmonie and agreement, that euery one is ready to helpe another; and any one of them being ill affected, the rest are immediatly drawne to a simpathy and participation with it. Which society and fellowship of the parts, *Hippocrates* in his Booke *de Alimento* hath thus breefelie, but excellently expressed, σύμπνοια μία, συρροια μία, συμπαθέα πάντα: *One agreement, one confluence, all consenting.* To conclude then, these wonderfull and euer-worthy to bee admired workes of God in the composition and frame of mans bodie, are as it were dumbe Schoolemaisters, the Bookes of vulgar Diuinity, and the Doctors and teachers of Diuine wisedome.

Gods infinite goodnesse in the structure of the body.

How profitable Anatomy is to Philosophers, and in a manner to all Artificers and Handy-crafts men. CHAP. VII.

THese two fruites of Anatomy, as they are abundantly beneficiall and profitable, so they seeme to be common to all in general; first the knowledge of our owne Nature, and then of the inuisible God. There are also other benefites and commodities of Anatomy proper and peculiar to Poets, Painters, yea, and to the most part of handy-crafts men and Artificers, to teach them the better to bring their Arts to perfection. And first, *Galen* dooth account Anatomy verie proper to a naturall Philosopher, though it were but onely for speculation sake, or otherwise

Anatomy verie profitable for a naturall Philosopher.

wise to teach him the singular workemanship of Nature in euery particular part. For inasmuch as the proper and proportionable subiect of his art is a body Naturall, and the body of Man is as it were the square and rule of all other bodies, he ought not, nor cannot be truly accounted a Naturall Philosopher, who is ignorant of the historie of Mans body; and for this cause, that most excellent *Genius*, and interpreter of Nature *Aristotle*, wrote those elegant and eloquent Books of the History of the parts, and of the generation of liuing creatures. Anatomy is also very profitable for a morall Philosopher: for hee shall easily learne by the mutuall offices and duties of euery part, and by the constitution of the Naturall houshold gouernment appearing in our bodies, how to temper and order the manners and conditions of the minde, how to rule and gouern a Commonwealth or Citie, and how to direct a priuate house or family.

Aristotle.

Anatomie is profitable for a morall Philosopher.

I spare to speake how profitable it is for Poets and Painters, for the perfection of their Art and Science; for euen *Homer* himselfe hath written many things, and those verie excellent concerning Anatomy. But my purpose is onely to shew, that for a Physition, a naturall Philosopher, a Chirurgion, and an Apothecary, it is not onely profitable, but euen also absolutely necessary.

Profitable for Poets & painters.

Homer.

Wherein is demonstrated that Anatomy is not onely profitable, but of absolute necessitie for Physitions and Chirurgions.

CHAP. VIII.

AS Geographie is worthily accounted a great euidence for the credite of an History, so to them that any way appertaine to the art of Physicke, the knowledge of mans body seemeth to bo very necessary, φύσις γὰρ τοῦ σώματος ἀρχὴ τοῦ ἐν ἰατρικῇ λόγου. *For the Nature of the body is the first thing to be spoken of in the Art of Physicke*. Againe, *Hippocrates* in his Booke *de Flatibus*, maketh but one Idea of all diseases, *It is onely the variety & difference of places, that maketh the difference of diseases*. Hee therefore that will be ignorant of the Historie of the parts of Mans bodie, he shall ill distinguish and discerne the affections of the same, worse cure them, and worst of all foretell who are likely to recouer and escape, and who not.

Hip. de locis in homine.

Hip. de flatibus.

How necessary the knowledge of the parts is to the discerning of diseases.

The discerning and iudging of a disease, consisteth in two things, namely, the knowledge of the euil affect, & the knowledge of the part so affected. The signs of the part affected, are drawne and deriued from many Fountaines (as it were;) but especially from the scituation, and from the action empaired. For hee that knoweth the action of the stomacke to be concoction, if the concoction be empaired, he may easily discerne that the stomacke is ill affected. He that knoweth the Liuer to bee placed on the right side of the paunch, if the right *hypochondrium* or side be sore, or do swell, hee will presentlie affirme, that the Liuer and not the spleene is ill affected. Now this scituation, as also the actions of all the parts are taught and demonstrated vnto vs by anatomy onely.

Anatomy necessarie for *Prognosis* or prædiction. *Galen.*

For *Prognosis* or prediction of the euent of diseases, *Hippocrates* maketh three chiefe and maine heads of it: *Those things that are auoyded, the action impaired, and the habite of the body in the colour, figure, and magnitude or quantity*; all which are discerned onely by Anatomy. Now how much the knowledge of the seuerall parts of the bodie auayleth towardes the curing of diseases, *Galen* hath verie well expressed in the beginning of his Booke *de Ossibus*: πάντα (saith hee) ἐν τῇ ἰατρικῇ σκοπὸν ἔχει τὸ κατὰ φύσιν, that is, *All things that concerne the action of healing, haue that for their scope or direction which is naturally disposed, or in a good and lawdable constitution*. *Hippocrates* in his Booke *de officina Medici* giueth this rule, *That the Physition should first looke into those thinges that are alike one to another, and then to those things that are vnlike*: insinuating thereby, that he that knowes the perfect Sanitie or health of euery part, shall easily discerne if it fall from that perfection, by the perfection which remaineth in other like parts not tainted. *Aristotle* in his first Booke *de Anima*, vsurpeth a rule of Geometry, That which is straite and right (saith he) doth not onely measure it selfe, but bewrayeth that which is oblique or crooked. In like manner, how shal a Physition restore or set right bones that are broken or out of ioynt, if hee be ignorant of their naturall place, figure, and articulation? The exquisite method of healing cannot bee performed but by indications, and indications are not onely deriued from the disease, but also from the part affected, and the remedies must bee changed and altered, according to

Necessary for curation. *Hippocrates*

the

the diuers and seuerall nature, temperature, scituation, connexion and sence of the part.

Neither is Anatomy needefull onely for the Physition, but euen also for the Chirurgion and Apothecary. The knowledge of the outward parts, as the Muscles, the nerues, the veines and arteries, is most necessary for a Chirurgion, for feare least in his dissections & launcings, he should mistake a broad Ligament for a Membrane, and a round Ligament for a Nerue or sinnew, least he should diuide an arterie in stead of a veine; for he that is ignorant of these things, shall euermore be in doubt; in things safe and secure still fearefull; and in things that are to be feared, he will be most secure and audacious.

Anatomy necessarie for a Chirurgion.

Anatomy profitable for an Apothecarie.

An Apothecarie also shall finde it very needful for him to vnderstand the scite and figure of the parts, for the better applying of such remedies as shall bee requisite. For hee must apply his Topicall and locall medicines, fomentations, oyntments or Liniments and Emplaisters, in their apt and proper places; as if the Liuer be ill affected, on the right side; if the Spleene be ill, on the left side; if the wombe or bladder be diseased, then vpon the *hypograstium* or water-course, betweene the nauell and the priuie parts; if the heart be ill affected, then on the left brest must the remedies bee applied. Hee must also make his plaister or other remedy of the same figure that the part affected is of, least the parts adioining be couered therewithall.

Profitable for the vnderstanding of the writings of the Ancients.

I forbeare to speake how profitable and necessary it is for the explaining of the writings of *Hippocrates*, *Galen*, and all the ancient Physitions. For in them there are many passages darke and obscure, whereunto the knowledge of Anatomy will giue a great light and splendor: and therefore in old time, Physitions were woont to propound vnto their young Schollers the precepts of Anatomy, as the first rudiments and principles of the art of Physicke and Chirurgery.

With what Method Anatomy may be best taught and demonstrated. CHAP. IX.

SEeing then, the profite and necessity of *Anatomy* is such and so great, I would perswade all Students, in our art especially, and in Chirurgerie, that they woulde very heedefully and diligently employ themselues in the studie of the same; neither shall they neede to be deterred or affrighted with the difficulty, for it is very easie and feasible, if it be laide downe in a good order and Method, otherwise the most easie and obuious art prooues harde and obscure. The Method therefore of learning and teaching *Anatomy* is on this manner.

Anatomy to be attained two wayes by Inspection & by Instructiō.

The Art of *Anatomy* (as I suppose) may bee attained two wayes; by Inspection, which we call αὐτοψία, and by Instruction: and both these wayes are very necessary, if the perfection of the art be desired: but the first is the more certaine, the latter carrieth with it greater grace and state; the former may be called the way of Historie, or the historicall way; the latter, the way of Science, or the artificiall way. The first, which is Inspection, is either of figures depainted or carued, and printed on Tables onely, or of the bodies themselues of Men or Beastes; of Men, onely when they are dead; of beastes both dead and liuing, for the better obseruing of the diuers and obscure motions of the inward parts.

In like manner, the way of Doctrine or Science is double; One, by the writinges of most famous and renowned men; another, by the liuing voyce of a Teacher or Instructer.

Galen disallowed pictures of Plants and Anatomy.

The Inspection of Figures some haue disallowed, because they are bare shadowes, which in their opinion doe rather hinder then further young Students. For, if *Galen* would not haue Plants and Hearbes painted or desciphered, no nor so much as described, but taught and deliuered by hand onely: how would hee haue endured the delineation of the parts of our body?

But I am not altogether of that opinion, to thinke these pictures vaine and ydle, because I see euerie day represented vnto mine eyes by these Pictures manie things,

The benefites of pictures.

and those oftentimes of great consequence, which were vnknowne to the skilfullest artists of former ages. Neyther do the Geometricians and Geographers, who are but the Anatomists of the Great world, as we are of the little, despise those demonstrations which in Cards & Maps they receiue one from another. Again, it is not alwaies, or in each place easie to find & obtain such store of humane carkasses, and therfore that want is well supplied by a curious draught or delineation of such obseruations, as are made in true dissections by cunning artists; that so both the memory of those that were present may be refricated and refiesshed, and such as were absent, made also partakers of their labors; yet for all this, I do not thinke it fit to trust too much to these silent shadowes. For as it is not possible to make a good Commander, or a skilfull Pilot by any typicall or representatiue army, fortification, or watch carde, but onely by practise and experience: so it is a very vaine thing to take in hand to learne Anatomy by the bare inspection of figures, without practise vpon the body it selfe: and because our art concerneth the cure not of Beastes but of Men, we must therefore exercise our selues chiefly in the anatomy of the bodie of Man, and that not aliue but dead.

Geometricians are Anatomistes of the Great World.

A Caution.

Comparison.

Who vsed to butcher men aliue.

The cutting vp of men aliue is not only inhumane, but also of no profit or vse.

Obiection.

Answere.

I am not ignorant that some of the ancient Physitians, as *Herophilus* and *Erasistratus*, by the License of Princes whom they had possessed with the profit thereof, did anatomize the bodies of condemned wretches euen whilst they were aliue, which also in our age hath been done by *Carpus* and *Vesalius*. But for mine owne part, I hold it a very friuolous and vaine thing, beside the horror and inhumanity of the fact, which almost no necessitie can sufficiently warrant. For liuing dissections (as wee call them) are then put in vse, when we would finde out some action or vse of a part which by the dead carkas cannot bee discerned; now all those we may find aswel in Beasts as in Men. If it be obiected, that there is some difference betweene the actions of men and of beasts, especially the animall; and that the organ of voluntarie motion, to wit, the Muscles, are not alike in both kindes: I answer, that for the discerning of actions that belong to motion and sence, ther is no need of dissection, for they are almost all of them apparent to the sences; onely the motions of the hidden and secret parts, as not being subiected to sence, must be sought out by dissection. Now of those hidden motions, that of the heart and arteries, the midriffe, the brain, and the guts, which are of greatest consequence, are all one in men and in beasts; wherefore it is not anatomy but butchery, to mangle the trembling members of mans body, and vnder I know not what slender and idle pretence of profit, or behoofe, to violate the sacred Law of nature, and of religion.

The ancient Physitians were not allowd to cut vp dead carkasses of men, as we now vse dissection, but it was held a verie impious & prophane thing: how abhominable then is it, & sauoring of Caniball barbarisme, because we would make a nearer cut to our vnderstanding by our eyes then by the discourse and labor of our minds, to gather knowledge by the dissection or rather butchery of liuing men, if there were any vse of it, as we haue shewed that there is none. Let vs therfore content our selues, and giue due thanks vnto our State, by whose Lawes we are allowed dead bodies for dissection, euery yeare a competent number: and if there be any where want of such, wee may haue resort to the bodies of Beastes and make dissection of them both aliue and dead; aliue more sparingly, albeit by anatomy of liuing bodies, we may better discerne the actions of the parts, & by what Muscle euery part is mooued; in the dissection of dead bodies, the scituation, figure, magnitude, connexion, and originall of the parts, are well enough perceyued.

Those Beastes which come neerest to the frame of mans body, are fittest to bee dissected.

Five sortes of beasts according to *Galen*.

Now, because there are many kinds of Beasts, those are to be made choise of for dissection, which come neerest to mans body. *Galen* reduceth them to fiue sortes. The first sort is of such as chew the cud, that is, which after they haue eaten their meate, doe bring it againe from the dew-lap, as from a kinde of stomacke backe vnto the mouth, as Sheepe and Oxen. The second sort, is of those which diuide not the hoofe, as Asses, Horses, and Mules. The third sort, are such as haue teeth in manner of a Saw, as Lyons, Dogges, and Wolues. To the fourth sort, he referreth Hogges. To the fift, Apes. Now the dissection of all, or any of these, whether Man or Beast, is not to be taken in hand confusedly & disorderly, but methodically and with a due course of proceeding, and therefore it shall not be amisse, to prescribe some Lawes and Rules of Anatomy, for the better and more orderly practise and exercise of the same.

The method of Anatomy.

Lawes and rules of Anatomie.

This therefore, to begin withall, shall be the most generall and common rule, that wee begin with that which is best knowne, and that the dissection of dead bodies go before that

which

which is of liuing creatures, becauſe it is more eaſie and better knowne.

Againe, whereas ſome parts are externall and outward, others internal and inward: let young beginners firſt exercise their hands in the externall, forasmuch as the knowledge of them is moſt eaſie and neceſſary for a Chirurgion.

Thirdly, whereas of the parts ſome are ſpermaticall and ſolid, as bones, griſtles, and ligaments; others fleſhy as the Muſcles; we muſt beginne with thoſe that are the proppes and ſupporters or vpholders of the reſt, as the bones; to which the Muſcles do cleaue, from which they ſpring and ariſe, and into which they are engrafted or inſerted. And indeede, before *Galens* time, the ancient Phyſitions in the Schoole of *Alexandria* did vſe to quarter bodies for their Schollers firſt, and afterward allow them whole carkaſſes. The Schoole of Alexandria. Againe, wee muſt know, that for the exquiſite diſcerning of the ſolid parts, the bodies of old and leane men are the fitteſt, becauſe they are not ſo fleſhy or ſo ouergrowne with fat; to which are anſwerable the bodies of ſuch as die of conſumptions.

Fourthly, whereas there is a two-fold diſſection, either of a part taken from the whole, or of a part ioyning to the whole: the diſſection is firſt to be made of a part taken from the whole, becauſe it is more eaſie then to diſſect a part ioyning to the whole.

Fiftly, whereas in euery particular part *Galen* enioyneth three things to be obſerued & reſpected; the ſtructure, the action, and the vſe: the Anatomiſt muſt firſt ſearch out the ſtructure or compoſition, then the action, and laſtly the vſe.

Laſtly, in making diſſection, there is a two-fold order to be obſerued, the one where there is ſtore of dead bodies, the other where there is want and ſcarcity. If there be ſtore of bodies, you ſhall in one looke onely to the veſſels, in another to the Muſcles, in a third onely to the bowels or entrailes: but if you haue but one body and no more, and yet would ſee all in that, chooſe a bodie that is ſound and vntainted, and either hanged, ſmothered, or drowned; and in this body great skill muſt be vſed, that euery part may be ſhewed in his order and place. Now this order of anatomy is three-fold; of Dignity, of Scituation or diſſection, and of Preſeruation or continuance. The order of Dignity requireth, that we ſhold begin with the brain, as with the moſt noble part. The order of Scituatiō or diſſectiō, requires that we ſhould firſt demonſtrate thoſe parts which firſt appeare in view to the beholders; and for Diuturnity, if we would keepe a body long, the diſſection muſt be begun at thoſe parts which are moſt ſubiect to corruption; & therfore, firſt cut vp the lower belly, then the Cheſt, after the Head, and laſtly the ioynts. This order all Anatomiſts do obſerue in Schooles, and in all publique diſſections, when as they deſire to ſhew all, or the moſt part, in one and the ſame body: and this is the firſt method or order of learning anatomy, namely, by inſpection, which is gained by diſſection. The order of Anatomy threefolde.

Anatomy may alſo be taught without diſſection, and that either *viua voce*, by the liuing voice of the Teacher, or by writing. For there are many things which cannot be knowne by inſpection alone, which may notwithſtanding in good and apt words be taught, and ſo compaſſed; as namely, why the Muſcles are ſuch and ſo many, why of ſuch figure, magnitude, and the like: and for this cauſe, the Monuments and labours of olde and new Writers in this kinde, muſt be diligently trauailed in; whoſe names I intend to declare in the next Chapter. How we may attain the skill of Anatomy by inſtruction. Now Anatomy may be deſcribed and ſo taught after a two-fold method. The one is called the way of ἀνάλυσις or reſolution, which reſolueth the whole into his parts; as when we diuide the body of Man into foure principall parts, the head, the cheſt, the belly, and the ioynts; and theſe againe we ſubdiuide and mince ſmaller and ſmaller, till we come to the moſt ſimple, vnmixt, and incompounded parts. The other is called γένεσις, or the way of compoſition, which of ſimilar parts maketh diſsimilar, and of theſe compoundeth the whole frame and ſtructure. A two-folde Method of teaching Anatomy. Analyſis. Geneſis. But we eſteeme this laſt not to be the way of *Art*, but of *Nature*; and therefore leaue it to her who is onely able to performe it. The former belongeth vnto vs, as being the way of art, for we intend not to make a new man, but to preſerue and keepe a man already framed and made: and therefore as he that commeth to an olde yet ſtately pallace which he is not able to imitate, to repaire and amende the ſame, doth firſt take off the couerings, that ſo he may looke into euery corner, and ſee the defects of it, that he may apply himſelfe better to the reparation; ſo wee will firſt remoue the couer and ſhrine of this Sacred Pallace, and after looke as narrowly as wee can, into the ſecret corners of the ſame, that when we are called, we may bee better able to ſet our hands to the worke: and yet after we haue ended our whole Diſcourſe, we wil alſo giue you a view (as well as we may) of the worke of Nature, iterating the figures and their explicati- Comparison.

The benefites of pictures.

and those oftentimes of great consequence, which were vnknowne to the skilfullest artists of former ages. Neyther do the Geometricians and Geographers, who are but the Anatomists of the Great world, as we are of the little; despise those demonstrations which in Cards & Maps they receiue one from another. Again, it is not alwaies, or in each place easie to find & obtain such store of humane carkasses, and therfore that want is well supplied by a curious draught or delineation of such obseruations, as are made in true dissections by cunning artists, that so both the memory of those that were present may be refricated and refreshed, and such as were absent, made also partakers of their labors; yet for all this, I do not thinke it fit to trust too much to these silent shadowes. For as it is not possible to make a good Commander, or a skilfull Pilot by any typicall or representatiue army, fortification, or water carde, but onely by practise and experience: so it is a very vaine thing to take in hand to learne Anatomy by the bare inspection of figures, without practise vpon the body it selfe: and because our art concerneth the cure not of Beastes but of Men, we must therefore exercise our selues chiefly in the anatomy of the bodie of Man, and that not aliue but dead.

Geometricians are Anatomistes of the Great World.

A Caution.

Comparison.

I am not ignorant that some of the ancient Physitians, as *Herophilus* and *Erasistratus*, by the License of Princes whom they had possessed with the profit thereof, did anatomize the bodies of condemned wretches euen whilst they were aliue, which also in our age hath been done by *Carpus* and *Vesalius*. But for mine owne part, I hold it a very friuolous and vaine thing, beside the horror and inhumanity of the fact, which almost no necessitie can sufficiently warrant. For liuing dissections (as wee call them) are then put in vse, when we would finde out some action or vse of a part which by the dead carkas cannot bee discerned; now all those we may find aswel in Beasts as in Men. But we eſteeme this laſt not to be the way of *Art*, but of *Nature*; and therefore leaue it to her who is onely able to performe it. The former belongeth vnto vs, as being the way of art, for we intend not to make a new man, but to preſerue and keepe a man already framed and made: and therefore as he that commeth to an olde yet ſtately pallace which he is not able to imitate, to repaire and amende the ſame, doth firſt take off the couerings, that ſo he may looke into euery corner, and ſee the defects of it, that he may apply himſelfe better to the reparation; ſo wee will firſt remoue the couer and ſhrine of this Sacred Pallace, and after looke as narrowly as wee can, into the ſecret corners of the ſame, that when we are called, we may bee better able to ſet our hands to the worke: and yet after we haue ended our whole Diſcourſe, we wil alſo giue you a view (as well as we may) of the worke of Nature, iterating the figures and their explicati- Comparison.

plications which are disperſed through the whole worke, but much more largely, according to the order of γένεσις or compoſition, that nothing may be wanting vnto you, which either our induſtry or charge may accompliſh for your behoofe; but firſt we will inſiſt in the order of diſſection.

Who haue written of Anatomy; and firſt what Hippocrates hath written thereof. CHAP. X.

The praiſe of *Hippocrates.*

Hippocrates of *Coos* was reuerenced by antiquity as the Oracle of *Greece*, or a kinde of Deity, rather to be adored then admired, much leſſe imitated. This Man, when the art of Phyſicke was yet rude and vnpoliſht, ſo laboured vpon it, that he left it ſmooth and terce: the knotted budde, by the ſtrength of his wit and vigorous rayes thereof, he made to ſpread into a glorious flower. He like a good Husbande, hath reduced the ſeedes of Phyſicke, diſperſed before in the large field of the world, into certain ſeed plots, whence we may fetch them one by one at our pleaſure: and truth to ſay, his writings reſemble ſeede moſt of all, for they are not great, but full of power and efficacie: for as a ſmall Acorne hath in it the power of a mighty Oake, ſo in him one ſhort Aphoriſme conſiſting of a few wordes, hath growne to fill whole volumes of Commentaries; and ſo all other his writings are very enigmaticall, hauing in them as many ſentences as wordes. Before *Hippocrates* time, the knowledge of Anatomy was very geaſon and ſcarſe: no writings of the ancients were extant of that ſubiect. He was the firſt Man, that being inſpired (as I verily thinke) with a diuine Spirit, & truſting (as well he might) to the ſtrength of the pinions of his owne wit, cut the firſt way through this abyſſe; not onely leauing encouragement vnto others, but alſo monuments of many things which pertained to anatomy. For I verily thinke, that that happie ſpirit of *Hippocrates*, was ignorant almoſt of nothing that doth neceſſarily appertaine to the vſe & practiſe of the art of Phyſick. For whereas *Galen* in his ſecond Booke *de Anatomicis Adminiſtrationibus*, maketh two ſorts of Anatomy; the one profitable, becauſe it is neceſſary for the practiſe of Phyſicke; the other, beyond the vſe of art, and more for ornament and pleaſure, then profit which hee calleth *Superabundant*: I preſume I can demonſtrate vnto you, that *Hippocrates* hath moſt exquiſitely and elegantly deſcribed that former profitable, and vſefull kinde of anatomy.

Hippocrates writings like to ſeed.

Galen.

Hippocrates not ignorant of that Anatomy which is vſefull and profitable.

Of parts ſome are Similar, ſome Diſſimilar; Similar, are the Bones, Cartilages, Ligaments, Membranes, Veines, Arteries, Nerues; and of all theſe *Hippocrates* hath written many things, and thoſe excellently well. Concerning the Bones firſt in generall, what is their Nature, their manner of generation, their materiall cauſe, their efficient, and finally their vſe, he hath excellently demonſtrated in his bookes *De Natura Oſsium*, *de Carnibus*, and *de Natura Pueri*. The matter he deſcribeth in theſe words; *When the fat exceedeth the glue, then are the bones framed.* The efficient cauſe hath he thus ſet downe, τὰ ὀστέα σκληρύνεται ὑπὸ τῆς θέρμης πνεύματος, that is, *The bones being thickned by heate, are exiccated or dryed.* The common vſe of the bones, who did euer ſo accurately expreſſe in ſo fewe Wordes, τὰ ὀστέα τῷ σώματι στάσιν καὶ ὀρθότητα καὶ εἶδος παρέχονται, that is, *The bones doe giue vnto the Body ſtability, vprightneſſe, and forme or faſhion.* Hee hath alſo deſcribed the particular hiſtory of the bones, their ſeuerall differences, their faſhions and their parts. Of the bones of the head, he writeth in his booke *de vulneribus Capitis*: of the reſt, in his Bookes *de Articulis*, and *de Oſsium Natura*. For before hee do deliuer the diſeaſes or affects incident to the bones, he inquireth into the nature and faſhion of euery Bone: a taſt of which his elegant order, I wil giue you in the deſcription of the backbone, whereby you may imagine how he hath done all the reſt.

How Hippo. deſcribed the Nature of bones.

Hip. deſcription of the backe bone.

The Nature of the Backe-bone (ſaith he) *is firſt to be knowne.* The figure of it is θυσκόλιος that is, *In ſome ſort right and ſtraight*, but yet ſo, that ſometimes it bendeth outwarde, ſometimes inward. From the firſt racke-bone or *vertebra* of the necke to the ſeauenth, it hath *Figuram* λορδὴν, that is, *Inclining inward*, that it might bee ſubſtrated or couched vnder the Gullet, and the Rough Arterie. From the firſt Spondill of the backe vnto the twelfth, it hath *Figuram* κυφὴν, that is, *A forme bunching outward*, that the Organes of reſpiration might haue the better roome, and a more ſpacious cauity to extend themſelues in, to wit, the Heart and the Lungs.

The Loyns bend inward, & the *Os Sacrum* or Holy-bone, protuberateth or ſwelleth outward, yet with a ſtraitnes too, that ſo the cauity of the *hypogaſtriũ* or watercourſe might be

the

the larger, which was to containe the bladder, the right gut, and the wombe. The reſt of the bones he purſueth after the ſame manner.

Concerning the Cartilages, Ligaments, and Membranes, ſome things he hath deliuered heere and there, but ſcatteringly. Of the veynes he hath written many things, but all of them very obſcure, in his Booke *De locis in homine*, *De Morbo Sacro*, *De oſsium Natura*, and in the ſecond *Epidemiων*. And firſt, he doth very elegantly deſcribe the aſcendent and deſcendent trunke of the Hollow veyne, which he calleth κοίλην, that is, *the Liuer veine*; in the fourth ſection of the ſecond Booke *Epidem*. The Liuer veine (ſaith hee) paſſeth downward through the loynes, to the great or Holy bone. Againe, ariſing vpwards out of the Liuer, it aſcendeth through the Midriffe, and ſo runneth to the throate. As for the peculiar hiſtory of the veines, that is to ſay, the diuarication of their branches; albeit hee hath not preciſely ſet them downe, yet it ſeemeth he was not ignorant of them, ſo far as was needefull for the practiſe of Phyſicke: for hee mentioneth all thoſe branches which Phyſitians vſe to diuide in Phlebotomy; as for example, the veynes of the forehead, the nowle or backe part of the head called *Vena puppis* and we may call it the Sterne veine, the veines of the tongue, the eares, the iugular or throate veynes, the ſhoulder veyne called *humeraria*, the Liuer veine called *Baſilica*, that of the ham called *vena poplitis*, and the ankle veines called *Maleoli*. In the 68. Aphoriſme of the firſt Section, *When the backe part of the head is pained, the right veine of the forehead being opened, giueth eaſe.*

The deſcription of the hollow veine, after *Hippoc.*

Hippocrates knew all the veynes which are vſually opened.

Inſtances in them all.

In his third Book *De Morbis* in the *Angina* or ſquinancy, he ſtriketh the veynes vnder the tongue. In his Booke *de Aëre, locis & aquis*, he mentioneth the veynes behind the eares, which the Scythians did vſe to open, to helpe the Scyatica or hip-gowt. The Iugular veynes, he deſcribeth in the fourth Booke *de Morbis*. In his Booke *de Natura oſsium*, hee commandeth to open the veynes of the hams and ankles, in pains of the Loynes and Teſticles. In the firſt Section of the 6. Book *Epidemion* in fits of the ſtone, or inflamations of the Kidneyes, hee openeth the Ham veynes. The ſhoulder veyne he deſcribeth in his Booke *de oſsium Natura*, calling it *ſanguiflua* or the blood-flowing veine. In his Booke *de victus ratione in morbis acutis*, in the Pluriſie he openeth the *Baſilica* or Liuer veine, which he calleth τὴν ἔισω φλέβα, that is the *inner or internall veine*. Now the common Originall and vſe of the veines, he declareth in his Booke *de Alimento*, as alſo of the arteries, ἡ ῥίζωσις φλεβῶν ἥπαρ, ἡ ῥίζωσις ἀρτηριῶν καρδίη, that is, the radication or roote of the veynes is the Liuer, of the Arteries the Heart: out of theſe, blood, ſpirits, and heate are diſtributed into the whole body. Of the Nerues you ſhall reade many things, yet diſperſedly: but for their cõmon Originall (which all men were ignorant of) he pointed it out manifeſtlie. All men almoſt do hold, that the ſofteſt nerues or nerues of ſenſe doe ariſe from the brain, the hard & ſuch as ſerue for motion from the *Cerebellum* or little braine: but now it is reſolued eſpecially ſince *Varolius* his curious ſearch by a new manner of anatomizing the head, that all the Nerues euen the *Opticks* themſelues, doe ariſe from this *Cerebellum* or backeward braine, which me thinkes *Hippocrates* inſinuateth in his Booke, *De oſsium Natura*. Νεῦρων ἔμφυσι (ſaith he) ἀπὸ τοῦ ἰνίου ἄρχει πᾶσα ῥάχις ἐστὶ, The originall of the Nerues, is from the *Occipitium* or hinder part of the head, euen to the racke bones, the hippes, the priuities, the thighes, the armes, the legges, and the feete. Of *Glandules* or Kernels hee wrote an entire Booke: and ſo much of the ſimilar parts.

The Scythiãs cure of the Scyatica.

Hippo. diſcouered the Originall of the Nerues.

Varolius commendation.

Of the Organicall parts alſo he wrote much, and that excellently. Of the Heart a Golden booke, wherein he ſo excelleth, that I thinke neither *Galen* nor *Veſalius* haue gone beyond him for exact deſcription; but in it there are many things obſcure, which needes an Interpreter, if the world were ſo happy. The hiſtory of the infant, the Principles of generation, the conceyuing, forming, noriſhment, life, motion and birth, hath he moſt excellentlie deſcribed in his bookes *De Natura pueri*, *De ſeptimeſtri*, and *De octimeſtri partu*. We conclude therefore, that *Hippocrates* wrote very diuinely of Anatomy, but withall ſo obſcurely, as his workes euen to this age, ſeeme to be ſealed from the greateſt wits. I think therefore that he ſhall merit moſt of Phyſicke, who hauing all his furniture about him, ſhall labour to make manifeſt to the world, thoſe diuine Oracles, which hitherto we haue rather admired then vnderſtoode.

Hippocrates Golden booke of the Heart.

An exhortation to take paines in *Hippocrates*.

of

What Galen hath written of Anatomie, and how vniuſtly he is accuſed by the later writers eſpecially by Veſalius. CHAP. XI.

The prayſe of Galen.

ALmoſt all the *Grecians*, *Arabians*, and *Latines*, do very much extoll *Galen*, as after *Hippocrates*, the ſecond Father of Phyſicke; foraſmuch as he hath in ſuch ſort amplified and adorned the whole Art by his deep and diuine writings, that vnder him it may ſeeme to be as it were, borne anew. For indeede howbeit there were extant before many excellent Monuments & Records, yet were they ſo confuſed and ſhuffled out of order, that it ſeemed a new worke to gather together thoſe thinges that were diſperſed, to illuſtrate that which was hard and difficile, rude and vnpoliſht; to diſtinguiſh and order that which was confuſed, beſide many things which he obſerued in his owne particular experience. For other parts of Phyſick I will ſay nothing, but for Anatomy I will confidently auouch, that *Galen* hath ſo beautified and accompliſhed it, that he hath not onely diſperſed the blacke clowds of ignorance which hung ouer the former ages, but alſo giuen great light & ſplendor to the inſuing poſterity. For whereas there are three meanes, which leade vs as it were by the hand to the perfect and exact knowledge of Anatomy, namely, Diſſection of the parts, their actions, and their vſes: he hath ſo accurately deſcribed them all, as he hath gotten the prize from all men, not onely before him, but euen after him alſo. The manner of Diſſection, he hath manifeſted in his Bookes, *de Anatomicis adminiſtrationibus*, *de Diſſectione muſculorum & neruorum.*

Three things accompliſhing an Anatomiſt

The actions of the ſeuerall parts, he hath elegantly deſcribed to the life in his Booke *de naturalibus facultatibus* & *de placitis Hippocratis & Platonis.* But aboue all, are thoſe ſeuenteene golden bookes of the *Vſe of parts*, which are truly called Diuine labours, and hymnes ſung in praiſe of the Creator. So that the benefites we all, and thoſe before vs haue receyued by *Galen*, are indeede very great: and yet (the more the pitty) almoſt all the new Writers, do continually carpe and barke at him, yea teare and rend him, whether it be by right or wrong, wounding and lancing his credite vpon euery ſlight occaſion: one by way of cauill, another ambitiouſly ſeeking to make himſelfe eſteemed by *Galens* diſgrace, and few with any deſire that truth ſhould take place. But as flouds beating againſt the rockes, by how much they ruſh with greater violence, by ſo much they are more broken and driuen backe into the maine; ſo, & ſuch are their bootleſſe and ridiculous endeauors, who enterprize by the diſgrace of another, eſpecially of their Maiſters and Teachers, to gaine reputation vnto themſelues.

The ſlander of the new Writers againſt *Galen.*

But let vs ſee wherein theſe Nouices do blame *Galen.* Firſt they ſay, hee hath giuen vs onely the Anatomy of bruite beaſts, and not of Man, hauing neuer diſſected a mans body. Againe they vrge, that he was ignorant of many things, which at this day are generally & commonly knowne. Thirdly they ſay, he deliuers many things repugnant and contrary to himſelf. Laſtly, that he hath written all things confuſedly, & without Method or order. For (ſay they) what Method can ther be obſerued in his books of the *vſe of Parts*, which you cal diuine? Firſt he treats of the hand, then of the legges and feete, and laſt of all of the lower belly, and the naturall parts. How ſillie theſe calumniations are, and how miſerably theſe men are by their owne ignorance deceiued, let all men heare and iudge. For to begin with the firſt, I ſay and affirme, that *Galen* did not onely cut vp the bodies of Apes, but manie times alſo the carkaſſes of men. My witneſſe ſhall be the author himſelfe. In his thirteenth booke *de vſu partium*, *I am determined* (ſaith he) *to ſet foorth the ſtructure and compoſition of Man alone.* In his firſt booke, *de Anatomicis adminiſtrationibus*, *It is meete to obſerue and looke into euery particle, eſpecially in men.* In the ſecond Booke, *Now* (ſaith hee) *the foote of an Ape differeth from the foote of a Man, in that the ſtructure of the fingers is not alike in them both.* In his fourth book *de Anat. adminiſt.* and in the third *de vſu partium*, he ſheweth the difference of the tendons which go to the legs and feete: and in his firſt booke *de Anat. Adminiſt.* he ſaith, that *The head of the Thigh is more crooked in men then in Apes, and the Muſcles alſo vnlike, which are inſerted into the legge.* He ſheweth alſo the diſſimilitude between the Loynes of a Man and an ape. In his ſecond booke *de ratione victus*, hee ſaith, that *A Man differeth from ſome creatures in the Originall of the Veyne called Azygos*, that is, *the ſolitary veine, or without a peere.* In the 13. booke *de vſu partium*, he ſaith, *That the wombe of a woman, differeth much from that of other Creatures.*

The confutation of the firſt ſlander.

So

So then, if *Galen* did ſo well vnderſtand wherein the bodies of Men and Apes did agree, & wherin they did diſagree, it is very likely that he had made diſſection of mens bodies: for in things which are ſo like, it is the part onely of an artiſt and expert practitioner, to know and diſcerne what is differing and vnlike. And ſo much for ſatisfaction to the firſt imputation which is iniuriouſly caſt vpon *Galen* by his ſlanderous detractors. They ſay farther, that *Galen* was ignorant of many things which appertaine to the ſtructure and compoſition of mans body; as if it were not proper to Man to be ignorant. Was not *Veſalius* ignorant of a number of things which were afterward obſerued and ſeene into by *Fallopius*? & do not we daily finde out many things whereof the former ages were vtterly ignorant? I appeale to that of the ancient Poet, οὐς ἀνὴρ ὁ πάνθ' ὁρᾷ *One man ſeeth not all things.*

The confutation of the ſecond ſlander.

And whereas they obiect, that *Galen* doth not agree with himſelfe, but writeth manie things repugnant and quite contrary, let them learne and bee aduertiſed, that it was the manner of the ancients, to deliuer many things diuers times according to the opinion of other men: and the interpreters beare record, that *Hippocrates*, *Ariſtotle*, and *Plato*, did many times ſpeake after the manner of the common people. So *Galen* ſpeaking according to the opinion of others, may haply write ſome things that doe not ſo well agree together: but when he diſputeth preciſely of the point of Anatomy, then he alwayes agreeth and accordeth with himſelfe.

A Cuſtome of the Ancients.

Galen himſelf euer agreeth with himſelfe

Laſtly, they clamor that his Books *De vſu partium*, are written confuſedly, and vvithout Method: but their heate and furie of gainſaying, tranſports them I know not whither: for the Method of theſe Bookes is admirable, which being to many heeretofore vnknowne, I will now make plaine and bring to light.

I am determined (ſaith *Galen*) *to declare the ſtructure and compoſition of Man, and the vſe of all his particular parts*; and therefore what he hath proper and peculiar therein, & wherein he differeth from other Creatures, muſt firſt be opened.

The wonderfull Method of the Books of *Galen de vſu partium.*

Firſt therefore, for the nakedneſſe of his ſoule, he hath Reaſon, which is an art before all arts, and in recompence of the nakedneſſe of his body, hee hath the Hand, an organe before all organes. Of the Hand therefore which Man alone hath, and no other Creature beſide, he diſputeth in his firſt and ſecond Bookes, ſo accurately and elegantly, that he hath preuented all men for getting any honour by treating of that ſubiect. And, becauſe the legges haue a great affinity with the hands, and that there is ſomething proper and peculiar in the frame and ſtructure of the ſame, (for onely Man by the benefit of his Legges, goes directly vpright) therefore in his third Booke he intreateth of the Legges; for ſo the order of teaching ſeemeth to require, that thoſe things which are alike, ſhould be deliuered together.

Hauing declared what things they are which are proper to Man onely, hee commeth then to ſuch as are common vnto Man with other creatures. And whereas of thoſe parts whereof the bodies as well of men as of other perfect creatures are compoſed, ſome doe preſerue and maintaine either a particular and indiuiduall creature, or the generall ſpecies or kind; others do ſeruice, & adminiſter vnto the former, as the veyns, arteries, and nerues: in the firſt place, he diſputeth of thoſe that conſerue the *individium* or particular creature; and theſe are either naturall, or vitall, or animall; by reaſon whereof, the body is diuided into three Regions. Of the Naturall parts, hee diſputeth in the fourth and fift Bookes; of the Vitall in the ſixt and ſeauenth: of the Animall, to wit, the Brain, in the eight & ninth: of thoſe things which depend vpon the braine, that is, of the Inſtruments or organs of the ſences, in the tenth, eleuenth, twelfth, and thirteenth bookes; which may bee called the order of Nature. The organes ordained for generation or propagation of the ſpecies or kindes, aſwel in men as women, are deſcribed in the fourteenth and fifteenth books. Thoſe parts that are ſeruiceable to all theſe, as the veines, arteries, and the nerues, are delineated in the ſixteenth. The ſeauenteenth which is the laſt, ſerueth as an Epilogue or concluſion to all the reſt: and therefore, theſe ſlanderous accuſers of ſo worthy a Writer, are no better worth, then to be ſent packing from all ſociety of ingenuous learned men.

How

How farre Aristotles skill stretched in Anatomy. CHAP. XII.

The praise of *Aristotle.*

ARistotle is intituled by all Philosophers, the true interpreter of Nature, the light, the *Genius*, the only spirit of truth, who is able not only to stir vp & awaken mens minds, but to fulfil & satisfie them. In a word, he is another nature, furnished with eloquence. For he hath very curiously determined of all natural things, and their causes; but that so darkely and obscurely, that he is vnderstood but by few; for he was vnwilling to blab abroad, and prophane the Mysteries of Philosophie amongst the rude multitude; and therefore he hid them, not vnder a veyle of Fables, as the ancient Poets; nor vnder a superstitious proportion of numbers, as the *Pythagoreans*, but wrapped them vp in obscure breuitie; so sending them abroad, as if he had kept them at home. So the Cuttle-fish to deceyue the Fishermen, powreth forth a blacke humor, and in that clowd she escapeth. And whereas there are two parts of naturall Philosophy; the first concerning the generall and vniuersall nature of things, the latter which searcheth out the particular nature of man, and all liuing creatures. In the first, *Aristotle* was so absolutely excellent, as no man, no, nor anie age of men may stand in competition with him; but in the second, how many things hee knew not, how absurdly he vnderstood diuers things hee knew, *Galen* and all the whole Schoole of Physitians haue prooued by demonstrations, but especially by αὐτοψία, or the sight of the eye, which is of all arguments the most demonstratiue. He writ Bookes of the Generation, of the parts, and of the History of the creatures, but he bequeathed vs many things out of the testaments of other men: neither is it likely, that hee did euer cut vp the body of a man; for if he had, hee would not haue so fowly erred in that which is obuious to the sence. For both in the History of the similar parts, and in the description of the dissimilar, he hath set downe many things very grosse and absurd: as in that, where he writeth, that the Veines do originally proceede from the Heart, which also hee maketh the wel-spring of the Nerues; where he saith there are three ventricles in the Heart, that the Braine was made onely to refrigerate or coole the heart, and such like many more, which we shall meete withall in our Treatings of the bones, the veynes, the arteries, the nerues, the heart, the braine, and other particular parts; and therefore in those places, the diligent and studious Reader may looke for, and finde them.

Aristotle was ignorant in the particular History of the creature, and in Dissection.

What the other Greeke Authors haue written of Anatomy. CHAP. XIII.

THere were after *Hippocrates* time, certaine famous men, that did diligentlie practise the art of Anatomy, and deliuered many things in writing, which haue all perished, I know not by what mishap, or destiny, whether I should call it. *Alcmæus Crotoniata* (as *Calchidius* reporteth,) did vse to anatomize mens bodies. *Diocles Carystius* in his Epistle to King *Antigonus*, diuideth the bodie of Man into the head, the chest, the belly, and the bladder. *Lycus Macedo* was accounted cunning in the Dissection of the Muscles; and his bookes (as saith *Galen* in his 4. booke *de Anat. Administ.*) were with great commendation dispersed all abroad. *Quintus*, *Lycus* his Schoolemaister wrote some things of Anatomy; *Marinus* published 20. bookes of those things which *Lycus* was ignorant of in Anatomy. *Erasistratus* did much in this kinde also. *Herophilus* (as *Tertullian* saith) cut vppe aboue seuenty bodies, and oftentimes the bodies of liuing men: of him *Galen* writeth thus. *Herophilus* aswell in all other things that appertaine to out art, as also in Anatomy, did attaine to a most exacte and exquisite skill and knowledge, and for the most part made his experiments not in bruite beastes, as most men vse to do, but euen in the bodies of men.

Alcmæus. Diocles.

Lycus. Galen. Quintus. Marinus.

Erasistratus. Herophilus.

Pelops did publickly teach Anatomy, and was the Schoolemaister of *Galen*, he affirmed, that all the vessels of the body, did originally arise from the Braine. *Diogenes Apollonata*, wrote a Booke of Veynes. *Asclepiades*, *Eudemus*, *Praxagoras*, *Philotimus*, *Elianus*, *Polybius*, *Calistus*, in their seuerall times, did all of them excell in this art. Yet none of their writings remaine with vs; but if we beleeue *Aristotle* and *Galen*, they had many fooliſh and ridiculous conceites. There haue beene also Greekes of later times, who haue done somewhat

Pelops, Galens Schoolmaster *Diog. Apollon. Asclepiades. Eudemus. Praxagoras. Philotimus. Elianus. Polybius. Calistus.*

in

in Anatomy, as *Aretæus*, *Theophilus*, *Oribasius*; but *Galen* hath wonne the Girlond from them all, as we haue already prooued. *Arctæus.* *Theophilus.* *Oribasius.*

Who haue beene the chiefe Authors of Anatomy in our owne times.

CHAP. XIIII.

MAny things also haue the *Arabians* written of the matter of Anatomy, of whom *Auicenna* is worthily accounted, especially for the speculatiue part, the Prince and Chieftaine; but amongst all, the Latines haue taken most pains in this argument, and amongst them, those of our owne age; so that now the Art is so beautified, that it seemeth the last hand is put vnto it, and the art of Anatomy may now be accounted to haue attained the very height of her glorie. Among the ancientest of them, we haue *Mundinus*, who wrote very perspicuously by way of ἀνάλυσις, or resolution, following the order of dissection. *Carpus* wrote large Commentaries vpon him; but we must needes taxe them both with many ydle and absurd passages, besides the lameness and imperfection of their workes. *Thomas de Zerbis* set forth a large worke, but we imagine that he tooke much from other men, and had little of his owne, neither had he as we suppose, any great practise himselfe in dissection. After these came *Vassæus*, *Carolus Stephanus*, *Andernacus*. At length appeared *Andreas Vesalius*, who wrote very accurately; and some thinke, he balked nothing that may appertaine either to Dissection, or to the actions or vse of the parts; but he is condemned of many, and haply not vnworthily; for that hauing transcribed almost all his worke out of *Galen*, yet hee cannot afoord him scarse a good word, but either pricked by ambition, or with an itching desire to contradict so great an Author, he neuer leaues goading and wounding his reputation, and that very often vndeseruedly. *Auicen.* Latine writers. *Mundinus.* *Carpus.* *Tho. de Zerbis.* *Vassæus.* *Caro. Stephanus* *Andernacus.* *Vesalius* an accurate writer.

Iacobus Sylui herein hath carried away the reputation, that he hath digested in a most exquisite order, the vast and wilde Forrest as it were, and confusion of all the Muscles and Vessels, and giuen them particular and proper names, but hee was little beholding to his Printer, who hath let slip many escapes, and by your leaue added (as we thinke) somthings to him very superfluous. These two, *Vesalius* and *Syluius* flourished both in one time; but *Vesalius* was too tart and sharpe in his calumniations, *Syluius* too obstinate a defender of *Galen*. *Vesalius* hath rashly and vnaduisedly written many things against *Galen*. *Syluius* in defending his Maister *Galen*, is enforced to maintaine many vncouth Paradoxes. *Gabriell Fallopius* the most subtile and acute Anatomist of this age, hath deserued exceeding much of vs all; for in his obseruations he hath opened many things altogether vnknowne to the former ages: he wrote also an excellent Commentary vpon *Galens* Booke *de Ossibus*. *Columbus* couched the whole Art very succinctly in xv. Bookes, and penned them very neatly. *Valuerda* the Spaniard hath done also exceeding well, and with great commendations. *Eustachius* hath published some small workes of Anatomy concerning the bones, and the frame and composition of the Kidneyes. *Bauhinus* first exceeded all men, and since in a later worke, hath exceeded himselfe, both in his descriptions, and in his Tables. *Archangelus Picholominæus* a Cittizen of Rome, hath set forth very learned readings of Anatomy, interlaced with many disputations concerning things controuerted. *Varolius Arantius* and *Pigaseta* haue added also their tribute vnto this treasury. *Volcherus Coeiter*, and *Felix Platerus* haue beautified it with their Tables, *Volcherus* is more easie and facile. *Platerus* is acurate, but not fit Lettuce for euery mans lips, hee must picke nicely that will gather a Sallet out of him, hee is so intricate and full of his Dicotomies. Manie Frenchmen haue written well in their owne Language. *Iacobus Guillimæus* the Kings Chiturgion hath adorned the whole art with Tables and Figures, by which he hath made an easie entrance for all men to vnderstand the graueste authors. The like may be saide of that industrious *Paræus*, and *Cabrolius* the kings Anatomist in *Mompelier*. *Seuerinus Pineus* hath taken great paines: he wrote a Booke of the notes of virginity, wherein he hath very curiously described the parts belonging to generation. *Syluius* his commendation. *Fallopius* his commendation. *Columbus.* *Eustachius.* *Bauhinus.* *Archangelus Picholominæus.* *Var. Arantius* *Pigaseta.* *Volcherus Coeiter.* *Platerus.* *Guillemeus.* *Paræus.* *Columbus.* *Pineus.*

Andreas Laurentius hath taken worthy paines, and sweate much in this sande, to his great honour and the generall good of the whole Schoole of Anatomists; for beside his descriptions, he hath handled learnedly the controuersies of euery part, with great euidence of argument, wherein I beleeue he hath satisfied himselfe and all the world beside. These his Controuersies we haue taken into our worke, yet not alwayes tying our selues to sweare what he sayes, but for the most part we finde him in the right. His descriptions wee take *Laurentius* his commendation.

Bauhins diligence.

vnder correction, not to be so perfect, and his Figures most imperfect. In those two *Bauhine* hath farre exceeded him and all men else; to whom therefore we sticke the closer, although we could haue wished that *Bauhine* had had the care of his owne worke himselfe, & had not betrusted others with his credit, who haue in no few things fayled his expectation and ours.

Paulus.

Paulus of *Leiden* is a great Anatomist, but writes for his inscription, *Posse & nolle nobile.* Surely he can do much, and I would to God he could be ouercome, to communicate himselfe; some things we haue gathered from his owne mouth, whereof it shal neuer repent vs.

Iulius Casserius

Finally, within these three or foure years, *Iulius Casserius* the Anatomist of *Padua* in *Italy*, set forth an elegant Booke of the fiue sences, wherein he hath laboured sufficiently, if not too much; for there is a kinde of sobriety to be vsed also in humane studies, beyond which to be wise, is not farre from folly. *Casserius* hath done manie thinges excellently well, and of good vse, but his extraordinary diligence about the organs of the senses in so many creatures, I see no cause to imitate; for sure I am by that litle experience I haue, that many of these nice and fine points, though they make a faire shewe, and tickle the eares of a man when he reades them, and delight his eye when hee sees the resemblances of them printed before him; yet when he shall come to search for them in the bodye of man, they will not be so obuious, if they be at all, or if they be found, yet serue rather for a speculatiue pleasure & admiration, then be of any vse in the art of physick or Chirurgery.

Among our selues *Gemini* was the first: in his descriptions too breefe, in his Tables too confused, rather contenting himselfe with *Vesalius*, then giuing contentment vnto others: yet for those times he is worthily to be commended.

That good and ingenuous old man *Banister*, was a true patriot, he loued his Country & Learning, and spent himselfe in dooing good, and his memory is worthy to bee registred euen for his Anatomy among the rest of his Labours. At this day we haue also some worthy to be named, who if they listed, could turne the gaze of the worlde Westwarde, and time I hope will bring their monuments to light. In the meane time, we haue aduentured to hold vp this taper, at which if they please they may light their Torches.

Of the definition of Anatomy, and what Instruments are thereto necessary. CHAP. XV.

The notation of Anatomy.

TOMH is a Greeke word, and signifieth Section or cutting. Hence comes κατατομὴ, a diligent and curious Section, vndertaken to get knowledge or skil by. For ἀνατέμνειν, is to cut with great diligence. Now there is amongest Physitians, a double acceptation of Anatomy; either it signifieth the action which is done with the hande; or the habite of the minde, that is, the most perfect action of the intellect. The first is called practicall Anatomy, the latter Theorical or contemplatiue: the first is gained by experience, the second by reason and discourse: the first wee attaine onely by Section and Inspection, the second by the liuing voice of a Teacher, or by their learned writings: the first wee call Historicall Anatomy, the second Scientificall: the first is altogether necessary for the practise of anatomy, the second is only profitable; but yet this profit is oftentimes more beneficiall then the vse it selfe of Anatomy: the first looketh into the structure of the partes, the second into the causes of the structure, and the actions and vses therefrom proceeding. According to the first signification we may define anatomy thus: *An Artificiall Section of the outward and inward partes.*

Anatomy two fold. Historicall. Scientificall.

A definition of Anatomy. *Galen.*

I call it *Artificiall*, to distinguish it from that which is rash and at aduenture, which *Galen* calleth *Vulnerary* Dissection. For oftentimes in great wounds we obserue the figure, scituation, magnitude, and structure of the outward and inward parts; but that obseruation is but confused, for we cannot distinctly perceiue the branchings of the Nerues, the Serpentine and writhen Meanders of the Veynes, nor the infinite diuarications of the Arteries.

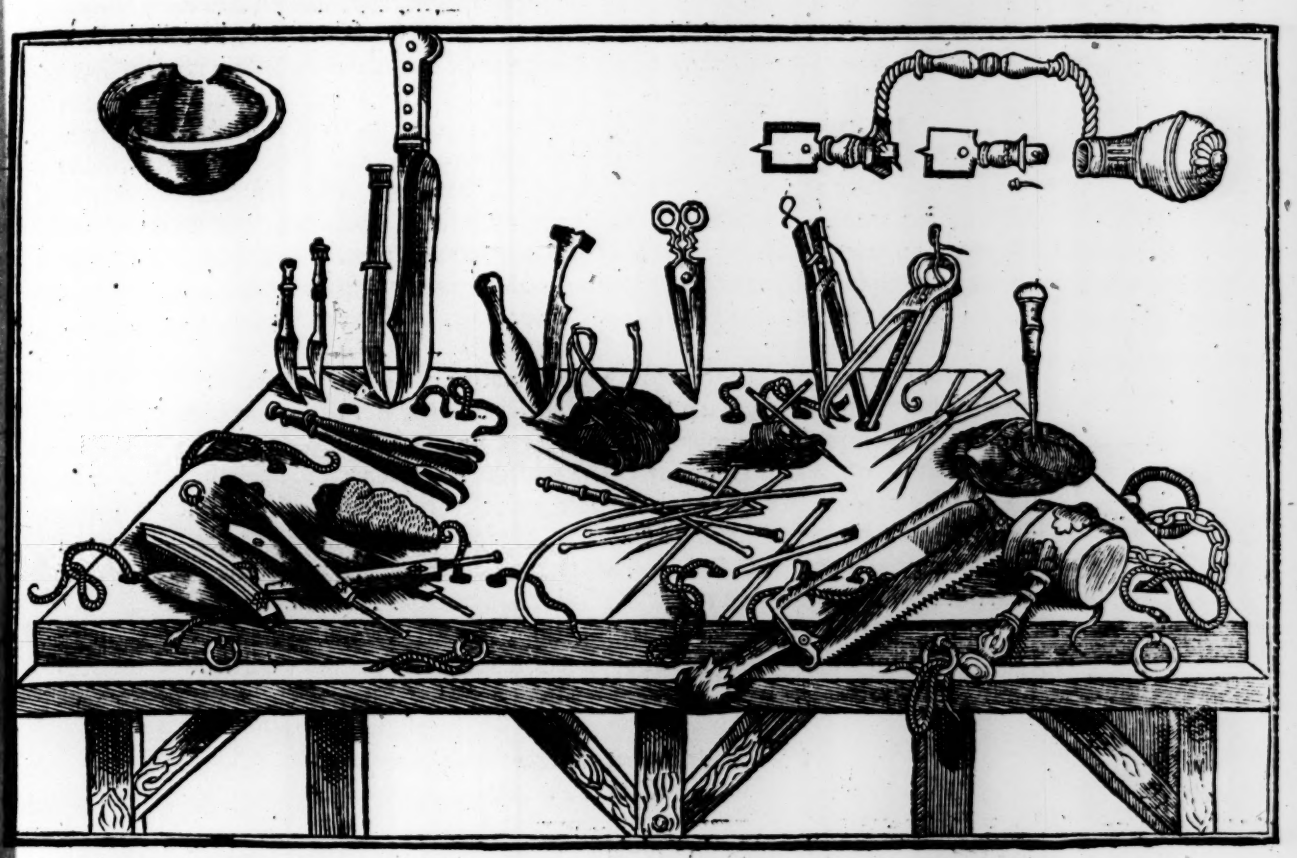
What thinges are required in artificiall Dissection.

Now that a Dissection may be made artificially, it is first requisite that the parts bee so separated one from another, that they may all be preserued whole, not rent and torne asunder. Next, that those which grow not togither, bee gently diuided. Thirdly, that those which do grow together, be carefully separated. Fourthly, that we mistake not many parts ioyned together for one, nor yet make many parts of one.

The Instrument of the Anatomy.

Now this Section cannot artificially bee accomplished, vnlesse the Ministers haue conuenient Instruments, as are these; Razors of all sortes, great, small, meane, sharpe, blunt, straight, crooked, and edged on both sides; Sheares or Sizers; round and large

long Probes of Braſſe, Siluer, Lead; a Knife of Box or of Iuory, Pincers of all ſorts; hooks, Needels bent rather then ſtraite, Reeds, Quils, Glaſſe-trunkes or hollow Bugles to blowe vp the parts, Threds and ſtrings, Sawes, Bodkins, Augers, Mallets, Wimbles or Trepans, Baſons and Sponges; the Figures of all which wee haue heereunder delineated, together with a Table whereon to lay the dead, or binde the liuing Anatomy, with the rings, chains, cords, & perforations fit for that purpoſe.



If Anatomy be taken in the latter ſignification, it is defined a *Science or Art, which ſearcheth out the Nature of euery part, and the cauſes of the ſame Nature.* I call it a *Science*, becauſe it hath vniuerſall or generall Theoremes or Maximes, and common Notions, out of which, being the *Firſt, true, immediate*, and *beſt knowne*, all demonſtrations are framed. Vnder the name of *Nature*, I comprehend many things. The ſubſtance which is the habitation of the particular Faculty; the Temper which is called the forme of the ſimilar part; thoſe things which follow the Temper, as the qualities, ſuch as may be felt, hardnes, ſoftneſſe, thightneſſe or faſtneſſe, and rarity; thickeneſſe, thinneſſe, ſauours or taſtes, and colours. Appurtinances alſo or accidents; as the compoſition of the part, to which I referre the magnitude, number, poſition, figure, continuity, and ſcituation; and finally the actions of the parts, and their vſes.

Another definition of Anatomy.

What is the ſubiect or immediate obiect of Anatomy, to wit, a Part, where the definition of a Part is vnfolded. CHAP. XVI.

THE ſubiect of both kinds of Anatomy as well Hiſtoricall as Scientificall is a Part. For the Anatomiſt doth not handle a whole body, but a body diuided into members and parts; and therefore we muſt find out what is the nature of a Part, & the differēces of the ſame. A Particle, a mēber, a Place, μέρος, μόριον, τόπος, μέλος, ſignifie one & the ſame thing. *Ariſtotle* thought that the apellation of a Part did beſt agree to the ſimilar particles, & of a Member to the Organicall and eſpecially to thoſe which were moſt cōpounded. *Theodorus* ſayth that the name of a Part or place hath a larger extent then that of a Member, becauſe that onely is a Member which is organicall, but all compound and ſimple particles are truely called parts. Wee with *Hip-*

The Names of a Part.

Ariſtotle.

Theodorus.

The definition of a Part.

Hippocrates and *Galen* make no difference betweene a part, a particle, or a place. *Galen* in the first booke of his method, defineth *a Part to be whatsoeuer doeth integrate or accomplish the whole*: and in his first book *de Elementis, whatsoeuer maketh to the constitution or frame of mans body*. For a Part is one of those thinges which the Logicians doe call τὰ πρός τι, that is, *haue reference or respect vnto another*: so a part is said to bee a part of the *integrum* and *whole*. In his first booke *de vsu partium*, he defineth a Part more accurately thus: *It is a body which neither is incompassed with a proper circumscription, nor yet is on euery side ioyned vnto other bodies*: for that which is incompassed on euery side cannot be called a Part but a whole. Now whereas the part must helpe to compound the whole, it is necessary it should adheare or cleaue vnto it by a connexion of quantity; wherefore in the whole body, a Part hath a true existence, and is *indeed* ioyned thereto, but *in reason* deuided therefrom. But both these definitions seeme to me to be too large, comprehending not onely the liuing particles of the body (which are onely true parts because they alone performe actions, and are affected with diseases) but also those that are without life, as haires, nailes, fat, and the marrow of the bones. *Fernelius* hath left vs a most perfect and absolute definition of a Part in these wordes: *Pars est corpus toti cohærens, communique vitæ coniunctum, ad illius functiones vsumque comparatum. A part is a body cohearing or cleauing to the whole, and ioyned to it in common life, framed for his vse and function*. From hence we may gather, that two things are required to accomplish the nature of a Part: First, that it should cleaue vnto the whole, and next, that it should haue some end or vse. The coherence of the part to the whole is by a double connexion, one Mathematicall, another Physicall: the first is a coherence of quantities; for a part of the creature being separated from the whole creature, cannot bee called a part of that whole, vnlesse it bee equiuocally. The latter connexion is called specificall, and is a vnion of life: for a dead or mortified part, although it haue a coherence with the whole, yet may not be called a part but equiuocally, because it hath not an vniuocall forme with the whole. But because *Fernelius* in the second booke of his Physiology, hath canuased this definition, and all the minutes thereof very exactly; I will not at this time insist vpon the explication of it, it may be we shall haue fitter opportunity for it hereafter.

Fernelius his perfect definition of a Part.

Connexion is double, Mathematical & Physical.

What an Anatomist must consider in euery part.
CHAP. XVII.

ANatomists doe obserue many things in euery part, which *Galen* in his bookes *de vsu partium* referreth to nine heads. We, the better to auoide confusion, least the wits of those that are ignorant should be too much racked, will consider onely three things, to which all the rest may bee referred, the *Structure*, the *Action*, and the *Vse*. The word Structure, I take here in a large signification, as *Aristotle* and *Galen* haue often taken it; not only for the conformation, but for whatsoeuer addeth or helpeth any thing to the constitution or composition of the part. Now these three things go to that constitution, the Substance, the Temper, and the Conformation. The substance (as wee said before) is the mansion of the particular and determinate faculty, and it is peculiar to euery part; and in that respect, the substance of a part is sayd to bee bony, membranous, neruous, fleshy, medullous or marrowy. This substance it hath partly from the forme, partly from the matter, and it is knowne by sensible qualities, such as are hardnesse, softnes, thicknes, thinnesse, raritie, density or thightnes, colour, and sauour or taste. The Temper accompanieth this substance and hangeth vppon it, following the materiall qualities; for it is not a thing abstracted or separated, but hath a firme coherence with the matter or substance, as with her subiect; and therefore the Physitians call the Temper, the forme of the similar parts, although indeede it bee not so much; but onely πρῶτον διεκτικὸν, that is, the immediate receiuer of the soule. This temper the Physitian especially standeth vpon; for euery part worketh thus or thus, according to and by his temper; and he that will maintain the actions or functions of the parts, must haue especiall care to preserue their true and genuine temper. In respect of this temper, the parts are sayd to be hot, cold, moyst, and dry; alwayes hauing a respect to a *medium*, that is, to a thing of a meane & middle temper, that is the skin. A hot and a cold temper wee distinguish rather by reason and discourse then by sence, because in a liuing creature there is nothing actually colde. But the moyst

Three things are to be considered in a Part. Structure what it is.

The substance of a Part what it is.

The Temper what it is.

and

and dry temper ſence onely diſcouereth, that is, the hardneſſe or ſoftneſſe of the part; for whatſoeuer appeareth hard to him that toucheth it, that we reſolue is dry, becauſe in a liuing creature there is nothing hard by concretion or curdling; whatſoeuer feeleth ſoft, is moyſt. The cõformation of a part conſiſteth in the Symmetrie, that is, the natural proportion or conſtitution of many things, to wit, of the figure, magnitude, number, & ſcituation. To the figure we referre the ſuperficies or ſurface, the pores and the cauities. To the ſcituation wee referre the ſeate and poſition of the part, as alſo his connexion with others; for the parts doe not hang looſe in the body, or ſeparated one from another, but they haue a coherence, being tyed together by ligaments and membranes. And therefore it behoueth a Phyſitian and Chirurgion to know which parts are tyed to which, that when one part is affected, he may know what parts may be drawne into ſimpathy and conſent with it. To this conformation *Galen* referreth the beauty of the part, which hee conceiueth to reſide in ἰσότητι, that is, in the *equality of the particles*; but wee place the beauty of the whole body, in the *inequality* of the parts; that is, in their vnlike and different quality and magnitude; but yet ſuch a difference as whereby the parts doe anſwere one another in an apt and neate correſpondencie of proportion, euen as muſique is made of different ſounds, but yet all agreeing in a harmonious concent; and thus much of the Structure of a part.

The conformation what it is.

The figure.

The ſcite.

The beauty of a part. *Galen.*

Next followeth the action, which *Ariſtotle* calleth *the end of the Structure*; becauſe for the actions ſake, the part hath his ſubſtance, temper, & conformation. So the heart, becauſe it was to be the manſion and habitation of the vitall faculty, and the ſtore-houſe of arteriall bloud, had giuen vnto it a fleſhy and ſolid ſubſtance, a temper hot & moyſt, a figure ſomewhat long, but comming neere to the Spherical, hollowed alſo with two ventricles or boſomes, and many obſcure cauities, in which the houſhold Goods and fire-harth of the body were to remaine, from whence there ſhould iſſue and ſpring a continuall ſupply of Natiue heat & ſpirits. I define an Action with *Galen*, *a motion of the working Parts*, or *a motion of the Actor*, to diſtinguiſh it from an affection; for an affection is a paſsiue motion, or a motion of a paſsiue or ſuffering body; but an action is *motus effectiuus*, an effectuating or working motion; ſo pulſation is an action of the heart; palpitation is an affection or a paſsion; the firſt proceedeth from a faculty, the ſecond from a ſickly or vnhealthfull cauſe, which we commonly call *cauſa morbifica*.

The action of a part. *Ariſt.*

What an action is. *Galen.*

Of actions ſome are common, ſome are proper; the common actions are found euery where; the proper are performed by one particular part. Nutrition is a common action, for all liuing and animated parts are nouriſhed, becauſe life is defined and limited by Nutrition. Proper actions are performed by a particular Organ, and they are either principall, or ſuch as miniſter to the principall: againe, of actions ſome are Similar ſome Organicall. A Similar action is begun onely by the Temper, and by the ſame is perfected, and is performed by euery ſound and perfect particle of euery part. The Organical is not commenced by the temper onely, neither is it accompliſhed by the particles, but by the whole Organ or inſtrument.

The differences of actions

Finally and in the laſt place, the vſe of the part muſt be conſidered by the Anatomiſt; For the Philoſopher ſayth, that wee are led vnto the knowledge of the Organ, not by his ſtructure but by his vſe. The Vſe which the Græcians call χρεία is two fold according to *Galen*. One followeth the Action; that is, ariſeth from the Action it ſelfe, and is the end of it; as by the Action of Seeing, the Creature hath this vſe, that hee can auoyde that which is hurtfull, and purſue that which is behoofefull. This Vſe, if you reſpect the generation and conſtitution of the part is after the Action; but in dignity and worth it is before it, becauſe it is the end of all actions: nowe the end is more excellent then thoſe things that appertaine or leade vnto that end. The other Vſe goeth before the Action, and is defined to bee *a certaine aptitude or fitnes to doe or worke*. So in the Eye the Chriſtalline humor doth primarily make the ſight; the other humors, the coates, the optick nerues afford a vſe, and are ordained to perfect the action of Seeing. This Vſe is in dignity behinde the Action, but in generation before it: by which it is manifeſt that the Action differeth, and is another thing from the Vſe, although many men vſe to confound them: for the Action is an actiue motion of the Part, but the Vſe an aptitude for Action. The Action is onely in operation, the Vſe remayneth alſo in the reſt or peace of the Member: the Action in euery Organ is onely the worke of the principall Similar part in that Organ, the Vſe is likewiſe of all the reſt: to conclude, there are many parts which haue vſe without any action, as the haires and the nailes.

The Vſe of a part. *Ariſt.*

The vſe is double. *Galen.*

How the vſe differeth frõ the action.

The differences of Parts: and first Hippocrates his diuision of Parts.

CHAP. XVIII.

THE diuision of the diuine Senior, in his sixt Booke *Epide.* is of all other the most ancient, into ἰσχοντα, ἰσχόμενα καὶ ὁρμῶντα, that is, *Containers, contained, & those that are impetuous*: To vse the Martialists word, doe make impression. *Alexander* more plainely diuideth the body into στερεα, ὑγρὰ, καὶ πνευματώδη. that is, into *solid, humid,* and *spirituous* partes. Wee diuide them into parts Nourishing, to be nourished, and impulsiue parts. The containing parts are solid, & such as are to be nourished. The name of solide I do not take as the common people do, for that which is hard and tight, or dense; nor for that which is contrary to rare & hollow, but with the best Philosophers, by solid I vnderstand that which is τὸ ὅλον *tale*, that is, which is wholly full of it selfe, not of any other thing, or which hath a Nature, euery way like vnto it selfe. For *solum* and *solidum* in Latine, do come of the Greeke worde ὅλον, by changing the aspiration into a hissing, and so s. is set before ὅλον: and thus the fleshy parts also may be called solid & containing parts. So the Heart, a fleshy entraile containeth in his right ventricle venal, in his left arterial blood. So the marowy substance of the brain, which hath in it many dens and cauities, containeth both humours and spirits. We call also all solid parts to be nourished, because whatsoeuer is solid, the same is similar, and the action of a similar part is Nutrition.

What are cõtaining parts.

Contayned parts are the humors concluded or shut vp in their proper vessels and conceptacles, as it were in Store-houses. *Galen* calleth τὰ ὑγρὰ, that is, humours, τὰ ἐν τοῖς ἀγγείοις ἐμφερόμενα καὶ καθ' ὅλα τοῦ σώματα διεσπαρμένα, that is, such as are contained in the vessels, and dispersed through the whol body. Some had rather cal them ἐνισχόμενα, *Things deteyned*, the better to signifie those things which are conteined within vs, as also which do preserue the substance of the part: and therefore we haue called them Nourishers, to restraine the word *Humors* to the Alimentarie, and not to include the Excrementitious. ὁρμῶντα or ἐνορμῶντά, that is, impulsiue or impetuous thinges, *Fernelius* referreth to the faculties of the soule, not to the spirits; but in my opinion he is in this out of the way. For though the spirits be conteyned, and haue proper conceptacles, to wit, the veynes, arteries and nerues, yet they are truly called impulsiue substances; and *Hippocrates* spake of the body & bodily things, & therefore not of the Faculties, which are but abstracted Notions. Now by the word Spirit, I do not vnderstand a wind, for these are ψευδοπνεύματα, *Bastard*, or as *Auicen* termeth them *Fraudulent* spirits, whose violence is sometimes so great & furious, that they are the cause of many tumults in the household gouernement, or naturall constitution of the body, which is oftentimes miserably distressed with their furious gusts: read what *Hippo.* in his Book *de Flatibus* hath written of the power of winds. But by spirits we vnderstand the primary and immediate instrument of the soule, which the Stoicks calleth *the Band which tyeth the soule and the body.* The force of these spirits is such, & so great the subtilty and thinnesse of their Nature, that they can passe suddenly through all parts, & do insinuate themselues through the fastest and thickest substances, as wee may perceyue in the passions of the minde, in sleepe and in long watchinges. By the ministerie of these spirits, all the motions of liuing creatures are accomplished, both naturall, vitall, and animall, and by these, life, nourishment, motion and sence, do flow into all the parts. Finally, the motion of the spirits is perpetuall, both of themselues, and by another. By themselues, that is, they are mooued continually from an inbred principle both wayes, vpward and downward; vpward because they are light, downward toward their norishment. They are mooued by another when they are driuen, and when they are drawne. The vitall spirits are driuen, when the heart is contracted, the animall when the braine is compressed. The spirits therefore are ἐνορμῶντα impetuous substances. They are fiery and ayery, and therefore very fine, subtle, and swift: so the seede although it be thicke and viscid, yet in a moment it passeth through the vessels of generation, which haue no conspicuous cauities, and that because it is spirituous, or full of spirits.

What are contained parts.

Impetuous or impulsiue things as the Spirits.

Hippocrates

Auicen.

Hippocrates

The continuall motion of the spirits.

Their motion double.

Per se & aliud

There are also other differences of parts, according to *Hippocrates* in his Booke *De veteri medicina*, which are drawne from their substance, figure, and scituation. From the substance some are dense, others rare and succulent or iuicy, others spongie & soft. From the figure, some are hollow, and from a largenesse gathered into a narrownesse or constraint,

Differences of parts according to *Hip.*

ſtraint, others are ſtretched wide, others ſolid and round, others broad & hanging, others extended, others long. From the ſcituation ſome are Anterior, ſome Poſteriour, ſome deepe, others middle, vpper-moſt, lower-moſt, on the right hand, and on the left.

A diuiſion of Parts into Principall, and not principall.

CHAP. XIX.

THE diuiſion of parts into principall, and leſſe principall, is verie famous, and hath helde the Stage now a long time. We define, that to be a Principall part, which is abſolutely neceſſary for the preſeruation of the *Indiuiduum* or particular creature. Or, which affoordeth to the whole bodie, a faculty, or at leaſt a common matter. In both ſenſes, there are only three principall parts, the Braine, the Heart, and the Liuer; the Braine ſitteth aloft in the higheſt place, as in the Tribunall or Iudgement ſeate, diſtributing to euery one of the Inſtruments of the ſences, their offices of dignity. The Heart (like a King) is placed in the midſt of the Cheſt, and with his vitall heate, doth cheriſh, maintaine, and conſerue the life and ſafety of all the parts. The Liuer, the fountaine of beneficall humor, like a bountifull and liberall Prince at his proper charges, nouriſheth the whole family of the bodie. From the Braine, the Animall Faculty by the Nerues as it were, along certaine Chords, glideth into the whole frame of Nature. From the Heart, the Vitall ſpirits are conueyed through the Arteries, as through Pipes and Watercourſes into euery part. From the Liuer, if not a Faculty, yet a Spirit; if not a Spirit, yet at leaſt a common matter, to wit; the blood is diffuſed by the veynes into euery corner. So that onely three are abſolutely neceſſary for the conſeruation of the whole *Indiuiduum*, the Braine, the Heart, and the Liuer, all which are fitted and tyed together in ſo ſtraite a conſpiracy, that each needeth the helpe of the other; and if one of them faile, the reſt periſh together with it. Not that I thinke theſe parts are of equall dignity; for the Heart is more noble then the Liuer, & the Braine more excellent then the Heart, aſwell becauſe his actions are more diuine, beeing the ſeate and Pallace of Reaſon, which is the Soule; as alſo, becauſe all other parts are but handmaides vnto it: and beſides, *Hippocrates* ſaith, it giueth the forme to the whole body, *For* (ſaith he) *the figure of the reſt of the Bones, dependeth vpon the magnitude of the Braine, and the Scull.*

What is a principal part

Three principall parts.

The Braine more excellent then the Heart.

Hippocrates

Galen addeth to the Principall parts the Teſticles, becauſe they are the chiefe Organs of procreation, by which alone, the ſpecies or kinde is preſerued. But we thinke that they confer nothing to the conſeruation of the *Indiuiduum* or particular creature, becauſe they neuer affoord any matter to the whole body, neyther faculty or ſpirit, but onely a qualitie, with a ſubtile and thin breath, from whence the fleſh hath a ſeedy rammiſhneſſe, a harſh taſte, and ſtrong ſauour, and the actions of ſtrength and validity. All the reſt of the parts may be called ignoble compared to theſe, aſwell becauſe from them proceedeth no faculty, ſpirit, or common matter, as alſo becauſe euery one of them, do miniſter to ſome one or other of the principall parts. So the Organes of the ſenſes ſerue the Braine, and were created for his vſe & behoofe: ſo the Lungs, the Midriffe, & the Arteries aſwel ſmooth as rough, were ordained only for the tempering and repurgation of the hart. ſo the Stomack, the Guts, the Spleen, both the bladders of Vrine and of Gall, were made for the Liuer: and in a word, none of theſe ignoble parts are of neceſsity for the conſeruation of the creature, or if they be neceſſary, it is not ἁπλῶς, that is, *ſimply* and *abſolutely*, but *ſecundum quid*, that is, as they are neceſſary to ſerue the turne of the Principall. For I pray you what vſe hath the arme, the legge, or the ſtomacke of the Lungs, the Spleene, and the Kidneys? Again, what neceſſary vſe haue the Lungs, the Spleene, and the Kidneyes of the Legs or Armes? But to all theſe the heart giueth life, the Liuer nouriſhment, and the Braine ſenſe and motion, ſo that the Braine, the heart, and the Liuer, are in all the parts of the bodye, by the mediation of their veſſels.

Galen.

How the Teſticles may bee called principall parts.

What parts are called ignoble & why.

Now, as there is not an equality of dignity among the principall parts, ſo the ignoble parts are not all of one and the ſame degree. For ſome of them ſerue the principall, by preparing ſomwhat for them, others by carrying or leading ſomewhat vnto them. There are alſo ſome ſorts ordained onely for the expurgation or cleanſing of the principall, which are the moſt ignoble of all the reſt, and are commonly called Emunctories or Drayners. So for the Liuer the Stomacke boyleth the Meate, the Veynes of the Meſentary giue the blood a kinde of rudiment or initiation; the Caue or hollow veyne diſperſeth the bloode al-

The differencles of the ignoble parts.

Emunctories.

already perfected. For the heart, the Lunges prepare the ayre, the pipes of the great arterie carry about the vitall ſpirits. For the Brain, the wonderful texture or plighted web of veſſels prepareth the animall ſpirit, and the nerues diſtribute it into the whole body. Behinde the eares are the Emunctories or draynes of the Braine; vnder the arme holes ſo many glandules or kernels which receiue the ſuperfluities of the Heart, and in the leske or groyne are the Emunctories of the Liuer.

An Elegant diuiſion of Parts into Similar and Diſsimilar, and an exquiſite interpretation of the ſame.
CHAP. XX.

THE moſt frequent diuiſion of the parts among Philoſophers and Phyſitions both, is into Similar and Diſsimilar, which is alſo the moſt neceſſary for the exquiſite diſquiſition and diſtinction of diſeaſes. The Similar parts, *Plato* first called πρωτόγονα that is, *first borne*, becauſe according to the order of generation, they are after a ſort before the compound parts; and becauſe they are the firſt *Stamina*, threds, or warp of the body. *Ariſtotle* calleth them ἁπλᾶ καὶ ἀσύνθετα μέρη that is, *ſimple and vncompounded parts*, becauſe they are not compounded of other parts, or elſe πρός τι, that is, *in reſpect of the compounded*: for they are not indeede and truely ſimple, for the body of the Creature being not ſimple; neither can the parts of it be truely ſimple.

Al the names of the ſimilar parts. *Plato.* *Ariſtotle.*

Anaxagoras. *Ariſtotle.*

Ariſtotle.

Galen.

What is a ſolid part.

Hippocrates

First *Anaxagoras*, and after him *Ariſtotle*, brought in the name τῆς ὁμοιομερείας *of ſimilitude*, whence they are called Similar, becauſe they haue one and a like ſubſtance. Some call them προσεχῆ μέρη, that is, *continuall Partes*, becauſe they are continually the ſame both in matter and forme. Others call them *Informes*, *without forme*, but wee thinke it better to call them *vniforme parts*. *Ariſtotle* called them *ſenſorias*, becauſe that which is Similar is capable of ſenſible obiects, and all ſence originally proceedeth from the ſimilar parts. *Galen* calleth them ſometimes *ſenſible Elements*, becauſe they appeare to the ſences moſt ſimple and vncompounded; ſometimes ἐλάχιστα στοιχεῖα, that is, the *leaſt particles*. Sometimes the *firſt*, ſometimes the *laſt bodies*; *Firſt*, in reſpect of their compoſition; *laſt*, becauſe into theſe, the body is diſſolued as into the leaſt parts that may bee perceiued by the perceiuing ſences. Some call them *Solid*, not becauſe they are conſtant, euer conſiſting and neuer diffluent (for then the fleſh ſhould be no Similar part) but becauſe they are euery way full and compleate. The common people call that Solid, which is hard, denſe, or compacted; for water or a ſpunge, they will neuer acknowledge to bee ſolid: but the Philoſoper calleth that ſolid, which is wholly full of it ſelfe, and of no other thing, which is of a like or of the ſame nature; ſo the fire in his owne globe, and the Heauen (although they bee moſt rare and ſubtile bodies) yet true Philoſophers will call them ſolid bodies. *Hippocrates* calleth them ὀγκώδια, that is, *contayning Parts*: but enough of the name, now let vs come to the eſſence of the ſimilar parts.

A ſimilar part hath a double conſideration. A definition of a ſimilar part. *Ariſtotle.* *Galen.*

A Similar part may haue a double conſideration, one in reſpect of the matter, an other in reſpect of the forme: if you regard the matter, which is altogether one and the ſame, in all partes likevnto it ſelfe; then ſhall ſimilar partes bee defined according to *Ariſtotle*, ὅσα διαιρεῖται εἰς ὁμοιομερῆ *which are deuided into parts like vnto themſelues*, according to *Galen*, *All whoſe particles are like to themſelues and to the whole*: Or *which are deuided into parts not differing ſpecie, or in kinde*. If you reſpect the forme of the ſimilar parts, then they ſhall be defined, *Such as haue a vniforme figure*. For, becauſe the forme giueth the proper denomination to euery thing, that ſhall be called *ſimilar*, which hath a ſimilitude or likeneſſe of forme and figure. In the firſt conſideration or reſpect, euery particle of the ſimilar part retayneth the name of the whole, but not in the latter: ſo the bone of the Leg becauſe of the ſimilitude of the matter is vniforme, but if you reſpect his figure, then are not all his parts of the ſame nature, for euery little particle of that bone is not hollow, though the whole bone be hollow. Hence we may gather that euery ſimilar part may bee ſayd to be organicall, and that they do not well who oppoſe ſimilar and organicall parts for *deuiding members*, as we ſay in Schooles: for among Philoſophers, the nature of the part and of the whole is the ſame. The whole body is organicall, becauſe *the ſoule is an act of an organicall body*.

Euery ſimilar part may be ſaid to be organical. *Membra diuidentia.*

The eſſence

The eſſence of the ſimilar parts ſeemeth to conſiſt of an vncertaine medley of the Elements,

ments, and a temper of the foure first qualities, heate, cold, moysture, and drought. And therefore the Physitians say, the Temper is the forme of the similar parts, because it is πρῶτον δεκτικὸν, *The first receiuer* and the first power with which, and by which, the forme worketh; and the similar part, as it is similar, suffereth whatsoeuer the forme worketh. So Nutrition, which is the common action of the similar parts, is inchoated or begun by the temper alone, by it perfected, and plenarily and perfectly accomplished by euery particle of the part.

The differences of the similar parts, are some of them belonging to the Philosopher, some to the Physitian. The Philosopher raiseth his differences from the first qualities, and those which follow the temper. The Physitian from the sensible and materiall principles of generation. The first qualities are indeed foure, but because heat and cold are certain acts, and an acte is according to it selfe indiuisible, therefore the Philosopher raiseth his differences only from the diuersity of drowth and moisture. Wherefore *Aristotle* maketh similar parts, some dry, some moist. The moyst are either properly so called, that is, such as of their owne nature cannot containe themselues within their owne *termini* or limits, and therefore do stand in neede of conceptacles or receptacles, as the bloud; or else are softe, which do better contain themselues within their bounds, as flesh. The dry are those whose Superficies or Surface is pressed, and yeeldeth either not at all, or very hardly: and such he calleth στερεὰ, or στερεὰ μέρη, that is, *solid* parts; of which he maketh two kinds. Some are fragile or brittle, which cannot be bent without the dissolution of the part, as Bones; others, are tough or stretching, which may bee bent and extended without dissolution, as Ligaments and Membranes.

The differences of similar parts, from the sensible and materiall Principles of generation.

A Philosophicall diuision of them into moyst & drie. *Aristotle.*

The Physitians do gather the differences of similar parts, from the sensible and materiall Principles of generation. There are two materiall principles, the Crassament or substance of the seede (for onely the spirits or the workemen) and Bloud: and therfore some parts are spermaticall, and some fleshy. The first are immediately generated out of the Crassament of the seede, the latter of bloud: the first in growne and olde men, do hardlie revnite κατὰ πρῶτον σκοπὸν, *according to the first intention*, as we vse to speake, because of the weakenesse of the efficient; (for they are colde) because of the vnapt disposition of the matter, whose affluence is no confluence, that is, it floweth not together-ward and ἀθρόως, *at once*; & because it must passe through many and diuerse alterations; ad heereto the siccity and hardnesse of the parts; for dry things do not easily admit a vnion or consolidation, and the Philosopher in all mixtion requireth a watery moisture, that by it as by Glue all partes may be vnited. On the contrary, fleshie parts, because they are hotter, softer, and nourished with bloud little or nothing at all altered, do presently revnite and close together, sometimes without any meane immediately; sometimes *per medium homogeneum*, that is, by a thing of the same kinde.

The Physitians diuision of them into spermaticall and fleshy.

There are diuers differences of spermaticall and fleshy parts. For the seede, though it seeme to be similar, vniforme, and euery where like it selfe, yet hath it parts of a different Nature, some thicker, some thinner, some fat, some slimie, some fit for stretching, others for concretion, or to be gathered together. Whilst therefore the procreating vertue worketh vpon that part of the seede which can extend it selfe, it maketh Membranes, Veines, Arteries and Nerues; when vpon that which is fitter for concretion, it formeth bones and gristles; when the fat is more then the glutinous matter, then are bones & gristles formed.

The differences of spermaticall parts.

Againe, *Galen* obserueth in the spermaticall parts, a double substance, that which is truly solid, and that which is fleshy; the first may be moistned, but not restored; the other is as it were a concreted or congealed liquor, cleauing to the solid Fibres. There are three kinds of fleshy parts, three sorts of flesh. One *Flesh* properly so called, to wit, that of the Muscles, which therefore *Hippocrates* calleth absolutely σάρκας, that is, *Flesh*. There is another flesh of the Bowels or inward parts, which we call enteralles and παρέγχυμα, as it were an affusion or confluence of blood. There is also another flesh of the particular parts.

Galen. In spermaticall parts ther is a double substance. Three sorts of flesh. *Hippocrates*

We will adde a third diuision of similar parts, into Common and Proper. I call those Common, which make and constitute many parts compounded of an vnlike and different Nature, as the Bones, Gristles, Ligaments, Membranes, Flesh, Nerues, Veines and Arteries. Of which, the first fiue are truly similar, the others only according to sence; for the inner substance of a nerue is medullous, the outward membranous. I call those Proper, which do make the substance onely of one part, and such as is not found elsewhere; such are the marrowy substance of the Braine, the cristalline and glassy humors of the eye. Of all

A third diuision of the similar parts.

The necessity & vse of similar parts.

Auerrhoes.

al similar parts there is a double necessity: one, that of them dissimilar parts may be compounded; the other I find in *Auerrhoes*, that they may be the seat of the Sensatiue vertues, for all sence commeth by the similar parts.

What is a dissimilar part.

To the similar part, we oppose the dissimilar; for as the similar part is, or may bee diuided into particles of a like, so dissimilar into particles of an vnlike or different kinde: as the particles of the similar part retaine the name of the whole, so the particles of dissimilar parts haue no names at all. Wherefore we define dissimilar parts to be; such as are deuided into parts of a different nature and diuerse kinde. These the Physitians κατ' ἐξοχὴν by way of *exellence* doe call Organicall, because their action is more perfect and euident, as also because the neatnes of the figure, the magnitude, number and scituation (which foure accomplish the Nature of an organ) do more plainly appeare in compounded parts then in simple; so that both in respect of the forme and of the actions, they are more properly called the Organs of the Soule; for the forme of the similar parts is the Temper, of dissimilar a laudable conformation: now conformation doth better answere the functions of the soule, then doth the Temper, because the soule is defined to be *an act of an organicall body*. The action of the similar is Naturall, to wit, Nutrition, as beeing manifest euen in plants; the action of the dissimilar part is Animall, and therefore that is sayde to bee the action of Nature, this of the Soule. Furthermore, I define an organ (with the ancients) to be a part of the Creature which can performe a perfect action; by perfect I vnderstand proper: for the action of the similar parts is common, not proper. *Galen* maketh foure orders of organs or instruments; the first is such as are most simple, which consist onely of similars, as the muscles. The second are those that are composed of the first, as fingers. The third are such as are made of the second, as the hand. The fourth are such as are made of the third, as the arme. Againe, in euery perfect organ we may obserue foure kindes of parts; The first is of those by which the action is originally performed; where these are, there is also the faculty; and therefore they are said to bee the principall parts of the organ; such is the Christalline humor in the eye, for it onely is altered by colours, and receiueth the images of visible things. The second kind is of those without which the action is not performed, and these doe not respect the action primarily and *of themselues*, but the necessity of the action; such are in the eye, the opticke nerue, the glasie humour, and the albuginious, which is like the white of an egge. The third kinde is of those by which the action is better performed; and these respect the perfection of the action, and therefore are called *Helpers*, such are in the eye, the coates and the muskles, which moue and turne the eyes with a wonderfull volubility. The last kinde is of those parts which doe conserue or preserue the action; these are the causes that all the rest do worke safely; & they respect the action, not as it is an action simply, but as it is to continue and indure; such in the eyes, are the browes, lids and orbe of the eye; and this is the nature of dissimilar and organicall parts. But that we might not passe ouer any thing, wee will adde this one for a complement; that of dissimilar parts, some are such by the first institution of nature, as the hands and the feet, from which if you take all the similar parts, you shall reduce them into nothing; others are dissimilar secondarily, because of the implications and textures of veines, arteries, and sinewes in them, as the Heart, the Braine, and the Liuer; for if you take from the Braine the common similar parts, yet there will remaine the proper substance of the Braine.

The dissimilar parts are rather the instruments of the soule then the similar.

What an Organ is.

Foure orders of Organs.

In a perfect Organ there are 4. kinds of parts.

Perse.

Another diuision of dissimilar parts.

The other differencies of the parts are vnfoulded.
CHAP. XXI.

Galen maketh 4. differences of parts.

THere are also other differences of parts not so necessary for a Chirurgion to know, which notwithstanding because we would leaue nothing behinde vs, we will briefly declare. *Galen* in his Booke *de arte parua*, maketh foure differences of parts: some parts are principall, as the Brayne, the Heart, the Liuer, and the Testicles. Some doe arise from these principal and minister vnto them, as nerues, veines, arteries, and seede vessels; some neither gouerne others, nor are gouerned of others, but haue only in-bred faculties, as bones, gristles, ligaments, membranes. Finally, some parts haue vertues both *in-bred*, and *influent*, as the organs of sence and motion. The *Arabians* gather the diuisions of parts, from the substance, the Temper, those things which follow the temper, and those things which are accidentarie or happen to the part: whence some parts are fleshy, some spermaticall; some hot, others cold;

How the *Arabians* distinguish the parts.

some

ſome moyſt, others dry; ſome ſoft, others hard; ſome mooueable, others immooueable; finally, ſome ſenſible, others inſenſible. Thoſe which haue ſence, haue it either ſharpe and quicke, or ſtupid and dull. A part is ſaide to haue exquiſite ſence three wayes, either becauſe of the perfection of the ſenſe, ſo the skin which couereth the palme of the hand, and eſpecially the fingers endes, hath an exact perception of the tractable or touchable qualities; or becauſe it is more eaſily and ſooner violated and offended by the internal and externall qualities which ſtrike the ſence; ſo the eye is ſaide to be of very acute and quicke ſence: or becauſe it hath a determinate or particular ſence, which no where elſe is to bee found; ſo the mouth of the ſtomacke is of moſt exquiſite ſence, that it might apprehend and feele the exhauſtion or emptines, and the ſuction or appetite of the other parts: ſo alſo the parts of generation in both ſexes, haue in them a ſtrange and ſtrong deſire and longing after their proper ſatisfaction.

The Anatomiſts commonly do diuide the whole body into the Head, the Cheſt, the lower belly, and the ioynts. The Egyptians into the head, the necke, the cheſt, the hands, & the feet. *Diocles* into the head, the cheſt, the belly, and the bladder. *Fernelius* in the ſecond Book of his Method, diuideth the body into publicke and priuate Regions: and truely as I thinke very commodiouſly, for a practiſing Phyſitian or Chirurgion. The publick Region is threefold: One, and properly the firſt, reacheth from the Gullet into the middle part of the Liuer; in which, are the ſtomacke, the Meſeraicke veynes, the hollow part of the Liuer, the Spleene, and the *Pancreas* or ſweete bread between them. The ſecond runneth from the midſt of the Liuer, into the ſmall and hairy veines of the particular partes, comprehending the gibbous or bounding part of the Liuer, all the hollow veine, the great arterie that accompanieth it, and whatſoeuer portion of them is betweene the armeholes & the Groine. The third Region comprehendeth the Muſcles, Membranes, Bones, and in a word, all the *Moles* or mountenance of the body. There are alſo many priuate Regions, which haue their proper ſuperfluities, and peculiar paſſages for their expurgation.

The Egyptians diuiſion of the bodie.

Diocles.

Fernelius his excellent diuiſion of the bodie.

And thus me thinkes, I haue run through the nature of Man, the Excellency, Profite, Neceſsitie, and Method of Anatomy, who haue written therof as well in olde times, as of later yeares, and among our ſelues; the definitions & diuiſions of Anatomy, the Subiect or proper Obiect of the ſame, the nature of a Part, with the differences and diſtributions of the ſame: it remaineth now, that we vntie ſuch knots as might in this entrance intangle vs, and ſo hinder our progreſſe to that wiſhed end which we ſet before vs.

A Dilucidation or Expoſition of the Controuerſies concerning the Subiect of ANATOMY.

The Præface.

AS in the knowledge of Diuine Myſteries, Implicit Fayth is the highway to perdition, ſo in humane learning, nothing giues a greater checke to the progreſſe of an Art, then to beleeue it is already perfected and conſummated by thoſe which went before vs; and therfore to reſt our ſelues in their determinations. For if the ancient Philoſophers and Artiſts had contented thẽſelues to walke onely in the Tracke of their predeceſſours, and had limited their Noble wits within other mens bounds, the Father had neuer brought foorth the Daughter, neuer had Time broght Truth to light, which vpon the fall of *Adam* was chained in the deepe Abyſſe. There is, as of the World and gouernement thereof, ſo of arts a frame, the matter whereof comes downe from heauen, but is gathered heere by diſcourſe of reaſon and experience. The beauty and glory of whoſe Columns wer not perfected in one age, but the ground worke was firſt laid in the times which were neereſt to the Originall of Nature; afterward addition was continually made by the vigour of the ſoule of Man, and ſhall be vnto the end of the world. It were not hard to giue inſtances heereof in all arts, nor happely would it be very tedious; but it ſhal bee ſufficient (to auoyd prolixity) to inſiſt a little vpon generals, and ſo deſcend vnto our owne art we haue in hand. The firſt man (ſaith the Diuine ſtory) ſaw all the Creatures, and gaue them names according to their Natures, but that Sun-ſhine was ſoone clouded, that Image defaced, that ſtampe battered by his fall. Afterwards, as a Marchant that had loſt all his inheritance in one bottome, he was to begin the world anew, and to gather an eſtate or ſtocke of knowledge, by the trauell and induſtry of his ſoule and body; yet was not his ſoule *Abraſa Tabula*, a playned Table, there remained ſome Lineaments which the Scripture calleth *The Lawe of Nature*; not ſuch as could exhibite any ſufficient originall knowledge, but ſuch as whereby, hauing gotten knowledge from without himſelfe, might make him again acknowledge the darke and defaced foot-ſteppes that remained in himſelfe, and to poliſh and refreſh them ſomewhat, though it was impoſsible to reduce them to the former perfection. Thus the ſoule by diſcourſe of reaſon, that is, by her owne acte, knewe her naturall immortality, and by induction of particulars, came to informe her ſelfe of the Natures of other things: not as ſhe knew before, from the vniuerſall to particulars, but by gathering particulars together to frame generall and vniuerſall notions.

Rom. 2.

And ſurely in the firſt age, by reaſon of their long life, and conſequently of their infinite obſeruations, haply alſo becauſe they were neerer to integrity of nature, the Defection not being ſo ſuddenly confirmed, men laide the grounds of arts, which were deliuered by tradition from the firſt Fathers ſimply and faithfully; but afterward by enuy or corruption were wrapped vp in Myſticall Hierogliphickes, or poyſoned with ſuperſtition, or forfeited by negligence, many of them alſo were worne out by length of time, for want of Letters and meanes to preſerue them. Thoſe which remained, ran in Families, and from Families were

were deuolued vnto Nations as the world encreaſed; Firſt as is ſuppoſed to the *Chaldeans*, then to the *Phœnitians*, after to the *Egyptians*; all which as the Nature of man is prone to worke vpon that, it can leaſt attaine vnto; or elſe, becauſe the Diuinity of the ſoule findeth no contentment, in that ſhe conceiueth to be leſſe then her ſelfe, did therefore neglect all ſublunarie things, & applyed it ſelfe to ſpeculations of heauen and heauenly bodies, wherein they were farthered by that olde and cunning Serpent, who put to his helping hande to ſeduce them from the acknowledgement of their owne imperfection, by goading them forward in an addle and veine diſquiſition of friuolous and impious ſecrets. So the tradition of God, as being of too high a pitch for their imped wings, was peruerted vnto an vnknowne *Numen*; the Tradition of the Angels into feigned ſpirits, gouerning the motions of the Heauens. That of the true vſe of the Starres into iudiciall and Genethliacal Aſtrologie. That of the fall of *Adam* and *Eue* into the Fable of *Iſis* and *Oſyris*. The Deluge into *Deucalions* flood. The Diuinity of the minde and ſoule, into the tale of *Mitris* and *Arimanis*, and a world of ſuch ſuperſtitious toyes. And verily almoſt all ſuch was the learning of the former ages, till the Græcians fell vpon the grounds of Demonſtrations: and then men firſt began to fall from thoſe abſtruſe and tranſcendent contemplations, and to bring home Philoſophy vnto themſelues. Their Metaphyſickes were Logicall, their Phyſicks Elementary; the Diuinity of the ſoule was tyed to the Principles of generation, and ſuppoſed to reſult out of the power of the matter of the body: and in a word, Philoſophy fell from heauen into the Elements, wherein they ſo accumbred themſelues, and thoſe that followed them, that to this day we are ſcarſe vninthralled from them. Yet there wanted not ſome, who laboured in all kindes, to bring Learning to better thrift. *Homer*, *Hippocrates*, *Plato*, all of them in their kindes, the very Oracles of Philoſophy, ſo as we may truelie ſay, that whatſoeuer we haue ſolide and ſubſtantiall, it is but deriued from theyr Fountaines.

Neyther were theſe men onely happy in their owne ſublime and diuine wits and apprehenſions, but alſo in their Interpreters, *Virgil* to *Homer*, *Ariſtotle* to *Plato*, and *Galen* to *Hippocrates*. The former two we let paſſe, as belonging to another Forum. *Hippocrates* as the firſt head of our Tribe, the Father and founder of the Family of Phyſitians, leſte a goodly inheritance to his poſterity, which *Galen* (to paſſe by the reſt) hath not miſpent, but much improoued, and wee who are *Artis Filij* may worthily be accounted decoctors and prodigals, if we keepe not our Patrimony together; nay, in this kinde of Thrift, not to go forward, it is to go backeward. Yet I muſt confeſſe, that after *Galens* time, and his Epitomizer *Oribaſius*, who liued but in the next age, Anatomy (for that is the ende wee driue at,) lay raked vp *Patrio in puluere*, till within ſome of our Memories; *Veſalius* albeit ſomewhat importunately, yet verie Learnedly, blew vp the almoſt deade ſparkes into a moſt Luculent Flame, at whoſe Beacon, all ſince his time haue teened theyr Torches, though happelie beeing put together, they may ſeeme to dimme his light by their multitude.

There is, and will alwayes be left *Locus Philoſophandi*; ſcope enough, euen in this Little World for ſuch as liſt to exerciſe themſelues; and many haue with no ſmall commendations made proofe of their agility, yet we muſt needes acknowledge, that the Groundworke of the building, and not onely ſo, but the whole frame was by the ancients reared vp; and therefore now if any Ornaments be added, they muſt be fitted thereunto. Wherefore, we haue laboured to bring all the ſubtilties and nouell inuentions of the later Writers, to the Touch-ſtone of the ancients Monuments; that as no man ſhould be defrauded of his due Commendation; ſo the Crowne may remaine, where with ſo much duſt and ſweate it was gloriouſly merited; whereby we do not deſire to be accounted amongſt the number of the Antagoniſts, but as a Herald of *Honor*, do indeauor to marſhall the fielde, and ſometimes where the caſe is cleere, to ioyne in vmpeirment with the Spectators; or where it is difficult to aſsiſt them.

Of the definition of a Part. QVEST. I.

Hippocrates the oracle of Phyſicke. *Galen* his interpreter. Words ſynonymal.

HIppocrates, whoſe happy workes are the very Oracles of our Arts, and *Galen* his interpreter, doe promiſcuouſly vſe the names of a Part, a Member, and a Place, for the ſame thing. The *Eye* (ſayth *Galen* in the firſt Book of his Method) *we call a Member; neyther is there any oddes which you call it, a Member, or a Part: if any man ſhall ſay the Eye is a Part and not a Member, or a Member, and not a Part; I will not in either contend with him.* In his firſt Book *de locis affectis*; *Not onely the latter Phyſitians* (ſayth he) *but many alſo of the antients doe vſe to call the particles of the body, Places.* *Hippocrates* in his Book *de locis in homine*, and *de victus ratione in morbis acutis*, calleth alſo Parts, *Places*: yet there are ſome who diſtinguiſh a Member from a Part, and a Particle from a Place. *Ariſtotle* calleth thoſe only *Members* which are compounded of parts of diuers natures, as the Head, the Feete, and the Hands; and thoſe that are ſimilar he calleth properly *Parts*. *Theodorus* in *Ariſtotle*, thinketh that the name of a *Part* or *Place*, is of larger extent then the name of a *Member*. So alſo *Galen* in the ſixt of his Method, ſayth that the Eye may be called a Part or a Member; and the horny tunicle a Part, but not a Member: but becauſe in theſe Philoſophicall diſquiſitions, it becommeth vs better, to ſtand vpon ſubſtances, then vpon wordes; wee take no care whether you vſe the name of a Part, a Member, a Particle, or a Place; it concernes vs more to find out an eſſentiall definition of a Part.

Hippocrates. *Ariſtotle.* *Theodorus.* *Galen.*

Auicens definition of a part imperfect. *Fen prima primi. Doct. 5. ca. 1*

Auicen defineth a *Part to be a body ingendered of the firſt permixtion of the humours, as the humors doe conſiſt of the firſt mixtion of the meate, and the meate of the Elements.* But this definition of the Arabian, is too preſſe, ſtraight & narrow, becauſe it agreeth only to homogenie parts, & not to heterogenie: for euery man may eaſily perceiue that heterogenie or diſſimilar parts are compounded immediately of ſimilar, not of the firſt mixture of the humors. And this *Galen* teacheth in plaine and expreſſe words, in his firſt Book *de Elementis*, where hee ſayth; *that compounded partes are immediately made of the ſimple or ſimilar, the ſimple of humors, humors of Aliments, Aliments of the Elements.*

Galen.

An excuſe of *Auicen* but which wil not hold water.

They which would ſalue the Arabians credite, ſay that his definition is materiall, not formall; for both ſimilar and diſſimilar do communicate in the matter, though their forme or difference be diuers; but they forget that an eſſentiall definition muſt expreſſe the forme eſpecially, becauſe it is the chiefe part of the eſſence, as that which giueth Being to the thing. *Aponenſis* defineth a part to be *a ſolid and thick body, begotten of humidities or moyſtures, and adorned with the powers of Nature*; which definition laboureth of the ſame diſeaſe with the former, comprehending onely ſimple not compounded parts.

Aponenſis definition of a part.

Galens two definitions.

Galen hath two definitions of parts. The firſt, in the firſt Booke of his *Method* and the fift Chapter, and in the firſt booke *de Elementis*, cap. 6. The ſecond is in his firſt Booke *de vſu partium*. The firſt is this; *A Part is that which accompliſheth or integrateth the whole*: Or *whatſoeuer addeth any thing to the frame of a humane body.* The ſecond is this, *A Part is a body which neither hath a proper circumſcription of his owne, nor yet is on euery hand ioyned with others.*

Both too large.

Both theſe definitions ſeeme to bee too large, comprehending not onely liuing particles (which are onely, truely and properly partes) but thoſe alſo which haue no life, as the haires, the nailes, the fat. *Hippocrates* alſo vſeth this large and ample ſignification of a part, in *Lib. 6. Epidemion*, where οἱ χόμβοι καὶ ὁ ἐμῶν τα, that is, humors & ſpirits he calleth parts. So *Ariſtotle* calleth ſeede, bloud, milke, marrow, phlegme, and fatte, or greaſe, *Parts*.

Fernelius the french *Galen.*

Fernelius the french *Galen*, giueth vs a perfect definition of a Part, in the firſt Chapter of the ſecond Booke of his *Phyſiologia*, and diſputeth and ſcanneth the particular branches of his definition learnedly and at large.

Argenterius his cauil at *Fernelius.*

Argenterius (a common Calumniator ſayeth *Laurentius*) taxeth *Fernelius* definition, aſſuming a diuerſe conſideration of mans body; firſt as it is a ſubſtance, and ſo hee ſayeth the parts of it are the *Matter* and the *Forme*; next as it is a body, and ſo the parts of it are all the Corporeall ſubſtances therein contained. Finally, as a liuing and animated Creature, and in that reſpect (ſayth he) whatſoeuer liueth, may be called a part of the liuing Creature, not a part of the body. Wherefore *Fernelius* did ill define a Part of mans body to bee *a body cohearing or cleaning to the whole, and ioyned to it in common life, framed for his vſe and function.*

But theſe are but nice and friuolous cauils, and indeede extrauagant from a Phyſitians conſideration: for a Phiſitian doth not conſider the body of man as it is a naturall body,

con-

consisting of matter and forme, but as it is obnoxious or liable to sickneſſe or health. And therefore *Fernelius* doeth well determine that thoſe bodies onely are to bee called partes, which may be the Subiects of sicknes and health. Now thoſe parts only are afflicted with diſeaſes, which performe ſome actions in the body, and actions belong to liuing parts, not to thoſe which haue no life. For ſicknes is an indiſpoſition which at the firſt hand and immediately hurteth or hindereth the action. And therfore *Fernelius* his definition is exquiſite and perfect, beſeeming a true Phyſitian.

Fernelius defended.

Of the principalitie of the Parts againſt the Peripateticks, prooving that there is not one onely Principall; to wit, the Heart. QVEST. II.

Concerning the principalitie of the partes, there is a famous difference betweene the Phyſitians and the Philoſophers. The great *Genius* and interpreter of Nature *Ariſtotle*, in the ſeauenth and the tenth Chapters of his ſecond booke *de partibus Animalium*; in the fourth Chapter of his third book *de partibus Animalium*; in his ſecond booke *de generatione Animalium*; in his booke *de vita & morte*; in his bookes *de ſomno*, and *de cauſa motus Animalium*, determineth that there is but one Soueraigne in mans body, and one Principle, which in his boſome and imbracement conteyneth and comprehendeth all the faculties. And this he reſolueth is the Heart, the fountaine (ſayth he) of the veines, arteries, and the ſinewes; the ſource of heate, ſpirits, and quickning Nectar, the firſt and onely ſtorehouſe of bloud, or worke-houſe of ſanguification; and finally, the ſeate and manſion houſe of the vegetatiue, ſenſatiue and reaſonable Soule. In *Ariſtotles* foot ſteps haue walked *Auerrhoes* in the ſecond of his *Collectanies*; *Aphrodiſeus* in his firſt booke *de Anima*, and many other both *Greeks* and *Arabians*: but they bring for confirmation of their opinion no neceſſary arguments, but ſuch onely as are probable, ſhadowed ouer with a veile of truth.

Ariſtotle wold haue but one principal part and that the heart.

It is more honourable (ſay they) and monarchical, that there ſhould be one principle then many; and that the very name of a principle doeth neceſſarily import ſo much. For if the ſoule of the Creature be but one in number, and that indiuiſible, then muſt the bodye likewiſe of it bee, either *one whole*, or at leaſt haue ſome one principall part; for eſſences muſt not be multiplied without neceſsity. And as in the great vniuerſe which we behold, there is one Principle, which *Ariſtotle* in his eighth booke of his *Phyſicks*, calleth *Primum mouens*, and *Primus motor*, that is, *the Firſt mouer*:

The argum nts of the *Peripatetiks*. The firſt.

Οὐκ ἀγαθὸν πολυκοιρανίη, εἷς κοίρανος ἔστω.

Ti's naught to haue moe Kings then one,
Let him that raygnes, raygne King alone.

So in the *Microcoſme* or Little world, there muſt be but one principle, one prince, which is the Heart, whoſe excellencie and dignity aboue the reſt of the partes, theſe things doe cleerely demonſtrate. Firſt, becauſe it firſt liueth, and dyeth the laſt; and therefore is the originall of life, and the ſeat of the ſoule. Next, becauſe it endureth no notable diſeaſe, but yeildeth preſently to Nature if it be afflicted. Againe, becauſe it obtaineth the moſt honourable place, that is, the middle of the body. Fourthly, for that by his perpetuall motion, all thinges are exhilerated and doe flouriſh: and nothing in the whole Creature is fruitfull, vnleſſe the powerfull vigour of the Heart do giue fœcundity vnto it. There (ſay they) is the manſion and Tribunall of the ſoule where heate is to be found, the firſt inſtrument of all the functions; but the Heart is the ſpringing fountaine of Natiue heate, which by the arteries as it were by ſmall riuerets, is deriued into the whole bodie. Moreouer, the ſeate of the faculties is there, where the Organs of the ſame faculties doe appeare; but all the veines, arteries, & ſinewes, doe ariſe out of the Heart. For the arteries no man euer made doubt. The veines doe ſurely ariſe thence, where their end and termination doeth appeare: but that is about the Heart, for the implantation of the great arterie and the hollow veine are alike. Beſide, all the veines are continuated with the heart, to it are they fixed, where they alſo haue membranes ſet like dores vnto them, which ſeeme to bee the beginnings and heads of the veines; but through the Liuer they are onely diſſeminated, and the reſt of the entralles they make a paſſage through, and ſo end into haire ſtrings. *Ariſtotle* alſo is of opinion, that the hart is the originall of the nerues; for his fleſh is hard, thight,

The dignity of the heart.

The ſecond.

The third. The heart the original of the veines.

The heart the original of the ſinewes. *Ariſtotle.*

and ſomewhat membranous; but the ventricles thereof haue in them infinite textures of manifeſt ſinewes.

The 4. argument.

The Heart the firſt ſtore-houſe of bloud.

Finally, the Heart is the firſt αἱματοποιητικὸν, the firſt ζωτικὸν and the firſt κινητικὸν καὶ αἰσθητικὸν that is, *Sanguifier*, *Liuer*, *Mouer*, & *Senſator*. That it is the firſt Sanguifier or the work-houſe wherein the bloud is made, the Philoſopher demonſtrateth; becauſe in it the bloud is contained as in a veſſell or conceptacle and receptacle; whereas in the Liuer it remayneth but as in a pipe or conuayance; and beſide, no where in the whole body is the bloud contained out of his veſſels, ſaue only in the Heart, which therefore is the Treaſurie thereof; and therefore in all ſudden paſsions of the minde, it returneth and flyeth to the heart as to his fountaine, not to the Liuer or to the Braine.

The heart the firſt ſenſator.

The firſt reaſon.

That it is *primum ſenſorium*, the firſt ſenſator (that is,) that the faculties of ſence, motion and appetite, are deriued from the heart, the *Peripateticks* proue by theſe arguments. Becauſe in a *Syncope*, that is, a ſwounding where the vital ſpirits faile, there appeareth a ſodaine and head-ſtrong ruine and decay of all the faculties. Becauſe in all ſodaine motions of noyſome and hurtfull things, as alſo when we would auoide them, the heat of the heart being drawne inward, there appeareth a pale wanneſſe in the face; and on the contrary, when we conceiue ioy for any thing that is profitable, or when wee purſue ſuch things, the heate of the heart being called outward, there appeareth in the countenance a ruddineſſe and alacritie. Becauſe if the arteries called *Carotides* be tyed or obſtructed, then followeth preſently a ſenceleſſe dulnes, and a priuation of the Animality, if I may ſo ſpeake, the patient lying like a ſenceles ſtocke. Becauſe Ioy, Sorrow and Hope, are motions of the Heart, in which conſiſteth all the Appetite wee haue to purſue that which we like, or to flye and auoyde that we diſlike and abhorre. Finally, becauſe in ſleepe the Animall faculties doe reſt and ceaſe from their labours: now ſleep is nothing elſe but a retraction or calling backe of the heate to the heart from the other partes wherein it was in continuall expence; and that is the reaſon why a man after ſleepe is ſo much refreſhed, and riſeth ſtrong againe to the labour either of minde or body, albeit in both he were well wearied, yea tyred out before. As for the Braine (they ſay) it cannot be the authour of ſence, becauſe it is of a cold temper, vnapt for motion and made only to refrigerate and coole the exceeding heat of the Heart, being of it ſelfe without all ſence. Theſe and ſuch like are the arguments of the *Peripateticks*, by which they perſwade themſelues, that there is but one Principle of mans body, which is the Heart.

The ſecond.

The third.

The fourth.

The fifth.

A confutation of the *Peripateticks*.

But theſe conceits of *Ariſtotle* and the Philoſophers, are long ſince hiſſed out of the Schooles of the Phyſitians, and baniſhed from amongſt them; becauſe they aſſume thoſe things for true which are vtterly falſe, and obtrude things probable as if they were neceſſary. And what I pray you is more abſurd, then to preferre the probability of a Logicall argumentation, before the euidence of ſence, reaſon, and experience, ioyned togither? Nowe that the veines doe ariſe from the Liuer, that the nerues or ſinewes which are ſoft and medullous or marrowy within, and without cloathed with membranes, are deriued from the ſubſtance of the Braine, he that hath but one eye may clearely diſcerne. That great Philoſopher obſerued in the heart many Fibrous ſtrings in both his ventricles, wouen out of the extremities of the ſmal membranes, and miſtooke them for threddy nerues; whereas indeede it hath but one ſmal nerue ariſing from the ſixt coniugation of the brain, which looſeth it ſelfe in his ſubſtance. Hee ſaw the hollow veine in the heart very large and ample; but he did not obſerue, that it onely openeth into the heart; (gaping at it with a ſpacious orifice or mouth, to poure into the right ventricle, as it were into a Ciſterne, ſufficient bloud for the generation of vital ſpirits to ſupply the expence of the whole body) but goeth not out of the heart; as doeth manifeſtly appeare, by thoſe three forked membranes, or values and floud-gates, yawning outward, but cloſe inward. But becauſe wee ſhall haue fitter occaſion hereafter to diſpute this queſtion with them, of the originall of the veines and the ſinewes, it ſhall bee ſufficient that we haue ſayd thus much of it at this time.

Demonſtratiue arguments to proue that the heart is neither the originall of the veines, nor of the ſinewes.

That the hart is not the beginning of animal motion

As for the ſeate of the faculties of ſence and motion, is it not againſt all reaſon and experience to place them in the heart? The heart indeede is moued, and that perpetually; but that motion is not Voluntarie but Naturall; it is moued, yet not at our pleaſure, but according to it owne inſtinct. Dayly practiſe and experience teacheth vs, that when the ventricles of the Braine, are either compreſſed, or filled and ſtuffed vp, as in the Apoplexy, Epilepſie, and drowſie *Cares*, then all the faculties are reſpited and ceaſe from their functi-

ons;

ons; but when the heart is offended, the life indeede is endangered, but neither motion nor sence intercepted.

Againe, if the heart were the seate of all the faculties, as the *Peripatetikes* would faine haue it, then vpon any affection of the same, or notable depravation of his temperament, all the functions should be impeached; because all actions come from the Temper. But we see that in a *Hectique* ague or Consumption, wherein there is an vtter alienation of the temper (as being an equall distemper, of all distempers the most dangerous) yet the voluntary and principall faculties, do remaine inviolate. In the violent motions, and throbbing palpitations of the heart which (some say) haue beene seene so extreame that a rib hath beene broken therewith, yet neither the voluntary motions of the parts are deprayed, nor the minde at all alienated or troubled. Who will deny, but that by pestilent and contagious vapors and breaths, comming from the byting of venomous beasts, or the taking of poyson, the vitall faculty is oppugned, and as it were besieged in his own fortresse? But yet those that are so affected, do enioy both sence and reason, euen to the last breath most times.

An elegant argument against the Peripatetickes.

Strange motions of the Heart.

When the Braine is refrigerated, sleep presently stealeth vpon vs: now *Aristotle* himselfe defineth sleepe to be ἠρεμίαν τοῦ πρώτου αἰσθητικοῦ, *The rest of the first sensator*. If any of the principal Faculties, either Motiue or Sensatiue be affected, where do the remedies applyed auaile? Surely at the Head, not at the Heart. The Braine therefore, not the Heart is the first Mouuer, and first Sensator. But the *Peripatetiks* obiect that the Braine hath no sence, and therefore cannot be the author of it. We will giue them a learned answere out of *Galen*, *The Braines sensation is not* παθητικῶς, *but* ἐνεργητικῶς, that is, not passiuely, but operatiuely. It receiueth not the species or Images of sensible things; but like a Iudge it taketh knowledge of their impressions, and accordingly determineth of them. They say, the Braine is vnapt for motion, because it is cold: we answere, it was necessary it should bee cold, that is, lesse hot, for the better performance of the functions. For if the Braine had exceeded in heate, then would his motions haue beene rash and vnruly, and his sensations giddie and fond as in a phrensie. In a *Syncope* the Animall faculties do faile. It is true, but why? Because there is an exolusion, and so a defect of vitall spirits, by which the animall are cherished. The Ligation or interception in like manner of the arteries of the necke, called *Carotides*, induceth a priuation of motion and sense, onely because the vitall Spirits are intercepted, which minister matter to the Animall.

Aristotle.

The sensation of the Braine not passiue but operatiue.

Why the braine is cold that is, lesse hot.

Answeres to the arguments of the Peripatetiks.

But one Principle is better then many. That we confesse is very true; but yet we know there are many reasons why it is not posible it should be so in this Little world. We will instance but in a few. It is granted by all men, that the substance of the arteries is diuerse from that of the veynes; and the substance of the sinnewes differing from them both; and as their substance, so is their structure very different, and their temper not one and the same: how then could it be, that Organs of so distinct kinds, should yssue all from one and the same part? Againe, it was necessary that these organes should in their originall be verylarge and ample to transfuse sufficient spirites, and a common matter suddenly and togetherward into the whole bodye. Now the magnitude or proportion of any one part, (much lesse of the heart) could not be sufficient for this purpose, either to affoord a foundation for so large vessels, or to supply a competent allowance of matter for them all. Adde heereto, that the faculties of the soule, follow the temper of the body, and therefore so diuers faculties might not issue from one part, which hath but one single temperament. How can we imagine reasonably, that three distinct & different faculties, yea oftentimes quite contrary, Reason, Anger and Concupiscence shoulde reside altogether, as if they were sworne friends in one Organ? Or how when the heart is on fire with anger, should reason make resistance, which delighteth in a middle and equall temper? Do not the vital and animall faculties require a different temper? Their Organs therefore must also necessarily be different and distinct. For the heart is by nature fitted to contain and propagate the vital faculty; but for the preseruation of the animall, it is vtterly incompetent. The reason is at hand. The vitall spirit is very hot, impetuous, raging, and in continuall motion, and therefore stood in neede of a strong organ wherein it should be wrought and contained, that the spirit might not because of his tenuity, be exhaled, nor the vessell by which it is conueyed, breake in perpetuall pulsing and palpitation; which both wold easily haue hapned, if the heart and arteries had bin thin, and of a slender texture. The animall faculty required another temper in her organ, otherwise the motions would haue beene furi-

Why in the Little worlde there cannot be one onely principle.

The first demonstration.

The third.

The fourth.

rious, the ſences giddy and raſh; Reaſon would continually haue erred, becauſe the property of heate, is to confound and make a medley of all things, ſhuffling in one thing hudlingly vpon another, through his continuall and indefinent motion. And theſe are the arguments whereby the opinion of the *Peripateticks* is expulſed out of the Schoole of the Phyſitians.

How *Auicen* interpreteth *Ariſtotle*.

Auicen, Fen prima primi, doctrina quinta, cap. primo, interpreteth *Ariſtotles* opinion, playing the ſtickler in this manner. All the faculties (ſayth he) do reſide in the heart as in their firſt Root, but yet they Shine in the other members; that is, the Heart is the originall of diuers faculties, but vſeth the Braine as the inſtrument of ſence, ſo that *Radically* (that is his word) the Animall faculty is in the heart, but by *manifeſtation* in the braine.

The opinion of ſome later writers and their diuers diſtinctions.

Some againe intercede for the *Peripateticks*; and ſay, that the principal faculties motiue and ſenſatiue are in the heart, as in their originall and fountaine. That the rootes of the nerues are in the heart, but becauſe it is too narrow to yeelde out of it ſelfe all their propagations, they think the braine was framed as a ſecond principle, wherin the animall functions might, not obſcurely as in the heart, but euidently manifeſt and exhibite themſelues. And this power or faculty when the braine hath once receiued it from the heart, ſtandeth in no neede of continuall and immediate aſsiſtance therefrom, but onely of a ſupply after

Compariſon.

ſome time: Euen as the Commander of an Army, who hauing receiued his authority and his company from the Prince, ſtandeth in no farther neede of the Princes protection, vnleſſe it be now and then vpon eſpeciall ſeruices. They conclude therefore that the Braine and the Liuer are truely called principall parts; but this principality is but delegatory from the heart, no otherwayes then the Lieutenants of Princes, by them choſen for ſuch and ſuch imployments, doe receiue from them an order and power of diſpenſation and diſpoſition, whereby they are authorized, and ſo taken, as if they were immediate commaunders themſelues. Some others vſe another diſtinction, and ſay that materially the nerues proceede from the Braine and the veines from the Liuer; but the firſt and the formall principle they ſay is in the heart.

Scaligers opinion.

That Prince of humaine learning (at leaſt he that affected that ſoueraignty) *Iulius Cæſar Scaliger*, in the two hundred foureſcore and ninth Exerciſe of his booke *de ſubtilitate*, maketh many principles in the Heart. The firſt or primarie is τὸ ζωτικὸν or the liuing, the ſecõdarie τὸ κινητικὸν or the moüing principle; theſe do neuer ceaſe, neither are they hindred or intercepted in our ſleep or repoſe: yet are they not τὰ πρῶτα αἰσθητικὰ *tametſi* τοῦ πρώτου αἰσθητικοῦ that is, they are not *the firſt Senſators*, though they be of or from *the firſt Senſator*. Thus learned men labor to reconcile the *Peripateticks* & the Phyſitians. But they ſeem not

The late writers did not vnderſtand *Ariſtotle* well.

to hold themſelues cloſe to *Ariſtotles* meaning: for hee doeth not thinke that in any ſence, the Braine can be ſayd to bee the author or original of Senſation, neither that the nerues doe ariſe from it. No where doth he attribute any delegatory power of Senſation vnto it; but thinketh it was onely made to refrigerate or coole the heat of the heart; whereas notwithſtanding all he can produce, it is the firſt principle of ſence and motion, neither receiueth any power for the performance of either of them from the Heart.

The opinion of the *Arabians* confuted.

And whereas the *Arabians* ſay, that the Animall facultie is *Radicall* in the heart, and but by *Manifeſtation* in the braine; we can no way admit of that diſtinction: for if that faculty were in the heart as in the roote, then when the braine is obſtructed, the body ſhould not become ſenſeleſſe and without motion, becauſe there ſhould be a remainder both of ſenſe and motion in the roote, that is in the heart. But though the heart bee obſtructed, or the paſſages intercepted between it and the braine, yet there followeth not any ſodaine priuation of ſence and motion. Inſtances hereof wee haue in Sacrifices, where the Beaſt ſometimes hath beene heard to cry, and ſometimes alſo ſeene to runne a little way after his heart hath beene cut out: and we haue ſeene the ſame tryed in a Dogge, which ran crying a while after his heart was cut out, the veſſels ariſing from it vpward, being before bound.

Sacrifices run from the altar without their heart.

Galens elegãt demonſtratiõ.

Galen in his firſt booke *de Placitis*, illuſtrateth the whole matter, by an elegant demonſtration. If the Heart (ſayth he) did giue vnto the Braine the Animall faculty, then ſhould that power be deriued either by veines, arteries, or ſinewes; for there are no other veſſels which goe betweene them, and are common to them both. By veines or arteries, *Ariſtotle* himſelfe doth not thinke it is conuayed; beſide, theſe veſſels do not directly paſſe vnto the Braine, but after diuers contorſions and aberrations from a right & direct progreſſe. That it is not deriued by or through the nerues is manifeſt; becauſe, if the nerue which is diſſeminated through the ſubſtance of the Heart, be either diuided and cut aſunder or intercepted,

ted, yet the Creature doth not presently fall, but onely groweth mute and dumbe.

It is therefore more consonant to right reason, that seeing the soule is but one and a simple substance, and wholly in the whole, and wholy in euery particle of the body; and therefore must necessarily haue the helpe of Organs, for the accomplishing of her seuerall functions: to assigne the seate of the faculty there where the Organs of those faculties are especially to be discerned. Wherefore seeing the *Peripateticks* doe confesse, that the Organs of sence and motion are more conspicuous in the Braine then in the heart: why will they not yeeld to the Physitian, that the Animall faculty is in the braine, the Vitall in the Heart, and the Naturall in the Liuer; but make all the worlde witnesses of their refractarie mindes, then which in a true Philosopher nothing is more illiberall? Howsoeuer, to conclude, we subscribe to the opinion of the Physitians, who haue banished this Vnitie of Principles out of their Schooles. The conclusion of the whole disputation.

QVEST. III. *How many principall parts there are.*

BY those things which we haue thus at large discourst, it is manifest to all men, that there is not one, but many principall parts of mans body; it remaineth that we shew you now how many there are. The number wee cannot better aportion, then from the nature and definition of a Principle. First therefore, we must make it appeare (because Physitians heerein doe not agree) what a principall part is.

Galen in his Booke *de vsu partium*, defineth this principality by Necessity. That is a Principall part, which is of absolute necessity for the life of Man. I will shew you (saith he) by what markes you shall know a principall part, to wit, by the profit it bringes; now the profit of a part is threefold, either it is simply for life, or for better life, or else for the preseruation of them both; and all such parts without doubt, are truly principall. And in the first Chapter of the xiiii. Booke *de vsu partium*; Nature hath a three-folde scope in the structure of the parts of Mans body. The first is of those which are necessary for life; and such parts are called Principall, as the Braine, the Heart, and the Liuer, &c. We wil therfore define a Principall part to be *that which is absolutely necessary for the preseruation of the whole indiuiduum or particular Man.* What a principall part is. *Galen.* The first definition of principality.

Argenterius, who in a humor of contradicting *Galen*, opposeth himselfe vnto him, reiecteth this definition; because if a principall part be defined by necessity, the Stomacke, the Loynes, the Spleene, the Bladder and the Kidneyes, will all fall into the reckoning of principall parts. For the action of the Stomacke, is necessarie also for life. The motion of the Lunges we cannot misse, no not for a moment of time; the interception of the Vrine is mortall; and therefore the excretion or auoyding thereof, which is accomplished by the Kidneyes and the Bladder is necessary. But he seemeth to me not to haue attained to the thorough vnderstanding of *Galens* mind: for there is a double necessity of the parts, one absolute for the preseruation of the *indiuiduum*, another not ἁπλῶς, that is, simply and absolutely, but *secundum quid*, or hauing reference to the former. The first maketh a part principall, as the Braine, the Heart, and the Liuer: the second kinde of necessity is but relatiue or collaterall, by which some parts owe obseruance to the principall, as necessary seruitors vnto them. For example: What necessary and immediate offices do the Lungs, the Kidneyes, the Bladder, and the Spleene performe to the arme, the legge, or the stomacke? But the heart giueth them life, the Liuer affoordeth nourishment, and the Braine supplieth them with sence and motion. *Argenterius* his vaine opposition to *Galen*. *Argenterius* answered. A double necessity of the parts.

This may seeme somewhat obscure to those that are but Catechists in our Art, but by examples we shall make it sufficiently perspicuous. The Liuer is the onely Prince in the lower region or belly, being therein alone absolutely necessary, and at his owne cost, nourishing the whole family of the body; all the other parts within his precinct are made for his vse. The stomack as a seruant ministreth meate vnto him, the bladder of Gaul purgeth away the Choller from that meate, the Spleene drayneth away the Melancholy iuice, and the Kidneyes the serous or whayie humor, all concurring to depure and cleanse it from excrements to his hand. If therefore they be necessary, it is not for the preseruation of the whole Man, but because they be necessary Ministers to assist the Liuer in his worke. Againe, the Heart sitteth in the middle Region as in his pallace, the Lungs, the Midriffe, and all the arteries attending him for his vse, whom he employeth in quickning the whole body; the How the other partes serue the principall, & in that regard are necessary

the ſame may be ſaide of the braine. Wherefore the braine, the heart, and the liuer, are onely principall parts, becauſe they alone are immediately and abſolutely neceſſary for the preſeruation of euery particular creature. *Galen* alſo anſwereth this cauill another way, on this manner. The action of the ſtomacke is not abſolutely neceſſary, but only for the continuance and prorogation of life. Witneſſe thoſe Creatures which mew themſelues vp all Winter, neuer eating, and ſo not vſing the action of the ſtomacke, albeit they liue natheleſſe. Furthermore, nouriſhing Cliſters do not aſcend vnto the ſtomacke, yet they are ſucked by the Meſeraick Veynes, and tranſported vnto the Liuer, and ſo ſuſtaine the body, as may be inſtanced in that malefactor, who after hee was taken from the Gallow, was found to be aliue, and a good while ſuſtained by ſuch Cliſters, when it was not poſſible to get any thing into his ſtomacke. A Creature therefore may for a time liue without Chilification, which is the action of the ſtomacke, but not without ſanguification, ſayth *Galen*, which is the proper function of the Liuer.

Galens anſwer to the former cauill.

A Storie of a Malefactor.

Sexto de placitis.

That which is obtruded concerning the Lunges, is of no moment; for they worke rather for the commodity of the heart, then for the immediate maintenance of life. The hart might ſatisfie it ſelfe with aire attracted through the rough and ſmooth Arteries; but leaſt the outward impurity thereof ſuddenly ruſhing into the Ventricles ſhold offend it, Nature hath cautelouſly ſet the Lunges betweene them, as a ſhop wherein the aire is broken and dulcified before it come vnto the heart. And thus much may ſuffice to ſatisfie the former obiection, and to euince that onely thoſe partes are principall, which are abſolutely and immediately neceſſary for the preſeruation of life.

How the Lunges ſerue the Heart.

An obiection againſt *Galen.*

But there are others which oppoſe *Galen* to *Galen*, who in his firſt Chapter of his firſt Booke *de Locis Affectis*, affirmeth, that the heart onely is abſolutely neceſſary for the life of the creature: his words are theſe, *If the Creature bee neither nouriſhed, nor haue ſence or motion (which happeth in ſuch as lye within the earth) yet may it liue as long as the heart is not violated; but if the heart be defrauded of reſpiration, the Creature inſtantly periſheth.* To this we anſwere: That in bloody and perfect creatures, the action of the braine and the Liuer, is abſolutely neceſſary; but thoſe creatures which liue ſo mewed vp in winter, are vnbloudy or without bloud, although it cannot be denied, that hyſtericall women, that is, ſuch as haue violent fits of the Mother, do liue ſome good ſpace without breathing, as we could inſtance in many, if it were not ſo ordinary, as that no man will deny it.

Galen.

The anſwere to the obiection.

Another definition of a part.

There is alſo another very elegant definition of a Principle, in the tenth Chapter of *Galens* ſixt booke *de Placitis*, in theſe words; *That is called a Principal part, which alloweth or affoordeth to the whole, either ſome faculty, or at leaſt ſome matter.* According to this definition alſo, there will be three principall parts. For that the Braine doth tranſmit the Animall faculty, and the Heart the Vitall, will be eaſily yeelded vnto vs. All the ſcruple is about the Liuer, becauſe it ſeemeth not reaſonable, that it ſhould affoord to the particular parts, a naturall influent faculty, ſeeing euery part hath ſuch an one bred, and ſeated in it ſelfe. For the time we let paſſe that Controuerſie, it is ſufficient for our preſent purpoſe, to prooue it a principall part, though it yeeld no faculty, if it yeeld a matter to the vvhole body, which no man in his right wits but will eaſily confeſſe, or let him but pricke his finger and he ſhall ſee it. *Auicens Fen prima, doctrina 5. Cap. primo*, defines that to be a principal part, which hath in it ſelfe the Originall or beginning of the firſt and chiefe faculties of the body; or wherein the power or efficacy of thoſe faculties, by which the body is diſperſed or gouerned, doth as in his chiefe ſeate eſpecially reſide and manifeſt it ſelfe. Some of the late Writers haue defined a principall part to bee that, which out of it ſelfe exhibiteth and communicateth to other parts, ſome actiue Inſtrument; as for inſtance, a Spirit. So that which of all theſe definitions we accept of, it will ſtill remaine that there are three principall parts, the Braine, the Heart, and the Liuer. For if we reſpect Neceſsity, theſe only are abſolutely neceſſary; if the originall of the faculties, in the Braine reſideth and ſhineth the animall, the vitall in the heart, and the naturall in the Liuer; if the Inſtruments, then from the Braine floweth the animall ſpirits by the ſinnewes, the vitall from the heart by the arteries, the naturall from the Liuer by the veins; and by thoſe paſſages are all diffuſed from their fountaines in the whole body.

Auicens deſinition of a principall part.

A definition of the late writers.

Galen in his Booke *de Arte parua*, addeth to the principall partes a fourth, to wit, the Teſticles: not in reſpect to the *individuum* or particular creature, but becauſe they are of abſolute neceſsity for the conſeruation of the kinde, and production of encreaſe. For the Teſticles indeede do not make allowance to the whole body of any matter, or facultie, or

ſpirit,

ſpirit, but only of a quality, together with a ſubtile and thin breath or aire, from which the fleſh hath a ranke taſte of the ſeede, and the bodye a ſtrength or farther ability in the performance of his actions.

QVEST. IIII. *Which of all the principall Parts is the moſt Noble.*

HAuing præmiſed this diſputation concerning the number of the principall parts, it remaineth (becauſe wee would haue nothing wanting which may giue ſatisfaction to ſuch as deſire it) that we inquire which of all the principall parts is worthily to be preferred aboue the reſt. *Galen* in his firſt Booke *de ſemine*, preferreth the teſticles to the heart; where he ſaith, *The Heart is indeede the author of liuing; but the Teſticles are they which adde a betterneſſe or farther degree of perfection to the life*, becauſe if they be taken away, the iollity and courage of the Creature is extinguiſhed; the Male followeth not his Female, the Veynes looſe their latitude, and become ſunke & narrow; the Pulſe abateth of his ſtrength, and becomes weake, dull, and languiſhing; the skin is pilde and bare, whereupon ſuch men are called *Glabriones*; and in a word, all virility or manhoode vanitheth away. *Galen* addeth. The Teſticles are another Fountaine or Well-ſpring of in-bred heate; the Feu-place or Fire-hearth, where the *Lares* or houſhold-Gods of the body, do ſolace and diſport themſelues: from hence the whole body receyueth an encreaſe of heate, and by that meanes not onely fœcundity, but alſo a great alteration of the temper, the habite, the proper ſubſtance, yea and of the manners themſelues: ſo that to ſay true, their power is very great, and almoſt incredible, then eſpecially knowne when it is wanting, as we may obſerue in Eunuches.

Galen preferreth the Teſticles before the Heart.

Glabriones. Galen.

Wherein the Teſticles do ſhew their power.

Wherefore as to be and liue well, is more excellent then ſimply to liue and haue an Idle and ſluggiſh exiſtence, ſo the Inſtrument of the former which is the Teſticles, is more excellent then that of the latter, which is the heart. A probable but a ſophiſticall argument. True it is, that which giueth better life, if it giue life alſo, is more excellent then that which giueth life onely: but the teſticles do not giue life at all, the creature can liue without them; they adde indeed a perfection, not to life, that is, to the concreate as we ſay, but to liuing, that is, to the abſtract; ſo do the eyes, ſo do other parts, without which a Man ſhould liue, but in liuing ſhould be miſerable: the heart therefore giueth the ſubſtance, the teſticles exhibite but an additament, which may be away, albeit it bee with notable detriment; detriment I ſay, not of that which the heart giueth, which is the ſubſtance; but of that which themſelues affoord, which is a complement. Now that a ſubſtance is of more excellence then a complement no Man will deny, the heart therefore is more noble then the teſticles. But the heart hath a greater concurrent in this plea of honour, which is the braine.

Galens ſubtile argument anſwered.

Whether the Braine be to be preferd before the hart.

The *Peripatetikes* and *Ariſtotle* their Prince, together with the whole family almoſt of the *Stoickes*, eſpecially *Chryſippus*, do giue the preheminence to the heart, as well becauſe it is ſeated in the middeſt, which is the place of honour; as alſo becauſe it is a liuing and abundant Fountaine of Natiue heate; and finally, becauſe it is the ſpeciall habitation of the ſoule; for euen *Hippocrates* himſelfe, the Oracle of Phyſicke, in his booke *de Corde*, placeth the ſoule in the left ventricle of the heart; and hence it is, that they call the heart καρδίαν, *quaſi* κρατίαν: for κράτος ſignifieth Empire or rule comming from κρατέω *to Command.*

The opinion of the Peripatetiks & Stoiks

Hippocrates.

But all this notwithſtanding, we are enforced to yeelde the ſuperiority to the braine, becauſe his functions are more diuine and more noble then thoſe of the heart. For example: All ſence and voluntary motion proceede from it, the habitation it is of Wiſedome, the Shrine of Memory, Iudgement and Diſcourſe, which are the prerogatiues of Man aboue all other Creatures. This is the Prince of the Family, and the head is the head of the tribe, all other parts are but attendants (though ſome ſerue in more honourable place then others,) and owe homage vnto it, yea all were created onely for his vſe and behooſe. For the braine being the ſeate of the intelligible or vnderſtanding faculty, it was requiſite firſt, that it ſhould be ſupplied with phantaſmes or repreſentations; theſe repreſentations could not be exhibited and repreſented to the vnderſtanding, but by the miniſterie of the outward ſences. For it is a rule in Philoſophy, *Nihil eſt in intellectu quod nõ prius fuit in ſenſu. There is nothing in the vnderſtanding or intellect, which is not firſt in the ſence.* It was neceſſary therefore, that the ſences ſhould be created for the intellect. Furthermore, the

We determin that the brain is the prime principal part

An Elegant demonſtratiõ how all the body is ſeruiceable to the Braine.

ſences

ſences could not haue beene perfect vnleſſe the Creature could haue moued locally to gather his phantaſmes out of diuers obiects, as the Bee flyeth from one flower to another to gather hony; and therefore Nature ordained the organs or inſtruments of motion, the muſcles, the tendons, and the nerues. Theſe (vnleſſe wee ſhould haue crawled vppon the earth like wormes) did neceſſarily require props and ſupporters to confirme and eſtabliſh them, whereupon the bones and the griſtles were ordained; and ligaments alſo to knit and ſwathe them together: now all of them ſtand in neede of perpetuall influence, of heate to quicken them, and of nouriſhment to ſuſtaine them; both which are ſupplied, the former from the Heart by the arteries, the latter from the Liuer by the veines: ſo that truth to ſay, there was no other end of the Creation of all the parts and powers of the body, but onely for the vſe and behoofe of the Braine.

Obiection. Anſwere.

It will be obiected, that the braine cannot accompliſh his functions without the ſpirits of the heart, and the influence of his heate; I anſwere, that that is an inuincible argument of the ſoueraignty of the Brain; for the end for which a thing is ordained, is more noble then the thing ordained for that end; the life therefore and the heart are but handmaids to the Braine. We will adde alſo this argument, which happely will ſeeme not incompetent: The Braine giueth figure vnto the whole body; for the head was made onely for the Brayne; how *Hippocrates* ſayth that the nature of all the reſt of the bones dependeth vpon the magnitude of the head: not that all the bones deriue their originall from the head; but becauſe it behooued that they ſhould bee all proportionably anſwerable to the bones to which they are articulated, as the legges to the thighes, the thighes to the haunches, the haunches to the holy bone, the holy bone to the ſpondles or racke bones, the racke bones to the marrow of the backe, and that to the braine.

Hippocrates.

The former arguments of the Peripatetickes & Stoicks anſwered.

For ſatisfaction to the arguments before vrged by the *Peripatetians* and the *Stoicks*, we ſay. That the *Etymon* or deriuation of the name of the heart, is but friuolous & not worthy the ſtanding vpon. For the ſcite of the heart in the middeſt, it doeth weigh *tantundem*, as much as nothing; neither indeede is the ground of it true: for of the whole body the nauel is the Center; and for the trunke or bulke, who euer ſaid (that was an Anatomiſt) the heart was in the middeſt of it? But if wee will draw an argument of dignity from the ſcituation, then will the true ſuperiority fall to the Braine, becauſe it is placed vppermoſt, as the fire aboue the inferiour elements; the higheſt heauen the ſeate of the bleſſed ſoules aboue the ſubiected orbes; for to be placed aboue, is high ſuperiority and præeminence; to be thruſt downe below, betokeneth baſe ſubiection and inferiority. As for that place of *Hippocrates*, where he placeth the ſoule in the left ventricle of the heart, either he ſpeaketh to the capacity of the vulgar, or elſe by the ſoule he meaneth the heate, as happely wee ſhall haue more occaſion to ſhew hereafter. We conclude therefore, that of the principall parts, the firſt place belongeth to the Braine, the next to the Heart, the laſt to the Liuer. Againe, in the *Oeconomie* or order of the parts, this rule is obſerued; that thoſe which are firſt in order of nature, are laſt in dignity and excellencie: ſo the Infant firſt liueth the life of a plant, then like a beaſt it mooueth and becommeth ſenſible; finally, it receiueth it's perfection when it is indued with the reaſonable ſoule; as hauing then the laſt hand and conſummation from the Creator, when he ſetteth his ſtampe or image vpon it.

The argument retorted.

Expoſition of *Hippocrates.*

A rule in the diſpoſition of the parts.

Galen.

A conference of the dignity & neceſsity of the principal parts.

Galen in the laſt Chapter of the ſeauenth booke of his Method, compareth the dignity and neceſsity of the three principall parts one with another in theſe wordes. *The dignity of the Heart is very great, and in ſicke patients his action and the ſtrength of it, of abſolute neceſſity; the Brayne is of equall moment for the preſeruation of life, yet the ſtrength of his actions is not ſo immediately neceſſary in thoſe that are diſeaſed for their recouery: the action of the Liuer is as neceſſary as eyther of them for the maintenance of the particular parts, but yet for preſent & immediate ſuſtentation of life, it is not ſo inſtantly neceſſary as both the former.* To conclude this queſtion, there is a threefold principle; one of Beginning, another of Dignity, a third of Neceſsity. The *parenchyma* or fleſh of the Liuer is the originall principle; the Braine is the moſt noble principle; and the Heart of moſt neceſsity; yet they all haue ſuch a mutuall connexion and conſpiration, that each needeth others aſsiſtance, and if one of them decay the reſt doe forthwith periſh. Euen as in a wel gouerned Citty or Common-wealth there is a wiſe Senate to guide it, a ſtout and valorous ſtrength of ſouldiours to defend and redeeme it; and an infinite multiplicity of trades and occupations to maintaine and ſupport it; all which though they be diſtinguiſhed in offices and place, doe yet conſent in one, and conſpire together for their mutuall preſeruation. And this conſpiration *Galen* expreſſeth

The deciſion of the whole queſtion.

A three fold principle.

Compariſon.

Galen.

to

to the life, in his booke *de formatione fœtus*, and the fift chap. thus: *When the Heart is depriued of respiration it ceaseth to moue, & immediately death ensueth; now it is deprived of respiration when the nerues (which come from the Brayne) are either cut, or obstructed, or intercepted.* The mutual conspiration of the principal parts. As therefore the Heart needeth the helpe of the Braine, and being forsaken by it, maketh a diuorce betweene the soule and the body; so it also maketh retribution to the Brain, supplying it with spirits of life, out of which the Animall spirits of the Braine are extracted; and the Liuer though it lye below, yet it yeeldeth matter to them both, wherof and whereby their spirits are made and sustained.

But against this doctrine of the consent of these principall parts, there is a notable place of *Galens*, in the fourth chapter of his second booke *de placitis*, which needeth to bee cleared before we fall from this discourse; for hee sayeth: *As Pulsation and voluntary motion belong to diuers kindes of motion; so neyther of those principles needeth the helpe one of another.* Which place we interpret thus: that the hart doth not transmit the Animal faculty to the braine, nor the braine the faculty of Pulsation to the heart, because the temper and formes of the faculties are diuers; and therefore the heart conferreth nothing to the *Idea* or forme of voluntarie motion, neither the braine to the power of pulsation; yet hence it must not be inferred, that the braine needeth not the help of the heart, or on the contrary the heart of the braine: and thus much of the definition, and number, and precedency of the principall parts.

Obiection. *Galen.* A hard place in *Galen* expounded.

QVEST. V. *Of similar and dissimilar parts, and first of the number of them.*

THE nature and number of the Similar parts because they are much controuerted, we will examine for their sakes, who are not so well exercised in these schoole poynts; that if they be not able to draw out of the fountaines themselues, they may dip their vessels in this shallow foord of ours, to satisfie their thirsty minds.

That there are no similar parts. *Galen.* Obiection. Answere. Why similar parts are so called. Some there bee that contend, that there are no similar parts at all, because the most simple are not voide of composition; and they alledge *Galens* authority for it; who in the eight chapter of his first booke *de Elementis*, sayth: *That the simple parts are made of humors, humors of Aliments, Aliments of Elements.* And in his first booke *de semine. All parts are generated of seede and bloud.* But the answere to this is easie and obuious; for parts are called similar, not because they are exquisitly simple and incompounded, but because they cannot bee diuided into *Parts* of diuers kindes, neither yet are compounded of any other *Parts*, though of diuers substances. So the Philosopher calleth the Elements simple bodies, because they are not compounded of other *bodies*, although they consist of matter and forme. Yea the very soule of man is not in this sence truely simple, nor yet the Angelicall substance; for if they were, they should be impatible: and indeede nothing is truely simple but God himselfe; but we of purpose giue ouer this mysterie before wee enter into it, because euery one is not a fit auditor of this kinde of Philosophy. The soule of man is not simple. The number of the similar particles concerneth vs at this time more, wherein there is great heate and contention of opinions. *Galen* in his commentaries vppon *Hippocrates* booke *de natura hominis* numbreth seauen: *Bones, Gristles, Ligaments, Membranes, Fibres, Fat* and *Flesh*. And whereas there is a threefold kind of flesh, one of the muskles, which is indeed true flesh; another of the entrals which is called παρέγχυμα, and the last of the particular parts; he accounteth them all similar, for so he speaketh in the sixt chapter of his first booke *de naturalibus facultatibus*. *Among the similar partes are to bee accounted the flesh of the Liuer, the Spleene, the Kidneyes, the Lungs, and the Heart; as also the Coates of the Stomacke and the Guts, and the proper body of the Braine.* For if from all of these you shall exempt or take away, either really or in your imagination, the veines, the arteries, and the nerues; the body which remayneth will be simple and elementary. In the sixt chapter of the first booke *de Elementis*, he addeth to the former seauen, *Sinewes, Marrow, Nayles* and *Haire*. In his booke *de inæquali intemperie*, *Tendons* and *Skin*. In his booke *de differentijs morborum*: and in the second booke *de Elementis*, he addeth *Veines* and *Arteries*. So that according to *Galen* in the places alleadged, if wee summe vp the similar parts, they will arise to foureteene: Bones, Gristles, Ligaments, Membranes, Fibres, Nerues, Arteries, Veines, Flesh, Skin, Fatte, Marrow, Nailes and Haires. The number of the similar parts. *Galen.* A three-fold kinde of flesh. *Galen.* *Galen.* 14 Similar parts after *Galen.*

Many

Galen accused

Many accuse *Galen* of leuitie and forgetfulnesse, because in diuers places hee calleth veines, arteries, and nerues similar parts; & yet in his booke *de inæquali intemperie*, hee accounteth them dissimilar and organicall. *Argenterius* answeres for him; that in a similar part, he hath a double respect to their matter and their form; and wheras he calleth nerues, veines, and arteries, similar bodies, he doth it with respect to their matter, which is simple and vniforme; where he calleth them organicall, he hath respect to their forme and figure, which is round and more or lesse hollow: but *Argenterius* by this answere, rather betrayeth then redeemeth his maister: for the matter of the veines, nerues, and arteries, is not vniforme. *Galen* in his booke *de placitis*, and *de vsu partium*, teacheth that nerues are withinward, soft and marrowy; outward, membranous; as also the bodyes of arteryes are wouen of membranes and fibres.

Argenterius answere for *Galen* insufficient.

Galen.

The common answere for *Galen* approued.

The common and vulgar answere for *Galen*, we rather approue, which is after this sort. There are two kinds of similar parts, some are so in trueth as bones, gristles &c. others similar to the iudgement of the eye; such are veines, arteryes, and nerues; because at the first view when we cast our eye vpon them, we perceiue an vniformity in their substance. But some man will vrge farther, that euen in the iudgement of the eye those three vessels aboue named are not simple but compounded; for our eye bewrayeth the inside of the nerue to bee medullous, and the out-side membranous. And *Galen* in the sixt chapter of his first booke *de naturalibus facultatibus*, sayth: *That similar particles are by no other meanes to bee discerned, but by dissection and autopsia*; that is, *by the eye of the Anatomist*. This scruple *Montanus* thus remoueth: there is, sayth he, a double Anatomy, one most exquisite and artificiall, another more rude according to the times wherein *Hippocrates*, *Diocles*, and *Erasistratus* liued, when the Art was in her infancy: and to these times, the nerues, veines, and arteries, seemed at the first sight similar parts, albeit since, as the Art hath gathered strength, and men growne more occulate priers into the nature and frame of the body, there hath beene some difference discerned.

Obiection.

Galen.

Montanus answere to the Obiection.

It will be further obiected, that there are more similar parts then *Galen* and the Schoole of Physitians haue described. For the marrow or substance of the braine, the Cristalline humor of the eye, the pith of the backe, as also the other humors of the eye are truly, and in the nicest construction similar parts. We may answere, that all these are indeed truly similar, but yet they all concurre to the frame of one part; but *Galen* spake onelie of those similars, of which as of sensible and common Elements, many dissimilars were compounded.

Obiection.

Solution.

Quest. 6. *Whether a similar part may be called Organicall, and whether the actions belong to the similar Parts, or to the Organicall.*

A similar part may also be said to be Organicall

According to the Doctrine of *Aristotle* and *Galen*, a dissimilar and an organicall part are not distinguished. But because according to the same *Galen*, the essence of an Organicall part consisteth onely in the conformation, that is, a conuenient figure, magnitude, number and scituation, all which are found also in similar partes; I am easily perswaded to be of the opinion of some of the late Writers, who thinke that similar particles, may also be called organicall, and therefore that the dissimilar is better opposed to a similar, and to an organical a rude & vnformed part. Neither do I think that *Galen* was heereof ignorant; but because the variety of composition, and the neatnesse of the Figure was more conspicuous in those that are dissimilar (the similar being vniforme) hee pleased to call them absolutely and by an excellence, organicall. So the Philosopher in his first Booke *de partu & interitu*, calleth the head, the chest, and the belly, principall Organs, because the most irresolute Scepticke, cannot but acknowledge their action and diuerse composition.

Fernelius.

Aristotle.

A twofolde consideration of an organicall part.

Some vnite this knot on this manner. An organicall part is to be considered either as it is figurated, or as it performeth some organicall action. In the first respect, almost all similar parts are organicall; for euen the bones haue a proper figure, magnitude, number & scite. In the second onely dissimilar, because these alone do performe organicall actions. For who will affirme, that in a bone there is any action organicall? It is true, that their Figure, magnitude, and scite are of good vse, but they performe no action. Whereas the Veine and the Muscle, although of all Organs they are the most simple, do performe each

of

of them a manifeſt organicall action; the one diſtributing and diſperſing the blood, the other accompliſhing voluntary motion. But that theſe things may be more manifeſt, and deſcend deeper into the capacity of thoſe that are but initiated, it ſhall not be amis to recal them againe to the ballance, and weigh them ouer more preciſely.

Galens diffinition of an organ. Another.

Galen in the ſixt Chapter of the firſt Booke of his Method, and in his Booke *de inæquali intemperie*, defineth an Organ to be *that part of the creature which can perform a perfect, that is, a proper action.* More fully it may be defined thus. *A Part which onely produceth an action proper and peculiar to it ſelfe*; ſo a Muſcle and an Eye may be called Organes, becauſe only the Muſcle mooueth, the Eye onely ſeeth. As for the ſimilar parts, their action is perfect indeede, but common, not proper or peculiar to themſelues, to wit, Nutrition; & therefore they cannot properly be called Organs. Now that nutrition is a ſimilar, and not Organicall actiõ, it appeareth by both their definitions. That action is ſaid to be ſimilar, which is commenced or begun onely by the temper of the part, and by the ſame perfected, and is beſide wholly and perfectly wrought by the leaſt portion of the part, as well as by the whol. That Nutrition is of that nature, it is ſo manifeſt, as it needeth no demonſtration; for euery part or portion of a Bone, draweth, retaineth, boyleth the Aliment; and beſide expelleth that which is ſuperfluous; the reaſon is, becauſe euery part of a bone is a bone, and hath the forme and nature of the whole bone: this forme is called *temperies* or the temper, wherfore onely from the temper proceedeth the original and perfection of nutrition. Againe, *Fleſh* (as *Galen* ſaith in the 9. Chapter of the firſt booke *de vſu partium*) *is fleſh onely through his temper, and a Nerue is a Nerue by his temper.* And in the firſt booke *de Naturalibus facultatibus*, *He that endeuoureth to preſerue the action of the ſimilar parts, it is neceſſary that he preſerue their temper.* So that it is manifeſt, that Nutrition accordeth with the definition of a ſimilar action. Now how repugnant it is to the definition of an organicall action, it remaineth that we ſhew. That is called an organicall action, which neither is begun, nor abſolued or perfected by the temper alone, but requireth to his integrity and perfection the whole inſtrument. So viſion which is the proper action of the eye, is not accompliſhed by the Chriſtalline humour alone, nor alone by the opticke nerue, or the coates of the eye, but by all togither. Neyther is the forme of this organicall action the temper, but the laudable conformation of the whole inſtrument. The eye ſeeth not, the hand handleth not, the foote goeth not forwarde, the muskle mooueth not onely by the temper; but becauſe the organs are thus or thus diſpoſed or framed.

What is a ſimilar action.

The forme of a ſimilar part is his temper. *Galen.*

What is an organical action.

Whether the action do proceed from the ſimilar parts

Here ſome ouertaken with irreſolution, becauſe of the obſcurity of the queſtion, doe ſweate and contend to proue, that all actions belong to the ſimilar parts and proceed from them, none from the organicall. And they alledge the authority of *Galen* for their warrant; who in the ſecond chapter of the ſeauenth booke of his Method, and the third chapter of the ſixt booke *de locis affectis*, and in his booke *de optimo corporis habitu*; ſayth, *That in euery organ there is one particle ſimilar, which is the principall cauſe of the organicall action, and that the reſt are onely aſſiſtant, conferring ſome vſe but no action.* So viſion proceedeth from the Chriſtalline humour, ſanguification from the *parenchyma* of the Liuer, voluntary motion from the fleſh of the muskle; but the coates of the eye, the muskles, the nerues, the two humours, doe eyther make the ſight more perfect, or onely conſerue it. Moreouer, in the fift chapter of his booke *de conſtitutione artis*; hee writeth *that the actions are primarily and per ſe*, that is, *of it ſelfe, from the ſimilar part; and ſecondarily and by accident, from the organical.* Adde hereto that the functions doe flowe from the faculties, the faculties from the temperament; now the temper is the forme of the ſimilar part, not of the organicall: and in the fift booke *de locis affectis*, he ſayth: *That the very eſſence of al the faculties doeth conſiſt in the temper.* In the ſixt booke *de locis affectis*: he ſayth, *that the actions doe flowe from the proper and peculiar eſſence of the parts not from the poſition: for if the Heart or the Lyuer ſhould change their place, yet would they performe the actions they doe in the places wherin now they are.* And in the tenth booke of his Method, ſpeaking of a cold bath: *Thoſe that are Hectical*, that is, *in a conſuming and lingring ague, are eaſily offended by the occurſion or touch of cold water or ayer, becauſe theyr ſolid and ſimilar parts*, (they being more neare the threds) *are bare and naked, by which all the actions of lyuing creatures are performed.* *Ariſtotle* alſo is of opinion that aliſence commeth from the ſimilar parts.

Authorities of *Galen* to proue that they do.

Ariſtotle.

This their deuice I muſt needs ſay is probable, but yet they trouble the pure fountain of *Galens* Philoſophy. It is true that he acknowledgeth in euery perfect organ one ſimilar particle, which is the principall cauſe of the action, but yet hee neuer meant to referre the

The explication of the queſtion, wherin *Galen* is interpreted

cauſe of the perfect action onely to the temper of that particle: ſo hee acknowledgeth the temper of the Chriſtalline humor, to be the efficient cauſe of viſion or ſight, together with his purity, ſmoothneſſe, and ſcituation, which are all organicall. For if the poſition of the Chriſtalline humor be changed, if it be drowned too deep in the glaſſy humour, although the temper of it remaine neuer ſo exquiſite, yet the viſion cannot bee perfect. In a word therefore I anſwere, that the originall of the action dependeth vpon the ſimilar part and his temper, but the perfection of the action followeth the frame of the whole organ. And this *Galen* teacheth in the ſixt chapter of his book *de differentijs morborum*, and in his book *de optima corporis conſtitutione*, where he willeth and reſolueth, *that the actions doe firſt of all and originally, iſſue from the ſimilar particles, but their accompliſhment and perfection dependeth vpon the frame of the whole organ.*

What we muſt reſolue vpon according to *Galen.*

Whether the Spermaticall parts be generated of ſeede.
QVEST. VII.

HAuing thus handled the diſtinction of the parts, & the natures of them all; it remayneth that we entreat of thoſe parts which are called Spermaticall. concerning which, there are three queſtions among the reſt moſt notable: Whether they be immediately made of the ſeede; whether they can grow together againe or bee reſtored; and whether they bee hotter then the ſanguine or bloudy parts or no; all which we will diſpute in order. The firſt queſtion is hard to be determined, and therefore we muſt be conſtrayned to take our riſe a little higher, for that the nature of ſeede which is intangled in many folds of difficulties, muſt firſt be vnfolded: notwithſtanding, becauſe wee ſhall haue fitter oportunity in the booke of the generation of man, to ſearch more narrowly into the myſteries of this ſecret, wee will content our ſelues in this place briefly to run ouer thoſe things which ſhal moſt concerne the matter we haue in hand.

Three queſtions concerning ſpermatical parts.

The firſt queſtion.

It is agreed vpon betweene the Phyſitians and the *Peripatecians*, that ſeede is a Principle of generation. But the Philoſophers doe acknowledge it onely to be a formall and efficient Principle, the Phyſitians both a formall and a materiall; formall, by reaſon of his ſpirits; materiall by reaſon of his body. The Phyſitians therefore doe determine, that the ſpermaticall parts are generated out of the craſſament or thicke ſubſtance of the ſeede, the *Peripateticks*, onely out of the bloud. This latter opinion is not without his patrons and abettors, and beſide, ſupporteth it ſelfe by theſe arguments. If the Spermaticall parts were made of the ſeede as of a materiall principle: then the actiue and the paſsiue, the act and the power; the mouer and that which is moued; the matter and the forme; the maker and the thing made ſhould be the ſame; which true and ſolid Philoſophy will not admit. Againe, according to *Ariſtotle* in the ſecond booke of his Phyſickes; the Artizane is neuer a part of his owne workmanſhip; the ſeede is the artizane. *Galen* calleth it *Phidias*, who was an excellent Statuarie, and made among other peeces *Mineruas* ſtatue of Iuory 26. cubits high &c. And in the 20. chapter of the firſt book *de generatione Animalium*; *The ſeed is no part of the Infant that is made*, ſayth the Philoſopher; no more then the Carpenter is a part of the woode which hee heweth: neyther is there any part of the art of the artificer in that which is effected; but onely by his labour through motion, there ariſeth in the matter a forme and a ſhape. Moreouer, it is an axiome of Phyſicke, *That wee are nouriſhed by thoſe things whereof we are formed, framed, and do conſiſt*; but all the parts of man are nouriſhed with blood, and therefore they are all generated of blood alſo.

The *Peripateticks* thinke that all the parts are generated of bloud.

The firſt reaſon.

The ſecond. *Ariſtotle.* *Phidias* the Statuary.

An axiome in Phiſicke.

The third.

Furthermore, if the principall parts, the Heart and the Liuer bee made of blood (for their ſubſtance is fleſhy, and *Hippocrates* calleth them both fleſhy Entrals) why is it not ſo with the other parts which al men admit and conſent to be made and perfected after them? Adde heereto, that if the ſeede of the Male be both the efficient, and the matter of the Infant, there is no reaſon but the male may alone beget an infant in himſelfe: ſhall the Nature of the ſeede be idle and at reſt, which all Philoſophers with one conſent doe agree, is alwayes actiue and operatiue? Finally, is it poſsible that ſo ſmall a moment of ſeede, as ordinarily ſufficeth for the generation of Man, ſhould bee ſufficient for the delineation of ſo many hundreds, nay thouſands of Bones, Griſtles, Ligaments, Arteries, Nerues, Veynes, Membranes, &c? Wherefore, the ſeede hath not the nature of a materiall, but onely of an effi-

The fourth. *Hippocrates.*

The fifth.

The ſixt.

efficient cauſe of mans generation.

There are a ſo two places in *Galen*, which ſeeme to fauour the opinion of the *Peripatetikes*. The firſt, is in the ſecond Booke *De Naturalibus Facultatibus*, where hee ſayth, *The Seede is an Effectiue Principle of the Creature, for the materiall is the Menſtruall Blood*. The other in the third Chapter of the ſame Booke, where he ſpeaketh verie plainly. *There is great difference* (ſaith he) *betweene the workemanſhip of Phydias, and of Nature. For Phydias of waxe can neuer make Iuory and Gold, but Nature keepeth not the olde forme of any matter, generating of bloud bloudleſſe parts. As for example, Bones, Griſtles, Nerues, Veines, Arteries, all bloudleſſe, yet made of bloud.*

But the trueth is, that *Galen* was of another minde, to wit, that all the Spermaticall parts were made of ſeede, as appeareth in his Bookes *de Semine*, where hee inueyeth purpoſely againſt *Ariſtotle* concerning this matter, teaching that the ſeede is both the efficient and the materiall cauſe of their generation. The efficient, in reſpect of the Spirites; the matter in reſpect of the Craſſament of it. And indeede, that admirable and vnimitable ingenie or diſcourſe of *Hippocrates*, did firſt bring this light into the worlde, as appeareth in his Bookes *De Natura pueri de Principijs*, and the fourth *De Morbis*. And *Ariſtotle* himſelfe is conſtrained to confeſſe as much in the firſt Booke of his Phyſickes, and in his Bookes *De gener: Animalium*, where he ſayth, that ſome parts are made onely of an Alimentarie excrement, ſome of an Alimentarie and a Seminall together. Beſides, not to ſtand vpon authorities, wee haue waight of Reaſon to prooue it. The ſeede of Man, is white, froathie, and thicke, and when it is caſt into the Wombe, if Conception follow, it is retained; for out of hand the mouth of the Wombe is ſo exquiſitelie cloſed, that a needle cannot finde entrance without offence.

The contrarie opinion of the Phyſitians. Authorities of Galen. *Ariſtotle.* Reaſons. The firſt.

This all Women know full well; and the Muſicall Huſwife in *Hippocrates*, when ſhee knew that the ſeede ſhe had receyued came not away, on the ſeauenth day with a *Lauato* I trow, or ſome ſuch violent friske, ſhee auoyded her Conception. For, if the ſubſtance of ſeede be retained in the Wombe, it muſt of neceſsitie bee reſolued into nothing, or ſomething muſt be made of it; or elſe (as the Peripatetikes dreame) it muſt bee diſſolued into winde and vapours. The firſt, no Philoſopher will aſſent vnto; for, as nothing is made of nothing, ſo that which is ſomething, cannot vaniſh into nothing. The laſt, *Galen* diſprooueth by this argument, Becauſe when the ſeede is conceyued, the Wombe is contracted, and the ſeede narrowly embraced on euery ſide, ſo that there is no place lefte for any diſtending winde: adde heereto, that if the ſeede were diſſolued into winde, the wombe beeing diſtended, would be afflicted with exquiſite torments; for of one part of earth, are made ten of water, and of one of water, ten of aire. *Hip. Pſaltria. lib. de nat. pueri*

It remaineth therefore, that of the Craſſament of the ſeede, ſome parts muſt neceſſarily be framed, and thoſe are they which are called ſpermatical, Bones, Griſtles, Nerues, Veynes, Arteries, Membranes, &c. And this is prooued by theyr whiteneſſe, and by the thickneſſe, and the lentor or ſlimineſſe of their ſubſtance.

Moreouer, that the Spermaticall parts are made of ſeede, wee may thus demonſtrate. Bones, Cartilages or Griſtles, Membranes and Ligaments, are bloudleſſe and white, and therefore they cannot be made of blood immediately, as fleſh; but of bloud chaunged, whitened, and incraſſated, and then what differeth it from ſeede? Nature therefore ſhould bee very ydle, if ſhee ſhould euacuate and expell a matter fyt for the generation of thoſe parts, and (as if ſhee had forgot her ſelfe) ſhould endeauor to bring blood into that forme of which ſhe had at the fyrſt hand ſeed enough. The ſecond.

To theſe demonſtrations of *Galen* (at which *Argenterius* like a Detractor ſcoffeth) we will adde other Reaſons. VVhen the ſeede is iniected into the boſome of the wombe, the wombe is inſtantly contracted, and the plaſticall or forming Facultie thereof, rayſeth vppe the ſleeping power of the ſeede; and then his ſpirites and natiue heate, commence theyr action. Now this action thus inſtantly begunne, woorketh vppon ſomewhat: not vppon bloude, becauſe yet there is no confluence of it to the part. For who will ſay, That in Coition there is a double ſecretion, one of ſeede, another of bloud at one and the ſame time? The Peripatetike himſelfe will not yeelde to ſuch a Soleciſme in nature; but we know, that that which is auoyded in the acte of generation, is ſeede, and not blood. The third.

It is therefore the Craſſament of the ſeede vpon which the Spirits doe worke, in which they haue their aboade as in their proportionable ſubiect; this they turne and toſſe

on euery side; the disimilar parts of it they separate, framing of the thicker bones & gristles, of the slimy Membranes and vessels; all which, being scored out as the rude and first draught of a picture, wherein are nothing but the maister lines; the seuenth day the blood floweth vnto it, to make the *Parenchymata* or flesh of the entrals, and to fill vp the vacant distances of the Fibres. If therefore in the very conception, no bloud doe flow from the Veynes of the wombe vnto the masse of seede conceiued, how can wee imagine, that the first delineation of the parts, is made of blood? Againe, the blood wherewith the infant is nourished, and of which the *Parenchymata* are made, must passe by veynes, veynes I say, not of the mother, for then it would encompasse the seede onely, not insinuate it selfe into the parts of it; but of the infant; and for this purpose is the vmbilicall veine formed, called therefore the *Nurse or Fosser* veine, so that this Veine must of necessity bee made before the blood can come vnto the seede; and of blood it is not made, because there is yet no affluence of it. If you shall say, that blood is powred into the capacity of the womb by the small veines of the wombe: I aske why is the Infant not immediately nourished by the same veines? What neede was there that any vmbilicall veine should be formed? Finally, another demonstration that the parts are made of seede may be on this manner. The seede of the male and female is of one nature, colour and manner of generation, they haue both the same vessels of preparation, concoction and eiaculation, onely they are distinguished in perfection, for that the seede of the male is hotter and better laboured. Now all men do acknowledge, that the seede of the Female is the materiall principle of the parts; why then do they deny it to the crassament or substance of the seede of the male? Wee therefore conclude and determine, that both seedes are not onely efficient but materiall Principles of the spermaticall parts.

The fourth.

The fift.

The determination.

But that we may leaue no enemies at our backes to interrupt our victory as wee gaine the field before vs, let vs make answere to such arguments as are brought against the truth of this assertion. And first for *Galen*: where hee writeth, that the spermaticall partes are made of blood; he doth not vnderstand an immediate generation, that is, that the Bones are made immediately of red blood, as is the flesh; but of blood passed through diuers alterations and mutations of dealbation and incrassation. And what I pray you is this, but to say they are made of seede?

Answere to the aduerse arguments.

Galen expounded.

To the first argument I answere thus. There are two things to be considered in the seed, the Spirit and the Body. In respect of the Spirit, *Aristotle* in his first Booke *de partibus Animalium* saith, the seede is the nature, the principle, and the efficient of the thing begotten; and *Galen* in his second Book *de Semine*, calleth it *Formator fœtus*, the former of the Infant. In respect of the Crassament or body, it is called a material & passiue principle, so that the same part of the seed shal not be the Actiue & Passiue principle, the act and the power, the mouuer and the mooued, the matter and the forme as the Peripatetiks would perswade vs it must be, if that opinion were true. And *Auerrhoes* giueth an instance how these respects may be separated, so that the same thing may become the mouuer and the mooued in diuers considerations. For example: In a stone, the grauity or weight mouueth downward, and the stone is mooued; so in the seede, the spirit is the mouuer, and that which is moued is the Crassament or substance.

Answere to the first Argument.

Auerrhoes.

In those things that are done by Art, wee confesse the Artizane is no part of his owne workemanship; but in naturall things there is not the like reason. And this *Aristotle* teacheth in the 5. Chapter of his Booke *de Spiratione*. There is a difference (saith hee) betwixt Art and Nature, for Art vseth heate onely as an Instrument; but Nature vseth it both as an Instrument, and as a matter. For the fire which is vsed by the Artist to his worke, is not a part of the worke it selfe; but the heate, which is in nature, is diffused thorough the substance of that she intendeth to accomplish. Some Learned men make a two-fold kinde of Instrument, *Wherewith* and *Wherein*. The Instrument *Wherewith*, remaineth not in the part that is formed: but that *wherein* remaineth, as being the subiect of the forming faculty, otherwise there should be a formall transition, or transition of the forme, out of one subiect into another. For the forming faculty should leaue his proper subiect, that is, the seede, & transport it selfe into the blood.

Answere to the second. *Aristotle.*

To the third; we do not deny that Bones and Spermatical parts are norished by blood, but that blood hath gotten and acquired vnto it selfe the nature of seede, in thickenesse, sliminesse, and whiteneſſe. Or say thus. The blood is the remote aliment of the spermaticall parts, and the seede or something like seede the immediate. To the fourth, the *Parenchy-*

Answer to the third.

Answer to the fourth.

mata

mata or flesh of the principall parts, are indeede generated of bloode; but their first foundations had their originall from seede. The Warpe is seede, the Woofe is blood. To the fift. The Male alone cannot generate in himself, although he haue both Principles in him, Efficient and Materiall, because he hath no fit place for conception, norishment, and preseruation of the Infant, yet therefore his seede cannot well be saide to be idle; for that is idle, which when it may or can, yet doth not work; but in the male it neither may nor can, because he hath not a field to sow his seed in; & the seed that lyeth in the garner, cannot be saide to be doted, because it groweth not; but if it bee put into the ground, then we know it is doted if it do not sprout. To the fift.

The last reason *Argenterius* makes great account of, for he taketh it to bee beyond credance, that all the spermaticall parts should bee made of so small a quantity of seede; and therefore that he might be absurd alone, against all consent of antiquity he sayth, that no parts are made of seede. But truth is, that in this there is nothing admirable, but as all the workes of God are iustly to be admired. Shall we see a Spider weaue out of her womb a web a hundred times as long as her selfe, her selfe not at all lessened, and shall we thinke that Nature cannot draw as fine a thred, and after by addition of competent matter, enlarge the dimensions thereof? But let vs returne to *Argenterius*, and see how Clark-like he disputeth against *Galen* in this point. It is not possible (saith hee) that so many Bones, Gristles, Membranes, Vessels, &c. should be all formed of so little seede, and therefore none of them are made of seed. A light and vaine argument, drawne from the weakenesse of his owne vnderstanding. Doth he imagine thinke we, that the geniture conceyued & delineated the seuenth day, is by that time grown into farther dimensions then the seed which issued from both the Parents was of? Out of doubt he was not diligent in viewing abortments. For we dare confidently and religiously auouch, that the first moneth the *Embryo* although articulated, is no bigger then halfe the thumbe, yea we haue seene it at xi. weeks not aboue an inch and a halfe long, and of the thickenesse of a good quill, though all the parts (euen of generation) were manifestly to be seene and distinguished. If any man shal call the credit of our asseueration into question, let him heare *Aristotle Probl. 36. sect. 1. & 7. de Historia Animalium*, where he auoucheth, *If a Male Infant of forty dayes growth, be put into any other thing, it will fall asunder: but if it be cast into cold water, it gathereth together, and abideth compassed as it were with a Membrane, which being broken, the Infant appeareth in the magnitude of a great Ant or Pismire, and the Members of his Body may be discerned.* What will *Argenterius* say to this? Is not the seede of greater quantity then a great Pismire? Let him remember *Aristotles* Philosophy, That in principles there is great perfection, litle quantity but abundant vertue. A small Acorne into how vast an Oake will it grow? The nourishment onely is from the earth: the extent of the parts from the vertue of the seede. But if hee will not beleeue *Aristotle*; as scarsely authenticall in Anatomy, wee will cite him before the Tribunall of truth it selfe, that is, of *Hippocrates*, who in his Booke *de Principijs* affirmeth the very same. *The Geniture in seauen dayes hath whatsoeuer it ought to haue. For common and prostituted Strumpets, when they finde they haue conceiued, they vndo it within their owne bodyes by wicked meanes, and so there falleth from them as it were a flesh. Which flesh if it be cast into cold water, and diligently obserued, you shal in it perceyue all the members, the place of the eyes, eares, hands, fingers, thighes, feete, toes, and the secret parts.* If therefore in the first seuen daies the infant be so small, why seemeth this vnreasonable, that of the seede at once cast into the wombe, the first threds and foundations of the spermatical parts should be formed, which afterward by the continuall apposition and assimulation of Aliment, receiue their increment and perfection?

To the last. *Argenterius.*

An example of the Spider

Argenterius confuted.

The small quantitie of the Infant after it is formed.

Aristotle.

Axiome.

Example.

We conclude therefore, that all the spermaticall partes are generated of the Crassament or body of the seede, as of a materiall Principle. And this Crassament, although it seeme at the first view homogeniall, that is, hauing al parts of it alike, yet notwithstanding containeth in it parts of vnlike natures; thinner, thicker, fatter, slimier, some fyt for concretion or gathering together; others for tension and diffusion, all which are separated by the spirits and heate of the same seede, stirred vp by the Plasticall or formatiue power of the wombe: and so much concerning the fyrst question.

The conclusion of the question.

Whether the Spermaticall parts can reioyne againe after they be violated and seuered. QVEST. VIII.

Proofes that the spermaticall parts may reunite.

CONcerning the coalition or reioyning of Spermaticall partes there is great contention; I know that many, as well of the ancient as later writers haue, and do maintain; that they may all reioyn κατὰ πρῶτον σκοπὸν; that is, *according to the first intention*, as Chirurgians vse to speake, and this they establish by these arguments. Where the Efficient, Materiall, and Finall causes of coalition are, there is nothing to hinder a reiunction; but in young, growne and aged men, this threefold cause is present, therefore in all such there may be coalition: the Maior proposition of it selfe is cleere enough; the Minor is thus confirmed. The Efficient cause of coalition is the forming faculty, which vseth heate as her instrument; this faculty is seated naturally in euery part, but more manifestly in the solid parts then in the fleshy. The Matter of the spermaticall parts is seede, of which there is sufficient plenty, as for nutrition and accretion or growth, so also for a newe generation. *Hippocrates* also, *Galen* and *Aristotle*, doe agree, that the seede is an excrement, or rather surplusage of the last concoction; now the last and most absolute aliment is plentifull enough, neuer fayling vnlesse it be in the vtmost limit of decrepit age, and therefore the excrement or surplusage of it is not wanting. Moreouer according to *Hippocrates*, veines, arteries, nerues, and all spermaticall parts haue the power of procreating seed. Neither is the Finall cause wanting, for a broken bone and a diuided veine, doe after a sort desire and striue to be reunited; because the solace and comfort of Nature consisteth in vnion, as her sorrow and desolation in solution. They haue also another argument not inelegant; Hollow vlcers are filled vp with new flesh, intertexed and wouen with small and capillarie veines, arteries and sinewes; for that flesh is sensible, it liueth and is nourished, therefore of necessity by veines, arteries and sinewes.

Hippocrates. *Galen.* *Aristotle.*

The second argument.

Who is so mad that he dare exclude the teeth out of the number of spermaticall parts? but they grow againe after they be extracted. *Hippocrates* in his book *de Carnibus*, maketh a threefould generation of the teeth. The first from the seede in the wombe; the second from milke; the third from more solid aliments. Now if by the transmutation of the aliment the spermaticall parts doe encrease, why shall they not be reunited, seeing that *accreation* is one of the kinds of *generation*? *Galen* in the seauenth chapter of the fift booke of his Method, and in the fourteenth of his Method writeth, *That he hath seene many seuldered & reunited arteries.* He telleth a story of a young man who had an artery diuided in his arme, which afterward did perfectly reunite againe. Also in his 91. chapter of his booke *de arte parua*, and in the fift chapter of the sixt booke of his Method, hee affirmeth that *the bones of children may reunite.* These are the reasons which they vrge, and wherewith they goade vs to subscribe, that spermaticall partes euen according to the *first intention*, may reunite themselues.

The third argument. *Hippocrates.*

The fourth. The fifth. *Galen.*

The contrary opinion Authorities for it. *Hippocrates.*

Those which haue giuen vp their names against this opinion, doe labour to proue the contrary by authorities and by reasons. And first they oppose the sixtieth *Aphorisme* of the sixt section; *If a bone, a gristle, a nerue, or the fore-skin bee cut, they neuer reunite againe.* *Galen* in the 8. and 10. chapters of his first booke *de semine*, as also in the 87. chapter *de arte parua*, writeth that *the fleshy parts doe easily conglutinate, spermatical neuer.* And in the 51. chapter *Artis parua*, he esteemeth *a fracture in a bone to bee incurable, because bones doe not reunite according to the first intention.*

Reasons.

These authorities are seconded by Reason; first, both the Efficient and Material causes of reunition are wanting. The Efficient is the formatiue facultie, which is onely in the seede, whose drowsie & lusking faculty is onely brought into act by the heate of the wombe. True it is, that there remaineth in the solid parts, a faculty conseruing the figure of the part; but to make any thing anew is proper onely to the seede, the Efficient therefore is wanting.

What is to be thought.

Neither is there any Matter at hand, as the seede; which being generated onely in the testicles, how can it be transferred to the head, the arme or any other part?

Three conclusions, and 2. foundatiõs. The first foundation. A double reunition.

Out of these waues and stormes of opinions, that wee may redeeme and establish their minds that are yet incertainely tossed to and fro, and set them safe aland in a quiet harbor, wee will determine the whole question by three conclusions, and these conclusions shall haue three foundations. The first is taken out of the determinations of *Galen*, in the 90. and 91. chapters *de arte parua*, and is on this manner. There is a double reunition of dissolued

ued parts; *One after the first scope, another after the second scope or intention.* The first intention is ἐν τῇ κολλήσει; that is, in *Agglutination* which we call σύμφυσις. The second ἐν τῇ δέσει; that is, in *Colligation* which wee cal πάρφυσις. The first is sometimes accomplished without any *medium*, that is, ought comming betweene; as in flesh which being cut or diuided, is presently glued together; sometime with a *medium* of the same kinde, which we call *medium homogeneum*. The second intention is accomplished with a *medium* of another kind, which wee call *medium heterogeneum*, as with a *Callus*, Cicatrice or scarre, and such like which are not of the same kinde with the part dissected or separated. Now that parts may reioyne according to the *first intention* and by a *homogeny medium* or meane, many things are required. First, the strength of the Efficient, to wit, of the formatiue faculty and of the natiue heate. Againe, a due disposition of the Matter, which must be plentiful, that it may suffice nutrition, accretion, and a new generation. Moreouer it must bee ministred not by little and little, but togetherward, that is, it must bee sodainely and at once altered, that nothing of a diuers kinde may interpose it selfe betweene the disioyned parts in the time of that alteration.

What are the first and second Intentions in Coalition.

What things are required to the first intention.

Another foundation is this; Of spermaticall parts some are soft, as veines; some harder, as arteries and nerues; some hardest of all, as bones. The third foundation, That in Infancy and Child-hood all the spermatical parts are exceeding soft, and the bones like curdled or gathered butter, and coagulated or sammed cheese; but in those that are growne to further yeares, they become dryer, and in old men very dry, because our life is nothing else but a drying of the spermaticall parts.

The second foundation.

The third.

These foundations being thus layd, we conclude thus triplewise. First, that fleshy parts are easily regenerated, and doe reunite according to the *first intention*; but spermaticall parts very hardly. Secondly, in Children and moyst natures, all the spermaticall parts, euen the bones may reunite by a homogenie meane; in those that are growne some parts may, but not all; veines often, arteries more rarely; bones neuer. In old men there is no hope of coalition in a nerue, membrane, arterie, veine or skinne, which is called νεύρωσις; none in a gristle broken, eaten a sunder, torne or dissected, which is called χόνδρωσις; none in a bone broken which is called ὀστέωσις. Thirdly, in all ages and sexes euen to the vtmost extent of old age, all the spermaticall parts will reunite according to the *second intention*, that is, by a *medium* or meane heterogenie, or of a diuers kinde, which in a bone is called *Callus*, in the rest a Cicatrice, or a scarre.

The triple conclusion.

First.

Second.

Third.

The truth of the first conclusion is thus confirmed; the mutation or change of bloud into flesh, is easie and expedite, because it is accomplished by a light and almost single and simple alteration. For bloud is red, hot and moyst; so also is flesh, redde, hot and moyst; one thing only is required; that the bloud be incrassated; there is therfore a fit & apt disposition of the matter. The Efficient is likewise very strong, because fleshy parts are hotter then spermaticall: whereupon it commeth to passe that they sodainly reunite, sometimes without any meane at all; sometimes with a Meane, but alwayes of the same kind and homogenie; yea oftentimes the flesh groweth so importunately in woundes (which wee call *hyposarchosis*) that we are constrayned to inhibite and restrayne the increase with *corrasiue* Liniments and poulders. But on the other side, the spermaticall parts doe very hardly reunite according to the *first intention*, because of the *weaknes of the Efficient*, the *ineptitude or vnfitnesse of the Matter*, and *the siccitie or drynesse of the parts*. The Efficient is heate, which being weake, hath enough to doe to intend conseruation and nutrition, and therefore cannot perfectly restore the decayed and vanished substance of the solid parts. *It is enough* (sayth *Galen* in the 59. chapter *Artis parua*) *if it hinder them from being exiccated or dryed vp.* How shall it then laudably indeuour a new generation, when it cannot preserue them in that state in which Nature produced or brought them foorth? Haply there will be a sufficiency of Matter, but it cannot flow together ward and at once, because the mutation or change of bloud into a bone, cannot be accomplished but by long interpolation and many meane alterations: first into marrow, then into glew, and so into seede; of red it must become white, of moyste it must become drie, of liquid it must bee incrassated or thickned; in a worde, it must alter the temper and all the qualities. Wherefore, because the aliment doth not flow but by little and little to the nourishment of the bones and the spermaticall parts; it commeth to passe, that the excrement which resulteth or ariseth out of the nourishment, doth interpose it selfe betweene the disioyned parts before the bloud can passe thorough those diuers alterations, and so breedeth a *Callus*. There is also another impe-

The confirmation of the first conclusion.

A threefold cause why spermatical parts do not reunite.

1. The weaknes of the Efficient.

2. The indisposition of the Matter.

impediment from the neighbouring parts; as if they bee fleſhy they preuent the coalition by filling vp the vacuitie or empty ſpace.

3 The hardnes and ſiccity of the parts.

The laſt cauſe of the difficulty of coalition, is the ſiccity and hardneſſe of the ſpermaticall parts. For thoſe things that are dry are very hardly vnited; and the Philoſopher in all mixtions requireth ſome watery moyſture, that by it as by a glew, all the reſt may bee vnited.

The confirmation of the 2. concluſion.

The ſecond concluſion is thus ſtrengthned: Children becauſe they are not far off from the principles of generation, haue the Efficient cauſe very ſtrong and forcible: they haue aboundance of naturall heate, plenty of ſpermaticall Matter and that very apt, which is ſodainly and eaſily changed, becauſe of the ſoftnes and ſuppleneſſe of the ſpermaticall parts. In growne men the veines becauſe they are ſoft and beſide at reſt from growing and extenſion, are eaſily glued together; but the arteries very hardly, as well by reaſon of their continuall motion which hindereth reunition, as alſo becauſe of the hardneſſe of their coates, for they are (as ſayth *Herophilus*) fiue-fould thicker then the veines. Some haue obſerued that many parts, albeit they be ſoft doe neuertheleſſe not reunite, becauſe of the excellency and neceſsity of their action; for that the creature dyeth before they can be reunited; ſo the fleſh of the heart being diſſeuered is neuer reunited, becauſe the man dieth inſtantly, by reaſon of the interception of a duty or function of abſolute neceſsity for the preſeruation of life.

Herophilus.

The confirmation of the 3. concluſion.

The third concluſion is ſo euident of it ſelfe, that it needeth no probation at all; for at all times ſpermaticall parts doe reunite by a heterogenie meane. If the skin bee wounded there enermore groweth a cicatrice or ſcarre vppon the ſeparation. A broken bone is alwayes and at all times ſouldered with a knotty *Callus*; notwithſtanding for further illuſtration two problemes or difficulties are to be cleered.

The firſt probleme.

The firſt, why if a bone be caued or hollowed by an vlcer ſo as there is any loſſe of the bone, the fleſh can neuer be generated ouer it? For *Hippocrates* in the 45. Aphoriſme of the ſixt ſection ſayeth, ***All vlcers that are Annual muſt of neceſsity looſe ſome part of the bone vnder them, and the ſcarres or Cicatrices become hollow.*** Why doth not the fleſh inſinuate it ſelfe into the hollow place of the periſhed bone? Or if there be a *Callus* generated, why is there not alſo fleſh generated about it? I anſwere, that fleſh cannot bee generated in the cauitie of the bone, becauſe fleſh is not made but of fleſh, a nerue but of a nerue; now the lippes or extreame verges of the cauitie are bony: what therefore ſhall they endeuour to generate? Surely either nothing at all, or elſe a bone or a *Callus*. If in the place of that which is loſt there be no body ſubſtituted, then is there no foundation layde whereuppon fleſh may ariſe. The bone it ſelfe in dry and hard bodies cannot be regenerated; therfore Nature not being able to doe that ſhe would, doth that ſhee can, ſo ſhee maketh a *Callus*. But what is the reaſon why no fleſh can grow vpon this *Callus*? Becauſe fleſh is a liuing and animated thing, and a *Callus* without life altogether: now that which is animated, and that which is inanimated, that which liueth and that which is dead, do differ in the greateſt difference, that is in the kinde and very forme; wherefore the *Callus* which is without life, cannot be a foundation to build fleſh vppon which hath life. That a *Callus* is without life, may be demonſtrated, becauſe it is produced of the excrement of the bone and the neighbour parts. If it be obiected, that if it bee without life and not nouriſhed, it could not endure and grow all the time of a mans life, which that it doeth is more then manifeſt: the anſwere is at hand; It encreaſeth not by nutrition, but by appoſition of the matter, as the haires, and the nailes; againe, it endureth as long as the bones receiue any nouriſhment, from which there alwayes redoundeth an excrement, whereby it is preſerued.

The anſwere to it.

Obiection. Solution.

Obiection. Solution.

The 2. probleme. Solution.

The ſecond Probleme is; why if the *Callus* come from the excrement of the bone, is it not generated in a ſound bone which alſo yeildeth an excrement? Becauſe, when the bone is weakned by a wound, the excrements are more plentifully driuen vnto it from the neighbour parts; euen as all the parts that border vpon a wounded part, doe thruſt downe their ſuperfluities vnto it. And thus I thinke I haue touched, I hope cleered, all difficulties which concerne the coalition of the ſpermaticall partes; it is therefore nowe high time to turne our diſcourſe ſome other way.

Anſwere to the formet obiections. To the firſt.

But before we leaue the field, it ſhall not be amiſſe to diſparkle all the forces of our aduerſaries, that we may be ſayd to haue gayned an intire and accompliſhed victory. The firſt argument of the firſt opinion is true onely in Children; for in old men euery man will confeſſe there is both a weakeneſſe of the Efficient, and a want of the Matter. The ſecond

cond is a captious Sophiſme, made to intrap the ignorãt. For it is not neceſſary that wherſoeuer there is ſence, there alſo ſhould be a nerue, for then the whole body ſhould bee a nerue; it is ſufficient, if a nerue be deriued vnto the part, by whoſe illuſtration and irradiation, all the particles of that part haue ſence; the ſame we may ſay of Veines and arteries. For Mathematicall or locall contaction is not required to euery action, but onely phyſicall and naturall. To the ſecõd.

For their third argument, I anſwere, that there is not the like reaſon of the teeth, and of other bones; for the teeth after they be drawne doe growe againe, by reaſon of their End, and by reaſon of their Matter. By reaſon of their End, becauſe they are ordained to chew, mittigate, and prepare the meate for the ſtomacke: and therefore as they encreaſe euen till the end of our age for our neceſsity, becauſe they are continually waſted by attrition or rubbing one againſt another; ſo for the ſame neceſsity they are regenerated when they faile. Beſide, if you regard the matter of their generation, there is aboundance of it contained in the cauities of both the iawes; add heereto, that the teeth are not incompaſſed with any other part which ſhould hinder their generation. To the third.

Fourthly, they vrge, that Accretion and Nutrition are kinds of generation; but bones do grow and are nouriſhed, why therefore may they not be reunited? Wee anſwere, that this is the order and diſpenſation of Nature; that firſt the part be nouriſhed; then, if there be any ouerplus, that the part encreaſe into all dimenſions; and after this expence, if there yet remaine any ſurpluſage of aliment, that then it may go to the reſtoring of the want or defect in the part; but ſeede is neuer generated in that quantity, that it ſhould be ſufficient for nouriſhment, accretion, and beſide for a new generation. To the fourth

In the wombe indeede the Spermaticall parts are eaſily generated, becauſe both the matter is copious, and there is moreouer ὁ δημιυργὸς δισσὸς, a double Workeman, one in the ſeede, another in the veſſels, or as ſome thinke, in the ſubſtance of the wombe; but after wee are borne, they are hardly generated, becauſe one of the workemen is abſent, which formerly was in the ſeede, or aſsiſtant vnto it. As for the authorities of *Galen*, they do not conclude either that all ſpermatical parts do admit coalition, or ſom alwayes; and therefore we willingly ſubſcribe vnto them, without any præiudice vnto our cauſe. Anſwer to the authorities of *Galen*.

The argument of the other Opinion, which denieth the formatiue faculty to the ſpermaticall parts, yeelding it onely to the ſeede, is eaſily ouerthrowne; becauſe the ſeede (according to *Hippocrates*, *Ariſtotle*, *Galen*, and all Phyſitians) containeth in it the Idea or formes of all the parts, which it receiueth from the ſolid or ſpermaticall parts. True it is, that in the Bones there is, that I may ſo ſay, a power to bonify or make bones, in the veins to veinefy, ſo there be an apt diſpoſition of the matter. But when wee ſay that Bones are nouriſhed, encreaſed, and do reunite by ſeede, we do not vnderſtand prolificall ſeede ſuch as is apt for generation; that is onely in and about the Teſticles, where it attaineth his forme and perfection, but we vnderſtand ſomething like vnto ſeede. Finally, the authorities of *Hippocrates* and *Galen*, doe conclude onely, that the hinder parts cannot reunite, which thing we haue already demonſtrated in the ſecond Concluſion. And thus much of the ſecond queſtion. Anſwere to the argumẽts of the ſecond opinion. To the authorities of *Hippocrates* & *Galen*.

QVEST. IX. *Whether the Spermaticall parts be hotter then the Fleſhie.*

IT were either ſuperſtition or oſtentation to quote all the places of *Hippocrates*, *Ariſtotle*, and *Galen*, wherein they auouch, that vnbloudy parts are colder then bloudy; but no man that euer I read of, did euer deny that fleſhy parts are bloudy, and ſpermaticall either without bloud, or at leaſt but lightly moiſtned therewith. Vpon theſe premiſes any man may gather the concluſion; or if they will not inferre it, it will ariſe of it ſelfe. Yet there are ſome among the late writers, who would faine perſwade themſelues, that the Spermaticall parts are hotter then the ſanguine or bloudy. *Iobertus* ſometimes the learned Chancellor of the Vniuerſity of *Mompelier* in *France*, ſet forth a Paradoxe concerning this matter, wherein he diſputeth many things with great wit and ſubtility; ſome probabilitie, but leſſe ſubſtance of truth, concerning the in-bred heate of the ſpermaticall partes. I haue alwayes much eſteemed the learning and edge of the mans wit, yet becauſe he is the Chiefetaine of them who hath impeached the authority of the receiued opinion concerning this matter; I am conſtrayned to diſſent from him, and will not thinke it preſumption to examine his arguments one by one, that the truth may more euidently appeare. *Iobertus* opinion of the heat of ſpermaticall parts.

Thoſe

His firſt argument.

Thoſe things (ſayth he) that ariſe of others do ſauor of the principles from whence they ariſe; but the ſeede from which the ſpermatical parts do proceed, is hotter then bloud; and therfore the ſpermatical parts are hotter then the ſanguine or bloudy. Now that the ſeed is hotter then the bloud, may thus bee demonſtrated. *Hippocrates* calleth ſeede fiery & ayrie; bloud cold and wateriſh. Beſide, bloud is contayned in a trough or channell, but the ſeed paſſeth through veſſels which haue no ſenſible cauities, which are certaine ſignes of the tenuity and heat thereof. But this reaſon ſeemeth to be more waſhy and looſe, then may anſwere the ſtrength and vigor of ſo great a Clarks wit. For there are two things to be conſidered in ſeed (as ſayth *Galen* in many places) the craſſament, corpulencie as I may ſay, or body of it, and the ſpirites wherewith it is aboundantly ſtored: in reference to the former the ſeed is ſayd to be watery and earthy; in reference to the ſpirits, fierie. The ſpirits are the inſtruments of the ſoule, by which that noble architect formeth her manſion or habitation out of the ſeede, working and forming it into parts conuenient. Theſe are called forming ſpirits, and in reſpect of theſe, the ſeed is ſayd to be *artifex*, a workman, and carrieth the nature of an Efficient cauſe. The watriſh and cold body of the ſeede, is the matter of the ſpermaticall parts. I conclude therefore that the whole ſeede conſidered with all his parts is hotter then the bloud, becauſe it is fuller of ſpirits; but if the ſeede be robbed of his ſpirits, then is it colder then the bloud; and therefore being auoyded, the heate of it preſently vaniſheth, and by the coldneſſe of the ayre it becommeth libuid and black: and ſuch did *Galen* acknowledge the matter of the ſpermaticall parts to be.

The anſwere to the former argument.

Two things to be conſidered in ſeede, the body and the ſpirits.

Iobertus his 2. argument.

This firſt argument *Iobertus* ſtrengthneth with another, thus. The conformation or ſtructure, and ſcite or poſition of the ſpermaticall parts doe manifeſtly proue their heate: for the bones occupy the in-moſt place, and are couered on euery ſide with fleſh, as are alſo the nerues, leaſt their ingenit or in-bredde heate ſhould vaniſh or bee offended by the coldnes of the ambient ayre; but the fleſh is placed about the vtmoſt parts. By which argument I cannot ſee what he wold conclude, for all theſe things do rather argue the coldneſſe, then the heat of the ſpermaticall parts; for becauſe cold was their greateſt enemy, that their weake and languiſhing heate might not bee extinguiſhed, Nature did on euery ſide cheriſh them with fleſh, and inueſt them with membranes for their defence. Moreouer, the bones are not ſeated ſo farre within for the preſeruation of their heat, but becauſe they ſhould ſerue as a ſtay and prop to vphold all the reſt of the frame. But if he will conclude that the externall parts are colder then the internal, it will follow that the skin (which all men acknowledge to be temperate) is colder then either nerues or bones.

Anſwere.

Iobertus 3. argument.

Anſwered. *Galen.*

His third argument is yet more abſurd. The ſpermaticall parts (ſayth he) are eaſily offended with the cold, therefore they are hot, for alteration is made by contraries, conſeruation by things that are alike. But this is vtterly oppoſite to *Galens* Philoſophy, who in his booke *de arte parua*, giueth this as a generall rule, whereby we may diſtinguiſh the tempers of the parts: that thoſe which are eaſily offended with cold, are cold, and the hot with heate. So ſayth *Hippocrates*, cold is the greateſt enemy to the bones, nerues, teeth & marrow of the backe, becauſe theſe parts are cold. *Galen* hath theſe expreſſe words in the 59. chapter of his booke *de arte parua*. *In all parts this is a common marke of the temperature, if the member doe eaſily grow cold, it is a ſigne of frigidity or rarity; if hardly, of heat or of denſity; if drying things offend it, then is it dry and raſhy, if moyſt things then it is moyſt.*

Hippocrates.

Iobertus 4. argument.

Finally, *Iobert* addeth this laſt argument. For that many actions of the ſpermatical parts doe teſtifie that there is in them a vehement and high degree of heate; ſo the ſtomacke which is membranous, attenuateth and boyleth the meat though it be very hard; yea, the Eſtrich ſoftneth yron in her maw. The bladder which is likewiſe membranous, baketh the ſtone harder then the kidneyes, which are fleſhy parts. Theſe obiections may at firſt ſight ſeeme of ſome moment to thoſe that are not ſufficiently grounded in our Art, but we will labour to ſhew their weakenes and inſufficiency. Firſt therefore that obiection concerning the ſtomacke is full of errour: for thoſe creatures in whome the innermoſt coate or membrane of the ſtomacke is more fleſhy, doe boyle their meat more ſtrongly: and thoſe creatures which haue no teeth, as birds, haue a ſolid fleſh, and very full of warmth annexed to their crops; and as for men, the inward coat of their ſtomacks is lined ouer with a fleſhy cruſt, which *Fallopius* firſt of all men obſerued. But go too, let vs yeild this vnto him, that the membranous ſtomacke doth more perfectly boile, the membranous bladder bakes the ſtone harder, yet it will not thereupon follow that the ſpermaticall parts are the hotter, but that the heat when it is retained in a more ſolid and faſt matter, burneth more powerfully.

Anſwered,

A good obſeruation of *Fallopius.*

Who

Who will say that a glowing yron is hotter then a flame of fire? No, it burneth more fiercely, but yet the degree of his heate is more remisse. So fire in his owne spheare, and in *aquositæ* doe not burne, because of the tenuity and thinnesse of the matter. For the stone, it is not generated so much by a sharpe and biting heate, as by long continuance in the part, & of the viscidity and slimenesse of the matter, as we see in old men. Hence therefore it appeareth that the spermaticall parts are not hotter then the fleshy. Neither must wee admit the distinction of *ingenit* and *influent* heat; because if there bee a collation or comparison made, it must be between equals; and thus much of the third question. Comparison. Equanitie.

QVEST. X. *Whether the solid parts being once dryed, can be made moyst againe.*

THere is also beside the former three, another by-question, concerning the moystning of solid parts after they bee dryed: for the opening whereof, wee must vnderstand that the name of a solid part is very ambiguous and equiuocall. The common people call that a solid part which is firme, hard, dense or thight, and well compacted or knit together. So *Galen* calleth the flesh of the heart *solid* flesh. *Hippocrates* in the 7. section of his 6. booke *Epidemion*, calleth all the containing parts solid, and thus fleshy parts also shall be esteemed solid. Some there are who by solid, vnderstand all animated parts, which haue a proper circumscription, and are bounded within their owne limits. Philosophers call that solid which is, τὸ ὅλον, *tale*, that is, *wholly ful of it selfe*: so the fire and the ayre in their owne spheares are sayd to be solid. So *Cicero* in the first booke of his *Diuinations* sayth, that when *Alexander* determined to weare a crowne of gold, he made doubt whether it should be of *solid* gold, or only laid ouer with gold on the outside: and according to this acceptation, all the similar particles (as we haue already shewed) are called solid, because all parts of them are equall and alike. But most properly the Physitians call those solid partes which are spermaticall, as *Galen* teacheth in the first chapter of the eleuenth booke of his Method, and in the 7. chap. of his first booke *de naturalibus facultatibus*, as also in the 16. chap. of his first booke *de semine*, in all which places he calleth fleshy parts bloudy, and spermaticall parts solid. These solid parts in the 59. chap. of his booke *de arte parua*, he calleth *primas* or the *First*; either because they are the foundations of the rest, and as it were the first threds & lines which support the whole fabrique of the body; whereas the flesh doth but as rubbish fill vppe the empty spaces betweene them; or else because seede is the first principle of the body; or lastly, because the spermaticall parts are generated before the fleshy. Now the question is concerning these true and properly so called solid parts; whether if they bee resiccated and dried, they may be by Art or Nature moistned again; that is to say, whether the Aliment that is substituted be of the same kinde with that which is wasted. *Galen* was the man who gaue the occasion to this question in the 59. chap. *Artis parua*. *Solid parts* (sayeth hee) *of the body can by no meanes be made moyster, it is all we can do if we can keep them from drying*. And in the 1. cha. of the 11. booke of his Method. *The quantity of the solid parts remayneth alwayes the same*. And in the 11. chap. of the tenth booke of his Method. *The siccity or drynes of the solid parts can by no meanes be cured*. Manifold acceptions of a solid part. *Galen.* *Hippocrates.* *Cicero de diuinatione.* Which are properly called solid parts *Galen.* Why they are called first parts. Whether the solid parts may be moystned. *Galen.*

We imagine that this doubt may easily bee assoyled, if wee remember that in the solid parts there is a double substance; one exquisitly solid & fibrous, altogither without bloud; another which filleth vp the distances of the fibres, which is called the proper and peculiar *flesh* of euery part. The first can by no possible meanes be humected or moystned, that is to say, neither *such* nor *somuch* can be restored *how much* and of *what kind* is spent or consumed. The later may easily be restored. But least you should think this distinction to bee a brat of my owne braine, you shall heare *Galen* making mention of the very same in his Medicinal Art, and in his booke of Method. In the 59. chap. *artis parua*. *The solid parts* (sayth he) *which are truely solid and first parts, can by no possible meanes bee moystned; it is as much as we can do if we can hinder them from being ouer soon exiccated or dried vp, but the inter-middle spaces may possibly be filled with this or that moysture*. In the 11. chap. of the 10. booke of his Method. *In the solid parts there is a fibrous substance and there is a fleshy; so a veine which hath but a thin coate, hath many fibres intertexed or wouen with it, to which the proper substance of the veine groweth. This hath yet gotten no common name; but by way of instruction I see no reason but you may call it the fleshy substance*. This distinction therefore is *Galens* owne, and therefore the fitter for vs to rest in. And so we haue gon through all the controuersies or difficulties that concerne the nature of a part, which we esteeme to be the proper subiect of Anatomy. It remaineth now that we addresse our selues to our busines. A double substance of the solid parts out of *Galen.* *Tantum et tale.* *Quantum & quale.* *Galen.*

THE SECOND BOOKE.

Of the parts Inveſting and Containing the whole Body: And alſo the lower belly in particular.

The Præface.

BEeing now to diſſolue this goodly frame of Nature, and to take in pieces this Maiſter-piece, it ſhall not bee amiſſe to take a light ſurvey of all the parts as they lye in order, beginning with that which firſt meeteth with the ſence. This body therefore, which indeede is but the Sepulchre of that God at firſt created, although to the eye it is very ſpecious and beautifull, yet is it but infirme and weakely defended, ſo that the ſoule is truly ſaide *Inhabitare immunitam Ciuitatem*; for to death and diſeaſes we lie open on euery ſide. The world is a Sea, the accidents and diuers occurrents in it are waues, wherein this ſmall Bark is toſſed and beaten vp and downe, and there is betwixt vs and our diſſolution, not an inch boord, but a tender skinne, which the ſlendereſt violence euen the cold aire is able to ſlice through. How then, may ſome ſay, commeth it to paſſe, that ſo weake a veſſell ſhould liue in ſo tempeſtuous a Sea, ſhould ride out ſo many ſtormes and dangers? Surely, it is put together with wonderfull Art, and framed according to Geometricall proportions, which the Engliſh Poet hath obſcurely but excellently deſcribed vnder the type of the Caſtle of *Alma*, that is, of the ſoule.

The Frame thereof ſeem'd partly Circulare,
And partly Triangulare: ô worke Diuine!
Thoſe two, the firſt and laſt proportions are;
The one, imperfect, mortall, fœminine:
The other, immortall, perfect, Maſculine:
And twixt them two, a Quadrate was the baſe,
Proportioned equally by ſeauen and nine;
Nine, was the Circle ſet in Heauens place,
All which compacted, made a goodly Diapaſe.

So that truth to ſay, it is not the matter, whoſe commencements are duſt, and conſummation clay, but the excellent proportion and ſtructure that maketh this Paper-ſconce high perill-proofe.

VVe liſt not againe to retriue the wonders we haue already ſprung, leaſt we ſhould ſeem to mingle Yarne to lengthen out our web: our paine is as great in choiſe, as others is in want. For he that would ſum vp all the rarities of Nature, which ſhee hath packed together in that goodly cabinet, had neede of the Sea for his Inke, and the ſand for his Counters.

ters. It ſhall be ſufficient in this place, to draw the Curtaine and to ſhew you the caſe, rather the Coffin or winding ſheete wherein nature hath wrapped this liuing body of death. Thoſe are foure beſides the haires, wherewith as with Flowers the coffin is garniſhed, that is, the Cuticle or Scarſe-skin, the skin it ſelfe, the fat and the fleſhy Membrane.

The Haires are a velature or couering for the more vncomely parts, a defence for the head, which we may encreaſe or diminiſh, keepe on or leaue off at our pleaſure and for our neceſsity, an ornament for the face, and finally a conuenient outlet and way of expence for the thicke and ſmoaky vapors, which otherwiſe would ſmother and choake the Braine.

The Scarſe-skin or Cuticle being voide of ſenſe it ſelfe, is ordained as a muniment to defend the skinne from the violence of outward iniuries, to attemper his exquiſite ſenſe, and ſo become the *medium* or meane of ſenſation; to couer the Orifices or mouths of the Capillarie and hairy or ſmall veſſels, which determine in the skin that the blood iſſue not from them, to ſucke vp the vaporous moyſture which otherwiſe would indecently well out of the pores of the skin, and inſenſibly to euaporate the ſame, which we call tranſpiration; and finally, to turne the roughneſſe and inequality of the skinne into a ſoft and ſlicke ſmoothneſſe, and ſo becommeth one of the principall beauties of the body.

The skin it ſelfe is the wall of the Caſtle, ſo quaintly framed, that the more fiercelie it is beſieged by the cold, the more ſafely it doth defend, and the more ſtrength it doth giue to the inward parts: and therefore *Hippocrates* ſaith, *In Winter the belly*; that is, *the inward parts of the body are hotter*; the reaſon is, becauſe all the ſpirits are immured, and the Naturall heate reſtrained from vaporing forth. But when the outward enemies are departed, then it openeth it ſelfe on euery ſide, ſo cleanſing the body of ſuch ſuperfluities, as in the time of conſtraint were contracted.

Next vnder the skin lyeth the fat, a pillow to the veſſels which run vnder it, a complement to fill vp the vacant diſtances of the Muſcles, thereby making the body plumpe, ſoft, and better proportioned; a light and ſoft veſture to keepe the ſubiected parts warm in winter, and in ſummer to defend them from heate. Finally, a Stowage or Magazine of nouriſhment againſt a time of dearth: for being diſſolued by the naturall heate, it melteth into a blood-like vapour, and returneth againe into the veſſels, and ſo becommeth a ſubſidiary Aliment in times of Neceſsity, Nature being at her own finding, and teaching vs with how little ſhe can content her ſelfe.

Finally, the fleſhy Membrane as an avant Mure or inward counter-ſcarſe, is ordained as a ſecret defence to hold out a ſecond aſſault, if the outward ſhould bee won by the enemy. It preſerueth alſo the fat, that it is not molten with the perpetuall motion of the Muſcles. It ſupporteth and ſuſtaineth the paſſages of the veſſels which run from within forth to the ſurface of the body. And to conclude, as a mound of earth within a Citie, ſerues to make vp the breaches of the wall, ſo doth this Membrane being fleſhy, helpe to conſolidate the skin being wounded, or otherwiſe violated, which without fleſh was impoſsible to be accompliſhed. And theſe are the outward defences which are generall to the whole bodye. There are ſome alſo more particular to the lower belly, with which in our Anatomical adminiſtration, we muſt begin according to the order of Diſſection: but firſt we wil giue you a generall view of all the regions & outward parts of the body, calling euery one by theyr names, and diſciphering them in two Tables, to which wee haue added alſo their expoſition, that the young Anatomiſt being in the beginning acbuainted with the appellations of the outward parts, may not be puzled in the future Diſcourſe.

CHAP. I. *A Diuiſion of the body of Man.*

Diuers diuiſions of the body.

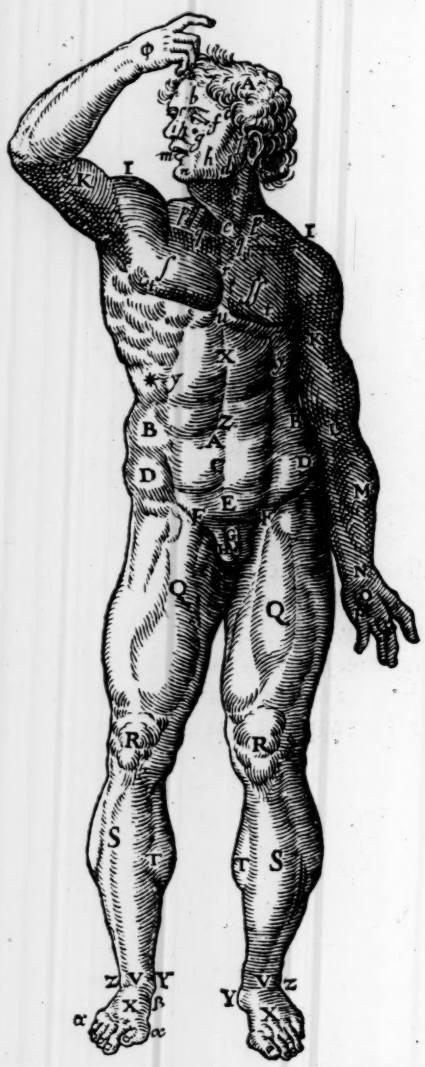
Our diuiſion.

The vpper region which is the head.

Iocles Cariſtius in an Epiſtle to King *Antigonus*, diuides the body of Man into the head, the cheſt, the belly, and the bladder. The Egyptians into the head, the necke, the cheſt, the handes, and the legges; we will part it into three regions, and the ioynts. The three regions are, the vpper which is the head, the middle which is the cheſt, and the lower which is the belly. The vpper region or the head, is circumſcribed or limited by the crowne, and the firſt racke bone of the necke. The ſecond Region the later writers do call *venter medius*, or the middle belly and the cheſt. *Hippocrates* in his Aphoriſmes calleth it the vpper belly, but in reference to the lower: and the cheſt in his Booke *De Arte*, is taken for the whole trunke of the body, for he writeth, that *the Liuer is ſcituated in the Cheſt*. This ſecond or middle Region is likewiſe limited by his bounds, the vpper part with the *Clauicles*, ſo called, becauſe they do *claudere*, that is, ſhut vp the Cheſt: we call them patelbones: below, with the breſt blade and midriffe, which like a partition wall diſtinguiſheth this middle from the lower region. On both ſides it is encloſed with twelue Ribs, before with the breſt

The middle region which is the Cheſt.

TABVLAI. *The firſt Table, ſhewing the outward and fore-parts of the body.*

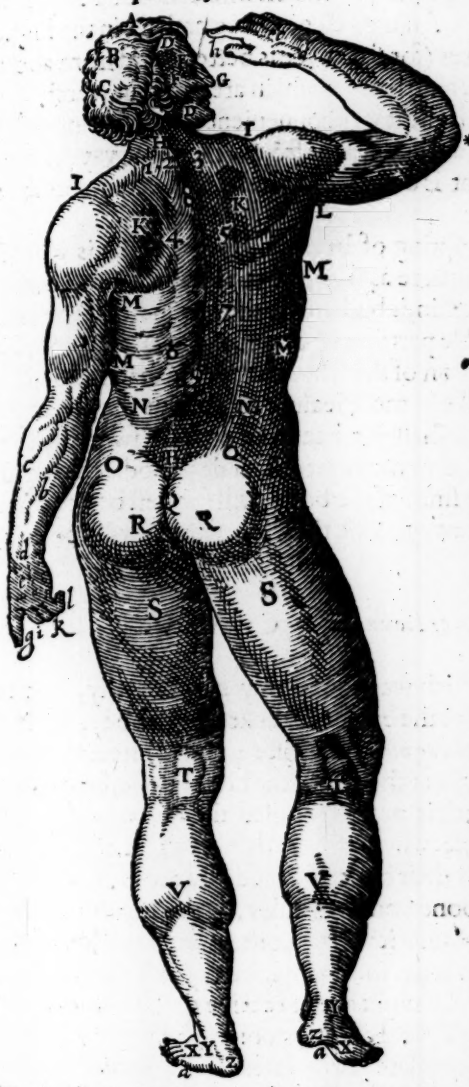


A The hairy Scalp, cald τριχωτὸς.
b The forhead cald *Frons*, μέτωπον
c The temples cald τέρορα, κρόταφοι
From *b*. to *d*. The compaſſe of the face.
e The greater or inward corner of the eie, cald *Canthus internus*.
f The leſſer or externall angle of the eye, cald *Canthus externus*.
* The lower eyebrow which is immooueable, *Palpebra*.
g The cheek-bal cald *mala*, μῆλα.
h the cheek-puf cald *bucca*, γνάθος
i The ridge of the noſe cald *Naſus externus*, ῥὶν.
K The noſthrils cald *nares*, μυκτῆρες
L The outward eare, *auris externa*
m The mouth made of the two lips, cald *Os*.
n The chin called *mentũ*, γένειον.
o The neck, *collũ* αὐχὴν & τράχηλος.
Frõ *o*. to *e*. the piller of the neck, *truncus*, & ὄλμος.
pp. The hollow of the neck, called *inguli*, σφαγαὶ.
qq. The patel bones, *claues* κλεῖδες
r. The cheſt *pectus*, στέρνον.
ſ. The right breaſt.
ſſ. The left breſt: to this Region we apply cordiall *Epithemations* moiſt and dry.
tt. The nipples of the breſts, *Papillæ* θηλαὶ.
u. The trench of the heart which the Ancients called καρδία. The Latines *ſcrobiculus Cordis*. This part is anointed for the mouth of the ſtomacke.
Frõ *u* to E. the lower belly, γαστήρ
x. The *Epigaſtrium* or vpper part of the lower belly.
yy. The *Hypochondria* or *Præcordia*
* The outwarde Liuer-remedies are applyed to this place.
z. The region of the nauill, called *vmbilicalis*, or the middle part of the lower belly.
A. The nauil *vmbilicus*. The root of the belly, ὀμφαλος.
BB. the ſides, *Latera*, πλευραὶ.
C. *Hypogaſtrium*. the watercourſe *Aqualiculus*, the lower part of the lower belly, ἦτρον.
DD. The flankes called *Ilia* and λεπεῶνες.
E. The Groine called *pubes* or *pecten*, λεὶς ἡ ἦβε.
FF. The Leske cald *inguen*, wher thoſe tumors are cald *Bubones*.
G. The yard with the foreskinne, *penis cum præputio*.
H. The ſtones or Teſticles, with the cod or *ſcrotum*.
II. The ſhoulders *humeri*, ὠμοπλάτες
KK The armes *Brachia*, βραχίονα.
L. The bowt of the arme, called *Gibber*, ἀγκὼν.
M. The outſide of the lower part of the arme cald *cubitus* πῆχυς.
N. The wreſt cald *Brachiale* κάρπος
O. The after-wreſt *poſtbrachiale*, μεταχάρπιον.
P. The Palme called *Palma* or *vola manus*, θέναρ.
ρ The backe of the hand *Dorſum manus*, ὀπισθέναρ.
QQ. The fore and middle part of the thigh, where wee apply cuppingglaſſes to bring down womens courſes. μηρὸν.

RR. The knee, *genu*, γόνυ. SS. The Legg, *Tibia* κνήμη. TT. The calfe of the Leg *ſura*, γαστροκνήμιον. V V. The inſtep, *tarſus*. XX. The top of the foote *Dorſum pedis*, σῦθος ποδός. YY. The Inner Ankles, σφυρὰ. ZZ. The outwarde ankles. αα The toes of the feete. β The place vnder the inward ankle, where the veine called *Saphena* is opened.

The

The Second Table, ſhewing the outward backe parts of a Man.



A. The fore-part of the head, *ſynciput*, βρεγμά.
B. The top or crown of the head *vertex*, κορυφή.
C. The hinder-part of the head, *occiput*, κόλις ϗ ἰνίον.
From D. to D. The face, *Facies*, πρόσωπον.
E. The eyebrowes *ſupercilia*, ὀφρύες.
F. The vpper eye-lid, βλέφαρον.
*G. The tip of the noſe cald *Globulus naſi*.
H. The back part of the neck, cald *cervix*, αὐχὴν and the nuke or nape of the neck, there is a hollownes at the top of this *cervix*, where we apply Seatons.
I. The backe part of the ſhoulder top, called ἀκρώμια, ὦμος.
KK The ſhoulder blades *ſcapulæ*, ὠμοπλάται.
1,2,3. On this place we ſet cupping glaſſes.
4,5,6,7. The backe *dorſum*, νῶτον.
8,9. The ridge, *ſpina dorſi*, ῥάχις.
L. The armehole, *ala*, μαχάλη.
* The elbow, *Gibber brachij*.
M M M M. The ſides, *Latera*.
N N. The loines *Lumbi*, or the region of the kidneyes, ὀσφύες.
O O. The place of the hips, *coxendices*, where wee apply remedies for the Sciatica.

breſt bone, behind with the backe: round about, on the outſide, with many Muſcles, on the inſide with a Membrane which compaſſeth the ribbes. The third Region is called the lower belly, circumſcribed aboue by the breaſt blade and the Midriffe: below, by the hip-bones, the Haunch bones and the ſhare bones: behinde, by fiue racke bones of the loines, and the holy or great bone; and before, by the whole *Abdomen* or paunch. The reſt of the body we call the Ioynts, in Latine *artus*, and thoſe are the armes and the legges, which like boughes or branches, grow out of the trunke of the body. In the vpper region, are contained the Animal organs, that is, the braine, which is the ſeate of the ſoule, and the original or fountaine of ſence and motion. In the middle region, are contained the vitall parts, and parts ſeruing for reſpiration, as the Heart, the Lungs, and the arteries. In the lower region are contained all the naturall organs ſeruing for concoction of nouriſhment, expurgation, of excrements and procreation. And therefore the vpper Region is called Animall, the middle Spirituall, and the loweſt Naturall. The vpper is walled about on euery ſide with bones, as it were a ſtrong bulwarke or peece for defence, becauſe in it, the ſoule which is the Queene of this Little world, keepeth her reſidence or ſtate. The middle is partly bony, and partly fleſhy: bony, for the ſtrength of the heart, and to frame the cauity; and fleſhye, for the more facile motion of the Syſtole and Diaſtole. The lower region is before altogether fleſhy, that it might better bee contracted and diſtended, and ſwell into a greater pro-

The Ioynts.

What is contained in each region.

Why the vpper region is bonie.

Why the middle is partly bonie, and partly fleſhie.

Why the lower is altogether fleſhie.

proportion for the concoction of the aliment, in the suppresion of the excrements,& for the contayning and increase of the infant. In which position who can but admire the wonderfull prouidence of the Creator ? The Animall Region hee hath set in the highest place, as well for the conueniency of the sences (for the voyce is better heard from aboue; the smell receiueth best an ascending vapour, and the eyes which are as scout watches and spies, doe see furthest from aboue) as also because it was conuenient that the principall faculties of the soule should be as farre distant as they might frō the noysome vapors which doe exhale from the partes where the aliment is concocted and the excrements are retayned.

Why the animal region is highest.

Why the spiritual region is in the midst.

Why the natural is placed below.

The spirituall Region, which is the well-spring of heate and source of life,is placed in the middest,that it might difuse his sweet influence as well into the lower as into the vpper parts. The naturall Region as it were the kitchin,is built neere the ground,that the excrements might better settle from the more noble parts,and bee also more cleanly conuayed away. And this shall suffice for a briefe diuision of the whole body,and description of the three regions, through all which we will walke at more leasure,to obserue the diuers parts therein contayned. But our perambulation shall not bee in an order answerable to the dignity of the parts, but rather Anatomicall. For they that dissect dead bodies,doe first open the lower region, which because it is the sinke of the body, will soonest bee corrupted vnlesse the parts therein contayned be taken away. We therefore from it will commence our discourse.

The order of dissection.

The diuision of the inferior or lower belly. CHAP. II.

THE inferior or lower venter, which wee commonly call the Belly, in greeke γαστὴρ; is almost the middle part of the bulke or trunke of the body, distinguished from the chest by the *diaphragme* or midriffe; and is circumscribed or bounded aboue by the breast blade at the end of the breast bone,below, at the share bone: before, by that which is properly called the *abdomen* or paunch. (for some call all the lower belly by that name, whence those that are great gormandizers are sayd to be *nati Abdomini*, that is, borne for their bellies)behind, by the spondels or rack bones of the loynes, and the sacred or holy bone; on both sides, by the ribs the bones of the hippes and haunches. This Venter, because it was to containe the members of generation & nutrition both,hath allotted vnto it the most ample cauity or hollownes of the whole body. It is therefore placed below, that it might better receiue the recrements or excrements of both concoctions, and more easily and cleanly conuay them away. Before and on both sides it is fleshy, that it might bee dilated or stretched out, as well for the receiuing of nourishment as for the contayning the increase of the wombe, or else bee compressed and straightned when need shall bee for the exclusion or auoyding of excrements.

The scituatiō of the lower belly.

Why it is placed below.

Why so fleshy

Celsus.

What parts are in the *Hypochondria.*

The 3. part of of the vpper *Epigastrium.*

The spoon or hole of the heart.

The middle region of the *Epigastrium* called the region of the Nauil.

It is deuided into two partes, the fore-part and the hinder-part; The fore-parte which *Galen* calleth ἐπιγάστριον, and the Arabians (though their part of Anatomy wee may without great detrement to our Art forget) *Mirach*, *Galen* deuideth into three parts: The *Hypochondria*, the Region of the *Nauill*, and the Water-course or *Hypogastrium*: wherfore in imitation of him wee also wil deuide it into the Vpper, the Middle,and the Lower Regions.

The Vpper, which is limited by the sword-like cartilage or the breast-blade and the ends of the ribs, hath three parts; two latterall or side-parts properly called *Hypochondria*, because they are vnder the gristles of the bastard ribs, for so much the greeke worde signifieth. *Celsus* by a like kinde of notation calleth them *præcordia*, because they bee vnder the mouth of the stomacke,which the ancient Greekes called by the same name with the hart. In the right *Hypochondrium* is placed the greater part of the Liuer; in the left, the spleene and the greater part of the stomacke: the third part of the vpper *Epigastrium*, which also standeth in the front,hath deseruedly gotten the name of the whole, and is truely called *Epigastrium*, because the stomacke lyeth vnder it, which by an excellency is called *Gaster* or the belly. In this place is that cauity which the latter writers call *Scrobiculum cordis*, the hole or spoone of the Heart,the ancients called it *Cardia*. The middle part of the *Epigastrium* is the Region of the Nauill; it is circumscribed on both sides, with the endes of the ribs; & they right line of the haunch bone it hath likewise 3. parts: two laterall which *Galen* calleth κενεῶνας, i. void because the place is without bones: & *Aristotle* λαγόνας, because the are laxe

laxe and looſe; ſome call them *Ilia*, we call them the ſlankes. On the right ſide the blind gut, and a part of the Collicke gut, and a part of the empty gut called *ieiunum*. The third part of this middle Region of the *Epigaſtrium* is the front, where the Nauill is ſeated called ὀμφαλος, or *Vmbilicus*; this is the very center of the body, and vnder it lyeth almoſt all the empty gut. The parts cõtained in it.

Vnder this Region of the Nauill, is the lower Region and third part of the *Epigaſtrium*, and it reacheth as farre as the ſhare-bone. It beginneth at the ſpine or ſwelling of the vpper circumference of the haunch bone, and if you draw a line croſſe from either ſide vnto the middle ſpace betwixt the nauil & the ſpines or protuberations of the ſhare-bones, you haue the full extent of this *watercourſe*. Of ſome in a large ſignification it is called the little belly, but more ſtrictly they would haue it to be that part onely wherein the bladder is contayned, following as it ſhould ſeeme *Diocles Cariſtius*, who deuided the body into the head, the breaſt, the belly, and the bladder. This ſmall belly is diſtinguiſhed from the greater by a certaine fence or mound, made of the production of the *Peritoneum* or the rim: which production ſtretcheth from the necke of the bladder by the backe part, and the bottome thereof euen vnto the nauill, and this production is vpheld and ſuſtayned by three ligaments: two of which are called the *Vmbilicall* arteries, and the 3. is called *Vrachus*. This little belly *Hippoc.* calleth ὑπερον, and *Galen Hypogaſtrium*, the Latines *Aqualiculus*, becauſe the excrements haue in it their Rendevous or place of aſſembly: for in the fore-part it hath the bladder and the gut called *Ileon*, in the hinder part the right gutte, and betwixt theſe in women is the ſeate of the wombe. This little belly is alſo ſubdiuided into three parts, two laterall and a middle; the laterall reacheth to the place where the haire buds, and are called by *Celſus*, *Ilia*; becauſe they contayne the gut called *Ileon*, and the ſpermaticke veſſels; we call them the flankes. The middle or forepart reaching to the very yard, is properly called *Hypogaſtrium*; whoſe right and left partes which in the bending of the thigh, ſide or leane to the ſhare-bone, are called by *Ariſtotle Boubones* (which name thoſe tumors that ariſe in theſe parts doe yet retaine) by the Latines *Inguina*, which is with vs properly called the leske. The third and forepart of this *Hypogaſtrium*, where the haires growe tufted and ranke, is called by *Hippocrates* and *Ariſtotle* ἥβη, in Latin *Pecten* or *Pubes*, with vs the groine; yet *Pubes* doeth more properly ſignifie the Downe or Cotton when it ariſeth about thoſe parts in men, neare vppon the fourteenth yeare; in women about the twelfth; and it is a ſigne of maturity or ripeneſſe. For (that I may vſe *Hippocrates* wordes in his booke *de Nat. pueri*) aſſoone as the paſſages are open for the ſeede & monthly courſes; the hayre or downe in a boy or girle ſtarteth vp, the skinne being rarefied or made thin. Vnder theſe are the Priuities, called *Pudenda*; the very name carrying the remembrance of our ſhame and of our ſinne.

The backe part of the inferiour Venter or lower belly, is limited by the end of the ribs, and the extemity of the rump-bone, this part ſome call διάζωμα, that is, *Cinctum*, the girdle-ſtead, giuing the name from the vpper part; or if you will *ſubligaculum*, the breeches, for the greeke word will beare both, and then it taketh his name from the whole.

The back part of the lower belly.

It is diuided into an vpper and an vnder part; the vpper is from the bending of the Backe vnto the Buttocks, which makes the Loynes, *Ariſtotle* calles them ὀσφύες; the fleſhy parts on either ſide are called in greeke ψόα, *Pulpa à palpando*, in imitation whereof wee call it the Fillet, as it were Feele-it. On the right ſide, lies the right kidney, and on the left ſide, the left. Below the loynes are fleſhy and globous or round parts diuided by a fiſſure called by *Herophilus* δυχάλα, by vs the *cleft*. *Ariſtotle* calleth them ἰσχια, becauſe they ſuſtain a man when he ſits, and we call it mannerly the *ſeate*: he calleth them alſo γλουτοὶ, in Latin *Nates*, *ab innitendo*, becauſe they ſerue in ſtead of quiſhions to ſit vppon, wee call them the buttocks. Betwixt theſe is the *Coccyx* or rump-bone, and vnder them as in a low valley, lie the very end of the right gut and the place of ſiege, the port eſquiline or the fundament.

How it is diuided.

Of the compoſition or frame of the lower belly. CHAP. III.

THE inferior or lower belly conſiſteth of two ſorts of parts; one called Continent or Contayning and inueſting parts, the other parts Contained. The inueſting or Contayning parts which properly make the *Abdomen*, (for they hide and conceale the bowels or entralles and the guttes ſcituated in this lower belly, called therefore of the greekes ἐπιγάστριον, that is, aboue the belly) are

Containing and contayned parts.

The common inveſting parts. The proper. are alſo of two ſorts, Common or Proper. The common, are the Cuticle or the curtaine or ſcarfe-skin; the true skin; the fat and the fleſhy membrane: for they encompaſſe all the whole body, excepting ſome particular parts, as we ſhall ſhew afterward. The proper inueſting parts are the Muſcles of the paunch, or of *Abdomen*; and the *peritoneum* or the Rim of the belly; for theſe are proper to the lower belly, euery venter hauing his proper inveſture vnder the common containing parts. And of theſe we will intreate in order, ſauing of the Muſcles, which wee will referre into their proper place, in the Booke of the Muſcles.

CHAP. IIII. *Of the Haires of the whole body.*

The names of haires. *Ariſt. 5. gener. Animal. 3.* THE haires in Greeke, are called τρίχες *quaſi* θέριχες, ὅτι θερίζονται, becauſe wee mowe or poule them. *Perſius* cals them *Cirri*, from the Greeke verbe κείρω, which ſignifieth to cut. In Latine they are called *Pili*. Almoſt euery liuing creature that ingendreth within it ſelfe is furniſhed with this couering, ſome more, ſome leſſe: and yet there are, which in ſtead of haires, haue prickes, as Hedge-hogges and Porcupines; others haue Feathers, as Birds (& therefore the ſauour of Feathers and haires when they are burnt are alike,) others Scales, as Fiſhes.

Haires and Feathers of a like ſubſtance

Whereof haires are ingendered. Haires are bodyes engendred out of a ſuperfluous excrement of the third concoction, torrified by the naturall heate; and they grow eſpecially where the skin is thinneſt & moſt temperate, and where there is for theyr nouriſhment ſome proportionable quantitie of moyſture. So that for their generation or production and their conſeruation, foure things are required. The heate for an efficient cauſe, the Matter, out of which they are generated or produced, a conuenient place for their production, and fit and competent nouriſhment, or rather apponed matter to be continuallie miniſtred for theyr preſeruation.

4. things required to the production of haires.

The matter. Remote. *Hip de nat. pueri.* The Matter of the haires is either remote, or more immediate. The remote matter is a ſuperfluous moyſture, which the kernels or *Glandules* which are diſpoſed in the ſobby and wateriſh places of the body could not ſucke vp; which moyſture therefore is thruſt out into the skin. Hence it is, that whereſoeuer there are any Kernels there are alſo haires: & verily *Hippocrates* in his Booke *de Glandulis*, aſsigneth the ſame profit vnto them both. The Glandules to receyue that matter which applyeth vnto them; the haires to gather it into their nouriſhment or for their production, being expelled by nature as a ſuperfluitie. So we ſee there are Glandules behinde the eares where alſo are haires, vnder the arme-pittes haires and Glandules; in like manner in the flankes and the groyne. And if in anie part there be Glandules and no hairs, *Hippocrates* in the place next aboue quoted, rendreth the reaſon, becauſe there is too great plenty of moyſture. For wee ſee that in ſobby and ſucken grounds ſeede will not take roote, nay the graſſe it ſelfe will not grow where the water ſtandeth continually.

In principio, where are Glandules, ther are hairs

Exception, & the Reaſon.

The immediate matter. *Galen.* The next and immediate matter of the haires, according to *Galen* in the fifte chapter of his ſecond Booke *de Temperamen*: is a ſooty, thicke and earthy vapour, which in the time of the third concoction, when the aliment is turned into true nouriſhment of the parts, is eleuated by the ſtrength of the action of naturall heate, and paſſeth thorough the pores of the skin. The efficient cauſe is as we ſaide, a moderate action of the naturall heate, which exiccateth or drieth this moyſture or theſe ſootie and thicke vapours, and thruſteth them out by the tranſpirable paſſages of the skinne. For the vapour being thicke, in his paſſage leaueth ſome part of it ſelfe, to wit, the groſſeſt, in the very outlet where it is impacted, & by a ſucceeding vapour ariſing whēce the former did, is protruded or thruſt forward; and ſo one vapour continually ſolliciting and vrging another, they are wrought together into one body: euen as in chimneyes we ſee by the continuall aſcent of ſoote, long ſtrings of it are gathered as it were into a chaine. The difference is, that the ſtraitneſſe of the paſſages of the skin, where through the matter of the haires is auoyded, formeth them into a ſmall roundneſſe, euen as a wyre receyueth that proportion whereof the hole is, where through it is drawne.

Their efficient.

The manner of their production. Compariſon.

A fit Compariſon. The manner of the out-gate of this matter, is thus. When by the continuall appulſion or arriuall of ſuch vapour to the skin, the pores are plenarily obſtructed, then the next vapour that ſtriueth to be at liberty, ſmiteth the former; which by reaſon of the ſtraitneſſe of the paſſage, is driuen out into the forme of a cord. He that would ſee an expreſſe image of this manner of production, let him reſort to a Glaſier, when he extendeth his mettall into the

guttered

guttered lead wherein he faſtneth his glaſſe, and he ſhall perceiue how the artiſt hath made an engine, whereby an inch of lead is driuen out into a foote of length. It was neceſſary therefore ſayth *Hippocrates* in his booke *de carnibus*, that this ſooty excrement ſhould haue a clammy or glewy ſubſtance, yet without any fatneſſe or greaſineſſe at all. Wherefore, whereſoeuer in the body, eſpecially in the outward parts, there gathereth together any ſuch glewy or clammy excrement, there the naturall heat bringeth forth haires; and this is the cauſe why in the arme-holes and about the priuy parts, yea and in all the reſt of the body haires growe plentifully. Now that part of the haire that is impacted in the pores of the skinne, may fittely bee reſembled to the roote of an hearbe ſticking in the ground, and that which beareth out of the skin, to the hearbe it ſelfe.

Hippocrates.

Comparison.

There is alſo required a conuenient place, as a foundation wherein the rootes of the haires may be eſtabliſhed, and that is the skinne, which of all other parts is fitteſt for their breeding, ſayth *Galen* in his firſt chapter of the ſecond booke *de Temperamentis*; becauſe it is neither too dry nor too moyſt; for as neither in Marriſh and Fenny ground, nor in one that is ouer dry and worne out of heart can any thing bee brought forth: ſo in an ouer moyſt or ouer dry skin no haire can grow. For though the skin be accounted dry, yet in a man it is not without ſome moyſture, as it is in thoſe creatures which are couered ouer with a ſtony or cruſty ſhell; as Oyſters, Lobſters, Crabs and ſuch like; and in ſuch as lurke in dennes, as Snakes; and thoſe that haue ſcales, as Fiſhes; in all which haire cannot grow, becauſe their skinnes are truely and altogether dry. Moreouer, the skin ought not to be too ſoft and moyſt, like Cheeſe new curded; for then it would not holde the rootes of the hayre becauſe of his thinnes; and beſide, after the pores were as it were bored by the excrement, they would fall together again, the parts being ſo fluid that they would run into one another and bee exquiſitely reunited: But moderately dry to hold the haire to his roote, and moderately hard, not vnlike a cheeſe already well gathered and ſomewhat preſſed, for ſo it would bee better thrilled and perforated by the iſſuing humour; which perforations alſo would remaine, the dry body not ſuffering the parts to reunite, but to conſiſt, and ſo by the continuall exiture of the matter, the pores would bee more fiſtulated. It muſt alſo be ſlack and thinne. Wherefore conſidering the whole skin is full of pores, whereout ſomthing is continually breathed by the naturall heate which diſperſeth, attenuateth, and carrieth away with it ſelfe no ſmall part of the inward moyſture, it followeth, that in all parts of the body the haires may iſſue forth, euery pore hauing a haire in it to keepe it open, for the better breathing or thruſting out of exhalations: yet we muſt except the skin of the palms and ſoales of the hands & feet, becauſe, as ſome ſay, in thē there is a large Tendon immediatly vnder the skin, which being exceeding thicke and dry, makes it vncapable of haires; but I cannot admitte of that reaſon, ſeeing a Hare hath alſo that broad tendon, and yet hath not thoſe parts voyde of haire. Therefore wee ſay that nature hath made thoſe partes haireleſſe, both for vſe that they might be the more ſenſible, as alſo for motion.

The conueniency of the place for hayres.

A dry skin admitteth not hayres.

Nor a ſoft.

But moderatly dry & thin.

Why there is no haire in the palmes & ſoales.

Now that the thinnes of the skin is required for the production of haires, it appeareth by the example of ſcarres; for if you raiſe a bliſter by ſcortching the vpper skin or cuticle, after it is healed, and the vpper skin is growne thicke no haire will riſe out of the ſcarre, becauſe it hath no pores in it.

Why haires grow not vpon ſcars.

The haires be of two kinds, ſome are συγγενικαὶ, that is, *congeniti*, bred with vs, as the haire of the head, of the eye-browes, of the eye-lids. Theſe are bred in the child while it is yet in the wombe, and are reſembled not vnto hearbes that grow by ſowing, but vnto ſuch plants as nature bringeth forth of her owne accord; and ſuch do not neceſſarily follow the temperature of the body.

2. kinds of haires.

Ariſt. 3. hiſt. Animal. 11.

Congeniti.

Other haires are called ὑστερογονεῖς, that is, *poſtgeniti*, bred after the skin is growne thin, which hapneth in Boyes when they beginne to breed ſeede, in Girles when their monthly courſes begin to flow; theſe come out in three places, anſwerable to the three places where nature bringeth forth the former kinde; Firſt about the priuities, ſecondly vnder the arme holes, thirdly in the chin and cheekes. Thoſe that are gelded before the age of foureteen yeares, haue no haires growing on their chinne: the reaſon is, becauſe the wayes of the ſeede are not opened, and by caſtration are after intercepted; and therefore the skinne doth not rarifie: if after thoſe haires be growne the Teſticles be taken away, thoſe haires alſo fall, excepting in the groyne. Againe, in women thoſe hayres which wee called *poſtgeniti* doe ariſe later, neuer in the chinne, becauſe there is not ſo great agitation of the humor in the act of generation in women as can rarifie the skin ſo farre from the place where

Poſtgeniti.

How the haires fall in ſuch as are gelded.

the

Why women haue no berds

the ſeed is engendred; and yet wee ſee, that in ſome women after their Courſes are ſtaide, the haire begins to bud on their chins. It may alſo fall out, that both men and women may be without any of the *poſtgeniti* by ſome naturall defect, contracted in their generation.

The formes of the haires, and the cauſes of them al. Their colours

The forme of the haires is expreſſed by certaine accidents; for they do vary in thickeneſſe and thinneſſe, hardneſſe and ſoftneſſe, length and ſhortneſſe, ſtreightneſſe and curledneſſe, multitude or ſcarſity, as alſo according to the quality of the skin, and the naturall propriety or condition of the parts in which they are fixed. Moreouer, they differ in colours, whiteneſſe and blackneſſe, and middle colours betweene them; ſo alſo by reaſon of age, and growth of the body. The chiefe cauſe of their thickneſſe and thinneſſe is the skin

The cauſes of their craſitude.

ſaith *Ariſtotle*, 5. *gener. Animal.* 3. which in ſome is thicke, and in others thin; in ſome rare, and in others thight and compact. Another cauſe is the variety of the moiſture lying vnder the skin, for in ſome it is clammy, in others wateriſh: ſo out of a thicke skin, thick & hard haire, and out of a thin skin, thin and ſlender haires are produced.

And if the skin be rare and thicke, the haires are alſo thicke, by reaſon of the abundance of earthly ſubſtance, and the laxity of the paſſages. But if the skin be more thight and compact though it be thicke, they come out thin, by reaſon of the narrowneſſe of the paſſages. So if the vapour whereof they are bred be wateriſh, becauſe it is quickly dryed vppe, they growe not much in length; but if it bee clammy and glutinous, becauſe it is not eaſily dried vp, they ſpread themſelues in length. So that the cauſe of the length and ſhortneſſe of haires, is the abundance or ſcarſity of the humor wherewith they are fed. And

Of their lẽgth The haires of the head are the longeſt.

hence it is, that the haires of the head are the longeſt of all the bodie, becauſe the Braine affoordeth a great deale of a clammy moyſture, and becauſe the braine is bigger then the other Glandules; they are alſo craſſe or thicke, becauſe the skin of the head is exceeding thicke, yet rare and containing much moiſture. The haires of the head in Latine, are cal-

The names of the haires of the head.

led *Capilli*, *quaſi capitis pili*: in Greeke κόρση, from κείρω, which ſignifieth to cut. In men they are called *Cæſaries à frequẽti cæſione*, becauſe they are often cut: and in Women *Coma*, becauſe they beſtow great paines in combing and curling them. They are alſo in Women diuided by a line, which in Greeke is called λύσωμα, in Latine *diſcrimen*, in Engliſh the *ſhed*. Now the haire is either ſtraight or curled, eyther by reaſon of the exhalation it ſelfe, or

The cauſes of the ſtreitneſſe or curling of the haire.

of the pores whereout they paſſe. Of the exhalation the which of being ſmoaky, by the heate and drought maketh the haire curled. For it hath a double courſe, the earthy and dry part downeward, the hot part vpwarde: hence it boweth not downe right, but wrinkingly, becauſe there is in it but little moiſture, & much dry and earthy matter; and this we may perceiue, if we parch haires in the Sun, or neare the fire: for the criſping of the haire is as it were a kinde of conuulſion becauſe it wanteth moiſture: or elſe we may ſay, the haire curleth by reaſon of the drineſſe of the temper; and therefore all Black-Moores haue curled or criſped haire.

Of Curling.

By reaſon of the conſtitution of the pores wherein they are implanted. For when the exhalation is ſo weake, as that it cannot make a ſtraight way for it ſelfe, it

Compariſon.

giueth a forme to the pore anſwereable to it owne contortions. But if the exhalation bee ſtrong enough, yet it cannot aſcend directly vpwardes, by reaſon of the hardneſſe of the skin, then it turneth ſide-long, like as we ſee the ſmoake and the flame when it is hindred, to mount ſtreight vpwards, diuideth it ſelfe and turnes aſlant. Wherefore both by reaſon of the imbecility of the exhalation, and of the hardneſſe of the skin, the roots of the haires grow awry. Now it ſtandeth with good reaſon that they ſhould growe and continue ſtill ſuch as they were framed at the roote. For no hard or dry body can be extended ſtreight forth, vnleſſe it be firſt ſoftned and mollified.

Of ſtreight haires.

Thoſe that haue aboundance of moiſture, and the pores ſtreight, haue their haire alſo ſtreight. Againe, long haires are ſoft, but the curled are hard. Moreouer, haires encreaſe & grow more or leſſe according to the Nature of the skin, and the condition of the parts where they are implanted. In the head they grow in greateſt length and abundance, next in the Beard, becauſe that skin is moderately hot & dry, eſpecially when the haires are fine and ſlender. But the haires of the eye-browes and of the eye-lids, are ſmal and grow not almoſt at all: but for the moſt part, keep alwayes an equall magnitude, and ſeldome fall, becauſe they haue vnder them a hard body, like vnto a griſtle. For thoſe haires that ſpring from ſoft and moderately moyſt parts, encreaſe very much, as thoſe of the head and the beard; and *Galen* addeth thoſe of the arme-pits, and about the priuities: but thoſe that ariſe out of hard and dry places, are ſmall and almoſt of no growth: yet in ſome the eye-

browes

browes grow ſo hairy in olde age, as that they are conſtrained to cut them, or elſe they would offend their eyes. Haire buddeth in the chin, when the skin beginneth to ratifie or grow thin; the matter of it is a moyſture ſent thither from the head, as *Hippocrates* holdeth in his Booke *de Natura pueri*, and theſe haires make the Beard, which is not alike in euery man; for ſome about their chin and lips haue great ſtore of haire, ſome haue no haire there, but very much on their cheekes. The Beard.

Ariſtotle in the third Booke *de Hiſtor. Animal.* the 11. chapter ſaith, that the haires vſe to grow extraordinarily in ſome diſeaſes, eſpecially in conſumptions; hee addeth alſo, in old bodies and dead corpes they receiue augmentation both in length and thickneſſe, but do not ſpring anew.

They varie likewiſe in colour, and are anſwerable to the predominant humor, for ſuch as the humor is which the fleſh draweth vnto it (ſaith *Hippocrates*,) ſuch alſo is the colour of the haire. The cauſes of the colours of the haires. *Hippocrates.*

Galen in his ſecond Booke *de Temperamentis*, and the fift Chapter, ſaith, that the haire becomes blacke, when the vaporous excrement ſcorched by the heate is changed into a perfect ſoote; and ſomewhat red, when the excrement impacted in the paſſage is not yet altogether growne black; but yellow, when the vapour is leſſe ſcorched; for the excrement that is ſo impacted, proceedeth of yellow and not of blacke Choller. White haires are made of Flegme, and the colours betwixt theſe of a mixture of Flegme and choller. *De Nat pueri.* The humour. *Galen.* When Black. Reddiſh. White.

But a queſtion may be asked, why in Beaſtes the colour of the haire followeth the colour of the skinne; and in men it is far otherwiſe; for the whiteſt men and women, haue often haire coale blacke. *Ariſtotle* maketh anſwere 5. *de generatione Animal.* 3. and 3. *Hiſtor.* 11. Becauſe, ſayth hee, a mans skin is thinner then the skin of any other Creatures of his magnitude; and therefore the skinne cannot affoord any matter of haire of it ſelfe, or reteyne the excrement driuen to it ſo long as to giue it his owne colour. Why mens haires are not of the colour of their skin.

The haire varyeth alſo by reaſon of the region and the diuerſe diſpoſitions of the ambient ayre; ſo thoſe that inhabite a hotte and dry country, haue hard, blacke, dry curled and brittle haire, and of ſmall growth, as the Egyptians, Arabians and Indians: contrariwiſe thoſe that inhabit in a moyſt and cold climate haue ſoft haires which grow moderatly, are ſmall or fine, ſtraight and reddiſh, as the Illirians, Germans, Sarmatians and all the coaſt of Scythia, as *Galen* ſayth. But ſuch as inhabit a temperate tract betweene theſe, haue hayre of greater growth, exceeding ſtrong and ſomewhat blacke, moderately thicke, neither altogether curled, nor altogether ſtraight. The Region.

They vary alſo by reaſon of age; for little children haue little haire, becauſe as yet their skin hath no pores, nor any ſootie excrement applying vnto it: when they beginne to cotten, which is about xii. and xiiii. yeares of age, their haires are ſmall and weake; but as their youth growes ſtrong, and their flouriſhes grow vpon them, which is towards xv. & xviii. then their haires grow many, great and ſtrong, as well becauſe their skin is growne full of pores, as alſo for that they abound with ſootie excrements. How haires alter acording to ages.

Thoſe that are well in yeares haue hard haire, becauſe their skin becomes hard & thicke in old age, by reaſon of their coldneſſe and ſiccity. So we ſee ſome men when they grow in yeares, become bald eyther for want of hot and clammy moiſture, or becauſe naturally and originally their skin was ſomewhat too dry, or elſe as *Hippocrates* ſaith, becauſe they abound with Flegme, which being ſtirred in their heads by carnall copulation, and ſo growing hot; when it ariſes into the skin, it ſcorcheth the rootes of the haire and ſo cauſeth them to fall off; and that is the reaſon, why neyther Eunuches nor children vſe to growe balde. Now this baldneſſe begins commonly in the forepart of the head, becauſe (ſaieth *Ariſtotle* 5. *generat. Animal.* 3.) it is dryeſt, for there the skin lyeth vpon the bare bone, without any interpoſition of fat, as it is in the Nowle. *Hippocrates De Nat. pueri.* The reaſon of baldneſſe.

In like manner, Men growing olde become gray-headed; not by reaſon of drought, for we ſee often that many haires become gray together, but nothing can vpon a ſuddaine become dry: the true cauſe is putrifaction for want of ventilation, and therefore thoſe that haue their heads continually couered, grow ſooner hoary then others, as *Ariſtotle* obſerued. *Galen* in his ſecond Booke *de Temperam.* and the 5. chapter, ſaith, that before the skin of the head is growne to extreame drineſſe, the haires become weak for want of conuenient foode, and white becauſe the nouriſhment wherewith they are fed, is as it were the dregges of Flegme, which in proceſſe of time remaining about the skin, do putrifie. Why old men grow gray. 3. *Hiſt. Animal.*

Of all parts the Temples are firſt hairy, becauſe they are very moyſt by reaſon of the great

great Muſcles which lye vnder them. Now euery Muſcle is fleſhy, and fleſh is moyſter then eyther bone or skin. Next vnto them, the forepart of the head growes white; laſt of all, the haire about the priuities and the eye-lids; but no body growes bald in the temples or in the hinder part or nowle of the head.

How haires are nouriſhed

The haires are fed by moyſture, therefore *Hippocrates* ſaith, they grow moſt plentifully where they finde moderate moyſture for their foode, which *Ariſtotle* ſaith, is diſpoſed at their roote; for if you plucke them vp, that moyſture is drawne vp with them: beſides, the haire is thicker at the roote then in the reſt of his length, becauſe it hath ſome of that moiſture newly applyed to it. From theſe humors are exhalations raiſed, and nature turnes the thickeſt and clammieſt of the excrements, into the nouriſhment of the haires. Therefore when they are well fed, and with lawdable aliment, they encreaſe apace, and are moderately craſſe or thicke. But when they are cut, they do not beginne to grow vp againe where the Sheeres diuided them, but at the root, from whence they iſſue, and ſo they encreaſe and are nouriſhed by appoſition, as the teeth are; not by the excrements of faultie and vicious humors, but by excrements of the third concoction: otherwiſe, they would not fall off, but rather encreaſe in thoſe that haue the French diſeaſe and the Leproſy, conſidering that in ſuch bodies the Excrements of vicious humours are exceeding aboundant.

The vſes of the haires.

The vſe of haires in generall is foure-fould. Firſt for a couer; ſecondly for a defence; thirdly for an ornament vnto the partes vnder them; fourthly to conſume and waſte away the thicke and *fuliginous* or ſooty excrements. So the haires of the head which are in great aboundance, (for of all creatures a man hath moſt haire on his head) do couer the braine, and ſhelter it from ouer much cold or heate. For mans braine being in proportion greater and moyſter then any other creatures, it requireth accordingly a more carefull guarde and preſeruation; for that which is the moyſteſt will moſt eaſily grow hot and cold againe. And becauſe the brain is ſeated farre from the fountaine of heat, and neare vnto the bones, and vnder them is not couered with any fatneſſe; the haires are prouided both to fence it, and to keepe it warm. They alſo waſte and conſume the thicker excrements; and becauſe it is not behoofefull for vs that wee keepe our heades alike couered in all ages of our life, times of the yeare, countries and conſtitutions of bodies; therefore we may fit our ſelues vnto the times, & weare them either longer or ſhorter; but if they be altogether ſhauen off, they proue the cauſe of defluxions. The haires of the head haue not onely this vſe to couer the cheekes and chinne (which women doe with veiles and maskes) but alſo they ſerue for ornament. For it is a venerable ſight to ſee a man when he is come to the yeares fit for it, to haue his face compaſſed about with thicke and comely haire. Nature therefore hath made the vpper part of the cheek and the noſe without haire, leaſt the whole face ſhould be wilde and fearce, vnbeſeeming a milde and ſociable creature ſuch as a man is. In women the ſmoothneſſe of their face is their proper ornament; they needed no enſigne of maieſty becauſe they were borne to ſubiection. And Nature hath giuen them ſuch a form of body as is anſwerable to the diſpoſition of their minde. To conclude, the vſe of hayre is diuers, according to the ſeuerall places where they are: as for example, the haire of the eye-browes ſerue for to receiue the humour falling downe from the head, and thoſe of the eye-lids to direct the ſight, and ſo of the reſt.

Man more braine then any other creature.

Of the Cuticle or Skarfe-skin. CHAP. V.

How it is generated.

THE firſt contayning or inueſting part, is the Cuticle, which the Greekes call *Epidermis*, becauſe it runnes vppon the ſurface of the true skinne; whereof it is as it were a flowring or creamy production. For whileſt Nature in the generation of the skin mingleth bloud with the ſeede, a moyſt vapour of the bloud foaming or frothing vp, and driuen forth by the ſtrength of the heate, is condenſed or thickned by the coldneſſe of the ayre, and turned into the Cuticle or skarf-skin, for ſo I thinke wee may properly call it. And this is the reaſon why in Infants newborne, the whole skin looketh red, the Cuticle not being yet formed for want of cold ayre; or at leaſt not ſufficiently condenſed, as it is after a ſhort time; the aire thickning the cream or froth of the bloud, as wee ſee in gruell or boyling of paſte or ſtarch, a skin, filme or phlegme gathered together of the vapbrous froth that ariſeth from the thicke moyſture which is by the cold ayre condenſed.

Why Infants looke red.

This

This Skarfe-skinne is eaſily loſt by attrition or ſcalding, and riſeth apparantly from the skinne; it is likewiſe as eaſily recouered where the skin remayneth ſound (for where there is no skin, but onely a ſcarre or cicatrice, there it will not growe againe) and therefore it is no ſpermaticall part, becauſe if they periſh, they cannot or very hardly againe be reſtored. It wil not grow vpon a ſcarre.

It is wondrous thin (vnleſſe it growe *Callus* or hard by continuall labour, as wee ſee it doth in Felt-makers) that it ſhould not dull the ſence of the skin vnder it: yet in the palmes of the hands, and the ſoales of the feete, where it is continually worne and renued againe, it is more craſſe and thick. This is that which Serpents caſt euery yeare, we call it the ſlough; men neuer, but vpon long ſickneſſe or poyſons, or the vſe of ſlabbering complexions. It is thighter or more compact then the skin it ſelfe, whence it is, that thoſe watery humours which are thruſt out from the Center to the Circumference of the body, doe eaſily paſſe through the skin, but hang often in the Cuticle, and generate *Ecthymata*, *Phlyctides*, and thoſe many wateriſh Puſtles which are called *hydrea*. It is altogether without bloud, becauſe it receiueth neither veine nor arterie, ſo that it encreaſeth rather by a kind of addition of matter, then by Nutrition. Why thin. The ſlough of a ſnake. The thightnes of it maintained. The reaſon of puſtles in the body.

Inſenſible it is, that it might defend the skinne vnder it from externall iniuries; as alſo attemper the exquiſite ſenſe of the ſame, and ſo becommeth *medium tactus*, the *meane of touching*. For ſayth *Ariſtotle*, all ſenſation is made by ſome *Meane*, none by the immediat touch of the obiect and the inſtrument. Hence it is that a man cannot ſee to reade vpon a booke that is layd vpon his eye; becauſe there wanteth the meane betweene the obiect and the inſtrument of ſenſe, that is, ayre enlightned. In like manner when the Cuticle is off, we cannot diſtinguiſh between one Temper and another; becauſe the very gentleſt touch of the bared skin breedeth paine, and the ſenſation is confuſed, which is diſtinct when the skarfe-skin is whole. The vſes of the skarfe-skin. *Medium tactus.* *Lib. 2. de Anim. Text. 114.*

There is alſo another vſe of it, to couer the open ends of the *Capillarie* or hairy veines which doe determine in the skin: for if the Cuticle be taken off, the skin vnder doth bleed. Moreouer it is alſo a couering to the skinne, that the moiſture might not indecently or vnprofitably well or iſſue out at all times; for in a gall or rub, which is called *Intertrigo* in which the Cuticle is ſeparated, the skinne is euer moyſt.

Laſtly, it ſmootheth and poliſheth the roughneſſe and inequality of the skin, making it ſoft, ſupple and ſlicke, and ſo becommeth one of the greateſt beauties that nature hath giuen to the body of man. That I cannot but wonder at *Columbus*, who vtterly forgot the manifold vſes of this Cuticle.

Of the Skinne. CHAP. VI.

VNder this Curtain or Skarfe, lieth the true & genuine skin which the Greeks call δέρας, becauſe it may bee excoriated or flayed off, ſo *Hippocrates* in his booke *de Arte*: but in his book *de inſomnijs*, γρῶμα; and *de victus ratione in acutis*, ῥοίνη; and *de oſsiũ Natura*, δέρμα *quaſi* δέμα a band, becauſe it compaſſeth and knitteth together the whole body; in Latine it is called *Cutis*. It hath a ſubſtance proper to it ſelfe, although it bee very like to a ſinew and membrane, becauſe it is white, will ſtretch, and is of exquiſite ſence; but it is thicker then any membrane. It is ingendred of ſeede perfectly mixed with bloud, whence it commeth to paſſe that by it wee may iudge as well of the ſpermaticall as of the bloudy parts. It ſeemeth therefore to be of a middle nature betwixt fleſh and a ſinew, and ſo *Veſalius* conceiued it, not ſo abounding with bloud as fleſh, but as it were a bloudy ſinew; ſo ſayth *Galen* in his firſt booke *de Temperam.* Notwithſtanding in the compoſition the ſpermatical part exceedeth the ſanguine, which appeareth as by the colour, ſo by this, that being wounded it is only reunited or conioyned by a cicatrice or ſcarre. *Columbus* thought it was bred of the extremities or ends of the veſſels dilated; *Varolius*, onely of the ſofter ſinewes, which attayning to the ſurface of the body, doe there growe together into a couering, receiuing addition from the affluence of bloud; as the broade leaues of water Lillies ariſing from a ſlender ſtemme, when they appeare aboue the water, are extended into a great bredth out of a ſmall ſtalke. *Galen* in the third of his Method, ſayeth it is bred of the dryed and conſtringed or writhen fleſh vnder it; and that is the reaſon why no hayres will grow vppon ſcarres, becauſe they haue no foundation for them as the true skinne hath: but it ſhould ſeeme that heerein *Galen*, and not he only, but *Plato* and *Ariſtotle* were ſomewhat miſtaken: for the skinne may be flayed from The names of the skin. His ſubſtance. Whereof it is made. *Veſalius.* *Galen.* *Columbus.* *Varolius.* *Plato.* *Ariſtotle.*

from the fleſh vnder it, yea and betweene the skin and the fleſh there are two partes (if at leaſt they may be ſo called) the fat and the fleſhy Membrane.

The colour followeth the humor.

The skin is naturally white, but according to the humours that abound, or the bodyes vnder it, ſaith *Hippocrates* in his Booke *de ſuccis*, it varieth the colour. For example: where blood aboundeth and the skin is thin as in the face, there a roſie redneſſe mingleth it ſelfe with the white, or ouercommeth it, eſpecially if eyther by heate or motion of the minde it flowe to the place more plentifully; and this blood when it is condenſed or thickned by cold, maketh the skin looke liuid or blew. In Chollericke men the skin is pallid or yellowiſh: in Melancholy ſwarty and blackiſh or duskiſh, but if it bee defiled with vitiated Humors, it becommeth yellow and black in the Iaundiſe and Morphew.

It altereth alſo his colour, by reaſon of bodies vnder it; ſo where it adhereth or cleaueth to the fleſh, as in the bals of the Cheekes and Palmes of the handes, it ſooner becommeth red; if to the fat, it is whiter and ſmoother, eſpecially where the fat is more plentifull; but when that fat is conſumed, the skin becommeth wrinkled and looketh like a duskiſh ſhadow; as alſo it is liuid or blewiſh where the greater Veines are branched vnder it. Furthermore, the skin that it might be a kinde of muniment or defence is thicke, though not ſo thicke as in other creatures. It cannot without extreame paine bee ſeparated from the fleſh, becauſe the extreamities or ends of the veſſels do determine in it; whence ſome haue thought, that it proceedeth from thoſe extreamities of the veſſels dilated or ſpread into a ſuperficies or ſmooth plainneſſe. It is ſoft and of exquiſite ſenſe, by which it forewarneth the inward parts of the approaching euill before it ouertake them.

What parts of the skin are thin & thick.

According to the diuers vſe of the parts, it is either ſofter and thinner, as in the face, the yard, and the *ſcrotum* or cod; or harder, as in the necke, the backe, the legs, and the ſoles of the feete; ſome of it is in a middle temper betweene hard and ſoft, as in the palme of the hand, and eſpecially in the fingers ends, becauſe they are ordained to apprehend with; and beſide in the skin of the hand, the power or ſenſe of feeling was to be perfect, and therefore it behooued that it ſhould bee voide of all exceſſe, and moſt temperate of all others; becauſe that which is the iudge of feeling as all other Inſtruments, muſt be free from any forreigne or externall quality whereby the iudgement might be preiudiced: So ſome part of the skin is exceeding thicke, as in the head; ſome part onely thicke, as in the necke; ſome part thin, as in the ſides and ſoales of the feete, which is the reaſon that there men are ticklish, ſome part yet thinner, as in the palme of the hand; and ſome thinneſt of all, as in the lippes.

The connexion of the skin

It hath alſo a diuers connexion to diuers parts: for ſomewhere it may bee eaſily ſeparated, as in the vpper and middle venter, the armes and the legges; otherwhere very hardly, becauſe of the fleſhy Membrane to which it is tied by the mediation of certaine Fibres & veſſels, betweene which and the ſaide Membrane, the fat where it is, ſo interpoſeth it ſelfe, that the skin may more eaſily be flayed from it: but from ſome parts it can hardly or not at all be ſeparated, as from the ſoales of the feete, and the palmes of the hand, to which it is immediately conioyned, that the apprehenſion of thoſe parts may be more firme and ſtable. It is alſo very hardly ſeparated from the fleſh of the fore-head, & almoſt of the whole face, eſpecially of the eares and lippes, becauſe of Tendons and Muſcles; eſpecially that which they call the *broad Muſcle* mingled therewith. Finally, in the forehead it is mooueable, in the reſt of the body (of a man I meane) immooueable, or for the moſt part. for in Beaſts it is almoſt alwayes mooueable, and they ſay, an Elephant can by the corrugation or wrinkling of his skinne, kill the flies that moleſt him.

Where the fat interpoſeth it maketh the skin more eaſie to flay.

Where the skin is moueable.

The paſſages of the skinne.

It is an vnſeamed garment couering the whole bodie, yet hath it certaine breaches made by Nature for her eaſe and reliefe, partly manifeſt, which are not many, and are called *Foramina* or outlets; partly inſenſible, which are infinite, called *pori*, & of vs pores. Al which ſerue either for receyuing in or letting out, or both as neede ſhall require.

The paſſages or outlets of the skin.

The *Foramina* or paſſages and outlets are theſe: about the eyes for the help of the ſight, the thwart holes of the eye-brows; about the eares for the hearing, that as well the diuerſities of ſounds might be let in, as alſo the excrements or waxe of the eares be auoided out; about the Noſethrils for a helpe to reſpiration and to ſmelling, and the conueying away of the mucous or ſlimy excrement of the Braine: the mouth is open to receyue meates and drinkes, and ſometime againe to vomit. The nipples of the breaſt ought neceſſarily to be perforated, that by them the Infant might ſucke milke from the Mother: the nut of the yard for the emiſsion of ſeede and vrine; the port *Eſquiline* or ſiege, that the noyſome excre-

crements may be conuayed out of the body. In women the *lap* of the wombe, as well for the admiſsion of the part of generation, as for the bringing the Infant into the world, and to auoyde the vrine and the monthly courſes. In the Infant the nauill that it might receiue bloud and ſpirits to ſupply it with nouriſhment and life. Finally, the fingers endes where the nayles are affixed it is alſo perforated, out of all which parts we haue knowne bloud to iſſue in a cruell diſeaſe.

The pores are aboundant like to the pin-hoales of a ſyue or ſearce, as is manifeſt by the ſweate and hayre that breathes and breakes out (in which regard *Plato* compares it to a fiſh net:) and theſe parts are the way of tranſpiration, that the excrements of the third concoction which haue no other, might this way haue egreſſe or auoydance; whence of ſome it is called the vniuerſall *Emunctorie* or draught, becauſe it receiueth all the ſuperfluities of the inward parts. Theſe pores are ſmall and almoſt inſenſible, leaſt otherwiſe there ſhould be too free a diſsipation of the ſpirits, yet in ſome bodies they are narrower or ſtreighter, in ſome wider, and ſuch doe eaſily melt away in ſweat, and are leſſe affected with inward cauſes: the other ſweat very difficultly, and becauſe the excrements are retayned, doe eaſily incurre diſeaſes thereby.

The pores. Tranſpiration

That theſe pores may bee kept open, Nature hath aſsigned to euery one a haire (of which we ſhall ſpeake by and by) which is faſtned in the pore with a ſlimy white roote, excepting thoſe places where they are continually worne off, as in the palmes of the handes. Theſe pores are the cauſe that the *Bands* in ſome deligations become bloudy, and ſometime pure bloud hath auoided by them, as in the Engliſh ſweate: by theſe alſo ſome thinke the ſpirits doe powre themſelues forth in profuſe ioy, and the more liberall vſe of Saffron and other Diaphoreticke or ſweating medicines, by both which they are exceedingly relaxed.

Why the haires are ſet in the Cuticle. How the bands or tyes in deligatories of parts become bloudy.

That this Skinne may be nouriſhed, that it may liue and haue ſence, it receiueth all theſe three common Organs or inſtruments of nouriſhment, life and ſence, veines, arteries, and ſinewes; whoſe diuarications and diuers branchings, wee ſhall ſhew in fitter place in our diſcourſe of the veſſels.

The vſes of the skin, and firſt that it ſhould bee the immediate inſtrument of outward touching, that we might be forewarned of outward iniuries before they come to hurt the inward partes; like as the Membranes are the Organs of inward touching or ſenſation. Moreouer, it is ordained to be the common and natiue Veſtment or Mantle of the whole body; a muniment beſide and a comely ornament compaſsing and couering it on all ſides, that the veſſels might more ſecurely runne vnder it: the muſcles and entrals be contayned in their proper places, and defended from heate and colde, and the naturall heate deteined from ouer free effluxion.

CHAP. VII. *Of the Fat.*

THE Fat called in Greeke πιμελὴ, in Latin *Pinguedo*, in man is bedded betwixt the skinne and the fleſhy membrane, but in beaſtes it is vnder the membrane alſo. It is ingendered of the more oylie, thinne, and ayrie portion of pure and abſolutely laboured and concocted bloud, diſtilling like a dew out of the ſmal and capillarie veines of the habite of the body: which bloude is curdled by a moderate heate (for a burning heate would conſume it, and a weake heat would not concoct it) and the denſity or faſtnes of the membrane; which is the reaſon that beaſtes grow fatteſt in winter when their skins are more condenſed with the cold.

The Fat, wher of ingendred.

This membrane is neruous, thin, and very faſt or thight, and vnder the skin incloſeth all the body, that all that oylie matter rarified into vapors, which ſlippeth by the inward membranes, may light vpon and cleaue vnto this, and ſo be turned into fat, that nothing profitable might be loſt. The manner of this worke of Nature wee haue in diſtillations, where though the Stil-head be very hot, yet becauſe of his ſadneſſe or denſity, the vapours which were rayſed vp by the heate of the fire are thickned into water.

The Fat of a man is leſſe white then of any other creature; yet the white membranes by which the bloud which is his matter paſſeth, do alter it ſomewhat, ſo that it becommeth often yellower then white.

There be ſome parts, there be alſo ſome ages which want this Fat; for thoſe parts whoſe bending and extenſion it might annoy, are better without it, as the membranes of the

What parts & what ages haue leaſt Fat.

Braine, the Eye-browes, the Yarde, the Cod and the Stones, or Teſticles: whereuppon ſome haue excluded it out of the number of the Contayning or Inueſting parts. In thoſe parts where it is, it differeth in hardneſſe and ſoftneſſe; for in parts that are to be mooued more violently, it is harder and wouen with Fibres and ſmall veines, as wee ſee in the tallow of beaſtes; as in the palme of the hand, the inſide of the fingers endes (where there is more neede of it to moyſten the manifold tendons and veſſels that there are gathered, to fill vp the empty ſpaces and make the skin more euen and equall for better apprehenſion) the ſoale of the foot eſpecially in the heele, that we might more ſteadily reſt vpon it. Somtimes it is alone; ſometimes together with a craſsie and ſlimy humor, which ſtands in ſtead of tallow to fit the parts better for motion, and to hinder their exſiccation or drying.

Where it is hard & where ſoft.

In other parts it is ſofter and yellowiſh; ſo it is very ſparingly affixed to the out-ſides of the hands and feete; in the buttockes becauſe there is more vſe of it, it is more copious or plentifull. In cold and moyſt bodies, as in Men and Hogges it is aboundant (whence *Galen* ſayth that a woman is fatter then a man) as alſo in them that leade an idle and ſedentarie life. In hot and dry, as Apes and Hounds, it is either none at all or of no quantity. In new borne creatures none at all; in thoſe that are conſumed with famine, with diſeaſe, or with age very little.

Lib. 14. vſu partium.

The differences of fats. *3. Hiſto. Anim. 17. lib. 3. de facult. alment. 11*

This Fat which in horned beaſtes is called *Seame*, in Swine *Lard*, differeth from the *Greaſe* which in Greeke is called στέαρ, in Latine *Adeps*, as *Ariſtotle* and *Galen* teach; becauſe this Fat is ſofter and moyſter, and is eaſily melted, and being melted doeth not eaſily clod together againe; but the *adeps* or greaſe is harder and dryer, not ſo eaſily melted, and ſuddenly congealed againe, and therefore is more plentifull in thoſe creatures whoſe natures are altogether earthy and dry, and thoſe that are more moyſt haue aboundance of the fat we call *pinguedo*. Men haue much of this fat vnder their skin, becauſe the matter of it is retayned by the ſolidity and thickneſſe of the ſame, for ſo wee ſee that thoſe creatures that haue the faſteſt skins are the fatteſt, as Swine and Dolphins. Now the *adeps* or greaſe in a Man is in his Kall, Kidneyes, Heart, Eyes, the ioyntes of the Bones, betwixt the broade Tendon and the Skin of the middle of the palm of the handes, in the inſide of the Fingers and the Toes.

Where *adeps* is in men.

The vſes of the fat.

The Vſes of this Fatte are: Firſt it is a defence to the parts to which it is allowed, ſo in the Buttocks it ſerueth vs inſtead of a quiſhion; in other partes it auaileth much towardes their naturall poſition and free motion, and therefore in thoſe that be fat indeede, it lyneth the in-ſide of the muſcles as we ſee in fat Beeſes. For the veſſels which runne vnto the skin it is a ſoft pillow, ſo ſafe-guarding and moyſtning them, that they bee not dryed, and ſo diſtende or lying bare be broken in peeces; and therefore it is gathered plentifully in thoſe parts where the larger veſſels deuide themſelues.

Another Vſe of it is to fill vp the empty diſtances betwixt the muſcles, veſſels, and the skin, that ſo the body might be plump, equall, ſoft, white and beautifull. Moreouer it ſerueth for a light couering to warme the body and to cheriſh the naturall heate, prohibiting the effluxion of it by his viſciditie or ſlimineſſe, and by his thicknes cloſing the pores, that neither in winter the cold ſhould too freely enter, nor in ſummer the heat too frankly evaporate. Finally ſayth *Galen* in his fourth Booke *de vſu partium*, and the 11. Chapter, in great famines and want of ſuſtenance, it is conuerted into Aliment, and becommeth the Fother whereon the naturall heate relieueth it ſelfe. For being diſſolued it acquireth the forme of a bloud-like vapor which returneth into the veines, and ſo becommeth for want of better, a ſubſidiarie nouriſhment of the partes. The vſe of the greaſe is to moyſten and ſupple the hotte and drie parts, as the Heart, to make the motion more glib and agile, and to keepe the ioynts of the greater bones and the out-ſide of ſome Ligaments from being exiccated, as alſo the ends of the griſtles.

The vſes of *Adeps*.

Of the fleſhy Membrane. CHAP. VIII.

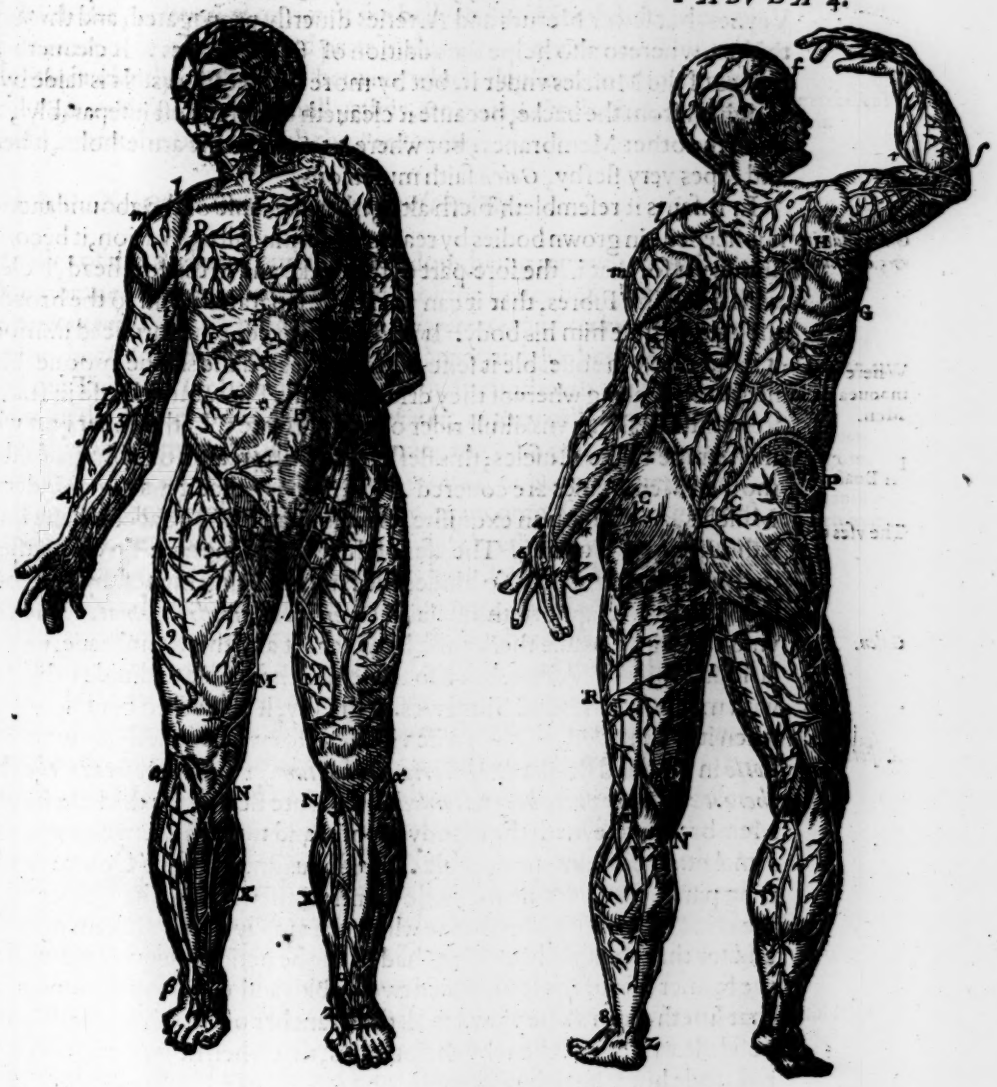
The fleſhy membrane.

THe fleſhy Membrane (firſt ſo called by the Arabians) or Pannicle, called *Panniculus Carnoſus*, in Greeke ὑμὴν σαρκώδης; is onely fleſhy among all the membranes, and that eſpecially in Beaſtes. *Galen* calles it ὑμήν, that is, a membrane; ſome call it the muſculous Membrane, becauſe in thoſe creatures which mooue their whole skinne, it is ſo ſprinkled with fleſhy Fibres, that it ſeemes indeed to be a muſcle.

This

The Third and Fourths Table shew the Skin-Veines which are opened and scarified: the third those on the Fore-side, the fourth those on the Backe-side; which Veines are for the most parts alike in every body, especially those that vse to be opened.

TABVLA. 3. *TABVLA 4.*



1.2. The outward iugular veine climing vp the sides of the necke, this can hardly be opened without danger, but his braunches may bee scarified in the necke.
1. The place where this veine is deuided into 2. branches.
1.1. The inner branch of the exte ior iugular, which going to the muscles of the mouth and the bone *Hyois* is couched vnder the toung, where it is opned in squinsies and other di eases of those parts.
1. 2. The vtter braunch of the same externall iugular that goeth to the back-part of the he d
1. Braunches going to the *buccæ* or chuck and the nose.
1.2. The fore-head veine, which in the middle of the fore-head where it is wont to be opened, is ioyned with the braunch of the same veine on the other side.
2. The veine called *vena puppis*.
3. Veines dispersed along the Temples, to which are adioyned a portion of the fore head vein.
1.2. The veine which goeth to the eares, and watereth the back part of the head.
1. A branch comming from the vpper part of the axillary veine, and going to the more backeward muscles of the necke.
1.2. A branch from the *Cephalica* or head veine, going to the skin and the muscles which lift vp the arme.
m. 1. *m*. 2. The *Cephalique* head or vtter-veine, which passing along the vtter part of the arm, accompanied with a nerue, and is opened commonly at the vpper bunch of the bought of the arme, but happely it might more safely bee opened a little lower wher it bendeth from the sinew.
1. Smal veines from the *Cephalica* dispersed through the skin of the arme.
2. Branches from the head vein to the shoulder blade, carried between the skin and the flesh.
1. The *Cephalica* is here diuided into 3. branches.
1. The first of these branches which goeth to the muscles, arising from the vtter bunch or knoe of the vpper part of the arme called *humerus*.
1.2. The second of them, which in the bought of the arme is ioyned with a branch of the liuer veine and their coniunction is marked with the figure 3.
1.2. The third is carried side-long aboue the *radius* and the vpper part of the arme bestowing branches vppon the skin, the chiefest of which neere the bought of the arme runneth outward, but turnes ouer neere the wrest, and there meeteth with the Liuer-vein, marked there in the second figure with a * and a little lower being diuersly deuided nourisheth almost the whole hand.
1. The Liuer veine called *Hepatica*, *Basilica* or the internall veine it is called of some, & in the leite arme *Lienaris* or the spleene-veine.
1 A braunch from the Liuer-veine deuided into two, nourishing the skinne within and without.
2. A branch going to the muscles of the vpper arme, and the skin on the vtter side.
1. The fore branch of the Liuer vein, which at the bought of the arme is ioyned with a braunch of the *Cephalica* marked with *r*, which two branches make the middle vein named *Mediana*, noted with 3.
2. A braunch arising from the former, and passing to the wrest, and on the after wrest meeteth with a braunch of the *Cephalica* which are ioyned aboue the little finger, which coniunction we noted in *s* aboue.
2. *m* Two fore-veines of the *Cubite* or lower arme from a braunche of the Liuer veine, which being accompanied with nerues, run all along euen through the hand, these wher they are marked are sometimes opened instead of the Liuer veine.
3. 1. The middle or common veines made of the braunches of the *Cephalica* or head-veine and *Basilica* or Liuer veine.
4. 1. 2. The diuision of this common veine aboue the wrest, which from 3. to 4. is called the common vein of the cubite or lower arme: but at 4. it is diuided, one part going to the outward side, another to the inside, and so mingleth it selfe with the neighbour veines, this veine is not opened.
5. 2. The outward braunche of this partition which watereth the back of the hand.
6. 6. 2. A braunch of the common veine which vnder the thumbe is opened for the *Cephalica* or head veine.
7. 2. The veine called *salutella* a braunch of the *Cephalica* and *Hepatica*, which aboue the little finger is opned for the spleen and diseases thereof.
8. 2. A veine between the middle and the ring fingers, which some take to bee that which *Aucen* calleth *Syele*.
9. 2. A branch toward the ring finger.
AA. 2. Braunches comming from the veines which about the loynes are produced knottily, these in the loynes are scarified.
B. 1. Braunches proceeding from the *Epigastricke* veine, distributed to the four paire of muscles of the *Abdomen*, a notable branch of which is wounded often, when men are cut for the rupture.
CC. 2. Veines comming from the vtter branch of the trunke of the hollowe veine called *vena cava*, and are dispersed thorough the muscles and skin of the buttocks.
DD. 1. Veines distributed through the pectorall muscles and the breast.
E. 1. Veines reaching to the breastes from the veine called *mammaria*.
FF. 1. Small veines comming out from the veines which are couched vnderneath and go to the chest, the principall of these are scarified in the shoulder blades.
**. 1. Certaine small veines reaching to the outside of the belly comming from the veines of the muscles vnderneath.
G, 2. A branch that runs along by the side of the chest.
H. 2 A veine which reacheth to the shoulder, the muscles of the shoulder blade, and the glandules in the arme holes.
II. 1. The inner crurall veine springing out neere the lerke, and goeth vnder the skin to the very foote, hauing a nerue running aboue him all the way.
KK. 1, 5 branches of the foresaid veine which by the inside of the thigh, reach vnto the very leske.
LLLL. 1. Veines passing vnder the skinne on the foreside of the thigh.
MMMM. 1. 2. The *Crurall* veine carried on the inside and outside of the thigh.
NN. 1. N 2. The inner leg-veine called *Tibiea*, which is diuersly carried vnder the skin, and here it may bee opened when we would let bloud in it.
O 1. The same carried vnto the fore parte of the inward ankle, and then spreadeth it selfe in the vpper part of the foote called *dorsum pedis*.
P. 2. A Braunch from the vtter *Crurall* veine, sending small surcles to the hippes, the muscles of that place and the skin.
Q. 3. A branch noted with 7, and 9, which beareth certaine suetles vpon the muscles of the leg, and the skin of the thigh.
R S 2, A veine from the ioyning of the branches of that other, which passeth to the back museles and skin of the thigh somewhat vpward.
TT 2. The Ham-veine *vena poplitis*, which runneth most what where it is marked, and so passeth vnto the calfe of the leg marked with V 2. where it deuideth it selfe into many braunches.
XX 1. The inner braunch of the crurall veine going to the muscles and skin of the calfe.
Y 1. The inner veine of the legge running to the inner side of the foot accompanied with a nerue, this they open vnder the knee instead of the *saphena*.
ZZ 1. 2. 2. A part of the crural veine going to the backside of the inner ankle: this is called the *saphena*, and is opened vnder the inner ankle in women most what to farther their naturall euacuations.
α α 1. The outwarde braunch of the crurall veine or the vtter leg-veine called *Tibiea*, which is diuersly braunched againe along the outside of the leg & the top of the foot.
β. A part of the foresaid braunch climbing along the outward ankle.
γγ 1. Among the veines of the foote, this is that that vnder the name of the *Cephalica* is opened at the great toe, but not without danger, because it hath a nerue ioyned with him.

The connexion of it.

This Membranous part, as all other Membranes, is made of ſeede. In a Man it is vnder the fat, but in Apes, Dogges, Sheepe, and ſuch like, it lyeth immediately vnder the skin. It compaſſeth the whole body, and cloſely cleaueth to the skin by the mediation of manie Veynes, but fewer Nerues and Arteries diuerſly propagated, and through it climbing vp thither, whereto alſo helpe the addition of fleſhy Fibres. It cleaueth alſo to the Membranes of the Muſcles vnder it, but by more ſlender Fibres. It is ſaide by ſome to haue his Originall from the backe, becauſe it cleaueth thereto moſt inſeparably, and there reſembleth the other Membranes; but where it toucheth the arme holes, it becommeth in dogs and Apes very fleſhy, *Galen* ſaith muſculous.

Gal. 1. Admin. & 5. eiuſdem 7.

In Infants it reſembleth Fleſh altogether, becauſe of the aboundance of blood wherein it is ſteeped; in grown bodies by reaſon of continuall exiccation, it becommeth like a membrane, yet ſo, that in the fore-part of the necke and in the forehead, it cleaueth to it ſo faſt with his fleſhy Fibres, that it can vneath be ſeparated, and to the broad Muſcle, that it is thought to giue him his body. It is in a man except the forehead immooueable; in beaſts it is not onely mooueable it ſelfe, but alſo maketh the skinne mooueable eſpecially in the necke, by ſhaking whereof they driue away the Flies, but a horſe in ſhaking of his skin, will ſometime ſhake an vnskilfull rider out of his ſeate. In the inner part which is next to the membrane of the Muſcles, this fleſhy panicle by reaſon of a ſlimy moiſture wherewith almoſt all Membranes are couered, it is ſlippery, that it may not hinder the motion of the Muſcles, and it hath an exquiſite ſenſe, ſo that if it be goaded by any ſharpe humor, it cauſeth a rigor or ſhiuering. The vſes of this Membrane are: To compaſſe the whole bodie, to couer and defend it: To hinder the fat from being melted by the continuall motion of the Muſcles. It ſupporteth alſo ſaith *Galen*, 3. *Adminiſtrat. Anat.* 2. the veſſels which attaine vnto the skin, becauſe there paſſe betweene it and this Membrane, not onely many Capillarie and threddy Veines, but alſo thoſe which wee vſe to diuide in bloud-letting; together with many Arteries and Sinnewes. Finally, it helpeth to conſolidate or heale vp the skin when it is wounded, or otherwiſe violated; for without fleſh it cannot reunite, ſo ſaith *Ariſtotle* in his third Booke *de Hiſtoria Animalium*, 11. *Whereſoeuer the skin is without Fleſh, there it cannot reunite being diuided.* In brute Beaſts, the thickeneſſe and faſtneſſe of this Membrane, reteyneth the bloody vapors, and turneth them into good blood, and beſides it maketh their skins mooueable. And thus much of the Common Containing or Inveſting parts. But becauſe we made mention euen now of the Veines which run betweene the skin & the fleſhy Membrane which are vſually many of them opened in Phlebotomy; and for that young Chirurgions had neede be betimes acquainted with them, we haue on the former ſide of the leafe added two Tables and their expoſitions at large, by which hee that liſteth may in one view ſee all the branches of the skin veines how they are ſeated, and beſide learne to call them by their names, that when he is commanded, he may know how to buckle himſelfe to his buſineſſe.

Where it is mooueable in Men.

In Beaſts.

The vſes of it.

Ariſtotle.

CHAP. IX. *Of the Inveſting or Containing parts, proper to the lower Belly.*

8. Muſcles of the paunch.

THe proper containing partes whereby the Lower Belly is inveſted, are the Muſcles of the *Abdomen* or Paunch, and the *Peritonæum* or Rim of the belly. The Muſcles are in all Bodies alwaies eight, foure on eyther ſide, matched equally in Figure, Magnitude, Strength, and Action. Of theſe there are foure Oblique, two Right, & two Tranſuerſe, all of them haue theſe appellations from the ſcituation and the texture of their Fibres. In Diſſection the Oblique external paire do firſt offer themſelues, which are the broadeſt of all the reſt. Next follow the Oblique internall; the Anatomiſts do vſually call the former oblique deſcendents, the latter oblique aſcendents, but how properly or improperly wee ſhall ſhew heereafter. Next to theſe follow the two Right Muſcles, in whoſe inward parts do appeare thoſe veines aſcending and deſcending, which conioyne about the Nauill. Vnder all theſe lye the two Tranuerſe Muſcles.

Two other Muſcles lately found out.

There are alſo in ſome Bodies two other ſmal muſcles called *ſuccenturiati* aſsiſters, or *Piramidales*

midales, that is, the ſpiry Muſcles. The Hiſtory of all theſe Muſcles, as alſo the Controuerſies and diuerſe opinions concerning them, we will at large proſecute in our Booke of Muſcles, whither for ſatisfaction we referre the Reader.

Next vnder theſe lyeth the *Peritonæum* or rim of the belly, a thin Membrane like vnto a Spiders web, which enwrappeth all the inward parts in this venter conteined. Towardes the bladder eſpecially it is euidently duplicated, betwixt which duplication thoſe veſſels which the ancients cal *Vaſa vmbilicalia*, the Nauill veſſels, are caried. Of al which it followeth now that we ſhould intreat, beginning with the *Peritonæum*.

Peritonæum or rim of the belly.

The vmbilical veſſels.

CHAP. X. *Of the Peritonæum or rim of the belly.*

THE Muſcles of the *Abdomen* and their Tendons being remooued, we meet with a Membrane ingirting the whole cauity of the lower belly, which they call the *peritonæum*. Immitating heerein *Hippocrates* and *Galen*, who giue it that name, becauſe it compaſſeth all thoſe parts which lye between the Midriffe and the Thighes. Or becauſe it firmeth or ſtrengthneth all the *viſcera* or entrailes that it conteineth. The *Arabians* call it *Ziphachi*, as they call all other Membranes and particularly *Charmel*, others call it the Membrane or coate of the *Abdomen*, we call it the Rim of the Belly. The figure of this Membrane is ouall, or like an Egge, [*Tab.* 5. AABCD.] The greateſt it is of all the Membranes of the belly, as incompaſsing the greateſt cauity of the whole body. In Longitude and Latitude, it anſwereth the whole inferiour venter. It is made of Spermaticke threds and the Mothers blood powred between them, after the maner of a *Parenchyma*. It proceedeth from the Meninges or Membranes of the braine which inueſt the marrow of the backe and the Nerues, but hath his beginning betwixt the firſt and the third Spondell or racke-bone of the Loines; and that is the reaſon why there it is ſo thicke that it cannot be ſeparated without tearing in pieces.

The rim of the bellie or *Peritonæum*.

7. Epidem. *6 admin. An.* 4.

The names.

The Figure.

The quantitie or dimenſions of it.

It is knit aboue, which part *Galen* 4. *de vſu partium* 10, calleth *vertex peritonæi*, to the *Diaphragma* or Midriffe, ſo ſtrongly, that when it is enflamed, the *Hypochondria* are drawne vpward; below, to the Bones of the Haunch and Share; before, it obſtinately cleaueth to the white Line, and to the Tendons of the tranſuerſe Muſcles, (of it ſelfe alone it conſiſteth without connexion, below the Region of the Nauill at the ſhare bones;) for as it applyeth to the region of the Nauill, it is knit to the thin Tendon of the tranſuerſe muſcles: backeward, to the originals of the tranſuerſe muſcles, and to that membrane of the Nerues proceeding from the Spondles of the loynes (from whence ſome ſay it ariſeth) & to all the *viſcera* or entrals, to whom it affoordeth ſeuerall membranes.

The connexion.

His ſubſtance is membranous and thin, *Galen* 4. *vſu part.* 9. addeth ſimple, (yet ſtrong and compact) that when the belly is full of meate, or the wombe of the burthen, it might be without danger ſtretched and relaxed as wide and long as neede required. Thinne it is before, leaſt it ſhould be a burthen to the parts vnder it; yet ſo, that in men it is thicker from the Sword-like Cartilage or breſt-blade as farre as the Nauill, then it is neerer to the Share; but in women it is ſtronger from the Share to the Nauill, that it might better endure diſtention as the burthen groweth. Toward the backe-bone about the Loynes it is thicker, becauſe it is to be ſliued or parted into many Cobweb-like membranes, which it affordeth to the Entrals, yet are theſe very ſtrong that they might be able to containe or keepe downe windie diſtenſions; and leaſt in holding of breath, or when they are ſtreatched they ſhould be broken. On the inſide it is ſmooth, and as it were lined with moiſture, that it may not offend the ſmoothneſſe of the entrals, and ſometime hath greaſe adioyned to it (which moſt what accompanieth the veines) eſpecially about the ſtomack and holy-bone. On the outſide it is ſharpe or harſh and fibrous (ſaith *Fallopius*) that it may the better cleaue to the muſcles. It is euery where double, which yet is moſt conſpicuous about the *Ridge*; the lower part or membrane of this duplication, is couched vnder the hollow Veine, the great Arterie, and the Kidneyes; all which the vpper and more inward part couereth, that the Veſſels being on euery ſide guarded and defended, might ſecurely diſperſe their branches betweene thoſe two membranes.

The ſubſtãce of it.

Where thicker and where thinner.

The duplication of this *Peritonæum*.

So the *Peritonæum* is doubled, where the Nauell veſſels paſſe through it on this maner. The two Arteries [Tab. 6. aa.] ariſe from below to the [Tab. 6. C.] nauell; and the veine aſcendeth alſo from the nauell [Tab. 6. from b to the vpper b,] to the Liuer. It is alſo manifeſtly duplicated in the *Hypogaſtrium* or water-courſe, and maketh there a large cauitie, that

How & where it is perforated.

betwixt his membranes the Bladder might bee incloſed. To which membrane it is alſo firmely connected, [Tab.2.lib. 3. at *]

It is perforated as the veſſels are neceſſarily to paſſe through it, but ſo as the orifices or verges of the membrane are cloſed about the veſſels. Aboue, where it cleaueth to the midriffe, it hath three perforations, one on the right hand for the paſſage of the hollowe Veine, another on the left, that through it the Gullet might be ioyned to the ſtomack, together with the ſinnewes that cleaue vnto it. A third, for the conueying through the great Arterie, the vnmated veine, and the ſinew of the ſixt paire. Belowe, it is perforated about the ſiedge, the neckes of the Bladder and the wombe, as alſo where the veines, arteries and ſinnewes which are ſent into the thighes, are diſtributed thorough the *peritonæum*

A.A. B.C.D. The vpper, lower, and laterall partes of the *Peritonæum*.

E E. The White Line from the Griſtle of the breaſt bone, called the Breaſt blade, to the Cõmiſſure or meeting of the ſhare bones.

F. The Griſtle of the breſt-bone, *Cartilago enſi-formis*, or the breaſt blade.

G. The Nauill which, al the Muſcles being taken away, muſt bee kept for the demonſtration of the vmbilicall veſſels.

H H. The productions of the *Peritonæum*, which containe the ſeminary veſſels on either ſide.

** The hole which giueth way to the ſeminary veſſels of men.

I I. A Veine and an Arterie from the Epigaſtricke, which beeing carried vpward vnder the right Muſcles, do heere hang downe, and are diſtributed into the lower part of the *Abdomen*.

K K. A Veine and an Artery from the internal Mammary proceeding from vnder the bone of the breaſt, are carried downeward thorough the right Muſcles, and are diſſeminated into the vpper part of the *Abdomen*.

1, 2. The place wherein the right Muſcles ariſe, which being here cut off, do hang down, that their veſſelles may the better bee ſeene.

3, 4. The *Anaſtomoſis* or inoculation of the foreſaid veſſels, making the conſent of the *Abdomẽ* and the noſe, and of the wombe with the breaſts, as ſome thinke.

L L. Branches of Veines running into the ſides of the *Peritonæum*.

N. The place of the hanch bone bared, to which the oblique & the tranſuerſe Muſcles do grow.

The ſecond Figure.

a The deſcending veſſels proceeding frõ the trunk of the hollow veine, and the great Arterie vnder the breſtbone. *b* The veſſels aſcending frõ the *Epigaſtrick* veſſels *ccc*. *Anaſtomoſes* or the inoculations of the aſcending veſſels with the deſcending.

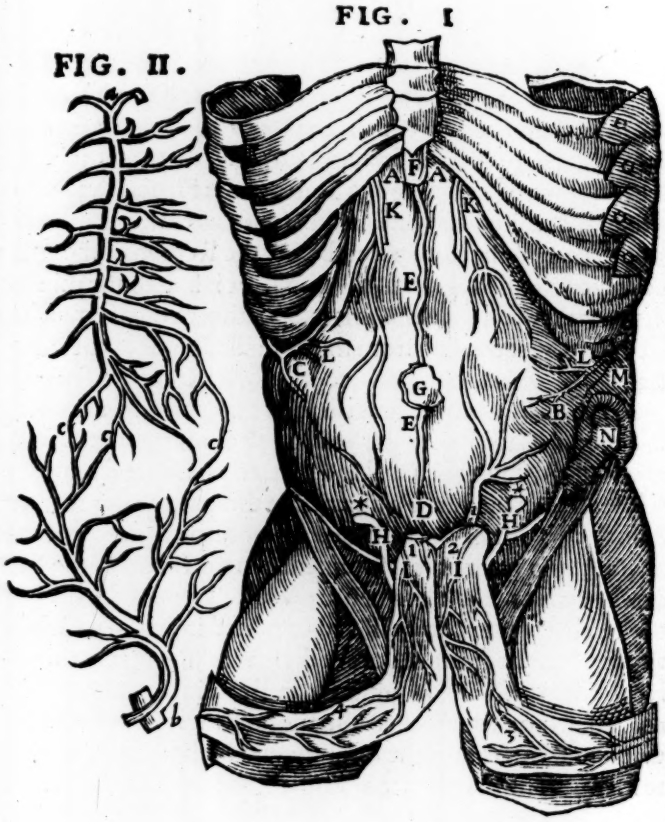
¶ *The firſt Figure ſheweth the right Muſcles of the Lower Belly, with the veſſels, and the lower belly it ſelfe couered with the* Peritonæum *or Rim, all the Muſcles being taken away.*

The ſecond Figure ſhewes the Veines and Arteries which deſcend from the Mammarie veſſels, and thoſe which aſcend from the Epigaſtricke.

TABVLA. V.

FIG. I

FIG. II.



it ſelfe, the muſcles of the *Abdomen* and the skin. There are alſo two productions, [Tab. 5. **] on either ſide one, which paſsing from his external membrane ſeated vnder the kidneyes neere the Share-bone, like looſe Canels or pipes, attaine through the Tendons of the oblique and tranuerſe muſcles without the cauity of the belly into the cod, and ſo to the Teſticles, where ſpreading themſelues, they compoſe or frame their proper coat. Through which

which productions the preparing ſpermaticke veſſelles doe deſcend, and the *deferentia* or leading veſſelles doe returne to the necke of the bladder together with the muſcles of the Teſticles in men. But in woemen two proceſſes or productions paſſe from the wombe to the vpper part of the neck of the ſame. To theſe productions adhereth very cloſely the internall membrane; which yet is diſioyned neere the ſhare-bone; which inward membrane if it be broken, and the externall dilated, according as the gut or the Kall ſhall fall downe either in men or women; ſo it cauſeth the one kinde of rupture or the other. This production (the skin being cut in the flanke) if it bee intercepted and taken it vp with a tie cloſe to the *Abdomen*, hindreth indeed the fall of the gut or Kall, but becauſe the ſpermatical veſſels alſo in men are neceſſarily tied with the production, the Teſticle of that ſide muſt needs be vitiated and looſe his vſe; but if the tie be not [at ** in the 5. Table] very neere to the *Abdomen*, then ſome part of the gut falling down, brings great moleſtation, & although there be no outward tumifying or bearing downe to be ſeene nor ſcarcely any can be felt; yet it requireth a new inciſion and a new tie, as we haue learned at the price of other mens experience. Finally, in the forepart about the middle of the belly where the nauill is, it is perforated in the Infant for the paſſage of the nauill veſſelles, that it may receiue nouriſhment from the mother, but afterward that perforation groweth vp, and if it breake out againe, it cauſeth the Nauill-rupture called ομφαλοκήλη.

The reaſon of a rupture. Why a teſticle is neceſſarily loſt in cutting for a rupture.

From this *Peritonæum* alſo as from their originall doe proceede particular coates, wherwith euery inſtruement vnder the midriffe is couered, but ſome of the entralles haue thinner coates, ſome thicker, according to euery ones neceſsity: as the kidneyes coate is craſſe and thicke, but thoſe of the ſtomacke, guts, bladder, and matrix much thicker: this coate compaſſeth the proper coates of the entrals and is called the common-coat; the vpper entralles as the Liuer, the Stomacke, &c. borrow it from that part of the Rim which groweth to the midriffe: the nether, as the bladder and the guttes, from that part which cleaueth to the ſhare-bone, as ſayth *Galen* in his 4. booke *de vſu partium*, and chapter 20. There bee alſo two membranes which proceed from this which are double, the Kall and the Meſentery, and ſome ligaments, as the ligament of the Liuer. Veines and Arteries the Rim hath from the neighbor veſſels aboue; from the veſſels of the midriffe which are called *Phrenica*; behind, from the muſcles which goe away by the loynes and ſo run through the ſides [Tab. 5. ¶¶] of this *Peritonæum*. Before and ſomewhat higher [Table 5. **] from the Mammarie or Pap veſſels which trēd downward vnder the ſword-like cartilage or breſt-blade to the right muſcles; lower frō the *Epigaſtricall* veſſels [Table 5. ¶] aſcending vnder thoſe right muſcles it receiueth certain ſurcles or branches for his nouriſhment and preſeruation of his natural heat; ſometime alſo ſeueral tendrils are communicated vnto it from the ſpermatical veines.

The coates which the *Peritonæum* giueth to al the viſcera or entrals.

His Nerues are very threddy which it hath from them that are diſtributed into the muſcles of the *Abdomen* by which it receiueth ſence.

The Vſes of this *Peritonæum* or Rim, are; Firſt ſayeth *Galen* in the 4. booke *de vſu partium* and the 1. chapter, to couer the parts contained in the lower belly; but this vſe ſayth he, is not the principall, becauſe thoſe partes are well couered beſide with the muſcles of the paunch, a great deale of fat and the skinne. The ſecond vſe is, that it ſhould bee a *medium* or meane betweene the entrals and the muſcles, and ſo hinder the Kall and the ſmall guts from falling into the ſpaces betwixt the muſcles or vnto the skin; (as it hapneth when this membrane is broken) where they would cauſe great paine, hinder the motions of the muſcles, and the free depoſition or auoydance of the excrements; all which inconueniences we finde when this Rim is wounded and not perfectly and rightly cured. Thirdly, it helpeth much to the ſpeedy vnburdening of the belly; for, becauſe the muſcles of the paunch and the midriffe by reaſon of their different ſcituation, cannot in their contraction ſtreyne the whole belly equally and alike in euery place: the continuated poſition of the Rim ſupplieth that want, as when a man caſteth both his hands vpon a bag of hearbes and compaſſeth them about on euery ſide, hee may more equally ſtraine the liquor out of all the parts of the bag. Fourthly ſayth *Galen* in the booke next aboue named and the 17. chapter, it giueth coats to all the entrals of the lower belly, and produceth diuers ligaments, as we haue partly touched before, and ſhall do more at large hereafter. Fifthly, it firmeth and ſtrengthneth all thoſe entrals, eſpecially the ſtomacke and the guts, which otherwiſe being diſtended with wind would be violated yea torn as it were, and their coats ſliuen aſunder; beſide, it tyeth them together and holdeth thē fixe in their proper places. Finally, it is a ſauegard to the veſſels, which hauing a long courſe to run, and being but ſlender of themſelues, are ſecured betwixt the duplicated membranes of this *Peritonæum*.

The vſes of the Rim.

Galen.

Of

CHAP. XI. *Of the vmbilicall or Nauel veſſels.*

The names of the Nauell.

THey are called *vaſa vmbilicalia*, becauſe they paſſe through the Nauel which is called *vmbilicus*, for of their convolutions or fouldings one with another, is the Nauell made; the Greekes call it ὀμφαλος, ἀπὸ τῆ ἐμπνεῖν, which ſignifieth to breath, by reaſon of the Arteries in it by which the infant in the Wombe breatheth or receiueth breath. *Ariſtotle* in the firſt Booke *Hiſt. Animal.* and the 13. Chapter, calleth it ῥίζα γαστὸς, the roote of the belly, becauſe by theſe veſſelles, as by the ſtrings of the roote, the Infant draweth nouriſhment from the cake or Liuer of the wombe, as it were out of the earth. The Latine name *vmbilicus*, is deriued *ab vmbone*, which ſignifieth the boſſe of a Buckler, which is repreſented in the middle of the belly, yea in the very middle and center, ſaith *Galen* 15, *vſu part.* 4. of the whole body, if you ſtretch out your armes and legs, and draw a circle about them.

What it is.

The ſixt Table, ſheweth the lower belly, all the containing parts, aſwell proper as common, being remooued, & the bowels lying in their natural poſition, couered with the kall or omentum, together with the vmbilicall veſſels.

TABVLA. VI.

A. A. B. B. The inner face of the *Peritonæum* cut into four parts, and ſo turned backward.

B. The vpper B. ſheweth the implantation of the vmbilical veine into the Liuer.

C. The Nauell ſeparated from the *Peritonæum.*

From D. to the vpper B. The vmbilicall veine.

EE. The vtter part of the ſtomacke blowne vp, neither couered by the Liuer, nor by the Kall.

FF. A part of the *gibbous* ſide of the liuer

G. Veſſels diſſeminated thorough the *peritonæum.*

* The breſt blade.

H. The bottome of the bladder of vrine

I. The connexion of the *Peritoneum* to the bottome of the bladder.

KKKK. The Kall couering the Guts.

MN. Veſſels and ſinnewes embracing the bottome of the ſtomacke.

O. The meeting of the veſſelles of both ſides, ſo that M. N. and O. ſhewe the ſeame which *Ariſtotle* makesmention of in the 4. booke of the parts of the creatures, and the 3. hiſtory.

PP. Certain branches of veſſels running along the bottom of the ſtomacke.

QQQQ. Certaine branches of veſſels diſtributed to the vpper Membrane of the *Omentum*, and compaſſed with fat.

aa. The two vmbilicall Arteries, going downe by the ſides of the bladder to a branch of the great artery.

b. The Ligament of the bladder which is ſhewed for the *Vrachus.* *The ſecond Figure ſheweth the vmbilicall Veine.* A. That part which ioyneth to the nauell. B. The other that is inſerted into the Liuer.

The vmbilicall veſſels.

The nauell therefore is the ſtumpe of the vmbilicall veſſelles, by which the Infant was nouriſhed in the wombe, [Tab. 6. C.] therefore implanted into the middeſt of the lower belly, becauſe it was requiſite, that as well the Alimentary as the Vitall blood ſhould firſt apply to the parts contained in this belly. Now the vmbilical veſſels are theſe: One veine, in bruite Beaſts there are two: Two Arteries ſometimes, (yet that rarely) but one: diuided at the inſide of the nauell into two, and in Beaſts the *Vrachus.*

The vmbilicall Veine.

The vmbilicall veine [Tab. 6. from ᴰ to ᴱ] is the firſt of all the veines, yea the *Principle of Perfection* of all the parts of the body, in reſpect of their fleſhy ſubſtance, becauſe it is the vehicle or conueigher of blood, as well for the matter whereof all the *Parenchymata* of

all

all the parts; wherefore it is alſo the roote of the Gate-veine, and is formed together with the vmbilicall arteries immediately of the ſeede before any of the entrals. And this truth accordeth with the opinions of *Hippocrates* and *Galen*, and with right reaſon: for the Infant needeth both bloud and ſpirits for the generation of his parts: now becauſe theſe muſt be conuayed by veſſels, it followeth neceſſarily that thoſe veſſels ſhould be generated before the parts themſelues; and theſe are they. So we ſee the ſeede of Corne or ſuch like, when it is caſt into the earth, firſt of all, it ſhooteth out of it ſelfe the beginning of the ſtalke and of the roote together, that afterward the ſtalke may be nouriſhed by the rootes. Semblably in the figuration of Man-kinde at the ſame inſtant that the ſubſtance of the body beginneth to be moulded, the vmbilicall veſſel is produced whereby the creature might be nouriſhed and augmented.

Hippocrates. Galen.

Comparison.

The paſſage of the vmbilicall veine.

This veine [Table 6. from [D] to [B]] paſſeth through the double membranes of the Rimme, and in the Infant hauing gotten through the place of the nauill, becommeth ſometimes two, ſometimes preſently after his egreſſe is deuided, ſo that it ſeemeth to bee double, and together with the arteries is compaſſed with a membrane called the *Gut-let*, and ſo runneth out into a great length; *Veſalius* ſayth of a foote and a halfe long, but oftentimes it is much longer, yea ſometimes double and treble. The veine is full of knottes, by which ſome ſuperſticious Midwiues gather how many children the Mother ſhall haue, but their true vſe is to ſtay and entertaine the bloud, that it might receiue a more exquiſite elaboration for the nouriſhment of the tender Infant. The arteries becauſe they are ordayned to conuay the ſpirites for the ſupport of life are ſtraight and euen without any boſſed knottes at all.

The knots of the veine.

When theſe veſſels come vnto the *ſecundine* or after-birth they diſperſe through it notable braunches, and leſſer toward his outward part, which atteining vnto the *Liuer or Cake of the wombe*, doe forme a Net-like complication, till at length they looſe themſelues into ſmall hairie ſtrings, by which as by the tendrils of the rootes of plants, the mothers bloude both alimentary and vitall together with the ſpirit is drawne out of the mothers veines and arteries into theſe vmbilicall veſſelles. From whence the veines conuey the bloud into the Gate-vein, & from thence by the *Anaſtomoſes* or *inoculations* which are betwixt the roots of the Gate and the hollow-veines, it paſſeth into the trunk of the hollow vein, and ſo nouriſheth the whole body of the Infant. The Vmbilical arteries by which the Infant hath tranſpiration do tranſport the vital bloud vnto the *Aorta* or great arterie, & from thence it paſſeth vnto the heart to maintain the natiue heate and life of the little creature. But after the Infant is borne, the Midwife after ſhe haue ſtroaked down the bloud to nouriſh the Babe, caſteth it into a knot cloſe to the belly, and then cutteth it off, and the ſtumpe that is left is the nauill.

The manner how they nouriſh & ſuſtain the Infant.

A direction for Midwiues

And becauſe the portions of them, which are left within the body ſhould, not be altogether vnprofitable, they are turned into ligaments. The veine becauſe it proceedeth out of the Fiſſure or cleft [Tab 6.[B] and tab.4.*lib.*3.[E]] which is in the hollow part of the Liuer, and thence attaineth betwixt the two Membranes of the Rim vnto the Nauill, becommeth the Ligament of the Liuer, which ſometimes in dropſie bodies openeth (yea and euen in our diſſections we haue ſometimes followed it with a Probe and found it open into the Liuer) and ſo auoydeth by the nauill the water which is gathered in the Liuer: but the chiefe vſe of it is to tye downe the Liuer to the Nauil that it riſe not vp and ſo ſtop the deſcent of the midriffe in our inſpiration. And this vſe of it the Egyptians know full well, for they vſe to ſlay at this day their Theeues, and they liue in great torment til the Hang-man or Butcher cut the nauill, and then they dye inſtantly, the Liuer gathering vp vnto the midriffe and ſo ſtopping their breath.

The vſe of theſe veſſels after the birth

The way of the dropſie water.

A cruel cuſtome of the Egyptians.

The Vmbillicall arteries [Table 6.[AA] tab.2.*lib.*3.[KI]] ariſe as moſt do agree (though *Veſalius* be of another mind) from the *Iliacall* arteries, or rather they are there implanted ſayth *Bauhine*, and running along by the ſides of the bladder [Table 2.[KI] tab.4.*lib.*3.[aa]] they paſſe vpward through the Membranes of the *Peritonæum* vnto the Nauill, and ſo become the laterall Ligaments of the bladder.

The paſſage of the vmbilicall arteries.

Finally, the *Vrachus* [Table 6.[b] tab.2.*lib.*3.[i]] or the *vrinarie* veſſel in beaſts, ariſeth from the bottom of the bladder [Table 6.[H] tab.2.*lib.*3.[g]] and aſcendeth betwixt the two arteries through the duplication of the *Peritonæum*, and iſſuing out at the nauill-ſtead is lengthned into two guts as it were, and maketh that coate of the creature which is called *Alantois*, into which the vrine of the Calfe is poured, which is there retained till it be calued.

The *vrachus* in beaſtes.

But

In Men. But in Man there ariſeth from the bottome of the bladder [Tab. 6.[x] Tab. 2. li. 3,[g]] a Ligament like to the *Vrachus* [Tab. 6,[b] Tab. 2. li. 3, 1,[i]] but it is not al perforated. It paſſeth betwixt the vmbilicall [Tab. 6.[a a].] Arteries, and is firmely knit vnto the nauell [Tab. 6.[c].] to which it faſtneth the bladder, and ſo holdeth it ſuſpended, that it may not moue this way or that way, or be otherwiſe in danger of breaking, becauſe (ſaith *Varolius*) whatſoeuer is ſeparated from the blood whilſt the Infant is in the Mothers wombe, is gathereth together in the bladder. Hence it is that new borne Babes haue their bladders diſtended & full of Vrine, which they auoide in great quantity before they take any ſuſtenance. But afterward as the childe groweth, this Ligament degenerateth into a very ſmal filament or twiſt with which the bladder is tied to the *Peritonæum*, and ſo ſuſtained, that when the bladder is diſtended, his necke might not be preſſed. But of theſe veſſels wee ſhall haue occaſion to intreate heereafter more in our diſcourſe concerning the *Conformation of the Infant*. In the meane time this ſhall be ſufficient. And thus much of the common Inueſting parts of the whole body, & of thoſe that are particular to the Lower Belly: now it remaineth that we decide ſuch controuerſies as are on foote concerning them, and ſo paſſe on to the nutritiue parts.

The vſe of it after the birth

A Dilucidation or Expoſition of the Controuerſies concerning the Common Inueſting parts of the Body, and thoſe that properly belong to the Lower Belly.

QVEST. I. *How the Haires are nouriſhed.*

THe controuerſies concerning the haires, how they are nouriſhed or otherwiſe encreaſed, although it bee a matter of no great neceſsity, yet is it very difficult and full of Philoſophical ſubtility. That they doe encreaſe from ſhort to long, is not doubted: ſo alſo it is paſt queſtion that nutrition goeth before accretion. *Galen* in his firſt Booke *De Naturalibus facultatibus*, and in the ſecond *De Temperamentis* ſaith, that their generation is like the generation of plants; and yet in his Book *de Arte Medicinali*, in the ninth chapter, where hee treateth of the differences of the members, he ſaith, they haue onely a generation, no gouernment; that is to ſay, they are generated of recrements; but not nouriſhed or gouerned by any Naturall faculty. And in his ſecond Booke *de Temperamentis* he thus expreſſeth their production. *But if the vapour be ſooty, thicke, and earthy, it remaineth impacted in the ſtraight breathing pores of the skin, neyther eaſily returning backeward, nor eaſilie euacuated; wherefore another vapour ſucceeding from within, ſtriketh the former and thruſteth it outward, and ſo one vapour following another, they are in time complicated and conioyned, & make a roping body like the ſoote in a Chimney, but are not nouriſhed at all by the aſsiſtance of any Facultie.*

Hence it appeareth, that they are onely excrements, and their auction is but an improper accretion, vtterly deuoide of life, and therefore they are not to be reckoned among the parts of the body; or if they be, it is not becauſe they do participate of life, but becauſe they haue other vſes of couering, ornament, and ſuch like, as before in their hiſtory is expreſſed. But there are ſome of *Ariſtotles* followers, who contend that they haue a life, but that of nouriſhment onely, not of ſenſe. Which diſtinction ſeemeth to mee to bee very friuolous. For if you take from them any part of life, you muſt alſo take away all life. Beſide

ſide the very ſubſtance of the haire ſo dry and without ſence, is a manifeſt euidence that they cannot be truly nouriſhed. For if they aſſume an Aliment into themſelues, and alter it for their behoofe, what ſhould hinder that they ſhould not encreaſe according to al the dimenſions, length, bredth, and thickneſſe? but we ſee manifeſtly, that they only encreaſe in length, & not otherwiſe, receyuing their additament or aliment, whether you wil cal it, onely at their rootes, not as other parts equally on euery ſide. It will be obiected, that the nailes and the teeth do alſo receiue their aliment after the ſame manner, and yet they are liuing parts. We anſwere, there is great difference. For the Nailes and the Teeth haue all kinds of Veſſels, Veines, Arteries, and Nerues, inſerted into their roots, by which they receyue nouriſhment and ſence, ſo haue not the Haires; and the reaſon why they are onely nouriſhed at their roots, is becauſe Nature foreſawe, that by continuall attrition and colliſion they would ſoone be worne away, vnleſſe new matter were ſupplied vnto them at their roots; and truly we willingly confeſſe, that the extreme parts of the nailes & teeth which are fartheſt from their roots do not liue, neyther are nouriſhed properly, but onely are driuen forward by appoſition and impulſion like as the Haires are. But it ſhould ſeeme that the nature of the Haires and of the nailes is all one, becauſe they both increaſe in dead carkaſſes. Wherefore if the nayles be nouriſhed, why ſhould it be denied that the haires alſo do grow by nouriſhment?

Obiection.

Answere.

Obiection. That Haires and Nayles are both of one Nature.

Answere.

Heereto we anſwer, that true it is, aſwell the nailes as the haires do ſhoot out after death; but the maner is not alike, for the haires do, ſo and from the ſame cauſes grow in length after death, as they did before; the heat of corruption and putrifaction ſeruing as well, ſo long as the matter laſteth, to driue out the excrement after death, as the naturall heate did while the man was on liue; but the nailes do not grow as they did in the life time, but onely become more prominent, the adiacent parts ſinking from them, as being conſumed by putrifaction. But it may further bee vrged, That the nature of a putrified excrement when it is not ouer-ruled by the faculty, is not to breath outward to the Circumference, but to gather inward vnto the place where the moſt putrified matter is; and this is daily obſerued euen in liuing bodies, that till the offending humour be brought into ſubiection vnto nature, and receiue a kinde of mitigation, it gathereth ſtill to the center; afterwarde, nature hauing gotten the victory, ſhe driueth it as farre from her as is poſsible, euen to the skin; as we ſee it falleth out in Criticall ſweats, in the Meazels, ſmall Pocks, and ſuch like. Now if the putred excrement haue no diſpoſition to the Circũference in liuing bodies when the ſecret paſſages of the body are open, the skin porous, & the faculties euery where at work; how ſhal it paſſe that way after thoſe paſſages and pores are falne, the habit forſaken of the ſpirit, & the trãſpirable wayes locked vp vnder the ſeale of death? It ſeemeth therfore more reaſonable to thinke that the matter of the haires which is added after death, was a ſurpluſage of the laſt concoction celebrated in the habit of the body, and remaining in the extremities of the veſſels which determine in the skin, which being in that place intercepted by the extinction of naturall heate, and hauing no ſpirits to guide it backward; yet hauing before attained the perfection which the faculty could impart vnto it, worketh it ſelfe a way through the skin. But this knot will eaſily bee vntied, if we conſider that after death the haires do not grow or encreaſe in any place of the body, but onely in ſuch, as wherein there were haires ſtanding in the time of life, to the roots whereof, as I ſaide before, the heat proceeding from putrifaction, is ſufficient to driue, though not any humor, yet a vapor which may paſſe where the way was before thrilled and bored, but cannot where the skinne was not notably perforated. Againe, there is a double limit, beyond which the excreſcence of the Haire dooth not proceede. For if either the confluence of the vapour to thoſe pores make a dampe, as in proceſſe of time it will, or the putrifaction of the vapour grow to a Venom, then the Haires ceaſe to encreaſe, but fall not ſo ſoon in dead carkaſſes as in liuing men, becauſe the aire exiccateth and drieth the skin wherein the roots are faſtned; but in thoſe that are aliue whoſe skin is open, they fall not vpon a dampe, for there can be no ſuch thing in a liuing body, but vpon a confluence of a venemous vapor, as we ſee in the *French* diſeaſe and the Leproſie. And ſo much of the Haires.

Obiection.

Answere.

QVEST.

Whether the Skin be the Organ or instrument of touching. QVEST. II.

The *Peripatecians* arguments.

THE Philosophers and Physitians striue about the instrument of touching. *Aristotle* and *Alexander* call flesh sometimes the *medium* or meane through which wee feele, sometimes the Organ or instrument of feeling it selfe, but neuer the Skinne. First, because the Skin is of it selfe insensible, and sensible only by reason of the flesh. For the skinne of the head which is without flesh say they, is insensible. Secondly, because flesh bared or exposed to the ayre, is more paynfull then the skin. Thirdly, because there is a more exquisite and discerning sence in the flesh then in the skin. For that Iewellers and Lapidaries doe more accurately discern the differences of roughnesse and smoothnes, and such touchable qualities by the toung then by the hand; and are able to distinguish betweene natural and fictitious precious Stones only by the touch of the tongue. Lastly, because it is a rule in Philosophy, that the sensible subiect beeing placed immediately vppon the instrument of sense is not sensible, but such sensible subiects placed immediatly vpon the skinne are felt, therefore the skin is not the instrument of touching.

An axiome.

Auicen. Fen.1.cap. Doctr.4.cap.1.

To these may be added the authority of *Auicen*, who writeth, that the skinne feeleth not equall bodies or obiects; if it feeleth not equall obiects, then is it not the proper organ or instrument of touching; because euery instrument of sence which the Greciās cal αἰσθητήριον apprehendes both extreme & also middle obiects; so the eie seeth both theextreme colours which are blacke and white, and also al middle colours made of their mixture, whether they contain lesse or more of either of the extreames. On the other side, the Physitians affirm the skinne to bee the instrument of touching, which will appeare to be the probable and likely opinion whether we consider the temper, the structure, or the scituation of the skin. For the temper, the skinne is the most temperate of all the partes in the very midst of the extreames, and is as it were the canon or rule of them all; and therefore can giue a more perfect iudgement of the tactible qualities.

The Physitians opinion. Their arguments taken from the temper of the skin.

2.de Anima. Why Iaundy eyes think all things yellow.

Aristotle hath determined that euery αἰσθητήριον or instrument of sence should be ἄτοπον, that is, deuoyde of all qualities whereby that sence is affected. So the Christaline humour which receiueth the Images and spectres of visible thinges, is deuoide of all colours; the yellow eyes of those that are full of the Iaundise imagine all things to be yellow. If the tongue be moystned with choller, all things though sweet haue a bitter tange: in the nose there is no particular and peculiar sent; no sound naturally residing in the eare: right so the skin which hath no excesse of qualities is to bee esteemed the organ or instrument of touching.

The structure of the skin. The scituation of the skin.

If we consider the structure of the skinne, there are moe nerues disseminated into it then into the flesh, but the nerues are the common conuayers of all sensible spirits, which they continually minister vnto the sences, whereby their operations are perpetuated. And for the scituation of the skinne, it is much more commodious then that of the flesh, because it is nearer to the occursation or confluence of outward obiects; because it is the limit and border as it were of all the parts. The skin therefore is rather the instrument or organ of touching then the flesh. As for the forenamed obiections of the *Peripatecians* they are easily answered: for first we deny that the skin feeleth by helpe of the flesh. I instance thus: cut a nerue which endeth into the flesh, presently the motion will cease, but the sence of the skin will remaine; but if a nerue be cut which passeth vnto the skin, presently the sence it selfe will be abolished. Againe, true it is that flesh when it is bared is more sensible and painfull then the skinne; but the reason of that is because it is looser, and lesse accustomed to outward iniuries of the ayre or ought else; whereas the skinne is so accustomed to the ayre, that it feeleth it not. So the teeth being vsually opposed to the ayre are not affected therewith, but other bones if they be bared doe presently putrifie. To proceed, the tong hath a more exquisite apprehension of the coldnesse and inequality of precious stones; but that apprhension is not from his flesh but from his membrane; nowe membranes are also instruments of sence. And whereas it is sayd that the sensible subiect or obiect being placed immediately vpon the instrument of sence, is not sensible; that I say is vtterly false, for by that reason there should be no organ of touching saue only a bone, a gristle, or a *vinculū* or tye.

Answers to the *Peripatecians* arguments. The first.

The second.

The third.

The fourth.

That

That Axiome of *Aristotle* stands neede to be interpreted: Of the sences some are absolutely and simply necessary to our life, as touching and tasting; some are *ad bene esse*, that is, for the better being of the creature, but not simply necessary to his being, as sight, hearing, and smelling. The *Medium* or *Meane* of these last is externall and separated from the instrument; the *medium* of the first is internall, and so ioyned with the instrument that it cannot be separated. In the first this axiome is true; for if any colour be laid vppon our eye, wee see indeed, but very depravedly, being not able without an outward meane to distinguish, so likewise it is in hearing and smelling: but in tasting and touching because the *medium* is internall, the obiect may be, yea is best distinguished when it toucheth the instrument. We therefore conclude that the skin is the organ or instrument of touching, and the Cuticle or skarfe-skin is his *medium* or meane.

An interpretation of an axiome.

The conclusion.

Whereas *Auicen* sayth that the skinne doeth not feele equall or temperate things, he meaneth that it is not violated or ill affected by them when it feeleth them, not that it feeleth them not at all: for that common experience would condemne. Lastly, you will say that the skinne feeleth by the helpe of nerues; the nerues therefore are the instruments of feeling not the skin. I answere, the flesh of the muscles are moued by the nerues, yet is not the nerue the immediate organ of voluntary motion but the muscle. In like manner the nerue giueth sense vnto the skin, because it bringeth downe vnto it the Animall faculty and spirit, yet nathe-more is it the immediate instrument of sense. But *Galen* sayeth that the stomacke is the organ of touching, because his sence is most exquisit: surely the mouth of the stomacke is wondrous sensible, because of the notable nerues it receiueth from the sixt coniugation, and by reason of the hunger and thirst of which it onely is apprehensiue: we acknowledge it the instrument or Organ of a peculiar and particular touch, as also the partes of generation haue their peculiar touch whereof they are instruements; but onely the skin is the Organ of externall touching, and sole iudge of all tactile qualities.

Answere to *Auicen*.

Another argument answered.

Answere to *Galens* authority.

Peculiar touches in mens bodies.

Of the Temper of the Skin. QVEST. II.

Galen is of opinion that the Skinne is absolutely temperate, because it is of a middle nature between bloudy and vnbloudy, whence it is called a neruous flesh and a fleshy Nerue; so in another place, if the flesh bee adstringed and dryed, it becommeth like the skinne; for the skin is dryer and thighter then the flesh. *Hippocrates* also expresseth so much where he sayth, *The outward Skin which is continual with it selfe and with the bloudy Nerue, because it is exposed to the aire, sometimes colder, sometimes warmer, is often affected by both, and needes now and then the help of the one to temper the other.* On the contrary it may be proued by the authorities of *Galen* and *Auicen* that it is not Temperate. *Galen* sayth that the Skin is nourished with phlegmaticke bloud; it is therefore of the Temper of Phlegme, for the nourishment of any part is the same with that whereof it is compounded. *Auicen* sayeth that the flesh commeth neerer to exact equality of Temper then any other part. The flesh therefore and not the skinne is temperate. Moreouer, that cannot be temperate which is the weakest of all parts: now the skin receiueth the superfluities of all the inward partes, and is therefore called the vniuersall Emunctory. But all these knots may easily be cleft with a soft wedge. The skin is nourished with phlegmatick bloud, that is, not ful boyled and labored, when wee know it is hot not cold. *Auicen* sayth not, that flesh is most temperate, but that it commeth neerest to that which is temperate; so the whole body of Man is sayd to bee temperate, although it be hot and moyst.

That the skin is temperate.

Hippocrates.

That it is not.

Galen.

Answere to the arguments which proue it not to be temperate.

The weakenesse of the Skinne proceedeth not from the Temper, for it is not weake of it selfe or of it owne nature, but by euent, by reason of the scituation and the vessels. For the greater vessels, because they are neerer to the fountaine are the stronger, and the expelling vertue of the inner-parts more powerfull: whence it is, that the inward partes expell their superfluities into the outward, and the greater vessels into the smaller vessels of the habit; so that the skinne becommeth weaker, because the expelling faculty is within warde and stronger, and layeth all the burthen vpon the skinne: and somuch for satisfaction of the aduersaries.

Why the skin is weake and becomes an Emunctory.

There is another scruple arising out of this Doctrine of the Temper of the Skinne; and that is, whether a Physitian by the Skinne may iudge what is the Temper of the whole body. *Aristotle* gathereth from this instrument of touching, the vigour of the minde it selfe, because

Whether by the skin the temper of the whole body may be known *Aristotle.*

becauſe where the touch is fine, there the ſence is leſſe polluted, & the Phantaſmes ariſing there from more ſubtile; and ſo the operation of the ſoule higher and more abſtruſe. *Galen* reſolueth the doubt where he ſayth; They are in an errour who doe determine alwaies of the Temper of the whole body by the skinne; for though the skinne be hard, yet is not the Creature neceſſarily dry; neither if it be ſoft & without haire is the whole creature moiſt; yet if the whole body be in equall Temper, then it is reaſonable that all the parts ſhould be proportionably correſpondent to the Temper of the Skinne, but if the body be vnequally tẽpered as oftentimes it is, from the nature, by accident, or by diſeaſe, then is it not reaſonable to iudge of the body by the skin. For we ſee that in Oyſters the fleſh is very moiſt, yet is their skin, which is their ſhell, beyond meaſure dry.

Galens reſolution of the queſtion.

Of the Originall and Generation of the Skin. QVETS. III.

The common opinion.

THere are many opinions about the generation of the Skinne. The common opinion is, that it ariſeth from the dilated endes of the Veines, Arteries and Sinewes, becauſe it euery where feeleth, liueth, and is nouriſhed: now life is communicated by the Arteries, nouriſhment by the Veines, & Sence by the nerues or ſinewes. For my owne part I doe not deny but that many veſſels are carried vnto and doe determine in the skin. From the Axillary, Iugular, and Crurall veines, many ſmall Surcles, and as many Arteries bearing them company: interlaced alſo it is with manifold Nerues, but yet I am not reſolued that the skinne is wouen together of their threds. *Galen* thought the skin was the firſt part of the Infant that was formed, the trueth of which aſſertion we ſhall diſcuſſe in another place. Some thinke the Skin is made of the ſuperficies of fleſh dryed, becauſe in woundes the fleſh dryed degenerateth into a Cicatrice or Scarre, which is very like the nature of the skinne; this may bee confirmed by the authorities of *Ariſtotle* and *Galen*. *Ariſtotle* auoucheth that as the fleſh groweth old, ſo it turneth into skinne. *Galen*, that the skinne is produced out of the fleſh which is vnder it. But becauſe between the fleſh & the skin there are many bodies interpoſed, to wit, the Fat and the fleſhy Membrane, which is truely neruous, vnleſſe it be about the neck & the face, I cannot ſee how the skin ſhould grow out of the fleſh. And that skin or ſcar rather which reſulteth vppon wounds, when the fleſh is ſoftned & dryed by *Epulotical* medicines as they call them; is not a true skin but illegitimate, ingendred of a ſubſtace of another kind; for it is harder then the true skin & more thight, & therfore neuer hath any haire growing vpon, it and in tanning it will fal away, whence comes the holes in Sheep skins, when they are made into Parchment. Some thinke it is compounded of fleſh and ſinewes mingled together, becauſe in many places of *Galen*, the skin is called a bloudy nerue; but this is prooued to bee falſe by this one argument, becauſe where there is moſt ſtore of nerues, there the skinne is not the harder for thẽ; as in the palme of the hand there are more nerues then in the crown of the head, and yet the skinne in the crown is much harder then that of the palme. I think, and for this time determine, that the skin is ingendred together with the other parts, to wit, of ſeed and bloud mixed together; and may therefore be called a fleſhy nerue, or a neruous fleſh, becauſe it hath a middle nature between fleſh and a ſinew: for it is not vtterly without bloud as a nerue, nor ſo abounding with bloud as fleſh. That there is bloud in it appeareth euidently if it be neuer ſo little wounded; that it is of ſeed, this one argument may ſerue for all, that when it is periſhed it can neuer bee reſtored, for it is impoſsible to heale a wound where any part of the skinne is taken away without a ſcarre or Cicatrice more or leſſe.

The differẽce between a ſcar and the true skin.

Another opinion.

But proued falſe.

The determination.

An argument that the skin is made of ſeede. and bloud.

Whether the Skin performe any common and officiall action. QVEST. IIII.

The common opinion.

MAny Phyſitians haue the ſame opinion of the vſe and action of the Skinne which they haue of the vſe and action of Bones. The Bones haue a common or official vſe, ſo ſayth *Hippocrates*, they giue the body ſtability, vprightnes and figure, but that they performe no common or officiall action. I account that a common action which is ſeruiceable either to more parts or to the whole creature. In like manner, the skinne hath indeed a common vſe, becauſe it couereth the whole body, cheriſheth it & tyeth it together, but it is not thought to performe a-

Hip. lib. de natu. oſſium.

ny

ny officiall or common action. *Galen* speaketh very plainely, *The skin* (saith he) *concocteth not, as the stomacke: it distributeth not as the Guts and the Veynes: it breedeth not bloud as the Liuer, it frameth not any pulsation as the Heart and the Arteries; it causeth not respiration, as the Lungs and the Chest, it mooueth not with voluntary motion, as the Muscles.* Notwithstanding all this, one common action may bee attributed vnto it, to wit, an Animall action. For although all sensation is passion, because to be sensatiue is to suffer, yet there is no sensation without an action. The better learned Philosophers in all sensation doe acknowledge a double motion, one Materiall, another Formall: the former motion is in the reception of the species (for we must craue liberty to vse our Schoole tearmes) the latter in an action; the first is in the Instrument by reason of the matter: the latter, by reason of the power is in the soule; the first is not the effectuating cause of sensation, but a disposition thereto: the latter is essentially sensation it selfe. Whereas therefore the skinne is apprehensiue of those qualities which strike or mooue the tactiue sense, and is thereupon esteemed the iudge and discerner of outward touching, it performeth vnto the whole creature not onely a common vse, but also a common or officiall action. Beside it hath another priuate action, to wit, Nutrition, to which as handmaids do serue the Drawing, Retaining, Concocting and Expelling Faculties, & more then these hath no part in the body of man which serueth for the behoose of the whole. Wee conclude therefore, that the skin beside his common vse and priuate action performeth to the body a common and officiall action, to wit, Sensation.

The common action of the skin is animal

How sensation is made.

The priuate action of the skin.

QVEST. V. *Whether it be heate or colde, whereby Fat is congealed.*

THE diuers yea contrary gusts of opinions amongst ancient Physitians about the generation of fat, hath raised such a tempest in our Art, that the Waues are not to this day setled. There needeth therefore some *Æolus, mulcere hos fluctus* to appease these waues, to call in the windes, or to abate them into a calme, which we will at this time intend to do in want of better helpe as well as we may. And b cause we would not bee accumbred with the variety of names which are vsually giuen to this substance, you shall vnderstand, that *pinguedo, adeps, auxungia*, and *sevum*, are promiscuously vsed by Physitians, albeit *Aristotle* and *Galen* haue taken great paines to distinguish them euery one from another. To which places, we refer those who desire heerein satisfaction. For we will onely paine our selues about the temper and generation of fat at this time.

The names of Fat. 2 *de partib. Animal.* 4. & 11. *de simpl med. c. Facultat.*

Galen is of opinion, that fat is congealed by colde, and that he expressely declareth together with the manner of it in this manner. VVhen the aiery and more oyly part of the bloud sweateth through the thin coates of the Veines in maner of a dew, and lighteth vpon the colder parts such as are Membranes, it is then by the power of the cold condensed: And hence it is, that women are for the most part fatter then men, because they are colder; & the same reason is of al other creatures growing fatter in the winter time, as do also those that haue smaller vessels; now we know, that the smalnes or narrowneſse of the vessels, is caused by the coldnesse of the temper. And if at any time those creatures which haue large vessels do not yet grow fat, it is not from their naturall, but from an aduentitious temper acquired by accident (to wit) by diet and order of life. Moreouer, that fat is congealed by colde, hence it is euident, because by heate it is presently molten and liquefied. The Lower Belly because it is Membranous and farre remooued from the fountaine of heate, is therefore couered ouer with a leafe of fat, which sometimes is of great weight; but the parts vnder the breast haue lesse fat about them. And this is the Philosophy of *Galen*, and almost all the Greeke and *Arabian* Physitians. Those that hold the contrary, do thus demonstrate the matter of Fat to be hot, the worker of it heat, and the effects of it hot. For the matter, *Galen* himselfe acknowledgeth it to be made of the aery fat & oily part of the blood, as also is cholen and seede; and therefore those creatures that are fat grow barren, and if wee would fat any thing, we first lib or geld it. And *Aristotle* saith, that that which is fat, is neither earthy nor watry, but airy, and therefore it floateth alwayes aboue. Now ayre wee know is hot and moyst. That the efficient or working cause is hot, *Aristotle* first of all men prooued, where he saith, That fat is made by concoction or boyling, but it is onely heat which concocteth or boyleth any thing. And in his Problemes he giueth this reason, why that which

How Fat is curdled. *Galens* opinion by cold.

Why women are fatter then men.

Arguments to proue that it is curdled by heate.

3. *de hist. anim.* 2 *de partibus Animal.*

is fat is not of ill ſauour, becauſe (ſayth he) it is not crude or raw, but concocted. This opinion of the Philoſopher doth the learned *Veiga* follow and *Argenterius*, as alſo *Laurentius Ioubert*, who ſet foorth an elegant and ſubtile Paradoxe concerning the nature of fat. The weight of the principall reaſons for this opinion, we will as briefely as wee can ſet before you. All concretion is made by that which is actually cold, as is ſeene in Ice, oyle, honie, and ſuch like, which by the outward cold aire are congealed: but there is no ſuch actuall cold in a liuing body; the bones are verie hot if they bee touched, and all the Membraes are actually hot, for the membranous ſtomacke boyles the *Chylus*, the membranous bladder burneth the Flegme euen into a ſtone. *Auicen* ſaith, That the Membranes are hotter then the Braine; now the braine is hotter then the moſt ſoultry hot aire that is in the heate of Summer: but the Summer heate melteth and congealeth not; the coldneſſe therefore of the Membranes cannot congeale the fat. Againe, the heart which is the hotteſt of all the inward parts, and in perpetuall motion, is yet compaſſed about the *baſis* with aboundant fat. About the Membranes of the Braine, which are watred as it were with aboundance of blood, and wouen with many thouſand veſſels, neuer any fat adhereth: nor vnto the coates of the bones. Old men and melancholy perſons, whoſe temper is cold, haue yet little fat. The Kidneyes which are very hot, and bake, yea burne Flegme into ſtones, haue yet about them abundance of fat. Beſide, the fat is a liuing part of the body, becauſe it hath a certaine and definite forme or figure, & is whitened by the power of the membrane which altereth it; now who euer durſt ſay, that a liuing part of mans body was made by actuall cold? We may alſo add the authority of *Galen* fauouring their opinion, where hee ſaith, That in cold and dry bodies the fat is larded amidſt the fleſh, not about the membranous coates; but euery one will confeſſe that fleſh is hot. Finally, the effects do teach vs that fat is hot. For *Galen* reckoneth it among concocting Simples; and the fatty kall (ſaith he, in his Booke of the vſe of Parts) by his heate furthereth the concoction of the ſtomack; beſide, it eaſily taketh fire. Wherefore they referre the cauſe of the concretion or congealing with *Ariſtotle*, to the faſtneſſe and thightneſſe of the Membranes. For ſay they, the ayery and fat part of the bloode, paſſeth eaſily through the rare and ſpongy fleſh: but when it commeth to the Membranes, there it is ſtayed and congealed by heate, and becommeth white through the operation of the ſpermatical part to which it adhereth, to wit the Membrane. Add heereto the authority of *Hippocrates*, who ſaith, *That heate is the ſeate and reſidence of Fat.*

That cold cannot congeale the fat.

Melancholy men ſeldome Fat.

The effects of fat are hot.

Pinguis ſedem & metropolim eſſe calidum

Thus you ſee the battell pitcht on either ſide, and contrary Enſignes and Armes in the field. Both parts cannot be maintained. It is more ſafe to ſide with the old Legions led by *Galen*, and followed by the Ancients, then with new and vpſtart Nouices; wherefore, we will determine thus; I wiſh it may be with approbation of the beſt.

The determination.

The Matter of Fat is a very and oyly, the Efficient cauſe a congealing colde, yet not abſolute and actuall (for there is no ſuch colde in any liuing creature) but leſſe hotte, which Philoſopers take for colde, ſo that the fat is congealed not by parts that are abſolutelie co'd, but by parts that are leſſe hot then others, ſuch as are Membranes. But this may better be exemplified, then taught by precept. Lead as ſoone as it is taken off the fire, although it be yet fiery hot, caketh together: this concretion is eyther by vertue of heat or cold; not by a fiery heate, for that melted it before; not by actuall cold, for if you touch it thus caked, it will burne; therefore by a remiſſe heate, which to it is in ſtead of colde. For there is a certaine degree of heate, which will not ſuffer Lead to cake, nor Fat to curdle. This degree is onely in the fleſhy parts; whence it is that fat neuer growes about them. But Membranous parts, becauſe they haue not the ſame degree of heate, doe curdle the Oylie part of the blood into fat. When a Veſſell of boyling water is couered, though the couer be hot, yet the vapour of the water turneth into a ſteame vppon it, and will ſtand in drops, yea will run from it in water, as we ſee in Stils, though the head be ſo hotte that a man cannot touch it. What then is the reaſon? Becauſe in the Couer there is a leſſe heate then in the boyling water. For it is heated onely by a vapour, the water immediatelie by the fire; The leſſe heate therefore of the Couer or head, is in ſtead of colde to the boyling water.

What kind of cold curdleth Fat.

Exemplifications.

Leſſe heate is taken for cold.

In like manner, in Melancholy men their hot and boyling entrals raiſe vapours, which when they come to the skin which is leſſe hot then the entrals, are gathered and thickned into ſweate. So the breathing vapours of all the lower parts being raiſed into a hot braine which yet is leſſe hot then the lower parts, are turned into water, & fal down in Rheumes,

Why Melancholy men ſweate much.

Gowts,

Gowts, and ſuch like. As for this manner therefore wee ſay that Fatte curdles by colde, that is, by a leſſer heate then will melt it; ſo wee ſay the Brayne is cold, that is, leſſe hot, although it be hotter as we haue ſayd, then the ayre can bee in the heate of ſummer. That ſummer ayre or hot gleames wee call hot, and ſo they are; yet are they colde in reſpect of fire, yea cold in reſpect of the heate of a liuing creature; the heart by them being refrigerated: for our life is proportionable to fire; and it is a true rule in Metaphyſicks (that is in Logicke,) that meanes are contrary to their extreames, elſe ſhould not liberality which is a vertue, be contrary to couetouſnes and prodigality, which are the extreames and vices.

It is a fiery heat that we liue by.

Meanes are contrary to their extreames.

Theſe things being thus firſt determined, we will now anſwere the argument vrged againſt vs. Firſt, we deny that all concretion or coagulation is done by actuall colde; for as it is ſayd, Lead yet firie hot, will congeale; and whereas Fat groweth to the heart, which is the hotteſt of all the parts, we anſwere, that herein is a great document of the wonderfull and prouident wiſedom of Nature, who hath thus prouided leaſt in perpetuall motion the hart ſhould gather ſo great a heat as ſhould waſte & conſume it; for which cauſe alſo ſaith *Hippo.* it lyeth in water much like vrine, that it might euer be freſh, & as it were flouriſhing.

Anſwere to the former arguments.

The wonderfull prouidēce of nature.

Chryſippus that notable *Stoicke* in his booke of *Prouidence*, ſayeth that the finall cauſe ouercommeth both the efficient and matter in naturall thinges; and *Ariſtotle* againſt *Democritus* ſayth, that in the workes of nature the end is the firſt and chiefe cauſe, for it moueth the other cauſes, it ſelfe being immoueable. I know that our aduerſaries will obiect, that nature indeuoureth nothing againſt her owne lawes, ſhee ſhould therefore haue made the heart temperate. But let me retort their owne weapon againſt them, Nature ſhould haue made the heart originally temperate, that there might haue beene no neede of breathing cold ayre; how abſurd this oppoſition againſt the wiſedome of nature is, no man but ſeeth. For the heart was neceſſarily to bee created very hotte, becauſe in it is the hearth and fire whereby the naturall heate of all the parts is preſerued and refreſhed. If they thinke not the Fat of the heart neceſſary, let them remember that it groweth not in the ventricles, nor in the fleſh of the heart, but onely vpon the Membranes of the veſſels, which are part leſſe hot then any of the other. Some there are which add further that this Fat is a part of the heart, becauſe it keepeth alwayes the ſame figure and circumſcription, and is not melted by fire, but rather torrifieth.

The finall cauſe is the firſt and chiefeſt in works of nature.

For the Membranes of the Braine, we ſay they haue no Fat, becauſe there was no vſe of it; yea it would haue hindered the breathing out of the ſmoaky vapors by his clammineſſe. For the Braine like a cupping glaſſe draweth continually and ſucketh vp the expirations of the inferior parts, to which if the Comb-like ſutures of the Skul did not gape and giue way, the Braine would be made as it were drunke with their aboundant moyſtures. Beſide, Fat would haue hindred the motion of the Brain, for it moueth perpetually as the Pulſe doth, as we ſhall ſhew in due place; wherefore in the Braine there wanteth the finall cauſe of Fat. The materiall cauſe is alſo wanting, becauſe there is required a great aboundance of bloud for the nouriſhment of the brain, and for the generation of Animall ſpirits; it behoued not therefore that it ſhould be conuerted into Fat. Old men and thoſe that are melancholy are ſeldome fat, becauſe the material cauſe of it is wanting, for they are too dry. The Fat of the Kidneyes compaſſeth not the fleſh, but their membranes only. *Ariſtotle* ſaith that both kidneyes are fat, but the right leſſe then the left, becauſe it is the hotter. And whether the Fat be a liuing part, we ſhall diſpute in our next exerciſe. Finally, whereas *Galen* ſayth that in cold and dry bodies the Fatte is Larded through the fleſh, not through the coates or membranes; we anſwere that by fleſh in that place he vnderſtandeth the muſcles which are couered with their proper coates, to which coates the fat groweth, becauſe they abound with bloud and veines; but in thoſe coates that are moſt diſtant, whereof he there ſpeaketh, becauſe of their drynes there wanteth matter of Fat; for you may remember wee taught you before, that Fat is not ingendred but only where there is an ouerplus of bloud which ſweateth through the ſpongy fleſh after it is ſatisfied. Now in cold and dry bodies ſuch as *Galen* there ſpeaketh off, ther is no ſuch aboundance of bloud that there ſhould be any ouerplus. The effects of Fat which they mention conclude nothing; it is true that Fat is a concocting medicine, and that the Fat of the Kall relieueth the heat of the ſtomacke, but not primarily and of it ſelfe, but by euent, becauſe the thicknes and viſciditie or clammines of it hindreth the euaporation of the heate, which by that meanes is doubled; beſides it ſtoppeth vp the pores, that the piercing cold cannot reach vnto it. Wherefore it heateth the ſtomacke, as cloathes heat the body, not by adding heat, but by keeping the naturall heat in, and exter-

Why there is no fat in or about the braine.

Why melancholy men are leane.

Galen expounded.

How fat heateth the ſtomacke.

Why Fat flames.

nall cold out. That it easily flameth, proceedeth from his oyly and aery matter, so Camphire burneth in the fire, which yet all men take to be cold.

The conclusion.

Moreouer the effects doe not proue the efficient cause of Fat to be hot; for oyle which becomes thick and congealed in winter, presently taketh flame, and yet no man will deny but that it is congealed by the externall cold of the ayre. We therefore conclude that Fat is curdled by cold, that is, by a lower or more remisse degree of heate, & that it groweth or adheareth onely to membranes, because their heate is weaker, as hauing no continuity with the heart, and therefore deprived of that plentifull influence of heat therefrom, which the other parts of the body doe inioy which haue a more notable continuity with it.

Whether Fat be a liuing and animated part of the body. QVEST. VI.

Authorities to proue the fat to bee a liuing part.

THey who imagine that Fatte is curdled or congealed by heate, beare themselues much vpon this argument, that no true part of the body is condensed by cold; now say they, Fat is a part & a liuing part of the liuing creature; this point we cal into question. It may I confesse be made probable both by authorities and by arguments. *Galen* in his Cōmentaries, reckons it among the

In lib. Hip. de natura hominis

similar parts; and in another place he sayth, it euery where performeth the same office as the Veines, Arteries, and Sinewes; if it performe any office to the body, then certainely it is a liuing part. Againe, in another place where he reckoneth vp foure differences of parts, he reckoneth the Fat among those that are gouerned by themselues. In his booke of the *differencies of diseases*, hee sayeth that the number of the parts is abated, if the Arteries, the Veines, the Nerues, the Flesh, and the Fat, be not counted among them. In his book of the *vnequall Tempers* the parts of the Fingers and Toes are these, the Bones; the Cartilages, the Ligaments, the Arteries, the Veines, the Flesh, the Skin, the Fat. And the authoties may be seconded by arguments; The Fat groweth and is augmented to a certain *terminus* or extent, and in some creatures it hath alwaies a certaine seate and figure, therefore it is a part. Moreouer it groweth white by the faculty or power of the Membrane, that altereth and assimulateth the bloud: nowe this alteration and assimulation is wrought onely by the power of the soule, and of naturall heate. And againe, in the middle of this Larde are found certaine kernels which could not be generated in the Fat, had it not the forming faculty inherent therein. For the vntying of this knot we must know that there is a twofold acceptation of a part, one more large, the other more strict. In the large account, whatsoeuer addeth any thing to the accōplishment of the whole, may be called a part of the whole which it helpeth to accomplish. In which respect the Fat deserueth the name of a part, as also the Haires, the Nayles, the Marrow, the Bloud, yea and milke it selfe. But in the more presse and strict signification, the Fat cannot be called a part, because it neither partaketh of a common life, as wee say, neither hath it any proper figure or circumscription. And moreouer as *Galen* witnesseth, in famine and want of nourishment it may bee conuerted into nourishment: now one part cannot nourish another, but all parts that enioy common life, haue also one common nourishment, either immediate or mediately. Adde to this, that it is neither spermaticall nor fleshy part; not spermatical, because it appeareth not in the first delineation of the parts; not fleshy, because all fleshy or bloudy parts are red; and therefore it is no liuing part partaking of the liuing soule.

Lib. 6. de placit. cap. 8.

Reasons.

Answered.

A twofold part.

Arguments that it is no animated part.

Galen.

Answere to the authorities.

Concerning the places alleadged out of *Galen*, where he calleth it a similar part, hee vseth the name of part, in the larger signification; where he sayth it is the author of a function, or performeth an office: by office or function he meaneth a vse. For *Galen* often confoundeth an action and a vse, although there is great differēce between them; for the haires haue a vse, yet they performe no office or action. Whereas they obiect that it is increased; we grant it, but how? by apposition onely, as the haires also grow and encrease, not by assimulation of Aliment as other parts doe: and therefore it onely increaseth so long as it hath matter, when the matter ceaseth, as in old age it doth, then it ceaseth to be generated.

Why haire & fat grow not in old age.

The whiteneſſe of the Fat say some, is acquired not by the forming faculty, but by cold; as all phlegme is white, whose efficient cause is colde. I thinke the whiteneſſe comes by a light alteration which the bloud hath from the membranous parts. For when as any notable quantity of bloud falleth vpon the membranes, it receiueth indeede a light rudiment of alteration from the power or faculty of the membrane; but because the quantity is greater then can bee assimulated, and yet it is impacted about the membranes, it is condensed by their weake heate; but is not changed into the nature of the part where it is condensed:

How the fat becomes whitish.

so

ſo that if it be a part, it is but an imperfect part; and this *Ariſtotle* perſpicuouſly diſcerned in his Booke of Parts, where he ſaith, that there is this difference betweene fleſh and fat: that in the generation of fleſh the blood is ſo throughly laboured and mitigated, that it is turned into a part partaking of ſenſe; but in the generation of the fat, the bloode is indeed changed into a part, but that part is not capeable of ſenſe.

The laſt argument may thus be anſwered. The Kernels which are found among the Fat, are not generated by the fat, but haue a delineation, though not conſpicuous in the firſt forming of the parts. and afterward the fat encompaſſeth them or groweth about them: or it may be ſaide that thoſe kernels are generated by the heate of the adiacent parts, not of the fat. And theſe are the queſtions which are controuerted concerning the skin and the fat.

QVEST. VII. *Of the Membranes, vſe, and productions of the Peritonæum.*

CONcerning the Rim of the belly, there is ſome difference betweene the Ancients and the later Writers, yea and amongeſt the Neoterickes themſelues. The Ancients thought it was a ſingle and ſimple Membrane, becauſe in Diſſection it appeareth to be very fine and thin like a Cobweb. *Columbus* ſaith, that it is ſingle onely from the Breſt-blade to the Nauill, and double from thence to the Share, and that becauſe of the vmbilicall veſſels which are carried through the duplicatiō. *Laurentius* ſaith, he hath alwayes obſerued it double euery where; aboue and below; before & behind; on the right hand and on the left, and auoucheth that all Membranes of the body euen the *Pia mater* or thin Membrane of the Braine, are alwayes double. For ſaith he; as below betweene the duplication of the *Peritonæum*, there ariſe two Arteries and the *Ourachos* vnto the Nauell, ſo from the Nauell to the Liuer paſſeth the vmbilicall vein between the ſame duplication aboue; and therefore wondereth at *Columbus*, who was ſo occulate an Anatomiſt, and yet did not obſerue ſo much. *Galen* obſerued a third vſe of the *Peritonæum*, which is to preſſe the guts, and to driue downe the excrements of the Belly. This vſe *Veſalius* derideth: for how can it haue this vſe (ſaith he) when it hath no voluntary motion of his owne, whereby it can contract and diſtend it ſelfe? by the ſame reaſon, the *Pleura* ſhould helpe the Midriffe in the contraction of the Cheſt. We anſwere for *Galen*, that he doth not intend that the *Peritonæum* doth this by his owne proper motion, or by it ſelfe, but onely by accident and euent. As when the Muſcles of the *Abdomen* and the Midriffe like hands ioyned aboue, and open below, doe preſſe and driue downward that which is ſtraightned in the middeſt betweene them, then the *Peritonæum* which holdeth theſe two in their proper poſitions, maketh the preſſure more forcible.

Columbus.

Laurentius.

All the Membranes of the body are double.

Galens 3. vſe of the *Peritonæum* derided by *Veſalius.*

Galen expounded.

Veſalius beſide denies, that there are any productions of the *Peritonæum* in Woemen, becauſe their Teſticles do not hang downe, but are truſſed vp to the ſides of the wombe; but he obſerued not that theſe productions reach in woemen to the Leske, and become the *Cremaſteres* of the wombe, and that there are the ſame holes or paſſages in the Tendons of their oblique deſcendent Muſcles which are in men; whence it commeth to paſſe, that woemen are often troubled with the *Boubonocele.*

Why women are ſo often troubled with *Boubonocele.*

QVEST. VIII. *Of a new kinde of compunction of dropſie bodies through the Nauell.*

IT ſhall not be amiſſe in this place, to annexe a kinde of Compunction of the Nauell, by which the water is ſafely let out of dropſie bodies. The ancient Phyſitians called all apertions of dropſie bodies παρακέντησιν. In the adminiſtration of which *Paracenteſis*, there ariſe foure Queſtions. Whether it be feaſible; when, where, and how it is to bee performed. That it may be done ſafely, remaineth vnder the Teſtimony of many witneſſes, all beyond exception; and beſide, it may by reaſon be demonſtrated. *Hippocrates* firſt of all other, preſcribes it both in his Aphoriſmes, and alſo in diuers other places. *Galen* in the 14. of his Method, *Paul* of *Ægina*, *Albucaſis*, and in a word, almoſt all Phyſitians. Beſides Authorities, reaſon alſo addeth her ſuffrage to this attempt. For when theſe reſtagning or gathering waters, can neyther by outward nor by inward Medicines bee euacuated, why ſhould

Paracenteſis.

That it is feaſible.

Hippocrates.
Galen.

ſhould we not proceede to Section in theſe, as well as in other watery and Flegmatick tumors: eſpecially ſeeing the parts wherein the Section is to bee made, are all ignoble and baſe.

The time for this worke.

The time fit for this apertion, *Hippocrates* elegantly deſcribeth, where he ſayth, *Dropſie bodies muſt preſently be cut, and thoſe that are Empui, preſently burnt.* This *preſently*, *Hippocrates* himſelfe interpreteth to be *out of hand*, or *in the beginning of the diſeaſe*: *Galen* ſaieth, it muſt be *before the inward parts are corrupted*; for the water is in vaine let out, if the entrals be vitiated, eſpecially any thing notably; becauſe it wil inſtantly and continually gather againe: ſo then it is a foule error in a deplorate or deſperate dropſie, to vndertake this kind of cure, becauſe (as *Celſus* very well ſaith,) it is a kinde of impiety in Art raſhly or inconſiderately to prophane ſuch remedies, as being rightly vſed may be of great auaile. The third queſtion is concerning the place for this apertion. *Paulus* and all Phyſitians after him, euen to theſe times, adminiſter this Section a little below the Nauell towardes the ſides, becauſe of the *Tendons* or *chordes* of the Muſcles: and that on the ſide that is oppoſite to the part affected; as if the liuer be affected on the left ſide, if the Spleen on the right. That kind of ſection is not to be diſcommended, yet *Laurentius* thinketh, it may bee more commodiouſly done through the very Nauell, and for his opinion bringeth very rare obſeruations, and ſtrong reaſons.

The place.

Aponeuroſis.

Laurentius his new conceite eſtabliſhed,

Antonius Benneuenius recordeth, how a certaine Dropſie Patient being giuen ouer by the Phyſitians, by a raſh and caſuall aduenture recouered his health. For, when hee was exceedingly dry (as is vſuall in that diſeaſe) and in deſpaire of recouery, hee powred in an abundance of water, whereupon his Nauell ſuddenly opened, whence iſſued ſo great quantity of the dropſy Lie, that his body fell to the wonted ſcantling, and he being aſsiſted by a diſcreete Phyſitian, recouered his health.

By Hiſtories.

I ſaw (ſaith *Laurentius*) at *Monpelier*, a dropſie Woman, whoſe Nauell in a tempeſtuous night, when ſhe thought little of it, opened, whereout flowed a great ſtreame of water: earely in the morning I was ſent for, together with *Bartholmew Cabrolius* a skilfull Anatomiſt: we found her ſpirits almoſt ſpent by reaſon of the ſuddenand immoderate euacuation; thoſe we preſently gaue order to refreſh and re-eſtabliſh, which being done, ſhe perfectly recouered through Gods helpe, and yet continueth in good health.

Gratianopolis.

Ludouicus Villonouanius a verie learned Phyſitian, tolde me at *Gratianopolis*, (ſaith *Laurentius*, that he knew a Countrey peaſant perfectly cured by this kinde of ſection. *Balthazar Garielus* my friend, and a learned Chyrurgion of *Mompelier*, at my appointment, ſaith the ſame *Laurentius*, opened after this manner a dropſie patient, who was very importunate vpon vs; his Belly fell almoſt vnto the accuſtomed extent, and he ſeemed to bee paſt all feare of death. The tenth day after his Section, without any knowledge, hee ate a pound of Cherries, hereupon he fell into a ſcowring, by which the frame of Nature was vtterly ouer-browne, and ſo within two daies he dyed.

By reaſons.

It is manifeſt therefore by experience, that this way ſection may be ſafely adminiſtred: neyther doth reaſon diſſwade from it. For, as *Hippo.* ſayth, *The way that Nature inclineth the Phyſitian muſt follow*; but Nature oftentimes findeth this way through the Nauel. Beſide, this kinde of apertion of the nauell, excuſeth the ſection of many parts. For, about the nauell, do meete the foure nauell veſſels, which if they chinke or cleaue, as they vſe to do by the forcible confluence of water to that part in dropſie bodyes, then there remaineth nothing to cut, but onely the skinne, and then the water will yſſue foorth. But it will bee obiected, that the *Chords* or *Tendons* of all the Muſcles of the *Abdomen*, do meete about that place, and therefore if that place bee wounded, it is a venture but Convulſions will follow.

Obiection.

Anſwere.

Wee confeſſe indeede, that all the extreamities of the Muſcles do determine in the white line, but theſe extreamities about the nauell are perforated, to make way for the vmbilicall Veſſelles, and therefore are not wounded in this kinde of apertion. Moreouer, thoſe which labour of that kinde of Dropſie which is called *Aſcites*, almoſt all haue ſtrutting or ſwollen nauels, the tumour growing by reaſon of the confluence of water to that part, ſo that if but the skinne bee pierced with a ſnarpe inſtrument, then preſently followeth a flood of waters. Againe, when the ſection is thus made in the middeſt, the patient may with eaſe lye vpon either ſide, which he cannot do if the other kinde of ſection be adminiſtred.

The manner how to adminiſter this kind of apertion.

The laſt queſtion, was mooued about the manner of this kinde of *Paracenteſis*, which is on this ſort. You muſt firſt caſt a bought or running knot round about the nauell, that as

your

your pleaſure you may ſtreighten the hole or paſſage, if the water ſhould yſſue out with too great violence; next, with a ſharpe poynted Nall or Bodkin, you muſt pierce the skinne in the verie middle of the knot of the Nauell, againſt which as wee haue ſaid, the Veſſelles doe chinke or cleaue in Dropſie bodyes; and then put a Brazen or Siluer pipe into the wound, through which the water may paſſe, which alſo may bee ſtopped at your pleaſure: for all the water muſt not at once bee drawne out, but ſome and ſome by degrees. For *Hippocrates* ſaith, *That if the Dropſie water, or the purulent Matter of an empyeme in ſearing or cutting do all at once yſſue foorth, the Patient will dye*: For, it is a rule, *That all plentifull and ſudden euacuations are dangerous*. And in another place, *Dropſie Waters muſt be by degrees euacuated*. Finally, it may ſeeme, that *Hippocrates* had ſome knowledge of this kinde of apertion, becauſe hee ſaith in one place, *Apply your actuall Cauterie about the Circumference of the Nauell, to let out the dropſie water, but burne not the part too deepe*. Haply leaſt they ſhould not be able to moderate the effluxion.

Caution.

Aphor. 27 ſect. 6

(:*:*:)

The End of the Controuerſies of *the Second Booke.*

THE THIRD BOOKE,

Of the Parts belonging to Nutrition or Nouriſhment.

The Præface.

HAuing in the former Booke diſmantled this Caſtle of the Bodye, and particularly the lower Region, wee are now arriued at that worke-houſe of Nature, wherein ſhee hath built her Engines and Inſtruments by which ſhe doth not onely nouriſh and ſuſtain the whole Family, but alſo perpetuate *Mankinde* by Propagation; the deſtiny of the matter not admitting a perpetuity in the particular creature. But becauſe theſe two workes of Propagation and nouriſhment are altogether diſtinct, if not in the Faculties being both naturall Alterations; the one called Generation, the other Aſsimulation; yet in the parts and Organs thereto belonging: wee haue alſo thought good to diuide them in our Diſcourſe; and referring the worke of propagation to afterward, in this place onely to handle the parts ſeruing to nutrition or nouriſhment.

Seeing therefore the ſubſtance of the whole body hath a neceſſary diffluence and diſsipation, as well by the in bred heate, which like the greene worme feedeth vpon the choiſeſt gemmes and flowers euen the Radical moiſture, as alſo by the outward aire, and other externall cauſes, and therefore cannot poſsible either encreaſe to the iuſt extent or conſiſt when it is growne, vnleſſe the detriment and ſcath which is ſuſtained by ſuch diſsipation and diſſolution bee reſtored and made good: Nature hath prouided certaine nouriſhing Organs, whereby that daily expence is continually ſupplied. And heerein we haue to admire the wonderfull prouidence of the great Creator, who hath diſpoſed theſe parts wherin it was neceſſary there ſhould be ſuch a confluence of noiſome excrements in the loweſt place, as it were in the ſinke of the body, leaſt otherwiſe their offenſiue exhalations ſhould defile the braine and the heart, which are the ſeats of the principall faculties, or vitiate and diſturbe the reſt of the ſenſes. For this lower Region, is as it were the kitchen of the houſe, in which there are ſome parts, which as Cookes do prepare the common diet for the reſt. But in the deſcription of this Region, it muſt be remembred that we muſt not follow the order of dignity, or of nature, but of diſſection, taking the parts according to their poſitiō.

The gie therefore falleth firſt of all into the ſnare of the kell, and indeede it is of all things moſt like to a ſnare or purſenet, the cloſe Meſhes whereof, are purfled with curled veines and curdled or criſped fat, ſo becomming a thrummed rugge to keepe warme the Membranous and vnbloody guts and ſtomacke vnder it. As for his duplication, wherein the ſnaking and ſnayling diuarications of the veſſels do craule all ouer the belly, I ſuſpect it to haue bin ordained by nature, for ſome more ſecret and myſticall end, then the ſecuring of thoſe tender ſaplings, albeit I reſt heerein vnſatisfied for any thing I haue read.

Immediately vnder theſe Cipreſſe wings (for wings they are called by the Anatomiſts) or Cauly cobwebs, appeareth the Maze or labyrinth of the guts wheeled about in manifold foulds & convolutions, that neither the aliment ſhould ſo ſuddenly paſſe away, and ſo the wombe of man become an inſatiate Orque voyding whilſt it doth deuour, neyther yet the noiſom ſteame of the Fæculent excrements haue free and direct aſcent to the vpper parts, but be intercepted and deteined within thoſe Meanders, & ſo ſmothered in thoſe gulphs of the

the Guts, or let out at the port Esquiline. In the middest of the Guttes is scituated the Mesenterie, which we may call not the Midriffe, but the Midruffe, for it is most like vnto a gathered ruffe, sustayning the winding reuolutions of the Guttes in their proper places, and conuaying vnto them the Meseraicke veines, by which as by tender bearded rootes, the Aliment is conuayed vnto the gate of the Liuer: some haue called them *Baiuli domus*, the Porters of the house, because they continually carry the Aliment vnto that furnace, where it is tryed into bloud. Neither are they idle and rigid passages, but as *Homer* feigneth that the instruments of *Vulcan* are moued by instinct and of their owne accord, so we may say that these vessels are taught by their Creator, not onely to leade along the *Chylus*, but to draw it and prepare it for the Liuer.

Next appeareth the *Pancreas* which we call in Swine the Sweet-bread, a rude and vnshapely lumpe, most like a map or dish-clout, both in fashion and vse; or if you would liken it to any thing in the body, then it nearest resembleth the Liuer or cake of the wombe, which groweth to the rootes of the Infants nauell. It serueth for a pillow or Cushion, to boulster vp the manifold diuisions of the Veines, Arteries, and Sinewes, which in that seat of the body are distributed vnto the adiacent parts; beside many other vses which we refer vnto their proper place: and passe along vnto the stomacke, the Cooke-roome, where Diet is the Steward, Appetite the Clark, and Concoction the maister Cooke. From thence the viands are deliuered vnto the Liuer, the principall part of this lower region, wherein they attaine their vttermost perfection, being depurated, from the scum by the bladder of Gall, from the residence by the spleene, from the vnprofitable liquor by the kidneies, which conuay it vnto the Cesterne of the bladder, to be cast out by the Conduite. Of all which if I should in this place vndertake to discourse, as it were easie for mee, though briefly as I began, yet the shortnesse of the partes I see would amount vnto too long a summe to bee comprehended in a Preface, especially considering wee shall at large prosecute euery particular in the following discourse: wherefore after we haue giuen you another kinde of distribution of them in the Chapter following, we will apply our selues vnto their particular Histories.

CHAP. I. *A distribution of the naturall parts contained in the lower Belly.*

HAuing already intreated of the Inuesting or Cõtayning parts of the lower region or nether Belly, it followeth now that we continue our discourse to the parts contayned also. These are of double vse, for either they serue for nourishment, or for generation; those that belong to generation and propagation of the kinde, we refer vnto the next Booke. The nourishing parts doe either perfect the Chylus which we call Chilification, or the bloud which wee call Sanguification. For the first, some make and concoct the Chylus, as the stomacke; some helpe and further this concoction, as the Kell and the Sweet-bread; others put to the last hand of perfection, and then distribute it, as the small guts; others receiue and auoyde the grosse and thicke excrements, as the great Guts, and these together with the smal, are fastned vnto the Mesenterie.

The parts belonging to nutrition.
To chilification.
Stomack.
Kell.
Sweet bread.
Guts.
Mensentery.
To sanguification.
Meseraicke Veines.
Gate veine.
Liuer.
Hollow vein.
Parts auoyding the excrements.
The bladder of gall.
The spleene.
Vas breue.
Hæmorroid veines.
Kidneyes.
Vreters.
Bladder and yarde.

For Sanguification, some parts sucke the Chylus out of the Guts, alter it and giue it a certaine rudiment or tincture of bloud, as the Meseraicke veines, which also carry it by the Port veine, vnto the gate of the Liuer, and thence into the substance thereof, where it receiueth the perfection of bloud. Others when it is thus perfected, doe distribute it into the whole body, as the hollow veine by his faire forked branches. Others receiue the excrements, either yelow choller, as the Bladder of Gall, and that which wee call *Porus Biliarius*, and conueyeth it into the Guttes; or blacke and feculent choler, as the spleene or Milt, in which it receiueth a farther concoction, and the more laudable part it reserueth for his owne nourishment, but the very Lees it sendeth away either vpward vnto the stomacke by a short vessell called *Vas breue*, where it becommeth the Appetites remembrancer; or downward to the *Hæmorrhoidall* veines. Finally, the serous or wheyie part of the bloud is still destilled away by the Kidneyes, wherein there is a segregation or separation made of that whey or vrine from the bloud; the bloud remayning behind for the nourishment of the Kidneyes, but the whey is deriued by the vreters into the bladder, from whence

whence it is deliuered out by the Conduite.

Of all which parts we will entreat as I said before, according to the order of Dissection, beginning with the Kell or *Omentum*.

CHAP. II. *Of the Omentum or Kall.*

The names & the reasons of them.

THE Kall or Kell which is deciphered in the sixt Table of the second booke, and in the first and second of this third booke, is called *Omentum*, as it were *operimentum*, that is a couering: of the Greeks ἐπίπλοον of ἐπιπλέω to swim vpon, becausse it swimmeth vppon the bottome of the stomacke [Table 2 bb] and the vppermost guts [Table 2 cc.] From the wandring and implicated passages of his vessels, which may be likened to a fishers net [Table 1. Figure 1. and 2.] it

Table 1. Lib. 3. The first figure sheweth the Kall or Omentum, whole and loosed on euery side, resembling a Satchell, or a small fishers Net, with the course of the Veines, Arteries, & Sinewes, running through it. The second figure containeth the lower membrane of the Omentum, the vpper being remooued with the Collicke gut which it containeth and the vessels.

aaaaaa. The outward face of the vpper membrane of the Kall.

bbbb. The circle or girdle of the kall at which it growes.

ccc. The vpper part of the lower membrane aboue the colon.

def. Sheweth the membrane, vessels, and fat of the *Omentũ*.

g. The trunke of the gate veine where it commeth out of the Liuer.

h. An arterie with a nerue reaching to the hollownesse of the liuer, and the bladder of gall.

i. A vessell comming to the *pylorus*, especially on the back-part, hauing an artery his cõpanion.

kk. A vessell with a nerue which goeth to the right bottom of the stomack.

llmm. Braunches inwrapping the body of the stomacke from a vessell marked with *k* which also goe through the vpper mẽbrane of the kal *mm*.

n A vessell reached out to the *duodenum*, and to the beginning of the empty gut, oftentimes hauing a small nerue to beare him company.

o The diuision of the gate veine into the right and the lefte branch.

p The right branch running into the *mesẽterium* & the guts

q A veine going to the backe-parts of the stomacke.

ſ A veine imbracing the lefte mouth of the stomacke, in manner of a crowne.

t The artery of the mesentery.

u An artery going to the lower mẽbrane of the kal.

x A vessel sent with a nerue to the colon and to the lower membrane of the kall.

x A vessel going to the lower *Omentum*.

yy The course of the vessels of the spleene from the spleenicke branch.

z A branch reaching to the left bottom of the stomacke.

aaaa The *Pãcreas* or sweet-bread vnder the vessels and the *duodenum*.

The second Figure.

AA The vpper part of the lower kal arising from the back, which behind is vnder the stomacke, & with twoe membranes comprehendeth or embraceth the colon at the bottom of the stomack.

B A veine comming from the left trunk of the gate veine and the arterie, with a nerue for the most part tied vp to it, going into the kall.

C A notable veine and an arterie communicated to the kall and the collicke gutte, to which a small nerue is added in some steads,

D A veine running along the left side of the kall. E. The right side of the collicke gut which lyeth vnder the hollownes of the liuer here cut away. F. The left side of the collicke gutte which lyeth vpon the spleene. GG, A part of the collick gut running along vnder the bottom of the stomacke. HHH. The lower part of the inner kall arising in some sort from the collick gut. III. The remayning portions of the vpper membrane of the kall torne off, that it may be shewne how the kall may be compared to a satchell or bagge.

is

is called *rete* or *reticulum*, for that ſayth *Archangelus*, as a net intangleth the fiſhes, ſo in this Membrane the Fatty vapours are intercepted and ſtayed. The Arabians call it *Zirbus*, the Latines *Mappa ventris*, the diſh-clout or map of the Belly, becauſe it licketh vp the ſuperfluities thereof. All the ſanguine or bloudy parts almoſt are couered heerewith, but ouer ſome it is more fatty, ouer others more membranous. Amongſt all creatures it is greateſt in Men and Apes; and of Men, thoſe that liue a ſedentarie and idle life, ſacrificing to their appetites, haue it ſo great, that it becommeth a burthen vnto them, whereupon they are called *Epiploocomiſtæ*, that is, Kal-carriers; but thoſe that vſe great exerciſes, as Hunters and ſuch like, haue it more membranous, and leſſe fatty. *Archangelus.* Kal carriers.

It is a large membrane, ſcituated before vpon the bottome of the ſtomacke, [Table 6. ** *Lib.* 2.] and downeward ouer the guts [Table 6. xxxx *Lib.* 2.] vnto the Nauill. Sometimes, but ſeldome, and that in Apes and Dogges it is ſtretched euen vnto the ſharebone; and vſually in diſſections it is obſerued to bee rowled vp, or doubled towards the ſpleene, not onely in ſuch as are hanged or drowned ſayeth *Veſalius*, but alſo in thoſe that die of other ordinary diſeaſes, or come to their ends by ſodaine miſchances. Sometimes alſo it inſinuateth it ſelfe into the conuolutions or windings of the guts, and ſometimes in Women it paſſeth betweene the bottomes of the wombe and the bladder, and by ſtreightning the mouth of the wombe becommeth an ordinary, but yet not a perpetuall cauſe of barrenneſſe or ſterility, as alſo *Hippocrates* obſerued in his book *de natura Muliebri*. In ſome women after their trauell, it remayneth gathered together about the middle of their Bellies, and there is the cauſe of ſore paynes. But if it fall into the paſſage that deſcendeth into the Cod, it cauſeth a ſoft rupture, which diſeaſe no creature is ſubiect vnto but Men & Apes, as ſayeth *Galen* in the third Chapter of his ſixt booke *de adminiſtrationibus Anatomicis*. The ſituation of the Kal. *Veſalius.* *Hippocrates.* *Galen.*

It is faſtned alwayes to the ſtomacke [Table 6. mno *Lib.* 2.] to the Spleen and the Collicke gut [Table 1. Figure 2. oo rr] to other parts ſometimes it is ioyned, ſometimes it is free from them, for it behooued not ſayth *Galen* in the 11. chapter of the fourth booke *de vſu partium*; that it ſhould hang looſely, leaſt it ſhould be crumpled together, and ſhould leaue many parts vncouered, which ſtand in neede of his warmth. His connection.

The forme of it is likeſt to a Purſe-net or Faulkners bagge, [Table 1. Fig. 1. and 2. ss] conſiſting of a double membrane knit together in the bottome; *Columbus* ſayth, but only reflexed or turned backe againe. It hath a round *oriſice* [Table 1. Figure 1. bb] which aſcendeth higher in the hinder part then before, and belowe it is round [Table 1. Figure 1. and 2.] The forme of it.

It is compounded of membranes and veſſels, and a muddy and eaſily putrifying Fatte, which compoſition *Galen* expreſſeth vnder the name of his originall, in the place next aboue named. The Membranes are two (whence of ſome it is called a double *Peritonæum*) and thoſe very fine and ſmooth (leaſt the guts ſhould bee ouer burdened with his waight) lying one vpon the top of another; the vpper is called the vpper wing, the lower the lower wing [Table 2. cc.] The vpper and formoſt ariſeth at the bottome of the ſtomacke [Tab. 2. aa. bb.] from the *Peritonæum* which compaſſeth it about, and maketh his third coat; and is ioyned in a right line, with a portion of this inferiour membrane in the hollow parts of the Liuer and the ſpleene. The lower and hind-moſt wing ariſeth from the *Peritonæum* at the backe [Table 1. figure 1. ccc] preſently vnder the midriffe; and being led to the hollow ſide of the Liuer, it cleaueth (yet but ſeldome) to a part of it, as alſo to the midriffe, to the right ſide of the ſtomacke, almoſt to the whole gut called *duodenum*, and to the hollowe part of the ſpleene, and groweth faſt to the ſtomacke, and to the collicke gut, [Table 1. figure 1. gg] all the way the ſame is annexed to the bottom of the ſtomacke, ſo that to that gut it is as it were [Table 1. figure 2. mm] a meſenterie. In Dogs it is neither tyed to the Colon, nor to any other gut; in Apes onely to the right part of the Colon. The frame or compoſition. His two membranes. Connexion.

Many veines (but onely from the port veine) paſſe through both his wings. Through the vpper from two veines which paſſe by the bottome of the ſtomacke (which are called the right and the left [Tab. 2. n and x] *Gaſtra epiplois*) infinitely propagated obliquely downward [Table 1. figure 1. kk mm.] Through the lower wing from thoſe veines which paſſe into the ſpleene [Table 1. fig. 1. ux figure 2. zcp] which are diuerſly ſpread, ſometimes with a foure-fold branch (as in the hiſtory of the Port veine ſhall be ſayd) for the nouriſhment of the adiacent parts. His veſſels. veines.

They are ſprinkled with ſo many Arteries [Table 1. figure 1. u figure 2. c] from the Cæliacall Arteries.

TABVLA II.

The lower belly, with the vpper Membrane of the Kall torn vp, and turned aboue the outside of the Chest and the stomacke; the stomack also remoued out of his seat to the Chest, that the lower Membrane of the kall might the better bee perceiued; as also the guts remayning in their naturall position, and a part of the spleen, are herein deciphered.

aaaa. The inside of the vpper membrane of the kal, which some call *alam superiorem* the vpper wing.
bb. The stomack strutting out couered with the vpper membrane of the kall.
cc. The lower membrane of the kall, or his nether wing gathered vpward.
d Vessels passing to the spleen which appeareth bunching vnder the *Omentum* at *h*.
e The trunke of the gate vein.
f The spleenick branch of the port veine.
g The bladder of vrine.
h The seate of the spleen.
i The vessels called *Vrachos*, by which the Infant is nourished in the wombe.
kk The 2. vmbilicall arteries.

Nerues.

liacall & mesenterical branches to giue them life; but their nerues from the Ribbe-branch [Table 1. fig. 1.] of the sixt payre are wondrous small, but finely scattered that they might not be altogether without sence.

The fat of the Kell.

The Fat is very plentifull about the vessels [Table 1. figure 1. d e f] but in the distances betwixt them, none at all. In an ordinary fat man it may amount to a pound, or a pound and a halfe; and amongst it do runne innumerable glandules or kernels, which sucke vp the faeculent moysture, which is separated in the first concoction. Wherefore seeing it is not ingendered of any portion of the bloud, as that fat called *pinguedo*, or as other fats, therfore it easily putrifieth, so that if vppon a wound it fall out of the body, it becommeth presently rotten, which happeneth not to the other fats vnder the skin, or in other parts.

The vse of the fat of the Kell.

The vse of the Fat of the Kall, is to cherish and to comfort the bottome of the stomack, (for the vpper part thereof is warmed by the Liuer which lyeth vppon it, and therefore it is that the Kall attayneth not so high) as also to increase the heate of the guts: for both these parts are membranous and without bloud; and therefore their naturall heate is but weake. Now this comfort the Kall affoordeth not onely by his owne heate, which yet is the more, because of the manifolde Veines and Arteries which are wouen together thorough his substance: but also because beeing thicke and bedded together, it much hindereth the heate from dissipation, and the incursion also of outward colde, and so by consequence is a great helpe and furtherer of concoction. And that it was ordayned to increase heate; *Galen* in his fourth Booke *de vsu partium*, and in the ninth Chapter, maketh manifest by the example of those, who hauing got a deepe wound in their bellies, so that a part of the Kall falleth out, do euer after worse concoct their nourishment, and stand in need of Stomachers or other couerings vppon their bellies to keep them warme, especially when much

of it falleth out; for it preſently groweth liuid, and conſtraineth the Chirurgion to take it off, ſo ſaith *Hippocrates* in the beginning of his firſt Booke *de Morbis*; *If the Kall fall out, it putrifieth neceſſarily.* And *Galen* in the place before named ſaith, hee tooke almoſt all of it from a Fencer, who was preſently cured, but euer after was eaſily offended with colde, ſo as he was conſtrained to defend his belly with Wooll. Heereto alſo *Ariſtotle* aſſenteth in the third Chapter of his fourth Booke *de partibus Animalium*, *Nature* (ſaith he) *abuſeth the Kall to helpe the concoction of the Aliment, that it might bee done with more eaſe, and greater expedition. For heate concocteth: now that which is fat is hot, and therefore the Kall beeing fat, muſt needs concoct.* *Hippocrates.* A ſtory out of Galen. *Ariſtotle.*

Another vſe of the Kall is to keepe the guts moyſt, becauſe they are often diſtended, & againe corrugated, as they are filled with *Chylus*, or emptied of it againe. A third vſe is, that in time of neceſsity and affamiſhment, ſaieth *Galen* in the xi. Chapter of the fourth Booke *de vſu partium*, it might ſupply a kinde of ſubſidiarie nouriſhment to the naturall heate. *Galen.*

The vſe of the Membranes of the Kall or Kell, is to ſuſtaine the branches of the Gate Veine, and the Cœliacall Arterie which paſſe into the Stomacke, the Spleene, the Gut called *Duodenum*, and the Collicke gut. Againe, to knit the ſtomacke, the *duodenum*, and the Collick guts vnto the backe. To couple together the Liuer and the Spleene. The vſes of the Membranes of the Kell.

Archangelus addeth. That the thicke and bloudie vapours ariſing from the parts contayned in the Lower belly, might cleaue into theſe Membranes, and by their denſitie and thightneſſe or faſtneſſe be condenſed or curdled into fat, that ſo good a vapour as might afterward be turned into nouriſhment, ſhould not vapour out in vaine. Finally, *Laurentius* addeth another vſe of the Membranes out of *Hippocrates* Booke *de Glandulis*, That when the humour which commeth from the Guts, is ſo plentifull that it cannot be receyued and aſſumed into the Glandules, the ouer-plus might bee reſerued in the Membranes of the Kell. *Archangelus.* *Laurentius* out of *Hippocrates.*

CHAP. III. *A briefe Deſcription of the Gate-Veine and his Branches.*

NOw becauſe the Branches of the Gate-veine, and the Cœliacall or Stomacke Artery muſt be demonſtrated by order of Diſſection before wee come to the Guts, or elſe they will be offended, I haue thought it not amiſſe to giue you a briefe deſcription of them in this place, referring the larger and more exact diſcourſe vnto the proper hiſtory of the Veins and Arteries. Firſt therefore, the Gate-veine (ſo called, becauſe through it as through a gate the Chylus is conueyed into the Liuer) ariſeth out of the hollow part of the Liuer, betwixt the two ſmall eminencies or ſwellings thereof which *Hippocrates* calleth *Portas* the gates. Some thinke, it is propagated from the vmbilicall Veine which proceedeth out of that cauity. We will diuide it into the Trunke and Branches. The trunk before it is diuided [Tab.3.ᴷ] ſendeth foorth two ſmall ſhootes from his fore-part called *Cyſticæ Gemellæ*, or Twin-veines of the Gall, [Tab.3.ᶜᶜ] which paſſe vnto the bladder of Gall. The ſecond is called *Gaſtrica dextra*, the right ſtomacke Veine [Tab.3.ᵇ] which goeth vnto the backe part of the ſtomacke, and the *Pylorus* or mouth of the ſame. Why we treat of thē in this place. The Original of the Gate-Veine. *Bauhine.* *Cyſticæ gemellæ* *Gaſtrica dextra*

The branches are ſome of them vpper, ſome neather. The vpper branches which wee call the roots of the Gate-veine, [Tab.3.ᴬᴬᴬᴬ] are diſſeminated through the hollow part of the Liuer, and do make one Trunke [Tab.3.ᴱᶜᴰᴱ.] Theſe roots are by *Anaſtomoſis* ioyned with the roots of the hollow Veine.

The nether branches ſhoot out on the right ſide, or on the left, from the right ſide three branches.

The firſt, called *Gaſtroepiplois dextra*, the right ſtomacke and Kall veine [Tab.3.ᴴ] attaineth from the right ſide of the trunke, to the bottome of the ſtomacke, and the vpper membrane or wing of the Kell. *Gaſtroepiplois dextra.*

The ſecond is called *Inteſtinalis* or the Gut-veine [Tab.3 I.] becauſe it is conueyed vnto the middle of the *duodenum*, and the beginning of the *Ieiunum* or empty gut. *Inteſtinalis.*

The third is called *Meſenterica*, or the veine of the Meſentery [Table 3.ᵇ.] which is ſubdiuided into three veines: two on the right hand called *Meſentericæ dextræ*, which are diſtributed into the guts called *Ieiunum*, *Ileon*, *Cæcum*, and a part of the collick gut, where becomming *Meſenterica dextra.*

Tab.iii. ſheweth the Vena porta, *or Gate-vein with his branches, which he ſendeth to the bladder of Gall to the ſtomacke, to the Spleene, to the Meſentery, and to the Guts.*

TABVLA. III.

1,2,3,4,5. The vpper Branches of the Gate Veine, diſſeminated thorough the Caue or the hollowe parts of the Liuer.

AAAA. Their diſtribution maketh the form of the Liuer.

B. The trunke of the Gate-veine comming out of the hollow part of the Liuer.

C C. The two twin veines of the Gall, called *cyſtica gemellæ.*

D. The right *Gaſtrick* or ſtomacke Veine.

E. The diuiſion of the trunke of the Port-Veine into two branches.

F. The left branch, which is the vpper, and is called the Spleene branch.

G. The right branch, which is the greater and the lower, called the Meſentericall branch.

H. The right ſtomack Kal-veine, cald *Gaſtroepiploïs.*

I. The Gut-veine called *Inteſtinalis*

K. The leſſer ſtomacke veine, called *Gaſtrica minor.*

L. The right Kall Veine called *Epiploïs dextra.*

M. The ſweet-bred Veines call-d *Pancreæ.*

N. The great ſtomack Veine called *Gaſtrica maior.*

O O. Two Veins of the laſt named branch, inwrapping the backſide of the ſtomacke.

P. The Bifurcation or partition of the great ſtomak Veine in the vpper part of the ſtomacke.

Q. The Crowne-veine of the ſtomacke called *Coronaria ſtomachica.*

R. A branch of the Crown-veine paſsing along the vpper ſide of the ſtomack, and giuing branches to the *Pylorus* or mouth of the ſtomacke.

S. The backward or hinder Kall-veine called, *Epiploïs poſtica.*

T. The diuiſion of the Splenick branch.

V. The left kall-veine called *Epiploïs ſiniſtra*, whoſe root in the great figure is at V. but his diſtribution is well ſhewne in the ſmall figure by V. and T.

X. The left ſtomack-kall veines, called *Gaſtroepiploïs ſiniſtra.*

Y Z. The veines which runne vnto the left ſide of the ſtomack turned backe from them which go vnto the vpper part of the Spleene, and the vpper Z of the two, ſheweth the veſſell called *Vas breue* or the ſhort veſſel, whereby the melancholy paſſeth out of the Spleene into the ſtomack, & this is the reaſon why melancholy people haue alwayes craſie ſtomackes.

aaaa. Smal branches running through the ſubſtance of the Spleene, making the forme of the ſpleene

b. The right Meſentericke veine.

c. The left Meſenterick. *dddd.* The Meſeraicall Veines. *e e.* The Veine which belongeth to the Collicke gut. *ff.* Veines belonging to the right Gut. *g g.* The Hemorrhoidall Veynes which compaſſe the Fundament: but theſe ſhall bee more liuely deſcribed heereafter.

The Meſeraik Veines.

comming verie ſlender and fine like bearded roots of a tree; they make thoſe veines which we commonly call the Meſeraick veines [Tab.3.^{dddd}] which paſſe between the two membranes of the Meſentery, and gaping with open mouth at the coate, not at the cauity of the Guts; do ſucke from them the *Chylus*, to which they affoord a certain rudiment or beginning of bloud, and then conuey it to the Liuer, or rather into the rootes of the *Porta*, which are diſſeminated in the Liuer. From whence a part falleth out into the ſubſtance of the Liuer for his Nouriſhment, the reſt is driuen into the hollow Veine, to be communicated to the whole body. Moreouer we muſt know, that the very ſame Meſeraicke veines which carry the *Chylus* thus vnto the Liuer, do alſo bring from the Liuer vnto the Guttes, perfect bloud for their nouriſhment at the very ſame time; the Veines of the Liuer drawing the *Chylus*, and the Gut drawing the blood.

Meſenterica ſiniſtra.

The third Meſenteriall Veine, is called *Meſenterica ſiniſtra*, and is diſſeminated into the left [Tab.3.C.] and middle part of the Meſenterie. From this commeth the *Hemorrhoidalis interna*, the inward Hemorrhoidall Vein, [Tab.3.^{gg}] (for the external proceedeth from the Hypogaſtricall branch of the Hollow Veine) and deſcendeth by the end of the Collicke [Tab.3.^{ff}] vnder the right gut, whoſe extremity it compaſſeth with ſmall Tendrils, by which the Hemorrhoides do flow. And thus much of the branches which proceede out of the right ſide of the trunke of the Gate-veine.

The Hemorrhoid Veines.

Ramus ſplenicus

Out of the left ſide iſſueth the ſplenick bough, and from it many propagations, ſome before

fore, some after his diuision: before his diuision spring fiue branches.

The first called *Gastrica minor & sinistra*, the lesser and left stomacke veine [Table 3. [n]] goeth vnto the back part of the stomacke. *Gastrica minor.*

The second called *Gastrica maior* [Table 3. [N]] creepeth vnder the stomacke to his vpper *orifice* with three branches; the middle of which is called *Coronaria Stomachica*, the Crowne veine of the stomacke [Table 3. [o]] because it doeth incompasse the vppermost mouth thereof. *Gastrica maior.*

The third is called *Epiplois dextra*, the right Kell veine [Table 3. [L]] this attayneth vnto the right side of the lower wing of the Kell, and to the Collicke gut. *Epiplois dextra*

The fourth called *Epiplois postica*, the backward Kell veine [Table 3. [s]] passeth with a double branch, one on the right hand, another on the left, to the vnder wing of the *Omentum* or Kell, and a part of the Collicke gut. *Epiplois postica.*

The fift is manifold, called *Pancrea* [Table 3. [M]] because like small haires they passe vnto the *Pancreas* or sweet-bread; and these are the braunches which doe issue before the diuision. *Pancrea.*

After the diuision from the vpper braunch neere the superior part of the spleene, springeth a notable veine, commonly called *Vas breue*, the short vessell [Table 3. [z]] which is inserted into the left side of the bottome of the stomacke, by which the melancholy bloud is belched out into the mouth of the stomack, to strengthē it by his adstriction, to further the principall action of the stomacke which is concoction, and to prouoke appetite. *Vas breue.*

From the lower branch proceed two veines: the first called *Epiplois sinistra*, the left kel veine [Table 3. [t]] which passeth to the left side of the lower wing of the *Omentum*. *Epiplois sinistra*

The second is called *Gastro epiplois sinistra*, the left stomacke and Kell veine [Tab. 3. [x].] It ioyneth it selfe with the right, and compasseth the bottome of the stomack; the remainder of them both after their copulation, is diuersly distributed [table 3. [y z]] into the middle line of the spleene: and so much of the Gate veine and his branches. *Gastro epiplois sinistra.*

Of the Arteries called Cæliaca, and Mesenterica; that is, the Arteries of the Stomacke, and the Mesenterie which accompany the branches of the Gate veine. CHAP. IIII.

THE Arteries which accompany the braunches of the Gate veine before described are three. The first is called *Cæliaca*, or the stomacke Arterie [Table 4. figure 1. [m]] and the other two, *Mesenterica superior*, or the vpper *Mesenterical* Arterie [table 4. figure 1. ζ.] and the lower [table 7. 10.] called *Mesenterica inferior*.

The *Cæliacall* or stomacke Arterie [table 4. figure. 1. [m] and table 7. 6.] is so called because it sendeth many branches to the stomack. It is a notable branch of the great Arterie, and euery where accompanieth the braunches of the Gate veine. His originall is from the foreside of the *Aorta*, where it leaneth vpon the back-bone, and is supported with the lower wing of the Kell, till it come to be diuided into two braunches: the right [table 4. figure 1. [a]] is lesser, and the left [table 4. figure 1. [u]] somewhat larger. *Cæliaca.*

The Right branch [table 4. figure 1. [n]] as it goeth vpward to the hollownesse of the Liuer, sheddeth small surcles out of it selfe, some from his vpper part, and some from his lower. *The right branch.*

From his vpper part two: First, the right *Gastricke* or stomacke Arterie [table 4. figure 1. [r]] is distributed into the lower part of his right *Orifice*. Secondly, *Cystica gemella* [table 4. figure 1. [f] figure 2. [x] table 7. [ϱ].] two small Arteries creeping to the bladder of gall. *Gastrica dextra.* *Cystica gemellæ.*

From his lower part three: First, the right Kell Arterie [table 4. figure 1. [o] figure 2. [h]] attayning to the right side of the Kell and the Collicke gut. Secondly, the gut Arterie [tab. 4, figure 1. [q] figure 2. [d]] to the *duodenum* and the beginning of the *Ieiunum*. Thirdly and lastly, the right stomacke and Kell Arterie [table 4. figure 1. [r]] which is fastned to the vpper Kell, and sprinkleth many branches to the foreside and backeside of the bottome of the stomacke. *Epiplois dextra.* *Intestinalis.* *Gastro-epiplois dextra.*

That which remayneth of the right branch, determineth in the hollow of the Liuer [tab. 4. figure 1. [y] table 7. [7]] by which it receiueth life.

The left branch [table 4. figure 2, [v]] called *Arteria splenica*, passeth obliquely through the *Arteria splenica*

Table iij. sheweth a part of the Trunke of the great Arterie, out of which the Arterie called Cæliaca proceedeth; and beside it sheweth the branches of the Cæliacall Arterie, which do accompany the Branches of the Gate Veine.

The second Figure sheweth the mutuall connexion of the Cæliacal Arteries, with the sweet bread and the spleene.

TABVLA IIII.

FIG. I.

FIG. II.

q The arterie belonging to the short vessell which passeth from the spleen to the stomack, called *vas breue arteriosum.*

m The place where the *Celiacall* arterie ariseth.

n The right branch of the *Celiaca.*

r The right Kal arterie, as it is disseminated into the lower membrane of the Kall.

p The right stomacke arterie running into the right side of the back of the stomack toward the *Pylorus.*

q The gut arterie which reacheth to the gut called *duodenum* and to the beginning of the *Ieiunum* or empty gut.

r The right stomacke-kall arterie which is dissemminated into the right side of the bottome of the stomacke, and into the vpper membrane of the kall.

s The two twin arteries of the gal, how they passe vnto it.

t Arteries distributed into the hollow part of the Liuer.

u The left braunch of the *Celiaca* or *Aluina*, which goeth especially to the spleene.

x The greater stomacke arterie which goeth to the binder side of the stomacke, and to his left *orifice.*

y Certaine shootes sent into the middest of the stomacke where it is tyed to the backe.

z The Crowne arterie of the stomacke, which circleth the left *Orifice* of the stomacke.

a The left stomacke arterie which goeth into the vpper parts of the stomacke at the right *orifice.*

β The back or hindmost Kall arterie, which is distributed into the lower membrane of the Kal and the collicke gut.

γ The left kall artery which goeth to the lower membrane of the kall.

δδ Branches which passe into the hollownes of the spleene.

ε The left stomack Kall arterie going to the left side of the bottom of the stomacke, and the vpper membrane of the kall.

ζ The vpper mesentericall artery.

ϑ The right and the left emulgent arteries as they goe to the Kidneyes.

ικ The right and the lefte spermaticall arteries

The second Figure.

aa The veine, the arterie, and the nerue, which fould themselues in the *Pylorus* or mouth of the stomacke.

b The lesser braunch of the Gate veine, or the spleenick branch.

c The greater branch of the Gate veine or the mesentericall branch.

d A veine and an arterie going to the gut called *duodenum.*

e Vessels going to the lower membrane of the Kall.

f The roote of the arterie which accompanieth the braunche of the gate veine.

g The *Coronarie* or crowne veine & arterie of the stomacke.

h Vessels going to the lower Kall, and to the collick gut.

i The sweet bread or *Pancreas* vpon which the vessels are for security distributed.

k A veine going to the left side of the lower Kal.

ll A company of vesselles which passe vnto the spleen.

m The insertion of these vessels.

mm Vessels reflected from the former, & offered to the stomack.

ooo Veines and arteries sent to the guts.

pq Two arteries going to the mesentery.

rrrr The glandules or kernels of the mesentery, which lie vnder the vessels for their security.

t The trunk of the gate veine.

u The hole of the bladder of gal where it openeth into the gut called the *duodenum.*

x The veines of the bladder of gal.

y Arteries and nerues that go to the liuer & the bladder of gall.

ϕ Two braunches which run vnto the back parts of the stomack.

* The *Hæmorrhoidal* veine & artery

the *Pancreas* [Tab.4.fig: 2.ⁱ] to the Spleene. [Tab.4.fig: 2.ᵐ.] It is larger then the right branch, that it might not easily be obstructed; for it conueyeth vitall spirits to the spleen, & also belcheth out into it the more fæculent part of the bloud contained in the great Artery. This Artery is continually ioyned vnto the splenick veine described in the Chapter going before, and hath so many branches, and in the same order of position, as also named by the same names, which we will runne breefely ouer in this place.

Before the diuision *from his vpper part* proceede.

Gastrica sinistra. *Gastrica sinistra vel minor*, the left or lesser stomacke Artery [Tab. 4.fig.1.ᵃ] turneth on the right hand to the vpper parts of the stomacke.

Gastrica maior *Gastrica maior* [Tab.4.fig.1.ˣ] offereth a branch to the backside of the stomacke, as also to the midst thereof marked in the fourth Table at [ʸ]; out of this also ariseth the crowne Artery [Tab.4.fig.1,2.] answering the crowne veine before described.

From the lower part.

Epiplois postica. *Epiplois postica* [Tab.4.fig.1.β. fig.2.ᵉ] diuided into two straddling branches, which are propagated into the lower wing of the Kall and the Collick gut thereto adioyned.

Epi.

Epiploïs ſiniſtra [Tab.4.fig:17]paſſeth alſo to the lower *Omentum*, and runneth in to the left ſide thereof. *Epiploïs ſiniſtra*

The remainder of this branch [Tab: 4.fig: 11] attaineth to the Spleene, and is diuided into an vpper and a lower branch, and theſe into others, till at length they reach vnto the hollow ſide of the Spleene, [Tab.4.fig:1,] From whence do proceede *Gaſtroepiploïs ſiniſtra*, [tab.4.fig:18] which is ſuſtained by the vpper wing of the Kell, and ſo goeth vnto the left ſide of the bottome of the ſtomacke. *Gaſtroepiploïs ſiniſtra.*

Alſo *Vas breue Arterioſum* [Tab.4.Fig.17]paſſeth out of the vpper part of the Spleen, and is inſerted into the left ſide of the ſtomacke. *Vas breue arterioſum.*

The Meſentericall Arterie is double, both of them proceeding from the fore-ſide of the trunke, the vpper below the *Cæliaca*; the lower below the ſpermaticall Arteries. *Arterie Meſentericæ.*

The vpper [Tab.4.Fig.1, fig.2 : Tab: 8, 10.] is propagated into the vpper part, and almoſt into the whole Meſentery, and reacheth his manifolde ſurcles to the empty gut, the *Ileon*, and a part of the Collicke gut, where it approacheth the right Kidney. Superior.

The lower [Tab.4 Fig.1, Tab.8, 12] Meſentericall Artery, runneth vnder the lower end of the Meſentery, and eſpecially to the left ſide of the Collicke gut and the right gut, and maketh the Hemorrhoid veſſell, together with the Veins, and it is noted in the ſecond figure of this fourth Table at this marke *. And ſo much at this time ſhall ſuffice to haue ſpoken of the Gate-veine, and the Cæliacall Artery in this place, conſidering that we ſhal haue fitter occaſion to proſecute their branches heereafter. Now we will proceede vnto the guts. Inferior.

CHAP. V. *Of the Guttes.*

THe Guttes are called in Greeke ἔντερα, and *Inteſtina* in Latine, becauſe they are placed in the inmoſt part of the body, and doe take vp the moſt part of the cauity of the lower belly. [their naturall poſition appeareth in the 2. and 5. Tables,] And becauſe they farre exceed the length of the ſame, they are neceſſarily gired and rouled into manifolde Convolutions, [Tab.2,5, and 6.] that it might conteine them, as we vſe to rowle vp a rope if we would put it into a bag. They are knit together by the benefite of the *Meſenterium* [as appeareth in the 7. Table,] by which alſo, and the interpoſition of the *Omentum*, they are tied to the backe, and are held vp or ſupported by the cauities or hollowneſſe of the hanch bones. The Names. Their Connexions.

They are long bodies, and commonly ſixe times ſo long as the man whoſe entrals they are, round they are and globous, that they might bee more capacious and leſſe ſubiect to outward iniuries; Hollow, but not all of a bore as wee call it, carried alſo in circuler conuerſions (excepting their beginning [Tab.6.fig.1,2. at I and a] and their end, that the entrance and out-gate of the Aliment ſhould not bee interrupted) leaſt the nouriſhment ſhould too ſuddenly ſlip away before the *Chylus* be fully diſtributed, and conſtraine a man eſt-ſoones to call for more, and ſo be the cauſe of inſatiable guloſity or rauenouſnes, which would as *Plato* ſaith, interrupt all good and liberall learning. For ſo we ſee thoſe creatures whoſe guts from the ſtomacke to the ſiedge, are either ſtreight or lax, are inſatiable deuourers, which alſo *Ariſtotle* witneſſeth in his third Booke *de partibus animal.* chap.14. for the looſeneſſe or laxneſſe of the gut encreaſeth, and the rectitude of it haſteneth the deſire of meate. Wherefore thoſe creatures whom it became to bee more moderate that way, haue more of theſe circumvolutions, which alſo make them able longer to containe the excrements, that they ſhold not be enforced but at their own pleaſure to vnburden themſelues; for thoſe creatures that continually put in, muſt haue anſwerable euacuation. Their length. The reaſons of their length. *Plato.* *Ariſtotle.*

The guts are continued with the ſtomack at the right Orifice called the *Pylorus*, but their ſubſtance is thinner then that of the ſtomack, and by reaſon of the inumerable veines that are inſerted into *Ieiunũ* and *Ileon*, which do in a ſhort time ſuck it, they receiue much nouriſhment, which preſently by as many veſſels is conueyed to the Liuer. This ſpeedy diſtribution of the nouriſhment could not be, if it went out of one ſtomacke into another, becauſe there would not be ſpace for the inſertion of ſuch a world of veines, and ſo the diſtribution muſt needs be ſlower, and beſide much of the Aliment would eſcape the Veins, vnleſſe it were eſt-ſoones all the way of the paſſage againe and many times as it were reuiſed, till there were nothing left but bare excrement. The veines of the guts called Meſeraicks.

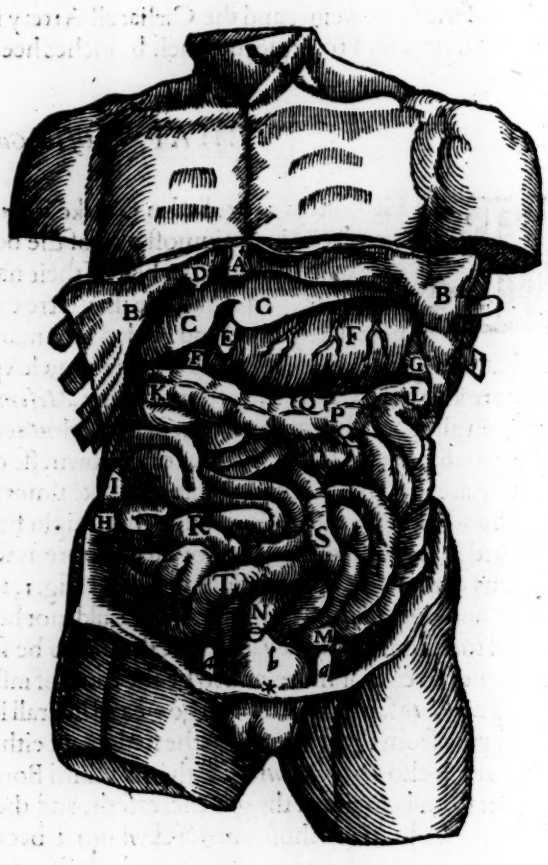
And albeit there be but one *ductus* or through-paſſage from the *pylorus* or mouth of the ſtomack

ſtomacke, euen to the ſiedge, that it may not amiſſe bee called one gut; yet becauſe the parts of it do very much differ in ſubſtance, figure, office, place, magnitude, and in number of circumvolutions and turnings: therefore firſt in reſpect of their ſubſtance, there are two ſorts of guts. One ſlender, fine, and ſmall, which *Galen* calleth μικρὰ ἔντερα, νήσια. *Plautus* calleth them *Lactes* of the old word *Lacio*, which ſignifieth to draw, becauſe they draw the *Chylus* more powerfully then the other which are thicke and craſſe, called by *Hippocrates* τὰ κῶλα.

The ſmall guts. The ſlender or ſmalleſt ſort of Guts is three-fold, *Duodenum*, *Ieiunum*, and *Ileon*, which though they haue all almoſt one capacitie or amplitude, yet they are eaſily diſtinguiſhed by their ſcituation, length, and by their Meſeraick veines. And beſide, the *Ieiunum* about his beginning, where it is tyed to the backe, is ſometimes obſerued to be enlarged.

Tab. 5. ſheweth the Bowels of the Lower belly, euerie one in their owne place. The ends of the lower Ribbes, together with the Midriffe and the Peritonæum adhering thereto are turned backe, that the Liuer, the Spleene, and the ſtomacke might be better ſeene.

TABVLA. V



A. The Breſt blade cald *Cartilago enſiformis*.
BB. The *Peritonæum*, togither with the Midriffe and the broken ribs bent outward.
CC. The *Gibbous* or bunching part of the Liuer.
D. A Ligament tying the Liuer to the Midriffe.
E. *A* part of the vmbilicall veine.
FF. The ſtomacke filled full of meate.
G. *A* part of the Spleene.
H. The blinde gut of the late writers: for the ancients tooke the top of the Colon for it.
I. The beginning of the great or thicke guts.
I. and ſo to K. ſheweth the paſſage of the Collick gut from the right kidney to the Liuer, & ſo the Collicke and the ſtone on this ſide are in one place, and therefore hardly diſtinguiſhed.
K. to L. the ſame Collicke Gut lyeth vnder the whole bottome of the ſtomack, which is the reaſon that thoſe which are troubled with the Collick caſt ſo much.
L. to M. The paſſage of the Colon, from the ſpleene vnto the ſhare bone by the lefte kidney a-way which maketh the payne of the Stone and the Collicke on the lefte ſide, very harde to diſtinguiſh.
N. The Colon ending into the right gut.
O. The beginning of the right Gut vnto the bladder.
P. Q. The ſunken or fallen ſide of the Colon at P. and his Chambers and puffes at Q.
R S T. The leſſer Guttes, eſpecially lying vnder the Nauell.
a a. The two vmbilicall arteries.
b. The bottome of the Bladder.
* The Connexion of the bladder and the *Peritonæum*.

The great guts. The thicke or great guts are as many [Tab. 6. fig. 2, 3.] called *Cæcum*, *Colon* & *Rectũ*, all differing in ſcite, figure, and magnitude. For the *Colon* and *Rectum*, that is, the Collick and the right guts, are more ample then all the reſt. For the figure, ſome are right as it wer by a line, as the *Duodenum* and *Rectum*, the reſt are full of turninges, and as it were chambered more or leſſe.

Their offices. In reſpect of their offices, ſome are appointed both for the perfiting and for the diſtributing of the *Chylus*, to wit, the ſmaller and narrower, that ſo the ſmalleſt crumme of the meate may meete with their ſides and veſſels; others are appointed for baſer vſe, to gather together the excrements, as the Craſſe or thicke guts.

Their ſcituation. The ſmaller, partly by reaſon of their excellency, partly for their commodity, do occupy the middle place, [tab. 5. R S T. tab: 7.^{cccc}] euen all the Regions of the nauell & the *Hypogaſtrium*, yet in dogs it is not ſo, which deceiued the Ancients, who called the ſmall the

vpper

vpper guts, the thicke the lower; which order we finde different in man, whoſe Colon occupies the vppermoſt place, and paſſeth vnder the bottom of all the ſtomacke. For their commodity they are placed neare the Center of the Meſenterie [tab. 7. ⁿ] that the meſentericall branch might without any great diſtance be conuayed vnto them, and ſo the *Chylus* quickly transferred to the Liuer.

The thicker guts are placed towards the ſides [table 5. table 6. figure :. table 7. ⁿⁿⁿⁿ] partly becauſe they might giue way to the ſmaller; (the Colon alſo is knit to the bottome [table 5. ᶻ] of the ſtomacke) partly that like a munition or defence they might compaſſe and defend the ſmaller, leaſt they ſhould bee preſſed or ſtreightned. They were alſo made large, that they might containe the greater quantity of excrements, before they were prouoked to excretion.

The firſt of the ſlender guts [table 6. figure 1, from ʸ to ˣ] which *Herophilus* calleth δωδεκαδάκτυλον, in Latine *duodenum*, hath his name from the length of twelue fingers, which yet we finde it not to holde in our bodies; it may be, becauſe now a dayes the ſtature of Man is much impaired. *Galen* calles it ἔκφυσις, as it were a production, to wit of the ſtomacke, which name yet ſome doe onely allow to the *orifice* of this firſt gut. This *duodenum* beginning on the right ſide, at the *Pylorus* [table 6. figure 1, ᵘ] is reflected or turned backeward, vnder the ſtomacke, that it may bee knit with membranous ligaments, to the ſpondelles or rack-bones of the loynes, to hold it ſtraight and right downe; for if it ſhould haue beene rowled and circled about, firſt the entrance of the *Chylus* ſhould haue beene hindered, and then being gotten in, it would haue beene ſubiect to bee returned backe againe. Moreouer, it would haue beene a hinderance to the veine that commeth from the Port or Gate of the Liuer, and to the Arterie which paſſeth to the Liuer: beſide, indeede there is no ſpace or ſcope for any ſuch cõuolutions or turnings in that place. It determineth vnder the Colon, about the beginning [table 6, figure 1, ˣ] of his windings. It is the ſtraighteſt of all, that the *Chylus* ſhould not ſuddenly and togetherward fall into it, out of the ſtomacke; and ſomewhat thicker then the other two, becauſe it receiueth a ſhort veine from the trunke of the Port veine, which we called *Inteſtinalis* [table 3, ʸ] or the Gut veine, (but no *meſeraicall* veine at all) and an Arterie from the *Caliacall*; both which are led along according to the longitude of this Gut, and to the beginning of the *Ieiunum*. Vnder this the *Pancreas* or ſweete-bread lyeth, eſpecially in Dogges, that it may boulſter the veſſels, and moyſten or ſupple the gut with a ſlimie moyſture.

Duodenum.

His ſcituation

The *duodenum* receiueth no *meſeraical* vein

The ſecond ſmall gut is called νῆστις *Ieiunum*, or the [table 6. figure 1, ᴹ] Empty gut, It is for the moſt part found empty, and that becauſe of the innumerable meſeraicks, and thoſe very large, which ending in the inner coate of the gut, doe there gape with open mouth, & draw away the *Chylus*, as the nouriſhment falles lower and lower, till all the goodneſſe bee drawne away. And if any part of the *Chylus* ſcape the firſt conuolution of this gut, yet the ſecond or third will embrace it, till moſt of the profitable iuyce be drawne away by the *meſeraicks* to this gut belonging; which ſuction or drawing is much encreaſed by the vicinitie of the Liuer, and beſide, the Aliment as it paſſeth by, being yet fluid, doeth eaſilie follow.

Ieiunum the empty gut.

His beginning [table 6. figure 2. ᴹ] on the right ſide vnder the Colon, where the conuolution of the Guttes begin, is very liuid or blewe; when it commeth aboue the Nauill (whoſe whole region it taketh vp) being before wound vp into many circled labyrinths, it endeth into the *Ileon*. It is in length twelue palmes and three fingers. In breadth it exceedeth not the little finger, vnleſſe it be puffed vp with winde. In the beginning of this *Ieiunum*, or in the end [table 6. figure 1. ᴸ] of the *duodenum*, is the paſſage of Choller or Gall inſerted, called *Porus Biliarius*; that after the *Chylus* is now fallen downe beneath it, the Liuer may vnburden it ſelfe by this vent of this humor, which by his *acrimonie* prouoketh the Guts both to expell the excrements contayned in them, and to work downward the ſlimy phlegme that cleaueth vnto them; whence it is, that in diſſections it is found more empty then the reſt.

His place.

Length.

The paſſage of the gal called *Porus Biliarius*.

Why it is found empty according to his name.

The third Gut is called λεπτὸν or *tenue*, that is ſlender, becauſe of the tenuitie of his membranes; it is called alſo εἰλεόν, from a worde which ſignifieth to encompaſſe, as it were the circled gut; alſo *voluulus*, becauſe of his many circumuolutions, in which the meat maketh profitable ſtay and deliberation: this gut alſo giueth name to that fearefull diſeaſe called *Ileos*, or *Iliaca paſſio*. It is ſcituate vnder the Nauell, on both ſides at the bones called *Ilea*, or hanch bones, and the cox or hip-bone: and though it be continuall with the *Ieiunum*, and

The *Ileon* his names.

Iliaca paſſio, miſerere mei Deus, a cruel diſeaſe.

His ſcituatiõ.

and of a like ſubſtance, yet heerein it differs, that we finde it not either ſo empty of *Chylus*, or ſo full of Veines. It beginneth where the gut groweth reddiſh, and the Meſeraicke Veines grow ſmaller and fewer, and paſsing vnder the right Kidney, meeteth vvith the craſſe and large or great gut, that [Tab.6.Fig.1: O] buncheth out like a great Globe or Bowle, and endeth in his left ſide where it hath two holes; one continued with the *Ileon*, another lower, to which the blinde gut is ioyned. [Tab.6, Fig.1,2,3,N] It is the longeſt of all the guts, euen one and twenty palmes long, and as broad as a finger is thicke, and becauſe this gut onely can fall into the cod, this onely cauſeth the rupture cald *Hernia inteſtinalis*, the gut rupture, and ſo much of the ſmall guts.

The great guts.

The great guts begin [Tab.6.Fig.1,2,3, O] where on the right ſide they ſtrut out like a great Bowle, where there hangeth downe an Appendixe or additament, which is the firſt of the thicke guts, and is called τυφλὸν or *Cæcum*, that is the blinde gut [Tab.6 Fig.1,2,3 P] hauing that name from his obſcure vſe, others call it *Monoculus*, becauſe it hath but one perforation, yet ſome ſay it hath two in the ſame ſuperficies, but diuided by ſo fine & thin a diſtance, that it ſeemes but one: when notwithſtanding one of them is the end of the *Ileon*, [Tab.6 Fig.1,2,3,N] and the other the beginning of the blinde gut, or of the Appendix. It taketh his beginning which is very thicke, from two heads; the end of the Ileon, [Tab.6 Fig.1,2,3,N & O] and the beginning of the Colon: vnleſſe we had rather ſay, that the vtmoſt part of the Colon ends into it, and that the Ileon is continued with it where it begins. In a man it is a ſlender long Appendix, and like vnto a great writhen worme [Tab.6 Fig.1,2,3,P] or a little purſe narrow toward the bottome, whence alſo it is called *Saccus*; farre narrower and ſtreighter then any of the other guts; foure Finger long, and as broade as the thumbe, and is knit to the right Kidney by the mediation of the *Peritonæum*, but hath no Meſentery tyed vnto it. In Dogges it is farre greater, and beſides differs in the originall, for in them it taketh his beginning rather from the beginning of the Colon on the right ſide of it, then on the left.

The blind gut called *Cæcum Inteſtinum*.

What was the *Cæcum* of the Ancients.

The Ancients did not call this Appendix of the *Colon* the blind gut (whence ſome of them haue deliuered, that in Beaſts there are three thicke guts, in a man but two) but for it, did take that Globous [Tab.6.Fig:2 at O] extuberation, which paſſeth from the inſertion of the ſmall guts vnto the Colon, of which we ſpake euen now. Wherefore *Galen* placeth the blinde gut on the right ſide of the *Ileon*, but the Colon he ſaith ariſeth out of the left ſide, brought firſt vpward by the right *Ilea* or flankes. This blinde gut of the Ancients wh ch we call the beginning of the Colon, in Apes, Dogges, Swine, & Oxen is very great, in whom it is a good helpe that in their groueling gate, when their fore-parts are violently moued, the excrements do not recoile to the ſmall guts. The vſe of this blind Gut ſaieth *Galen*, (vnderſtanding the beginning and bowled extuberation of the Colon) is to be as a belly wherein the excrements are receiued, that if in the paſſage any thing haue eſcaped the diſtributing vertue of the ſmall guts, and the Meſeraick Veynes, it might by remayning ſomet me in this blinde gut be exhauſted and ſucked out. But the vſe of the Appendix is whilſt the Infant is in the wombe, to receiue thoſe many and liquid excrements which in many moneths time are gathered together. After the childe comes to any growth in the world, as we ſay, the vſe of this Appendixe ceaſeth, becauſe (proportionably conſidered) there are fewer excrements gathered in the Collicke gut, and thoſe that are, are dryer and thicker. Wherefore one ſaith verie wel, that the excrements growing fewer, are not driuen therinto, and ſo it remayneth contracted and gathered together, not in length, (for the length continueth the ſame) but in the Latitude, ouer it was in the Infant, euen we ſaide before, it hapneth in the vmbilicall veſſels.

The vſe of the blinde gut of the Ancients.

Of the Appendix.

The Colon or Collick Gut.

The ſecond thicke gut, Tab.6.Fig:1.and 2. from ° to ². Tab.5 from ¹ to °, Tab.7 ⁱⁱⁱⁱ] is more lax and looſe, and is called κῶλον of a word which ſignifieth to fore-ſlow, becauſe by reaſon of his many blowne and ſwelling Chambers or Cels [Tab.6 Fig.2,3 ʸʸ] it forſloweth the paſſage of the excrements; or of a word which ſignifieth to wreth, or to rack, becauſe of the racking Collick paine which in it is bred. The beginning of this gut, called by the Ancients the blinde gut [Tab.6 Figur.1,2. O] as is ſaide, is very large and more capacious then any other part of the gut is, and round like a Bowle or Globe, ſeated in the right *Ileum* or flanke, [Tab.5 from I. to K.] for there is a fit place empty for it, becauſe the right kidney hangeth hie, to which it cleaueth; and touching the bladder of Gall vnder the Liuer, yea ſometimes being ſo faſtned vnto it, that it is dyed yellow by it, is turned vpward, rouled ouerthwart vnder the bottome of the ſtomacke [Tab.5.from ˣ to ʸ] and ſo paſſeth ouer the

The ſcituation of it.

ſmall

ſmall guts. And this is the reaſon why the Ancients haue written that it occupyeth the vpper place; yet not in Dogges but in Men. And ſurely heerein Nature hath made an excellent prouiſion both for nouriſhment and concoction, becauſe we eate many hard meates, which neither the ſtomacke nor the ſmall guts are able ſufficiently to put ouer; which are deteyned in the Chambers of the Colon; and becauſe this Colon paſſeth vnder the ſtomacke, and the Liuer the fountaine of heate, are there concocted and made fit for noriſhment, and from hence are ſuckt away by the Meſeraick Veines. On the left ſide it is tyed to the Spleene [Tab.5 G] with rare and thin Membranes; from the Spleen it paſſeth vnto the ſhare bone [Tab.5 from L to M] and then is preſently turned backward to the left Kidney, to which it is ſtrongly bound, and ſo maketh a ſhew as it were of a Scythian bow. This ſtrong binding of the Collicke gut to the left Kidney, is the cauſe why the Nephritick paine or fit

Tab. vi. ſheweth the leſſer and the greater guts.

The firſt figure ſheweth the forme and folding paſſage of the leſſer guts.

The ſecond Figure ſheweth the forme and conuolutions of the greater guts, and the Muſcles of the Fundament.

The thirde Figure ſheweth together with the figure of the great guttes, the value or Membrane of the Colon *or Collicke gut.*

The fourth Figure ſheweth a part of the collick and right guts and the coats of the Guts.

of

of the ſtone in the Kidneyes, is confounded with the collicke payne. But to returne to the collicke gut; at the left Kidney it is much narrower, leaſt it ſhould compreſſe the ſpleene, wherefore thoſe men that haue ſwolne ſpleenes, doe not eaſily breake winde, vnleſſe their ſpleenes be preſſed; here alſo it hath no chambers: and againe ariſing more on the left ſide as it were vnto the ſeate of the Nauell [table 6. figure 2. and 3, from ϒ to ϒ] maketh a double, (which double is the cauſe that in this place the collicke torments are moſt grieuous, ſo that wee haue ſeene heere apoſtemations [table 5. ϰ] maturated or ripened through the skin, and after healed) and ſo being carried to the beginning of the *os ſacrum*, in that very place where on the one ſide it aroſe from the right gut, it now on the other ſide [table 5. ϰ] endeth in it; but is diſtinguiſhed from it by a certaine narrowneſſe, cauſed as it were by the whipping about [table 6, figure 2, from ϒ to ϒ] of a ſtreight band: which place all Phyſitians in the adminiſtring of Cliſters, and cure of the Collick torments, muſt not forget. The length of this Gut is about 7. palmes [demonſtrated in the 6. table & the 1, and 2, figures] and ſo many fingers, and in breadth it is as wide as a mans Fiſt is thicke.

The length of the Collick gut.

It is the largeſt and wideſt of all the Guts, that it might be a receptacle of the winds ingendered in the firſt concoction, to wit, in the ſtomacke and the ſmall Guts; as alſo of the vnprofitable and fæculent part of the *Chylus*, which remayneth about the end of the ſmall Guts: leaſt ſayth *Galen* in his fourth booke *de vſu partium* and the 18, chapter we ſhould be conſtrayned continually, or ouer often to empty our bodies, becauſe within vs there is continuall ſegregation made of the excrements from the nouriſhment. Now this Gut being ſo capacious, thoſe excrements may in great quantity bee retayned, and auoyded but at conuenient times.

The Celles alſo or chambers of this Gutte [table 5, ϱ ϱ, table 6, figure 2, 3, ϒ ϒ] make much for this purpoſe of Nature; and hence it is that ſome Birds whoſe Guts haue no ſuch Celles, doe continually mute, or very often: and therefore ſome haue called this collicke Gut, *The lower Belly*.

Leaſt therefore the excrements ſhould forceably iſſue out, or perpetually prouoke the expulſiue faculty, this Gut firſt of all ariſeth vpward [table 6, figure 2, and 3, from ° to ϱ,] afterward bending downward, it is againe reflected vpward neare the end thereof [table 6, figure 2, and 3, from ϒ to ϒ] not vnlike to a Romaine S. And hence it is that in our deiections, the excrements are not auoyded all at once, but as it were at two ſtooles, the ſecond following the firſt, after a little diſtance of time.

And becauſe it is very great, therefore it hath two ſtrong ligaments; one, whereby it is faſt tyed to the vpper parts, and ſo by the other to the lower. It is alſo faſtned to the backe by meanes of an externall membrane, ſpringing out of the lower membrane of the Kall; as the other Guts are tyed to the backe by the interpoſition or helpe of the *meſenterie*. But in Dogges it is no where tyed to the Kall, neither hath it any of theſe ligaments. If it were narrow as the ſmall Guts, it would alwayes be diſtended, and ſo alwayes tortured.

Againe, whereas the excrements when they paſſe out of the *Ileon* into the Collick gut, doe manifeſtly aſcend [table 6. figure 3. from ϰ to °] leaſt in the compreſsion of the belly, (which is made by the muſcles of the *Abdomen*, and the helpe of the midriffe) to the ſiedge; the excrements and putrid or rotten vapours ſhould not ſo eaſily finde the lower paſſage by the right gut, as returne out of the Colon into the *Ileon*, and ſo diſturbe the diſtribution of the *Chylus*, and at length iſſue by the mouth as it hapneth in that miſerable diſeaſe called *Iliaca paſſio*, where the gut *Ileon* doubling into it ſelfe, maketh ſuch a conſtipation of the belly, that the meat cannot deſcend, and ſo the remainders thereof being yet liquid in the ſmall gut, and defiled with the noyſome ſauour of that place are returned by vomit, and at laſt the excrements themſelues, though not out of the great guts; leaſt I ſay in euery notable compreſsion of the belly this ſhould happen, Nature hath ordained & ſcituated a certain value, leaf-doore, or floud-gate, at the beginning [ta. 6. fig. 3. *] of this Colon where it is ioyned to the *Ileon*, which is membranous and thick, and looketh vpward, becauſe the excrements of the meate are carried by aſcent not by deſcent, out of the Ileon into the Colon, as is ſaid before. This value is eaſily found by the Anatomiſt, if you poure water into the right gut and hold it & the Colon vpward, for then you ſhall perceiue that none of the water will paſſe into the Ileon, no nor winde, vnleſſe you preſſe it very hard. You may finde it alſo when the guts are cleanſed, but then it is ſomewhat vitiated by the transfuſion of water, which you muſt neceſſarily vſe in the cleanſing of them.

The values of the Colon.

Lib. 5 method. medcn. cap. 5.

Hence it is that *Galen* ſayth, the matter of cliſters cannot naturally aſcend into the Ileon

or

or ſmall guts, although their medicinable force and vertue may goe a great deale higher. *Andreas Laurentius* hath deſcribed this value in his Anatomie, where alſo he maketh mẽtiõn of *Bauhines* deſcription of it, and attributeth vnto it this vſe eſpecially of hindering the regurgitation of the excrements. But *Archangelus* ſayeth, that at the blinde gut there are three values like thoſe in the heart, all appoynted for the ſame purpoſe, which the reſt before did agree vpon. *Lib. 1 3. method. medend. cap. 17*

The ſubſtance of the Colon is more fleſhy then that of the other guts, and beſide it hath many Celles [table 5. ᵠᵠ, table 6. figure 2, 3, ʸʸ] or chambered cauities, diuerſly as it were arched; and againe ſinking into a narrower extent, wherein the hardeſt part of the meate may reſt, and ſo receiue (for they lie vnder the ſtomacke and the Liuer [table 5. at ᶜᶜ) a better concoction. But the ſmall guts haue none of theſe Cels; the reaſon is, that the excrements of the Chylus ſhould not be reteined therein, the diſtribution of the Chylus hindered, or the place of the belly taken vp therewith.

Finally, leaſt the Cels or chambers of this Colon ſhould bee diſſolued or looſened foorth, there runneth through his middle and vpper part after his length, a certaine *vinculum* or band of the breadth of the middle finger: which being looſened or broken, thoſe chãbers are diſſolued. When this colon comes near to the right gut, it becommeth round [table 6. figure 2, 3, ʸ] like the Colon in Dogges (that ſo the excrements and the winde alſo which iſſueth ſometimes ſilently, ſometimes with noyſe, might bee more eaſily excluded) and ſo his end is narrow and ſtraight, fit to ioyne with the right gut.

The third of the great guts [table 5, his beginning is at ° vnder the bottom of the bladder, table 6. figure 2, 3, ᶻ, table 7, ᶠᵍ] is called *rectum*, of his right bore, and ἀρχὴν, the *beginner* by *Hippocrates* in his firſt booke *Epidem*: becauſe it hath his beginning where the boughts of the guts do end, and thence paſſeth from the top of the *ſacrum* or holy-bone, to the end of the rumpe, to which it is firmely tied by the interpoſition of [table 6. figure 4. ʰʰ] the *Peritonæum*, leaſt when it is burdened, it ſhould fall with his owne waight: and ſo endeth in the ſeate, [table 6. figure 2, 3, ᵃ] in men vnder [table 6, vnder ᵇ] the bladder; in women vnder the wombe. In this place it is very great, which *Hippocrates* calleth *Partem laxam* or his looſe part, and groweth to the yarde of men [table 6, figure 2, 3, ᵈ ſheweth the place] and to the necke of womens wombes, by the interpoſition of a muſculous ſubſtance. The laſt great gut called *rectum*, or the right gut.

Hence comes in men that notable ſympathy of this gut with the bladder, which maketh a man that is troubled with the ſtone in the bladder, to be euery moment prouoked to the ſtoole; but yet in women there is a greater ſimpathy betweene this gut and the wombe; ſo that oftentimes by compaſsion the gutte is vlcerated, and the excrements are auoyded by the ſecret parts. This gut could not be more commodiouſly placed, for the excremẽts being herein by degrees collected, may be fitly together excluded. To the end of this gut a round muskle [table 6. figure 2, 3, ᵃ] is annexed, which may binde the *orifice* of it, whereupon it is called by *Hippocrates* and *Galen* σφιγκτὴρ, that the excrements might not at all times but onely by voluntary compreſsion and violence be euacuated. This gut is a palme and a halfe long [table 6. figure 2, 3, from ᶻ to ᵃ] and three fingers broade, and very corpulent or ſubſtantiall, and hath certaine fat appendixes or additaments growing to it without. The great ſympathy betweene the right gut and the bladder. The ſphinter muſcle.

All theſe Guts as they are ſimilar parts, do conſiſt of a ſpermaticall ſubſtance and bloudy matter, changed into their proper fleſh, if it may be ſo called: but as they are diſsimilar they haue a membranous ſubſtance, that ſo they may without paine be diſtended or ſtretched, when they ſtrut with the *Chylus*, with the excrements, or with winde; yet is not this membranous ſubſtance alike thicke, but the ſmall guts haue it more ſlender, the great guts more craſſe and thicke. This may bee ſhiuen into three coates; whereof one is common [table 6. figure 4, ᶜᶜ] to them all, as hauing his originall *mediately* ſayeth *Galen* 4. *vſu partium* 17, from the *Peritonæum*: but immediately the *duodenum* and that part of the Colon that cleaueth to the ſtomacke, hath it from the lower membrane of the Kall, although it be not ſo in Dogs: and the *Ieiunum*, the *Ileon*, and the remaynder beſide of all the great Guts, haue their coate from the membranes of the *meſenterie*. For the membranes of the *meſenterie*, carrying the veſſelles to the Guts, doe grow vnto them, where parting aſunder, they ſeuerally walk along the ſides of the Guts, & do degenerate into their third coat. This firſt cõmon coat they haue as inſtead of a ligament, ſo as a couering for their better defẽce. They haue beſide, 2. proper coats, [tab. 6. fig. 4. ᶠᶠ ᵍ] partly that their expelling power ſayth *Galen*, might bee of greater force, partly alſo for ſecurity, when they abide many difficult The 3. coates of the guts.

4.*vſu part.* 17. aſſayes in diuers diſeaſes, eſpecially in the *Dyſenteria* or bloudy Flux, that the inmoſt beeing hurt, the other may remaine perfect for the performance of their duty. Wherefore, many haue beene knowne to ſuperuiue when the inner coate hath beene eaten out: yet both theſe coats are thinner and ſofter then thoſe of the ſtomacke, becauſe this receyueth the meate when it is harder and vnconcocted, thoſe when it is for the moſt part concocted and attenuated or made as thin as pulpe. The firſt [Tab.6.fig: 4, ff] or vtter of theſe coates is membranous, but ſtrong; for the moſt part furniſhed with tranverſe Fibres, ſprinkled alſo with fleſhy fibres, firſt to encreaſe his heate, that thereby the leſſe laboured and digeſted parts of the Chylus may in their paſſage be more throughly concocted; and again, that like Muſcles they might contract the guts to expel thoſe final remainders which could not be auoyded by the compreſsion of the *Abdomen*. Ouer this coate is drawne as it were a Veyle or Filme, thight but very fine, wouen for the moſt part of right Fibres. The other proper [Tab.6 Figure 4 g] coate is on the inſide in the ſmall gats rugous or plightie, (in the Colon the plights are vnfoulded and ſpred abroad into Cels) that it might moderately ſtay the Chylus as it falleth downward, that if any part of it bee leſſe laboured, it might receiue a farther degree of concoction in the paſſage.

Moreouer, that the ſame Chylus might the better bee ſucked vp by the Veynes, theſe tranuerſe foulds make this coate longer, and in ſome doubly and trebly longer then the vtter coate; and for this cauſe alſo it was neceſſarily gathered into Plights; and theſe foulds or ſurphles are moueable, & may be driuen out of one place into another, as the ſurphles of a hemme gathered vpon a thred, that they may reteine the Chylus moderately & without violence. This coate is alſo neruous, but yet it appears more fleſhy, becauſe of a cruſt like a Membrane which compaſſeth it about, engendred of the proper excrements of the guts ariſing from the third concoction, leaſt the mouth of the Meſeraicke Veins opening into this inner coate, ſhould be ſtopped; and leaſt the ſame inner coate, or the mouths of the Veines ſhould be made callous or hard by the perpetuall paſsing of the Chylus. Both theſe proper coats at the end of the Colon, and in the right gut are thicker and thighter or faſter.

The cruſt of the guts whiche is firſt loſt in bloody fluxes.

They haue Fibres of all kindes, the inner oblique or ſlope Fibres, that it might reteine the middle tranſuerſe or ouerthwart that it might expell; to the outward are added a few right Fibres, leaſt the tranſuerſe ſhould be ſeparated aſunder: wherefore without the gut they are tyed together with the right fibres as it were with a ligament, euen as Chirurgions for the holding on of circular or round Ties, do caſt ouer them right bands. But the right Fibres are fewer in the ſmall guts, more in the great. In the Colon the Fibres follow his impreſsions or chambers. They are very great and large in the right gut, becauſe of the many and hard excrements there heaped together.

What fibres euerie coate haue.

The veſſels of the guts [exhibited in the third Table] are Veines from the port veyne, arteries from the Cœliacall [Tab.4] and Meſentericall branches. For to the *Duodenum* & the beginning of the *Ieiunum*, the gut-veine called *Inteſtinalis* runneth with a long courſe; but the reſt of the *Ieiunum* and the *Ileon*, and a part of the Colon, from the *Ileon* to the left kidney, haue Meſeraicke [Tab.4.Fig:2 ooo] veyns, which are carryed from aboue with an oblique paſſage through both the coats of the Meſentery, as it were out of his center. The vſe of their veines, is to carry the Chylus from the guts to the Liuer, and bring back blood to them for their nouriſhment; of their Arteries, that they might be cheriſhed with vitall blood, and by their perpetuall motion be preſerued from corruption and putrifaction. *Galen* thought, that they tooke vp alſo a little of the meate in their paſſage. To the other and remaining part of the Colon, and to the right gut, they are in a right line carried from the left Meſentericall Veine, and the inferiour Meſentericall Artery.

4. The veſſels of the guts.

4.*vſu part.* 17.

They haue Nerues from the fixt paire, the *Duodenum* very ſmall ones from thoſe ſtomacke ſinnewes which compaſſe the *Pylorus* or lower mouth of the ſtomacke: the reſt of the guts on both ſides, receiue infinite ſurcles from a braunch which proceedeth from the roots of the ribs, from whence they haue moſt acute ſenſe, that they might apprehend the prouocation of the choller and the excrements; notwithſtanding that a certaine mucous or ſlimy matter which lineth them within, makes their ſenſation ſomewhat more dull.

The vſe of the fat and ſlime in the guts.

On the outſide they are ſmeared, ſometimes couered with fat, and on the inſide lined with ſlime, and as it were nealed like earthen pots, that through their ſlipperineſſe the excrements of the belly might ſooner be precipitated or thruſt downe (ſome thinke the Colon is lined within with fat) and leaſt their exquiſite ſenſe ſhould bee continually prouoked.

The

The common vſe of the guts is to be inſtead of earth or the ſoile to yeelde nouriſhment to the parts. For as in the earth is contained the Aliment of the plants which they draw out by the Fibres or ſtrings of the roots, ſo in the guts is the Chylus, which the rootes of the Meſeraick Veines do ſucke out for the nouriſhment of the creature. Againe, the vſe of the ſmall guts is to be the Inſtrument of diſtributing the Aliment; ſo ſaith *Galen* in his fourth Booke *de Vſu partium*, the 8. and the eighteenth chapters. For it behooued that there ſhould be one Organ to concoct, and another to diſtribute; for otherwiſe the veines could not but haue drawne crude together with concocted and laboured nouriſhment. For the Chylus boyled in the ſtomacke, was to bee diſtributed to other partes, and the profitable parts thereof to be ſegregated and ſeparated, which is accompliſhed by the Meſeraicall veines. But becauſe, as it hapneth in a Viall full of water, if it bee turned vp, the water cannot yſſue at the necke but by drops and degrees; ſo in the guts, if the Veines had beene ſet to one place, the multitude of the Chylus would haue ſtopped his owne paſſage: therefore Nature hath well prouided, that the guts ſhold be drawn out into a great length, that ſo in each part of them a litle quantity might be conteyned, & ſo a conuenient proportion ſuckt away by the mouths of the Veynes. Moreouer; in the very paſſage of the Chylus along the guts, it receyueth a farther degree of concoction, as alſo doth the blood in all the Veines. And therfore the ſubſtance of the guts is not much vnlike that of the ſtomack. But becauſe they are not ſo neere the heate of the Liuer as is the ſtomacke, therefore Nature hath aſſiſted theyr cold membranous ſubſtance, by couering them with the warme happing of the *Omentum* or Kell, whereby their weake heate is cheriſhed.

The common vſe of the guts

The vſe of the ſmall Guts.

The vſe of the great Guts.

The vſe of the great guts is to contain the thicke excrements and remainders of the meat together with the choler deriued vnto them from the Liuer by the paſſage of gall, as alſo the winds that are daily gathered, which are ſtored in the chambers of the *Colon*, and the bredth of the other great guttes; and kept in by the Muſcles of the fundament, as we ſhall more manifeſtly ſhew afterward.

CHAP. VI. *Of the Meſentery.*

IT is called *Meſenterium* and μεσέντερον in Greek, becauſe it is placed in the middle of the guts, which as we ſaid before, are called ἔντερα: for it is placed in the middeſt betweene the guts toward their backward poſition [Tab. 7 Fig. 1.] and incircleth them round. It is called alſo μεσάραιον from his peculiar ſubſtance. His figure is circular [Tab. 7. Fig. 1, 2] and plaine; but gathered into folds; about the beginning it is narrow, in the middle ample and large, and in the ſides, eſpecially the left ſide where it deſcendeth to the right Gut it becommeth more long, for which cauſes *Galen* ſayde, it was treble or three-fold.

The ſcituation cauſe of the name.

His Figure.

His beginning is at the firſt and thirde Spondell or racke bone of the Loynes from the *Peritoneum*, from whence are produced membranous Fibres which ſpend themſelues in the two Membranes [Tab. 7. Fig. 2 ττ] of the Meſenterie, from whence it is that there is great conſent betweene the Loynes and the guts; beſide there paſſe alſo from thence certaine Nerues vnto the Meſentery. For it is compounded of Membranes, Nerues, Veines, Arteries, Glandules and Fat.

Originall.

It hath two Membranes [Tab. 7. Fig. 2, ττ] one lying vpon another (in Dogs where it admitteth no veſſels, they ſo grow together, as if it were but of one ſimple Membrane, neyther hath it any fat to make ſeparation) and thoſe firme & ſtrong, as well for the ſtrengthening of the veſſels which are manifold and paſſe together vnto the guts, to which Veſſels it ſerueth for a band and ſtrong muniment, as alſo leaſt in violent motions the poſition of the guts ſhould be altered or confounded, and that they might be ſtronglier tyed to the backe.

His Membranes.

The Meſeraicke Veines [Tab. 3. ddd Tab. 7. Fig. 2] diffuſed or ſpred abroad thorough theſe Membranes are innumerable and wondrous ſmal, as it were the fine & ſlender threds of the roots of a tree, which are ſtill gathered into greater, till they growe all into one entire roote; ſo theſe veſſels by little and little are knit together into greater, and thoſe greater into others yet greater, till they are all vnited into one veine, which paſſeth vnto the Port, and reſteth in the hollow ſide of the Liuer. Two Arteries called the vpper and lower *Meſentericall*, are ſent vnto the guts, which make the Meſeraicke Arteries, which alſo run through the Meſentery, that by their continuall motion they might ventilate, and with

¶ *The first Figure sheweth where the Mesentery beginneth or ariseth, his scite, connexion, and vessells: in it also the guts are remooued from the middle of the Belly, and are laide vpwarde and downward vnto the sides, that the Mesentery might better appeare.*

The second Figure sheweth the Mesentery taken and freed from the body.

vitall spirite illustrate the Mesenterie and guts, and so keepe them from corrupting; all which also are ioyned into one great one which lyeth vpon the backe. This *Galen* obserued sometimes to be presently parted in twaine out of one roote, sometimes to be two seuerall distinct instantly from their beginning.

Lib.6. Admin. Anat.Cap.6.

Nerues.

It hath Nerues also sprinkled diuersly as it were into many tendrils. Those are two, one on eyther side frō the nerues which are reached from the sixt paire to the roots of the ribs: which Nerues being spread abroad after the fashion of a Membrane, doe inuest the branches of the Arteries, by which meanes the colde Nerues by the touch and society of the Arteries becomming warme, the Animal vertue proceeding from the Brain, is more freely communicated to the guts. It hath Nerues also from the sinnewes proceeding from the Spondels of the loynes, and that for his better sense, that feeling those things that molest it, the expelling vertue being prouoked, it might turne them downe into the Guts. These nerues together with the Veines and Arteries, are receiued into the center [Tab.7. Fig:1, 2 H] of the Mesentery, diffused through the whole body of it, and with an innumerable offspring are carried through his coates or Membranes vnto the guts. It hath also glandules or kernels very [Tab.7. Fig:1, 2 KK] many (to which certaine thredy or hairy veines do come from the Meseraickes) interlaced with infinite diuarications of the braunches of the Port-veine, & the great Artery, with which they hold a certain proportion for their magnitude; but the biggest of them are about his center, where the first distribution of the vessells is made, and where they are most gathered together: as wel that they may support & diuide the vessels, as also that they may hinder their compression which would otherwise forflow

The *Glandules* of the Mesentery.

the

the diſtribution of the *Chylus*, like as they doe when they become *ſchirrus* [table 7, figure 1. 2, ll] or hard; whence followeth for this reaſon a generall conſumption of the whole body.

Beſide, it had not beene ſafe that ſo many veſſels riding ſo high, being ſo ſlender and running ſo long a courſe from their originall, ſhould bee carried to the trunke of the port-veine without a kinde of conuoy; wherefore theſe glandules or kernels, as it were certaine wedges, are ſet between their diuiſions, that in vehement motions they be not broken nor offende one againſt another. Finally they ſerue to moyſten the guts, that their concoction may be celebrated by elixation or boyling, that is, by heate and moyſture.

Amongſt theſe glandules there is plenty of Fat, made of bloud ſweating or falling out of thoſe veſſelles wee ſpake of euen now, and there retayned by the ſolidity of the membranes, with which fat the middle ſpaces are filled, and the heate of the parts cheriſhed, that ſo the Chylus which is carried through them, may be prepared for ſanguification. The fat of the meſentery.

And although this *Meſenterie* be one and continued together, yet in regard of his double originall, and of the guts which it tyeth together, and of the two Arteries; it may be diuided into that *Meſenterie* which knitteth together the ſmall guts [table 7, figure 2, l m m] in the middeſt of the belly called μεσάραιον; and into that which tyeth the colon [table 7, fig. 2, frõ n to o] both on the right ſide and the left; [tab. 7, figure 2, from p to q] not vnder the bottom of the ſtomack, for to that it is knit by the help of the *Omentum* [table 7. figure 2, from o to p] & in his lower part [tab 7, fig 2, from q to r] groweth to the right Gut, & is called by *Hippocrates* μεσόκωλον. Laſtly, it hath a part which they call the appendixe [table 7. fig. 2, from q to r] of the *Meſenterie*, being of the nature of a ligament, whereupon *Galen* diuideth it into the right, the left, and the middle. How *meſeraion* differeth from *meſocolon*

The vſe of the *Meſenterie* is to tie the Guts together, as it were by a common ligament, and to faſten them to the Racke-bones of the Loynes, that they neither ſhould bee confuſedly ſhufled together, or fall downe by reaſon of their waight. But the Colon or collick Gut in that part of it that runneth vnder the ſtomacke, is tyed to the backe by the Kell as hath beene ſayde. Againe, the double membrane of this *meſenterie* doth incloſe and ſuſtaine the veſſels which runne through it, that they ſhould not be medled together, and ſo hinder one another, as alſo that they might more ſafely attaine vnto the Guttes, whereas happely if they were not ſtrengthned by this duplication, they might break when a man did leape or fall, or otherwiſe ſtraine his body there about. The vſe of the *meſentery*.

Of the Pancreas or ſweet-bread. CHAP. VII.

Pancreas, that is, all fleſh, is ſo called becauſe of the likeneſſe it hath with fleſh in an ordinary and moderate body, for in a Fat body it ſeemeth to be Fat it ſelfe: it is alſo called καλλίκρεας. It is an vnſhapely body, very looſe, all glandulous (wherefore *Archangelus* would haue it called *Pandenon*) and large. It hath his beginning at the firſt ſpondle of the loynes, and thence diſuſed, ſpreds it ſelfe vnder the backpart of the ſtomack and his bottome, the *duodenum* [as appeareth in the table belonging to the chapter of the bladder of gall at the note t] and the gate-veine at the Kidneyes, euen as farre as the ſeates of the Liuer and the ſpleene. In Man it is not ſo red as in Dogges, and in all beaſts becauſe of their groueling gate, it lyeth vppon the ſtomacke. The ſweet-bread. The ſciuation of it.

That which in his middle appeareth white, is his *Parenchyma* or proper fleſh, and becauſe of his whitenes and ſoftneſſe, ſome call it *Lactes*; we call it the ſweet-bread, becauſe in Swine it is eſteemed a ſweete morſell, though the ſweet bread of a Calfe or Veale bee another thing, as you ſhall heare hereafter. It hath veines but very ſmall from the Gate-veines for his nouriſhment: and Arteries from the *Cœliacall* for his life; ſinewes alſo from the ſixt paire, and glandules. His veſſels & glandules.

The eſpeciall vſe of it is to ſuſtaine, ſecure, and preſerue from Compreſſion the diuiſions of the branches of the Gate-veine, of the *Cœliacal* Arterie, and of the nerues which are carried to the ſtomacke, and to the Gut called *duodenum*; but eſpecially the Splenick braunch which paſſeth vnto the ſpleene; as alſo the veſſell which contayneth the choller called *Porus Biliarius*, becauſe about his ſeate is the originall of all their diuiſions. His vſe.

Moreouer another vſe it hath, by reaſon of the many glandules in it contayned, which is to licke vp the remaynders of that muddy and ſuperfluous Fat (or if you will, the crude The vſe of his *Glandules*.

and phlegmaticke part of the bloud, which *Hippocrates* calleth *Cœnoſam humiditatem*, the muddy moyſture) which the Kall and Meſenterie could not containe: that the bloud being thus depured, might bee exhibited to the inward partes, more pure and better defecated.

Againe, whereas theſe glandules doe as it were feede vppon and deuoure the crude or raw and moyſt part of the bloud; it muſt needes follow that from them ſhould exhale infinite vapours moyſt and hot, which ſteaming vp round about the ſtomacke, doe make this action of *Chilification*, a kinde of elixation or ſtewing, like a Maryes Bath.

Another vſe of the *pancreas*

Finally, the *Pancreas* like a pillow or quiſhion is placed vnder the ſtomacke and other parts, leaſt being filled, they ſhould leane too hard vpon the ſpondelles of the loynes, and be violated with their hardneſſe. Albeit *Fallopius* and *Archangelus* I know doe reiect this vſe of it, becauſe there is no ſuch vſe of it in brute beaſtes, in whome it lyeth aboue the ſtomacke. It parteth alſo the ſtomacke from the great Arterie, leaſt when the ſtomacke is very full and ſtrutteth out, the Arterie ſhould be preſſed, and ſo the free courſe of the vitall ſpirits to the lower parts intercepted.

Of the branches of the Hollow Veine, and the great Arterie, diſſeminated through the lower Belly. CHAP. VIII.

WEE ſhould now proceede vnto the ſtomacke, ſauing that wee thinke it not amiſſe before wee come vnto it, to giue you a ſhort view of the diuarications of the hollow veine and the great artery, as they diuide and ſubdiuide themſelues in the lower belly; that if you pleaſe in the ſame body, you may call for a ſight of them before you trouble the carcaſſe too much, by remouing the ſtomack and other entrals. And firſt of the branches of the Hollow veine.

The Hollow veine hath two trunkes, one paſſeth vpward through the midriffe, the other downward, which we will diuide into the trunke and the branches. From the trunk [table 8.^{x}] moſt commonly there proceed on each ſide foure veines.

Adipoſa.

The firſt is called *Adipoſa*, or the veine of the Fat of the Kidneyes: the left of theſe, [tab. 8.^{g}] is for the moſt part higher then the right [table 8.^{f}.] They runne vnto the Fat of the Kidneyes and their vtter membrane. Sometimes one of them ariſeth from the Emulgent, as appeareth, [table 8.^{f}] ſometimes both.

Emulgent.

The ſecond is the Emulgent; the left of theſe [tab. 8.^{e}] which ſometimes ariſeth threefould, is higher then the right [table 8.^{d}] leaſt one of them ſhould hinder another in their ſuction; and longer alſo, becauſe the ſeminarie or ſeede veſſell ſpringeth out of it [table 8.^{i}.] Both of them, when they attayne vnto the middeſt of the body of the Kidneyes are diuided and ſo implanted to carry vnto them the whey of the bloud, which becauſe it ſhould not returne againe into the hollow veine, Nature hath placed certaine values in the emulgents.

Spermatica.

The third is called *Spermatica* or the ſeede veine; the right of theſe [table 8.^{h}] is ſometimes double, ariſing out of the middle of the trunke below the Emulgent: The left ariſeth from the Emulgent [tab. 8.^{i}] becauſe otherwiſe it muſt haue rid ouer the Artery, yet notwithſtanding ſometimes it receiueth a ſmall branch from the *Caua* or hollow veine. They deſcend obliquely to the teſticles, and determine in the Bodden body called *Corpus varicoſum*, to which they carry the matter of the ſeede.

Lumbares.

The fourth are called *Lumbares* or the veines of the Loynes. Theſe are ſometimes two, ſometimes three of a ſide [tab. 8.^{mmmm}] they paſſe between foure rack-bones of the loynes, and doe ſend two veines to the ſides of the marrow of the back which ariſe vnto the Brain, and haply they bring from the braine a part of the matter of the ſeede.

Rami Iliaci.

Afterward at the fourth ſpondell of the loynes, the trunke of the hollow veine [table 8.^{n}] is diuided into two branches which are called *Rami Iliaci*, out of which before their diuiſion there proceede on either ſide two veines.

Muſcula.

The firſt is called *Muſcu'a* [table 8.^{nP}, ^{nP}] one of which is higher then the other; ſometimes it proceedeth not from the branches, but from the trunke, and paſſeth to the muſcles of the loynes and of the *abdomen* or paunch, from whence it hath his name.

Sacra.

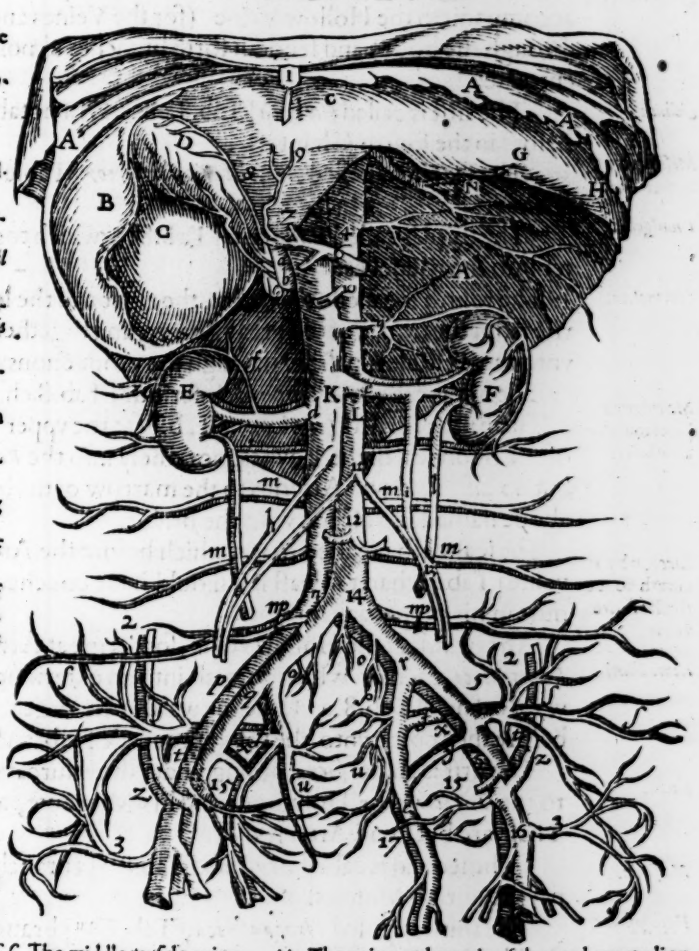
The ſecond is called *ſacra*, a ſmall veine, ſometimes ſingle, ſometimes double, and paſſeth through the vppermoſt and formoſt holes of the *oſ ſacrum* or holy-bone [table 8.^{oo}] vnto his marrow, and hath his name from the bone.

Then

The Branches of the Holllow veine and the Great Arterie, diſſeminated through the lower Belly.

TABVLA VIII.

AAA The midriffe called *ſeptum tranſuerſum*.
BG The Gibbous part of the liuer, the right ſide at *B*. the left at *G*.
CC The hollow part of the Liuer called *Caua icco-vis*.
D The bladder of gall.
EE The forepart of both the Kidneyes.
H The Ligament which tieth the liuer to the midriffe.
I The vmbilical or Nauel veine where it is inſerted into the Liuer.
K The trunke of the hollow veine called *vena caual*
L The trunke of the great arterie.
N The gullet where it paſſeth through the midriffe or the boſom of the Liuer called *ſinus beparis*.
a The trunke of the Gate veine.
b The *Cyſticke* veines where they goe to the bladder of gall.
c The paſſage of the bladder of gall which goeth to the gut called *duodenum*.
de The emulgent veines with the emulgent arteries vnder them.
f The right fatty veine called *aſipoſa dextra*, ariſing out of the emulgent.
g The left fatty veine ariſing out of the trunke of the hollow veine.
hi The ſpermatical veines, the right ariſing out of the hollow veine, the left out of the left emulgent.
ll The two vreters which carry the vrine vnto the bladder.
mmmm The veines and arteries of the Loynes called *Lumbares*.
npnp Below, the vpper muſcle veine and arterie, called *muſculæ ſuperiores*.
x The diuiſion of the hollow veine aboue the ho'y bone.
oo The holy veines and arteries called *ſacræ*.
p The *Iliacal* branch of the hollow veine.
q The *Iliacal* arterie.
r The diuiſion of the *Iliacal* artery, and the *Iliacal* veine vnder it, into the inward & the outward: the inward is marked with *r* the outward with *s*.



ſſ The interior tranſuerſe or croſſe braunch. *ſſſſ* The middle muſcle veine. *tt* The veine and arterie of the yard, proceeding from the branch marked with *r* and *s*. *uu* The *Hypogaſtricke* veine which ſendeth branches from the inner bough to the bladder, the wombe, and almoſt al the parts in the watercourſe. *xx* The place where the vmbilical arteries are inſerted. *y* A portion of the external branch, wherewith the internal is augmented. *z* Character. 1 The remainder of the inward branch. 2, 2 The *Epigaſtrick* vein which is a propagation of the vtter bough: it creepeth vpward by the lower parts of the *Abdomen* to the Nauel. 3 The lower muſcle veine, reaching to the *Coxendix* or Hips: a veine with o it an artery, which deriueth his branches to the muſcle of the fundament, and to the skin about them. 4 The great arterie piercing the midriffe. 5 The artery of the midriffe called *Arteria phrenica*. 6 The *Celiacal* artery. 7 9 An artery paſſing to the Liuer. 8 The *Cyſticke* artery, or artery of the bladder of gal. 10 The vpper *meſenteri-acall* artery. 11. The original of the ſpermatical arteries. 12 The lower meſentericall artery. 13 The coniunction of the ſpermatick veine and artery. 14 The diuiſion of the great artery into the *Iliacal* branches, and how it aſcendeth aboue the hollow veine. 15 The artery of the priuities called *arteria pudendi*, which is a ſhoot of the inmoſt braunch, going to the parts of generation. 16. 17 The remaynder of both the trunks marked with *r* and *s*, running to the thighes.

Then the *Iliacall* branch is on both ſides bifurcated or forked [table 8. vnder *r*] into an exterior or vtter [table 8. vnder *q*] and an interior or inner. From theſe proceede three veines. *The bifurcation of the Iliacall veines.*

The firſt is called *Epigaſtrica* [table 8. vnder character, *s*] which is diſſeminated into the *Peritonæum* and the muſcles of the *abdomen*. The chiefe branch of this veine ariſeth vnder the right muſcles of the *Abdomen*, euen vnto the vein called *mãmaria*, and with it about the Nauell is ioyned by *Anaſtomoſis* or *inocculation*. *Epigaſtrica.*

The ſecond is called *Hypogaſtrica*, a notable veine [table 8, *uu*] and ſometimes double. It is diſſeminated almoſt into all parts of the *Hypogaſtrium* or watercourſe, the bladder the yarde, and the wombe; and at the right gut maketh the external *Hæmorroidall* veines. *Hypogaſtrica.*

The third is called *Pudenda* [table 8. character *15 15*] which is conſumed into the *ſcrotum* and the fleſh of the yarde or *virile* member. *Pudenda.*

Theſe veines being thus deriued out of the *Iliacall* braunches of the hollow veine, they paſſe on either ſide out of the lower belly [table 8, *st*] & are called *Crurales*, or the veines of the thighes, of which we ſhall ſpeeake hereafter. And thus much of the Branches of the Hollow veine, now followeth the great Artery. *Crurales.*

The

The greater trunke of the great Artery.

The Great Artery alſo hath two Trunkes, the leſſer goeth vpward, the greater [Tab.8. character 4] deſcendeth, becauſe it hath more parts to be communicated vnto. This trunk accompanieth the Hollow Veine (for the Veines and Arteries are ſorted together quite through the body) and ſendeth forth branches almoſt like vnto it, of which wee will now entreate.

Cœliaca.

The firſt is called *Cœliaca* [Tab.8.char.6.] a notable Artery of which wee haue ſpoken before in the fourth Chapter.

Meſenterica Superiour.

The ſecond is called *Meſenterica ſuperior* [Table 8. character 10] before chapt.4. deſcribed.

Emulgens.

The third is called *Emulgens* [Tab.8 d e] which together with the Emulgent Veines enter into the Kidneyes.

Spermatica.

The fourth is called *Spermatica*, the right and the left [Tab.8.char.11] both of them ariſe from the trunke of the great Artery, and together with the Spermaticall veines attaine vnto the Teſticles, paſsing through the productions of the *Peritonæum* or rim of the belly.

Meſenterica Interiour.

The fift is called *Meſenterica* inferiour [Tab.8.char.12] deſcribed in the 4.chapter.

Lumbares.

The ſixt are called *Lumbares*. [Tab.8. at the vpper mmmm] They paſſe through the holes of the Spondels of the Loynes, not onely into the *Peritonæum* and the Muſcles confining, but do alſo ſend two Arteries to the marrow of the backe, which together with the veynes aboue named, do aſcend vnto the braine.

Iliaca, why it rideth aboue the hollowe veine.

The ſeauenth is called *Iliaca*, which before the Artery is diuided, rideth ouer the hollow veine [Tab.8.char.14] leaſt if it ſhould haue couched vpon the bone, it might haue beene hurt in his perpetuall motion.

Rami Iliaci

Afterward, as the Hollow veine, ſo this great Artery is diuided into two trunkes, called *Rami Iliaci*, each of which parteth into an exteriour or outward, and an interiour or inward branch; [Tab.8 at p q] the outward is the larger, & runneth into the thigh. From theſe before they come vnto the thigh proceede ſix branches.

Sacra.

The firſt is called *ſacra*, ariſing vnder the bifurcation or forking, [Tab 8 oo] and paſſeth to the *Os ſacrum* or Holy bone and his Marrowe, as the Veines did called before *Sacra*. Theſe are but ſmall Arteries.

Muſcula.

The ſecond is called *Muſcula*, [Tab:8 ff] a branch of the vtter bough running vnto the neighbouring Muſcles.

Hypogaſtrica.

The third is called *Hypogaſtrica*, [Tab, 8 uu] braunches of the inner bough paſsing vnto the bladder, the yard, the wombe and the Muſcles which couer the ſhare bone.

Arteriæ vmbilicales. Epigaſtrica.

The fourth are called *Arteria vmbilicalis*, of which we haue ſpoke abundantly before.

The fifte is called *Epigaſtrica* [Tab.8 char.1] a branch of the inner bough, which climbeth vp vnto the right Muſcles of the *Abdomen*, and is ioyned with the *Mammaria*, as is ſaide of the Veines.

Pudenda.

The ſixt and laſt is called *pudenda*, [Tab.8 char.15.] a braunch of the vtter bough, which is conſumed in the skin of the virile member. That which remaineth of the great Arterie,

Crurales arteriæ

paſſeth into the Thigh, and is called *Cruralis* of which wee ſhall entreate afterward: now we will returne vnto the Entra's or Bowels, from which we haue a little digreſſed, to ſhew you the diuarications of theſe veſſels in the Lower belly, but that very breefely, becauſe we reſerue their more exact deſcription to their proper place in the Booke of the Veynes and Arteries.

CHAP. IX. *Of the Stomacke.*

The ſtomacks names.

THE Ventricle as it were a little Venter, is called in Greeke κοιλία, that is, a cauity or hollowneſſe, of a word that ſignifieth Hollow or *concavous*, and γαστὴρ, which is indeede the proper Greeke word for it. It is the common receptacle of meate and drinke, the Kitchin of the body. It is but one in men and other creatures that haue both iawes ſet with Teeth, but in thoſe that chew the cud, which haue but one iaw of teeth, it is four-fold; in Birds it is threefold. It was neceſſarily to be placed where his extention might not be hindred, yet as neere the mouth as might be for the receyuing of the meat to be coqued for the whol body. Wherfore, for that there was no roome in the cheſt or neere the mouth, it beeing taken vp by the parts which ſerue for reſpiration, and encompaſſed beſide with a wall of bone, which would haue hindred his dilatation, it is ſeated in the lower, [Tab. 9. ff] immediatly vnder

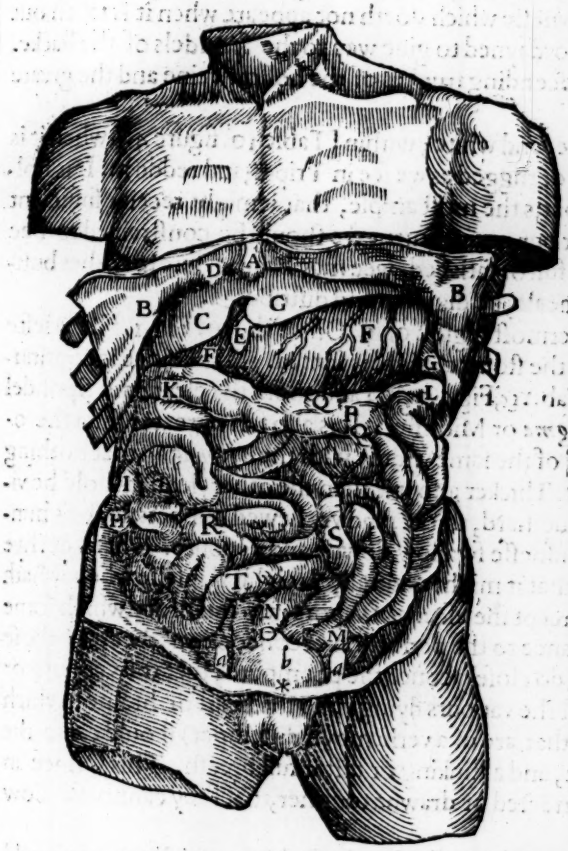
The ſeituatiõ.

the

the *Diaphragma*, betweene the Liuer and the Spleene, [Table 9 cc. ſheweth the Liuer, G. the Spleene, and FF the ſtomacke] in the middeſt of the body, ſaith *Galen 4. vſu partium 7.* eſpecially his vpper orifice, ouerthwart between the two *Hypochondria*, that it might be continuated with the guts, not ſo much for the diſtribution of the *Chylus*, as that the Excrements might be more eaſily ſetled lower, leaſt with their noyſome vapors they ſhould moleſt the heart and the Brain. It lyeth for the moſt part of it, in the left *Hypochondrium*, as appeareth in the 9 Table, becauſe heere it had moſt roome, and againe for the more commodious implantation of the vpper mouth, by which it receiueth the meate. Moreouer, to giue way vnto the [Tab: 9, cc] Liuer which takes vp the right ſide; and laſtly, with the Spleene to helpe to ballance the body againſt the Liuer. Before, it lyeth bare, eſpecially when it ſtrutteth, not vnproperly then called ἀπόζομος γαστὴρ *venter fermentatus*, for when it is empty, it is more hid vnder the Liuer) that it may eaſily be felt with the hand; wherfore

Tab. 9. ſheweth the Bowels of the Lower belly, euerie one in their owne place. The ends of the lower Ribs, together with the Midriffe and the Peritonæum adhering thereto are turned back, that the Liuer, the Spleene, and the Stomacke might be better ſeene.

TABVLA.IX



CC. The *Gibbous* or bunching part of the Liuer.

FF. The ſtomacke filled full of meate.

G. A part of the Spleene.

H. The blinde gut of the late writers: for the ancients tooke the top of the Colon for it.

K. to L. the ſame Collicke Gut lyeth vnder the whole bottome of the ſtomacke, which is the reaſon that thoſe which are troubled with the Collick caſt ſo much.

L. to M. The paſſage of the Colon, from the ſpleene vnto the ſhare bone by the left kidney a-way, which maketh the payne of the Stone and the Collicke on the left ſide, very harde to diſtinguiſh.

P. The ſunken or fallen ſide of the Colon at P. and his Chambers and puffes at Q.

it is quickly affected with cold, and therefore care muſt be taken of it. On the right ſide, the vpper and forepart of it lyeth vnder the hollowneſſe [Table 9. F vnder C] of the Liuer, and by it is embraced, whereby his heate is cheriſhed. On the left ſide his greateſt part reacheth to the *Diaphragma*, wherupon when it is too much ſtuffed, by hindering the motion of the *Diaphragma*, it cauſeth the diſeaſe calleth *Dyſpnœa*: likewiſe the Spleene, [Tab. 9 c] lieth vnder his left ſide againſt the backe and lower part thereof. Behind it are, the backbone as a ſtrong and thicke defence, and the Muſcles of the Loynes as a ſoft bed with fat growing thereto for his better repoſe, which alſo doe adde warmth vnto it. Below, it confineth vpon the guts, and the *Omentum* or Kall, and vnder his bottome lyeth the Colon [Tab. 9. xx] with the *Omentum* betweene them, whence commeth their mutuall conſent and ſympathy not onely in the Collicke paine, but alſo after the taking of a Medicine there followeth a kinde of loathing and vomiting, the excrements going this way to the *Rectum* or ſtreight gut.

His

His magnitude

His magnitude is diuers, *Hippocrates* counts it fiue palmes bigge. Taken out and blown it is much greater then it can be whilst it is in the body; notwithstanding, whether it containe more or lesse, yet it so closely embraceth that it receyueth for the better concocting and boyling of it, that it leaueth no emptinesse in his whole cauity.

The connexiō

But least being filled it should fall downe with the waight, his left orifice which is continuated with the [Tab.10.Fig:1,2 °]*œsophagus* or Gullet is tyed to the *Diaphragma*, the right is ioyned[Tab.10.Fig:1,2ⁿ with ᵖ] to the *Duodenum*.On his backe and vpper part, he lyeth vpon the backe bone, and cleaueth to the fifte spondell of the Loynes; below to the *Omentum*, other where it is loose and free, that it might more freely be distended.Finally, vnder his bottome, and especially vnder his lower mouth called *Pylorus* [Tab.10 Fig:2 ᴷ ᵞ] and vnder the beginning of the *duodenum* is the *Pancreas* placed[Table 10. figure 2.ˢ] to boulster them vp.

The Figure.

His figure[table 10.] is round for the more capacity,and that it might be lesse subiect to be offended. Long it is becausе of his two *orificies*,which make it very like vnto a Bag-pipe. On the left side, and in the bottome [Table 10. figure 2.ᴹ] it is larger and rounder, but toward the right hand it is by little and little attenuated or lessened, that it might giue place to the Liuer, and that the meate might by degrees fall from that side toward the bottome, which is the chiefe place of concoction. Foreward it is [Table 10. figure 1.ᴸᴸ] equally bunched; backeward [Table 10. figure 2.ᴹᴺᴼ] whilst it is yét in the body it hath two protuberations or bunches,the left is the greater,the right is the lesse and flatter, betwixt which is a hollowneſſe which doeth not appeare when it is taken out and blowne; which hollowneſſe was ordayned to giue way to the spondels of the backe, [Table 10. figure 2,°] and to the descending trunkes of the hollow veine and the greate Arterie.

His Cauitie.

On the outside it is smooth, plaine, and white; within [Table 10. figure 4.] when it is knit or gathered together,it is rugous or rugged as we see in Tripes;and reddish. It is hollow,and his hollowneſſe of all other parts the most ample, that it might receiue sufficient quantity of meate and drinke, least for our nourishment we should be constrained to bee alwayes eating; now, when it is once full or satisfied, wee may haue leysure for other busineſſe, whilst all the meate taken at a meale, be digested and distributed.

His Orificies.

There are two Orificies in the vppermost region of it. On [Tab. 10. Fig 1.ᴸ] the lefte side one which appeareth best when the stomacke is best stuffed. This orifice is continuated with the *œsophagus* or Gullet, [Tab.10,Fig.1,2,ᴬᴮᶜ] and about the eleauenth Spondel of the breast, is knit vnto the *Diaphragma* or Midriffe .

The vpper & left Orifice.

It is also farre greater then the other, [Tab.10. Fig: 4ˡ in respect of ᵐ] of the same widthe with the *œsophagus*, that nothing which we can swallow might stay at it. Thicker also it is then the other, least it should be violated when it is constrained to receyue hard, thicke, and vnchewed gobbets,such as hunger bitten folke do with great rauenousneſſe swallow downe and deuoure. It hath fleshye and circular Fibres [Tab.10.Fig.4ˡ] that it might naturally streighten it selfe when it hath receiued the meate and drink, to intercept the ascent of vapors into the Brain,which some also would haue to giue great furtherance to the perfection of concoction , becausе those that would sodainly boyle any thing, do closely couer the pot mouth, that the vapours or fumes might be kept in. Againe, least the vapours flying vp to the heart or braine (which happeneth to great eaters, and those that are of a verie moyst distemper) should cause the Giddineſſe, the Meigrame, suffusion, and a stinking or distastfull breath. This Orifice in some vpon extreame greefe is so contracted or drawne togither,that they cannot swallow any whole meate.

A pretty note why in great griefe meat wil not down.

The seat of appetite.

Finally, these Fibres serue to this good purpose, that those things which we eat,should not returne into the *œsophagus* or mouth when a man stoopeth low forward, or lyeth much backward.

This Orifice becausе of the aboundance of sinnewes [Tab.10 Fig. 1, 2. ᵀᵛᵉ Fig:2 ˣᵞ] that it receyueth is of most exquisite sense, that it might feele it owne want; which sense of want stirreth vp the appetite, that the creature might addresse himselfe to prouide for more meate and drinke to satisfie it. The Auncients call this Orifice καρδία, that is, the heart,becausе when it is affected,by reason of his exquisite sense,the like symptoms or accidents follow, which follow them whose very hearts are affected, whence the pain of this mouth of the stomacke is called *Cardialgia*, we call it heart-burning,when indeed it is only a diseasе of the mouth of the stomacke. Sometimes the like soundings do follow as when the heart is affected; and to say truth, the heart is alwayes with it drawn into consent,not so

καρδιαλγία or the heart-burning.

ſo much becauſe of the neere neighbour hood that is betweene them, as becauſe their ſinewes proceede from the ſame branch. Some call it the mouth of the ſtomack, commonly the vpper orifice; ſometimes it is called the ſtomack, becauſe of his largeneſſe; and becauſe it commeth nearer to the back-bone then to the breſt-blade, therefore wee applie in his diſeaſes, lo call medicines both behinde and before; before is more vſuall, but when the whole ſtomacke laboureth, then we apply onely before.

The neather and the right orifice [Tab. 10. fig. 1, 2 [n]] of the ſtomacke, is alſo bent a litle vpward, being the bredth as it were of foure fingers diſtant from the bottome, leaſt the weight of the meate ſhould open it. This within, beſide tranſuerſe Fibres, is compaſſed with a thicke and compacted circle, after the faſhion of a round Muſcle, or like the Sphincter or Muſcle of the ſiedge, which ſometime becommeth *ſchirrhus* or hard; and by which after a naturall inſtinct, it may be ſhut and opened, ſtreightned or widened. This remayneth faſt locked till the meate bee perfectly chaunged and boyled into a moyſt and liquid Creame, wherefore alſo it is narrower [Tab. x. Fig. 4. compare [l] with [m]] then the left orifice, yet it may be opened as wide, as do teſtifie the ſtones of fruite being eaten, Bullets of Lead ſwallowed, and other things by chaunce gotten downe, which without annoyance are againe rendred at the ſiedge. This afterward beeing by degrees relaxed and opened, doth by his ſtrength, not being prouoked by weight, driue downe the Chylus into the *duodenum* [Tab. x. Fig: 1, 2. [p]] and ſo to the reſt of the guttes, to be ſucked by the Meſeraicke Veines; wherefore it is called πυλωρὸς or the Porter, commonly the neather orifice. In a word, wher on the left ſide the ſtomack is thick in his top, there his vpper mouth beginneth from the *œſophagus* or Gullet; where on the right ſide it is thicke and eleuated, there is the end of the ſtomacke, and the beginning of the *Duodenum*.

The neather and right orifice called Pylorus.

The voluntary work of the Pylorus.

But becauſe when it is filled with meate and drinke, it might bee commodiouſly diſtended, and the vyands being diſtributed, againe conſtringed and ſtreightned, and in great Meales when it is thruſt full not be violated. For theſe reaſons I ſay, the ſubſtance of it is Membranous and Neruous, which when the ſtomacke is corrugated or crumpled vp, is thicke; when it is dilated, it is thin. And verily in thoſe that are much giuen to their panches, it is ſo enlarged and rarified that it can no more be corrugated, which oftentimes is a cauſe of long weakneſſe of the ſtomacke, after ſuch gourmandizing fyts; for in whomeſoeuer the body of the ſtomacke is thin, ſuch men do worſe concoct their meat, then they that haue it fleſhy and thicke.

The ſubſtance of the ſtomack

The Membranes of the ſtomacke.

It hath three Membranes or coates [Tab. x Fig. 3.] one common, and two proper. The fyrſt which is the vtmoſt and the common coate [Tab. x. Fig. 3. [hhh]] from the *Peritonæum*; yſſued thence where it compaſſeth the *Diaphragma* at the vpper mouth: this addeth ſtrength to the proper coats. It hath right Fibres, and is the thickeſt of all the coats which come from the *Peritonæum*, becauſe from it muſt ariſe the vpper Membrane of the *Omentum*.

The common Membrane.

The ſecond coate is altogether fleſhy [Tab. x Fig. 3 [i]] conſiſting of fleſhy Fibres, which being contracted, whatſoeuer is offenſiue to the ſtomacke, is as it were wittingly vomited vp; thoſe Fibres alſo encreaſing the heate, do make much for the helping of concoction; becauſe for that office a great heate is required. This is immediately knit vnto that which followeth: it hath alſo tranſuerſe Fibres [Tab. x Fig: 3 [i]] vnder which a few fleſhy oblique or ſide Fibres do lye. Some of which run from the vpper mouth, where they haue theyr beginning euen to the *pylorus*, but more of them do deſcend to the bottome of the ſtomacke toward the *pylorus*. Vnder theſe about the left mouth, do ariſe circular fleſhy Fibres which do ſhut the orifice: but when the tranſuerſe and oblique do moderately drawe the ſtomacke together, it embraceth the meate; if violently or ſtrongly, they driue the meate now digeſted by degrees toward the *pylorus*, becauſe it looketh vpward, and the Chylus is heauie.

The 2. Coate

The third coate is inmoſt and Neruous [Tab. x. Fig: 3 [k]] into which the veſſelles themſelues are ended: this is continuated to the coate of the *œſophagus*, and of all the Particles vvhich are in the mouth; becauſe the mouth ſhold admit of nothing that might be vnpleaſant or diſtaſtfull to the ſtomacke; and becauſe the preparation to the firſt concoction is made in the mouth. Hence it commeth, that vvhen any chollericke humor or vapour is raiſed vp, the tongue is defiled vvith bitterneſſe and yellovvneſſe, and oftentimes the exulcerations of the mouth and the tongue are communicated to the *œſophagus*, and the ſtomacke, and theyrs againe to them: by reaſon of vvhich conſent, vve cannot euacuate the head

The 3. coate.

The fibres of the third coat

head by the Palate, but we muſt alſo euacuate or empty the ſtomacke.

The vſe of the Fibres.

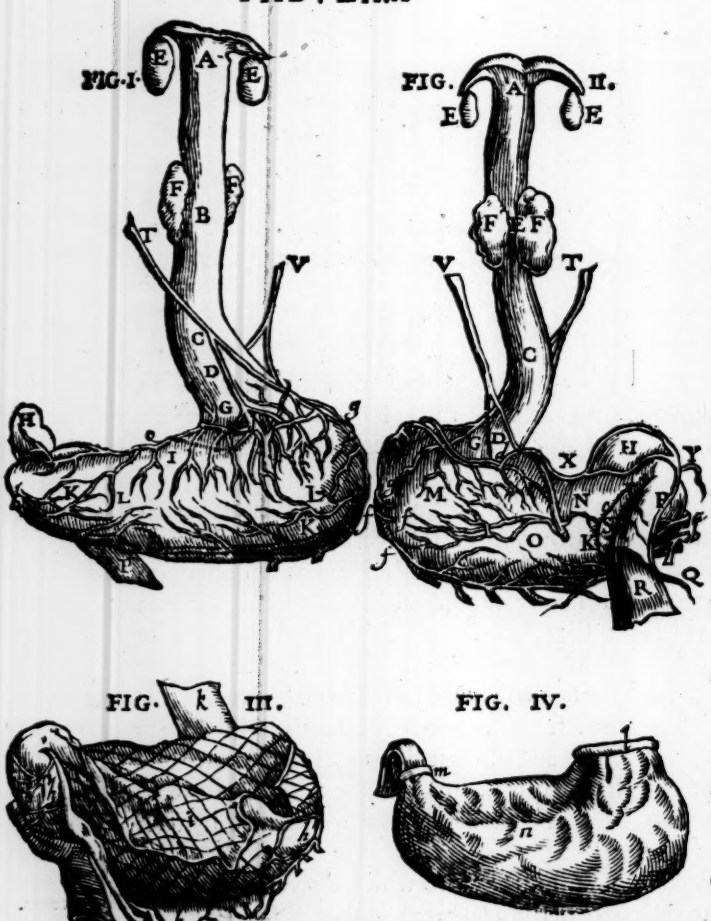
His third coat is wouen with three kinds of Fibres, that ſo the ſtomacke might bee the better extended. The right Fibres are very many and conſpicuous aboue the reſt, by which as it were by hands, they ſay it ſnatcheth his meate; by the oblique which are outwarde, it reteyneth it; and by the tranſuerſe it expelleth it after it is labored and concocted. Al theſe are ſo thightly wouen one within another, that they wil not appeare vnleſſe they be diſtracted and rent or ſliuen aſunder. This coate is alſo rugous and vnequall. In thoſe beaſts that chew the cud, harſh beſide and rough, and diſtinguiſhed into certaine proportionable inequalities, not vnlike to the hony-combe.

It hath theſe foulds and roughneſſe from a fleſhy cruſt which ariſeth out of the excrements of the third concoction of the ſtomacke, and ſerueth to defend it from anie harde thing that ſhould be receyued into it, leaſt if it ſelfe were made callous, the mouths of the Veynes ſhould be ſtopped, that neyther the Chylus could be ſucked out of the ſtomacke, nor the ſtomacke be able to draw blood for his nouriſhment. It maketh alſo ſomewhat for the moderate retention of the meate; for by his corrugation and harſhnes, it doth ſo much

Table x. ſheweth the ſtomacke with the Gullet.

The firſt Figure the foreſide of them both, with the veſſels inſerted into them. The ſecond figure their backe ſides. The thirde Figure ſheweth the Coats and Fibres of the ſtomacke. The fourth Figure ſheweth the ſtomacke with the inſide turned outward.

TABVLA X



A 1,2. The Orifice of the Gullet cut from the throate.

B 1. The ſtraight and direct courſe of the gullet from A to B.

C 1,2. How the Gullet aboue the firſt rack bone of the Cheſt from B to C inclineth vnto the right hand in the firſt Figure, and to the left in the ſecond.

D 1,2. His inclination to the left hande from C to D in the firſt Figure: but in the ſeconde to the right hand

EE 1,2. The two Glandules called *Tonſilæ*, or the Almonds ſet cloſe to the gullet in the very end of the throat

F 1,2. Another glandulous body in the midſt of the gullet about the 5. rackbone, but it lyeth vnder it. In Calues we cal this the ſweet bred.

G 1,2. The connexion of the gullet with the ſtomack where the vpper orifice of the ſtomack is faſhioned.

H 1,2. The 2. orifice of the ſtomack, cald *Pylorus*.

I,K 1,2. The vpper part of the ſtomacke, at I the lower K.

LL 1. The foreſide of the ſtomacke.

MNO 2. The backſide of the ſtomacke and M ſheweth the prominence of the left ſide, N of the Right, but O ſheweth the doke or impreſſion, where it reſteth vpon the racke-bones.

P 1,2 The gut cald *Duodenum*.

QR 2. The paſſage of the bladder of Gall into the *Duodenum* at R.

S 2. A Glandulous body growing vnder the *duodenum*, bearing vp his veſſels.

TV 1,2. The right and the left Nerues of the ſixt paire, encompaſsing about the gullet and the vppermoſt or left orifice of the ſtomacke.

XY 2. A Nerue on the left ſide creeping vp to the top of the ſtomacke, and ſo running out to the Liuer.

a 2. The firſt Veine of the ſtomacke, cald *gaſtrica dextra*, or the right ſtomack vein comming from the trunke of the gate veine, and his Artery commeth from the trunk of the *Cœliacall* Artery, both of them reach vnto the *pylorus*.

b 1,2. The ſecond veine called *Gaſtroepiploïs dextra*, togither with the Artery accompanying it, and a Nerue, all tending to the right ſide of the bottome of the ſtomacke.

c 2. The third Veine of the ſtomacke called *Gaſtrica minor*, it wanteth an Artery for his companion from the ſplenick branch.

ddd 1,2 The fourth veine cald *Coronaria ſtomachica*, with his artery, compaſsing the left mouth of the ſtomack. This is a branch of *Gaſtrica maior*. e 1 Certain branches from the branch marked with a diſcending from the top of the ſtomach, and running with their Artery toward the *Pylorus*. f 1,2. The firſt veine called *Gaſtrica maior*, deriued from the Splenick branch, which together with his arteris and nerues creepeth to the left ſide of the bottome of the ſtomacke. g 1,2. Veſſels deriued from thoſe which paſſe to the Spleene. *bbb* 3. The firſt and outmoſt coate of the ſtomacke from the *Peritonæum* i 3. The ſecond coate. k 3. The firſt and inmoſt parte in this place from the two other. l 4. A round ſwelling of the left orifice bending inward, where the Gullet is continued with the ſtomacke. m 4. A round ſwelling of the right orifice or the circle of the *pylorus*. n 4. The inward ſuperficies or ſurface of the ſtomack.

that

that nothing raw or vndigeſted can fall out of it. This Cruſt is ſpongie, hauing ſmal holes as it were ſhort Fibres from the inward to the outwarde ſuperficies, that by theſe hollowe paſſages of his the thinner part of the Chylus might pierce and bee ſucked away by the Veines. This cruſt may be ſeparated from the Membrane or coate in bruit Beaſts, yea alſo in the ſtomacke of a man if it be perboyled. The cruſt of the ſtomacke.

The ſtomacke is not thicker or fleſhier in the bottome then in other parts, as it is at eyther of the mouthes. Some ſay that in corpulent men there cleaueth a Fat to the bottom, on the left ſide; which when it is plentifull, they ſay a man may endure long before he ſhal haue any appetite to his meate.

The veſſelles the ſtomacke hath are theſe. Sixe veines branched from the gate-veine, ſome of which come from his trunk, others from the meſentericall or ſpleenicall boughes. From the trunke commeth the right *Gaſtricke* [table 10. figure 2.[a]] which goeth to the right *orifice*; and the right *Gaſtra epiploïs* [table 10. figure 1.2.[b]] from the meſentericall bowe attaineth to the middle of his bottome. From the ſpleene bow the leſſer *Gaſtricke* [table 10. figure 2.[c]] which goeth to his back-part; the greater [table 10. figure 1. 2.[f]] *Gaſtrick*, from which comes the crowne veine of the ſtomacke, which in [table 10. figure 1,2.[d d d]] manner of a crowne incompaſſeth his left *orifice* or vpper mouth: the left *Gaſtra epipleis* diſſeminated into the other middle part of his bottome. And finally, that we call *vas breue* or the ſhort veſſell [table 10, figure 1,2.[g]] of all which we haue intreated more particularly in the chapter of the gate or port veine. The veſſels of the ſtomacke. Veines.

The office of theſe veines is to bring in bloud for nouriſhment, for it is nouriſhed continually, as it was in the mothers wombe, that is, with bloud not with Chylus, by which we grant it is delighted and refreſhed but cannot graunt that it is nouriſhed with it. Some few of theſe alſo while the Chylus is boyling in the ſtomack, doe inſenſibly ſucke out ſome ſmall part of it (for they are but few in reſpect of thoſe which determine into the Guts, becauſe in the ſtomacke is celebrated concoction, but the guts containe the Chylus already concocted, which it was fit ſhould be withall expedition diſtributed) and do change it into bloud by a naturall inſtinct, before it come to the Liuer, as *Galen* teacheth. Haply that the membranes of the ſtomacke may with it be nouriſhed. Or if thou hadſt rather, ſay that theſe veines doe carry the Chylus, they haue ſucked after the manner of the *meſeraickes*, to the roots of the port veine, that are diſſeminated through the Liuer, that there it may be turned into bloud. From theſe veines come thoſe ſodaine refections of the ſpirits by ſweete and ſtrong Wine, Broths, and Cordials; which refections would not ſo ſoone follow, vnleſſe the Liuer did ſuck nouriſhment by them out of the ſtomacke. That which is called the *vas breue* or ſhort veine, which from the veines of the ſpleene is by an vnited paſſage of many braunches carried into his bottome, doeth there belch out a ſowre and ſharpe bloud, ſometimes to the vpper mouth to ſtirre vp appetite, (which yet properly is prouoked by ſence of want) and to ſtrengthen it by his adſtringent vertue. Their office. *Gal. 4. vſu part.* 12. A good note of the ſudden refections which come from wine & cordiall potions.

It hath Arteries from the Cœliacall branch of the *Aorta* [table 10. figure 1,2.[a b d f]] or great Artery, which doe accompany euery one of the veines, excepting the leſſe *Gaſtricke* [table 10. figure 2.[c]] to affoord ſtrength of life to preſerue it from putrifaction, by ventilation to cheriſh, refreſh and increaſe his naturall heate with their heat and vitall ſpirit, that ſo concoction might be made more perfect: but of theſe branches more hath beene ſayed in the chapter of the Cœliacall Arteries. The Arteries of the ſtomack.

It hath very conſpicuous and notable nerues from the ſixt paire, which at his *orificies* or mouths are double [tab. 10. figure 1,2.[r r]] diſſeminated from thoſe branches which make the *recurrent* nerues, and yeilde certaine Tendrilles to the lungs and the *pericardium*, or purſe of the heart; which Tendrils becauſe of their ſoftneſſe and the length of their way, are couered ouer with ſtrong membranes and doe run croſſe one another, that for greater ſecurity they might paſſe obliquely or ſide-long; and piercing through the *diaphragma* or midriffe are on both ſides doubly diuided: ſo that the left compaſſeth the [table 10. fig. 1,2.[r v x r]] right and backe part of the mouth of the ſtomacke, and the right the lefte and forepart; which *orifice* they doe ſo inuolue, that it ſeemeth to bee made altogether of ſinewes; from the aboundance of which it hath moſt exquiſite ſence to ſtirre vp and awake the ſence of the want of nouriſhment, which ſence ariſeth from ſuction; for there is the ſeat of the appetite; & to this onely part hath nature giuen the ſence of want or of Animal hunger; for euen we feele that part eſpecially to be contracted when wee are extreamely hungry. For if we ſhould not feele a kinde of moleſtation vpon the vtter and abſolute exſucti- The nerues. The cauſe of hunger. The ſeat of appetite.

on of our nouriſhment till there be a ſupply made, wee ſhould by degrees be extinguiſhed & affamiſhed before wee were aware; for our ſubſtance is in perpetual waſting and decay; the inbred heate continually feeding vppon the Radicall moyſture. But now it is otherwiſe, becauſe the naturall hunger that is ſetled in euery particular part, hath with it adioyned a ſence of diſcontent, which is onely appeaſed by aſsimulation of freſh nouriſhment.

The appetite of euery particular part.

Theſe branches of Nerues going downeward, make his membranes which were onely membranous before, to become neruous, being diſſeminated euen to his bottome. Theſe doe alſo impart the nouriſhing force or faculty to the fleſhy Fibres of the ſtomacke. From the left nerue there runneth a branch along the vppermoſt ſeate of the ſtomacke to the *pylorus*, which when it hath foulded with a few ſmall ſurcles, it goeth thence to the hollow of the Liuer. To the bottome of the ſtomacke doe other two nerues attaine from the ſixt paire alſo, to wit, from the propagation led by the roots of the ribbes. Sometime to the left ſide there are offered nerues ariſing from the ſinewes which runne vnto the ſpleene.

Why the brain being ſtroken the patient caſts.

Wherefore ſeeing the ſtomack hath obtayned ſo many ſinewes, it is no wonder if when the braine bee ſtroken or affected, the ſtomacke alſo bee diſturbed, and vomitings cauſed, eſpecially in the *Hemicrania* or Meigrame. And on the other ſide when the ſtomacke is affected, then the Animall facultie languiſheth, and melancholly ſymptoms do happen: ſo that one of them ſuffering the other hath euer a compaſsion, not as moſt men haue of others miſeries, but indeede a reall fellow feeling.

Veſſels from the bladder of gal to the bottom of the ſtomacke.

Furthermore, there attaineth to this bottome of the ſtomacke, ſometimes a veſſell or entrance of many veſſelles from the bladder of Gall, carrying choller thither, and cauſing perpetuall caſting. A Family of ſuch men are ſayd to be at *Spire* in *Germany*, all of which family euery third day, vomit vp a good quantity of Choller, & they be called πικροχόλοι ἄνω, that is, caſters of choller vpward.

The vſe of the ſtomacke.

The vſe of the ſtomacke is to receiue meate chewed with the teeth, and drinke altered in the mouth through the gullet, and the ſame to retaine till it haue contracted it ſelfe, and embraced them by cloſing both his *orificies*; and then his naturall inbredde facultie and proper heate, boyleth and conuerteth the better part of the Aliments into white creame, which we call Chylus; That is, a ſubſtance diſpoſed to be conuerted into bloud. For the proper action of the ſtomacke, ſayth *Galen* 5. *vſu partium* 4. is concoction, it being the organ or inſtrument of the firſt concoction, or the ſhop and forge of Chilification.

Galen.

What parts aſſiſt the ſtomacks concoction.

Moreouer, becauſe the ſubſtance of the ſtomacke is membranous, and therefore not ſo hot, his ingenit heate is encreaſed, yea doubled by the adiacent parts; as the Liuer, the Midriffe, the Spleene, the Kell, the Collicke gut, the trunkes of the hollow Veine and the great Arterie, the Sweet-bread; but eſpecially the *Cœliacall* Artery, compaſsing it about almoſt on euery ſide yeeldeth moſt immediate aſsiſtance. For the narrower ſide of the ſtomacke toward the right hand, is in a manner hid vnder the Liuer; the left lieth cloſe to the Spleene and ſo of the reſt, which are all as ſo many coales ſet together vnder a veſſell to make it boyle. After the Aliment is concocted, the *pylorus* or lower mouth of the ſtomacke is looſened, and the Chylus thruſt downe into the *duodenum*, from thence to ſupply Aliment to the whole body: and ſo much of the ſtomacke.

Of the Oeſophagus or Gullet. CHAP. X.

The reaſon why we diſcourſe of the gullet in this place.

NOw although the *Oeſophagus* or gullet is (for the moſt part of it) ſituated in the Cheſt or ſecond Region; yet becauſe it is continued with the ſtomack in ſubſtance, membranes and fibres little differing from it, being nothing elſe, but as it were a production of the ſame; we will intreate of it in this place, and not in the ſecond Region, the rather becauſe the Table wherein the ſtomacke is deciphered, contayneth alſo the delineation of this *œſophagus*. It is called therefore in Greeke by *Hippocrates*, *Galen*, and *Ariſtotle*, οἰσοφάγος from οἶω καὶ φάγημα, which ſignifieth to carry meat, as alſo στόμαχος the ſtomack, from words that ſignifie length and narrowneſſe. For indeed this name of the ſtomacke is proper to this part, albeit other authours, eſpecially our Engliſh toung hath turned it to ſignifie the ventricle or place where the meate is contayned; the true ſtomacke we call the gullet: the Arabians call it *meri* and *veſcet*, the Latins *Gula*. It is the common way of meat and drinke from the mouth into the ventricle or ſtomacke as we call it, which all creatures

The names. Hip. lib de reſect. corpor. Gal 6. vſu part. 5. Ariſtot. 1. hiſt. Animal 16.

haue

haue that draw breath. This part taketh his beginning in the lowermoſt cauitie or hollowneſſe of the throate, at the rootes of [table 10. figure 1, 2. ^ the *orifice* of the gullet cut from the throat] the toung behind the larynx or wezon to whom it is tyed, and on either ſide toucheth the Tonſils or Almonds [tab. 10, fig. 1, ^ ^] and paſsing through the necke & the breaſt, betwixt the wezon and [as appeareth in the table belonging to the chap. of the Lungs, figure 1, 2. where ^ ſheweth the gullet, and ^ the arterie] the ſpondels of the necke and breaſt vppon which it leaneth; (for it might not paſſe through the middle cauitie of the breſt, leſt it ſhould trouble ſome Inſtrument of breathing, and beſide it ſtood in need of ſome ſetled ſupporter and that farre within, to leane vnto, that ſo it might be ſafe from externall iniuries) it goeth directly [Tab. x. Fig. 1, 2. from ^ to ^] to the fift Spondell of the breaſt, where it enclineth it ſelfe a little to the right ſide, that it may [Tab. x. Fig. 1, from ^ to °] giue way to the trunke of the great Artery deſcending, which comming out of the left Ventricle of the heart, goeth neceſſarily to the left ſide ward. When it hath atteyned to the ninth Spondell, it is lifted aloft by the helpe of certaine Membranes, and paſſeth aboue the great Artery, leaſt in the deſcending of groſſe and thicke meates, it ſhoulde lye heauy vpon it, and hinder the courſe of the arteriall blood and ſpirits. Then againe it enclineth to the left ſide [Tab. x. Fig. 1 from ° to ^] where the vppermoſt mouth [Tab. x. fig: 1, 2 °] of the ſtomacke is ſcituated, and going vnder the hollow Veine, paſſeth through the Neruous part of the *Diaphragma*, by a poſterne of his owne into the lower belly, and is implanted not into the right, leaſt it ſhould neceſſarily perforate the Liuer, but into the lefte orifice of the ſtomacke, together with two Nerues [Tab. x. Fig. 1, 2 ^ v.]

To what parte it is tied

In his originall or riſing, it is tyed to the throate by a coate that compaſſeth the mouth, but to the ſtomacke (where it groweth to the *Diaphragma*) by the continuation of his body: to the bodies of the Spondels, to the weazon and the parts adioyning, by the helpe of Membranes proceeding out of the Ligaments of the backe.

The figure of it.

His figure is round, [Tab. x fig. 1, 2] both that more matter might paſſe in leſſe roome, (for of all figures the round is moſt capacious) and that it might be ſafer from iniuries: very long it was of neceſsity to be becauſe the mouth is farre from the ſtomack; and it may well be calléd a reddiſh gut, for after that manner it is diſtended into a ſufficient capacity, that the meate ſhould not ſtay in it, or preſsing the weazon hinder reſpiration, and put a man in danger of choaking.

The ſubſtance.

The ſubſtance of it is in a meane betweene fleſh and ſinnewes, (wherefore it may bee both enflamed and ſubiect to convulſion alſo:) ſinnewy or membranous, that it might be extended into length and bredth when the meate is put in, and againe fall, that it take not too much roome when it is empty; fleſhy it is alſo, that being ſoft it might giue way vnto the meate as it paſſeth downe. But becauſe as a ſacke to be filled with Corne, vnleſſe it be held vp and open, doubleth into it ſelfe when the corne is powred in; ſo the Gullet being ſoft, ſhould double into it ſelfe, when the meate is powred into it; it is ſupported and held open by his connexion to the bodyes of the Spondels. Hence it is, that lying vppon the long ridge bone when it is affected, we apply Cataplaſmes to the ridge of the back. It hath three Coats, one common, and two proper. The firſt bred out of the Ligaments of the Spondels, which is the Caſe or couer of the two proper Coates. The ſecond, which is called the external, is fleſhy and very thicke, as if it were a perforated Muſcle, and hath his originall from the ſecond Cartilage of the Weazon, as it lookes toward the necke, & hath onely tranſuerſe Fibres, that with theſe the Aliment that is drawne by the fibres of the inner coate might be more readily thruſt into the ſtomacke; they are alſo a great help when the ſtomack violently laboreth to vomit vp any thing that oppreſſeth it: which two things are after a diuerſe manner performed. For if the fibres do beginne to be contracted aboue, they ſerue to ſwallow with: if from the Orifice of the ſtomacke, for vomiting. The thirde coate is internall, and of a diſsimilar ſubſtance; vnder or within whoſe inward ſuperficies, a certaine ſmooth and ſlippery veyle or wimple is ſubſtrated, hauing right and ſlender fibres to draw the noriſhment after the mouth hath receyued it. The remainder of his ſubſtance from which that veile or filmy couering like the Cuticle from the skin may be ſeparated, is Neruous and more Membranous then the externall, more harde alſo and ſenſible, that the pleaſure and good reliſh of meates and drinkes may be better apprehended by contaction or touching. This Coate ariſeth from that which inueſteth the palate, the mouth, lips, and throate; and runneth as farre as the left Orifice of the ſtomacke. It hath very few oblong fibres, leaſt they ſhould keepe the meate too long in the gullet, which would haue

His conexion

The 3. coates of the gullet.

beene a great annoyance to the wezon. That theſe may be the better obſerued, they had neede be parboyled, to take away their aboundant moyſture.

The act of ſwallowing.

The act of deglutition or of ſwallowing, is a worke mixed of an Animal and Natural, & is helped by certaine muſcles called *æſophagæi*, belonging to the gullet; but they are accounted among the muſcles of the weazon, which proceeding from the ſides of the griſtle called *Thyroides*, doe wholly embrace the gullet; and being parted by a right line, are inſerted into his middle part, as we ſhall ſee more at large in the booke of muſcles.

The Glãdules or Tonſils called the Almonds.

For the facilitie of ſwallowing, the cauity of this gullet is alwayes moyſtned by the glandules that are ſet neare vnto it. In the throate by the glandules that are common to the gullet and to the wezon, which containe the ſpattle, and [table 10, figure 1, [zz]] are called *Tonſillæ* or the Almonds; again, by a glandulous body that on the backſide, [table 10. fig. 1, 2. [ff]] and toward the ſides groweth to his middle paſſage, commonly in a Calfe called the ſweet-bread; as well to moyſten his cauity and defend him from the hardneſſe of the ſpondels, as alſo to hold him ſteady from inclining to either ſide.

His veſſels. Veines. Arteries.

It hath veines, but very few, from the hollow veine and the Coronarie braunch of the [table 10, figure 1.2. [d d]] port or gate veine; Arteries from the great Arteries deſcending trunke, and from the coronarie branch of the *Cœliacall* Arterie [table 10. figure 1.2. [d d].]

Nerues.

His Nerues are very notable, comming from the ſixt paire [table 10. figure 1, 2. [xx]] which for ſecurity ſake are carried ſide-long; (the oblique way being much more ſafe then the right) for being ſoft and ſlender, and to be led a long way, they might eaſily bee ſtretched or broken by the waight of the ſtomacke, if they had been led right on: which nerues when they haue encompaſſed the gullet round, at length are faſtned in the ſtomacke, [tab. 10. fig. 2. [xx].]

The vſe of the gullet.

The vſe of this *æſophagus* or gullet is, that by it as it were by a tunnell, the meate and drinke, a little altered in the mouth, and turned ouer the rootes of the tongue by his muſcles to the beginning of this gullet, might by it be receiued, whither when it is ariued, the throat and parts of the gullet aboue the meate cloſing themſelues, and thoſe below being dilated, the meate and drinke are driuen downe into the ſtomacke.

It is worth the obſeruation, that with ſome men ſolid bittes finde freer paſſage then liquid drinks or broths, which are often returned into the noſe, and this hapneth vſually in thoſe who haue beene long afflicted with the Collicke.

A pretty obſeruatiõ with the reaſon of an vncouth accident.

The cauſe of this accident is to bee imputed to the reſolution of the muſcles of the choppes, for ſolid things with their waight offer a kinde of violence to the muſcles, and make their owne paſſage, but liquid things cannot doe ſo. Although I am not ignorant that there may alſo be another reaſon rendred hereof, to wit, a tumor or inflãmation of the glandules before mentioned; for ſolide meates doe preſſe them and ſo open the cauity, to make way for themſelues.

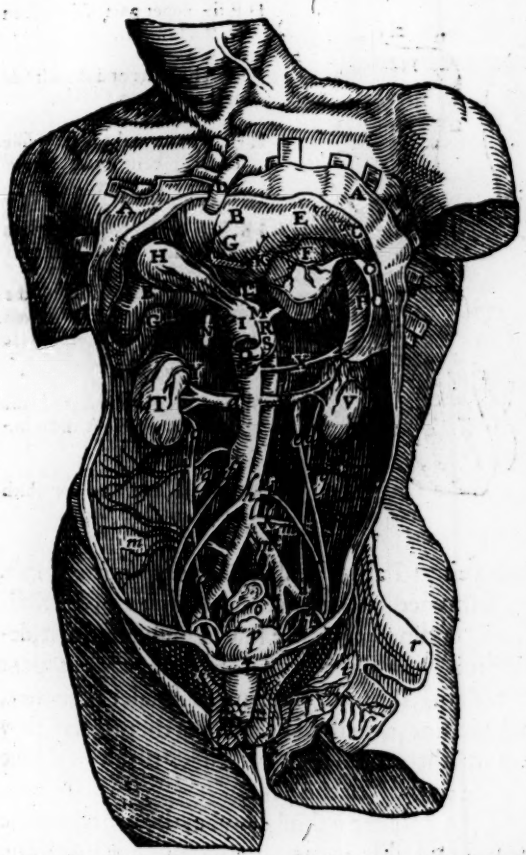
Of the Spleene or Milt. CHAP. XI.

THE Milt is called in Greeke σπλὴν, becauſe it draweth away the droſſe of the bloud, as they ſay Lupines among wheate doe ſucke away the bitterneſſe of the earth; in Latine it is called *Lien*. It is placed in the [table 11. [oo]] vppermoſt part of the inferior *venter* or lower belly, in the left *Hypochõdrium*, vnder the midriffe towards the backe: wherefore in hayle men it cannot be felt, but in thoſe that haue ſwollen ſpleenes, it may not onely be felt, but ſometimes ſeene to bunch out a good way in the *Abdomen*. The embowed part [table 11. [oo]] reſteth vpon the ſpondels and baſtard ribs which are a defence vnto it; the concaue or hollow part [table 11. [r]] turned to the right ſide, is oppoſite to the Liuer, as if it were a left Liuer. It is ſeated either higher or lower in diuerſe bodies, betwixt the ſtomacke and the ribs, for there onely was a roome empty for it. Commonly there is but one ſpleene, yet ſometimes two and three one on the top of another; neuer of an equall bigneſſe, but diſtinct in their coates and veſſels: it is wondrous rarely abſent, and very rarely doth it change places with the Liuer, that it ſhould be in the right ſide, and the Liuer in the left. It is knit to the Rimme or *Peritonæum* and the *omentum*, ſometimes more outwardly to the *diaphragma*, and to the externall membrane of the left Kidney with very ſlender membranes, ariſing from the *Peritonæum*, where it compaſſeth the *Diaphragma*, for it had not neede of ſo ſtrong bands as the Liuer, becauſe it is nothing ſo waighty, ſometimes inwardly, forward to the ſtomacke, backward

to the backe alwayes, by the interpoſition or mediation of veſſels, and of the vpper Membrane of the *Omentum* [Tab.xii fig: 2 CC] which cleaueth to the Line [Tab.xi. Tab. xii. fig:2 ᴺᴺ] of the Spleene.

It varieth much in his Magnitude, colour, and figure. For in a man it is thicke and great, but much leſſe then the Liuer, that it may not hinder the dilatation of the ſtomack. In ſome men it growes greater; for by reaſon of the looſe rarity of his ſubſtance, it eaſily encreaſeth by the affluence of humors; eſpecially it groweth in thoſe men in whom naturally there is more plenty of Melancholy iuice: and although this humor in reſpect of the Choller and Vrine be but little, yet becauſe it muſt be drawne a long way, and is ſtubborne

TABVLA XI.



O O. The fore-ſide and hollowe ſide of the Spleene, which alſo ſheweth how his poſition is in the body of Man.

P. A Line into which the Veſſelles of the Spleene are implanted.

and refractary by reaſon of his thickneſſe and vnwilling to follow, therefore the Spleene is ordained ſomewhat the bigger. It hath not alwayes the ſame colour. For in an Infant when it is nouriſhed with pure blood defecated by the mothers Spleen it is red like the Liuer; but in growne bodies where it is nouriſhed with a thicke iuice, it is more then ruſſet toward blacke; for ſuch is the naturall colour of the Melancholy humor. But in thoſe that are diſeaſed in their Spleenes, ſuch as is the humor that offends, ſuch is the colour of the Spleene, Liuid, Leaden, Aſhy or Leeke greene; ſometimes it is couered with a coate very like a Cartilage, in colour, thickneſſe, and hardneſſe; in Dogges, it is of a brighter red then the Liuer. The colour. A good note.

His Figure [Tab.xii.fig.2] he varieth according as the parts which lye neere him do require, yet is alwaies ſo long as the vncouered or naked left ſide of the ſtomacke will admit It is alſo broad, and ſomewhat ſquare like an Oxe tongue, or as *Hippocrates* hath it, like the ſoale of a mans foote. Aboue it is broader, and ends in a double obtuſe & blunt Angle or corner. Below narrower, and ends in one narrow corner or angle. Without and on the left ſide, and as it looketh to the *Diaphragma*, ſomewhat gibbous or embowed, ſo that it hath a little repreſentation of a globous or round figure. Sometimes from the ribs it hath [Tab.xii.fig:4 ᴸᴸ] certaine impreſsions or diſtinctions. Inward, and on the right ſide ſomewhat concauous [Tab.xii fig:2 betweene ᴺᴺ] or hollow, that it might giue way, or rather encloſe the ſtomacke, and ſo further his concoction. Through the middle length of this The Figure.

cauity, runneth a white line [Tab.xi.[p] and Tab.xii, figu: 2 [nn]] which hath ſome riſing inequalities in it, which receyueth the Veines and the Arteries [Tab.xii.fig:2 [n]] and the Kell [Tab.12 fig:2 [ss].]

The ſecond Figure ſheweth all the ſides of the Spleene taken out of the body. The firſt the fore-ſide with a part of the Kell and his veſſels. 2 The hollow ſide, 3 the gibbous ſide, the 4 ſheweth the impreſſions which ſometimes it receyueth from the Ribbes, the fift ſheweth the hollow ſide ſlit open.

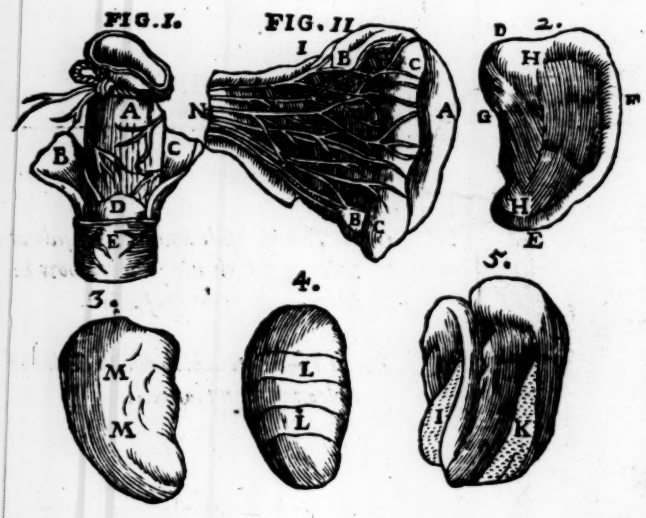
TABVLA XII.



The Milt or Splenicke branch of the Gate-veine [Tab.3 [p]] called *Ramus ſplenicus*, [Tab. 3 [r]] below the Liuer is ſent (a great bow it is ſuſtayned by the lower Membrane of the Kall, [Tab.xii.Fig.2 [ss]]) ouerthwart to the Spleen (ſending firſt ſome few branches from it, deſcribed in the hiſtory of the port-veine) and diuided in his cauity, [Tab.xii.Fig:2 [nn]] is ſpent in his ſubſtance [Tab.xii.Fig.2 [kk] Tab. 7. [aaaa]. Tab.4.Fig:2 [ll m]] into much ſmaler branches, not conſpicuous as in the Liuer, but ſo ſmal and fine, vnleſſe it be a few of them, that they rather ſeeme to be Fibres then veſſels: ouer and through which veſſelles, runnes a thicke and groſſe blood, making the proper ſubſtance or fleſh of the Milt.

The courſe of the Melancholy humour.

This Milt or ſplenicke branch carrieth to the Spleene a thicke iuyce, the more earthie part of the blood, that there it might be wrought into his nouriſhment. But becauſe ſome part of this iuyce is ſo groſſe that it cannot be attenuated by the Spleene, and therefore as vnprofitable muſt be ſegregated or ſeparated, there are ordained two kindes of Veſſelles to receyue it; one which belcheth it out vpward into the left ſide of the bottome of the ſtomacke, ſometimes vp higher toward the left orifice, where with his ſowreneſſe he ſtirreth vp the Appetite after the Chylus is gotten into the Veins of the Liuer: ſo wee imitate nature, when we make ſowre or ſharpe ſauces at ſupper, to prouoke and recall our appetite which by our dinner was extinct and loſt. Againe, this humour hauing a binding faculty, ſtrengthneth the ſtomacke, that his actions may be more firme.

How Melancholy prouoketh appetite.

This regurgitation or belching of melancholy, is made ſometimes by three, ſometimes by many Branches proceeding from the ſplenick branch; ſometimes by one, proceeding from the vppermoſt branch neere the Spleene, which *Galen* calleth *Vas breue*, that is, the ſhort Veſſell, deſcribed before in the 3. and 4. Tables. Hence comes ſometime caſtings of a blacke humor, which is after carried downe the guts with the Chylus, and ſo excluded. This Veſſell alſo is of great vſe in Quartane Agues; for by it ſuch patients are to good purpoſe by vomit purged, before and after the fit: for in theſe Agues, as alſo almoſt in all melancholy diſeaſes, not onely the Milt but the mouth of the ſtomacke is affected. There is alſo another veſſell by which this humour is carryed downeward, which beeing inſerted at the end of the right gut, maketh the inwarde Hæmorrhoida' [Tab.3.ss. Tab. 4. Fig: 2,*] Veines, for the outward come from the Hollowe veine; although this humour bee often

Vas breue.

Vomits how good in quartane Agues.

purged

purged by the Arteries, not onely into the guts, but more often into the emulgent veines, and ſo through the Kidneyes into the bladder. And ſo wee immitating Nature in melancholly diſeaſes vſe diureticks, or medicines prouoking vrine. Diuretick medicines in quartane agues & melancholly diſeaſes.

The ſpleene alſo receiueth many Arteries (more then the Liuer) and thoſe very [Table 4. figure 1.ᵘ] great, the Cœliacall [table 4. figure 1.ᵐ] which commeth out of the *Aorta* or great Arterie vnder the *Diaphragma*, after the ſame manner and with the ſame number of diuiſions that the veines haue, not onely that they may affoord him life, but alſo that by their perpetuall motion they might preſerue in good ſtate the body of the ſpleene, by ventilating, cheriſhing, and refreſhing his naturall heat, almoſt oppreſſed with a droſsie iuyce, which iuyce they change into a thicke bloud for the ſpleenes nouriſhment, and the droſſe is purged or auoyded away as wee haue ſayde. Beſide, theſe Arteries carry to the *Aorta* wheyey humors, together with a thin and cold bloud, which are receiued by the *Anaſtomoſis* or inoculation of the veſſelles; which humours by the emulgent Arteries are deriued into the Kidneyes; and from hence comes that quantity of vrine or whey which is in the great Artery. The arteries.

It hath Nerues inſerted into his coate very ſmal ones, from that branch of the ſixt paire which commeth from the rootes of the ribbes on the left ſide; but whether they paſſe farther into his ſubſtance we yet doubt. The nerues.

It hath but one coate, and that very thin, ſpringing from the membrane of the Kall, which we ſayd claue to the right line of the ſpleene, and was a production of the *Peritonæum*, which coate compaſſeth and defends his fleſh on euery ſide, becauſe it is very ſoft and looſe.

His ſubſtance [table 12. figure 5.ᵉᵉ] ſeemeth to be nothing elſe but a thicke blacke and congealed bloud ful of fibres, for it is a *Parenchyma* as *Eraſiſtratus* called it, or a fleſhy affuſion, very ſoft, thin, looſe, and ſpongious, that it might more eaſily draw thick iuyces from farre (for a ſpongie ſubſtance is fitter for that purpoſe then a faſt and firme) and giue them entertainment: wherefore alſo the veines diſſeminated through it, are ſofter and looſer then others, that the humour may more eaſily, though it be thicke, fall out of them. The fleſh or *Parenchyma*.

The vſe of the ſpleene, *Eraſiſtratus* thought to be none at all; inconſiderately accuſing Nature to haue framed it in vaine. The receiued opinion is, that it was ordayned to bee a receptacle of the craſſer and more fœculent part of the bloud, made and ſeparated in the Liuer, like as the bladder of gall is the receptacle of yellow choller; that the bloud being thus on either hand depured, might paſſe more cleare and neate to nouriſh the body, and eſpecially the principall parts. This thick and impure bloud yet mingled with much good and laudable, the ſpleene by the ſpleenicke braunch of the gate-veine, by an inbred faculty draweth vnto it ſelfe as familiar and of kin vnto his ſubſtance; which albeit the veines of the Liuer could not change, yet the ſpleene by reaſon of the perpetuall motion of his many & large Arteries worketh it into his owne nouriſhment: of which notwithſtanding there remayneth an vnprofitable part which it belcheth out into the ſtomacke, by the ſhort veſſell to ſtirre vp appetite by his aciditie and ſharpnes, and by his adſtriction to corroborate and confirme the actions of the ſtomacke. But againſt this common receiued opinion, *Bauhine* in this place annexeth a long diſcourſe, full of wit, but how conſonant to trueth, I will leaue to others to iudge. It ſhall be for the preſent ſufficient to make his conceite knowne vnto you. *Eraſiſtratus*. The receiued opinion of the vſe o the ſpleene.

If the ſpleen, ſayth he, had onely beene appoynted to ſtable an excrement, it ſhould not haue been ſeated in the vpper but in the lower part of the *abdomen*, as the other receptacles of excrements are: for ſo woulde it more commodiouſly haue receiued ſo heauy and earthy an excrement. *Bauhines* conceit of the vſe of the ſpleen. His argumeuts.

Againe, ſeeing of all the humours there is leaſt quantitie of this melancholy, Nature would not haue made the ſpleene bigger then the bladder of gall, if ſhee had not intended ſome other office for the ſpleene, beſide the receite of melancholly.

Moreouer, if this had beene her only end, ſhe would haue framed in the ſpleene a large cauitie where this humour might haue commodiouſly beene entertayned, as ſhe framed a cauitie for the choller in the bladder of gall.

Fourthly, we muſt know and vnderſtand that no part ordayned for the ſeparation of excrements, doth receiue and naturally auoyd them by the ſame paſſages, as we may perceiue by the Kidneyes and the bladder of gall. Fiftly, no part is nouriſhed by the excrement which it attracteth but by laudable bloud. Sixtly, as the paſſages of choller are diſperſed through

through the ſubſtance of the Liuer, among the rootes of the gate and hollow veines, to draw away the excrementitious choller. So alſo ſhould there haue beene many propagations and tendrils from the ſpleenick braunch, diſperſed through the ſubſtance of the Liuer, which we finde to be nothing ſo.

Finally, if from the Liuer the fœculent bloud bee purged away, as an excrement into the ſpleene, then it muſt of neceſsity follow that this excrementitious humour ſhould regurgitate or returne into the trunke of the Gate-veine, becauſe the ſplenick branch ariſeth out of the ſame trunke far vnder the Liuer, and aboue the trunke of the *meſeraicks*.

Authors on *Bauhines* ſide. *Ariſtotle.* *Galen.* *Aphrodiſæus.* *Aretæus.* *Veſalius.* *Fernelius.* *Platerus.* *Archangelus.*

Wherefore we think, ſayth *Bauhine*, that the ſpleene was ordained and inſtituted by Nature, for a further confection of ſome kinde of bloud. Which vſe, *Ariſtotle* firſt allotted vnto it, and therefore in his third booke *de partibus Animalium* and the 7. chapter, hee calleth it a baſtard Liuer. The ſame alſo *Galen* giueth aſſent vnto, in his booke *de reſpirationis vſu*, as alſo *Aphrodiſæus* and *Aretæus*: *Veſalius* and *Fernelius*, touch vpon this vſe of the ſpleene alſo; but *Platerus* and *Archangelus* reſolue vpon it very confidently.

Bauhines proiect.

The ſpleene therefore from an inbred faculty of his owne, draweth vnto himſelfe the thicker and more earthie portion of the Chylus, ſomewhat altered in hauing receiued a certain diſpoſition or rudiment of bloud in the meſeraicke veines, by the ſpleenick branch of the Gate-veine, out of the trunke of the meſeraick veines before the Chylus get into the Liuer; that ſo the Liuer may the better draw the more laudable parts of the Chylus, for otherwiſe the ſmall veſſels of the Liuer being obſtructed by the craſſe and crude bloud, not onely ſanguification would haue beene interrupted; but alſo the Iaundiſe, Dropſies, Agues, Scirrous hardneſſes, and many other miſchiefes, woulde haue ouertaken vs of neceſſity; all which we ſee do euery day hapen when the ſpleen fayleth to do his duty; and either through weakneſſe or obſtructions, ceaſeth to attract that craſſe and fœculent part of the Chylus. But a great euidence of this trueth is this; that the ſpleenicke branch doeth not proceede from the Liuer, but ariſeth as is ſayde, and is ſeated below it. Neither is it likely that ſo thicke a iuyce confected and made into bloud in the Liuer, ſhould get out of it by the hairie and threddy veines of the ſame; yet wee doe not deny that melancholly iuyce is ingendred in the Liuer; but wee ſay, that that onely is there ingendered which is a part of the maſſe of bloud, not that which is receiued into the ſpleen, for his nouriſhment and the vſe of the ſtomacke.

Furthermore we are of opinion ſaith *Bauhine*, that a part of the Chylus is ſucked euen out of the ſtomack, by veines ariuing at the left ſide of his bottom from the ſpleenicke branch.

When the ſpleen hath receiued this Chylus a little altered in the long iourney through thoſe ſpleenicke ſurcles and branches, it laboureth and worketh it at great leaſure, and by a long proceſſe, as the Alchymiſts ſay, and much preparation in the innumerable ſmall veſſels or Fibrous complications which are diſſeminated through his ſubſtance (like as the other and greater part of the Chylus is laboured into bloud in the complications of the veſſelles diſſeminated through the Liuer) and boyleth it into a thinner conſiſtence by the help of naturall heate aſsiſted by the many and large Arteries, and their perpetuall motion. And then a part of it becommeth the Aliment of the ſpleen, the reſt is carried by veines iſſuing from the ſpleenick branch, to nouriſh the Stomacke, the Guts, the Kell, and the Meſentery; which thing *Galen* alſo infinuateth, when he ſayth, That the ſame meſeraicke veines do carry Chylus vnto the Liuer out of the ſtomacke and the guts, and returne bloud againe vnto them and the *omentum*. For ſeeing that the originall and ſubſtance of all the veines which are propagated from the gate-veine is one and the ſame; it followeth neceſſarily, that their action alſo ſhould be the ſame; but to returne.

Galen.

A part alſo happely of this humour thus altered is drawne into the next adioyning arteries, and ſo conueyed into the great Artery, to contemperate the intenſe and ſharp heat of the bloud in the left ventricle of the heart, and to eſtabliſh and ſettle the nimble & quick motions of the vitall ſpirits, which are a very great cauſe why ſome mens wits are ſo giddy and vnconſtant.

This is ſomewhat ſtrange.

Sometimes it falleth out in great and confirmed diſeaſes of the Liuer, when his ſanguification is decayed or in a manner periſhed, that the ſpleen performeth his office, and tranſmitteth a part of the bloud by him laboured through the ſpleenicke branch into the veines of the Liuer, which through the rootes of the hollow veine and the branches thereof, is diſtributed into the parts of the body for their nouriſhment, euen as the bloud is wont to be diſtributed, which is laboured and confected in the Liuer it ſelfe.

But

But that part of the altered Chylus that before we ſayd was drawn into the ſpleen, which it cannot by reaſon of the thickneſſe thereof transforme into profitable iuyce, but is altogether vnapt for nouriſhment, is poured out, part of it into the ſtomacke, part into the *Hæmorrhoid* veines; ſometimes through the trunke of the gate veine, or through the ſpleenick Arteries it is deriued vnto the Kidneyes, whence it is that in diſeaſes of the Spleene, the water fals out often to be blacke. why in affects of the Spleen the vrines are often black.

Wherefore we conclude ſaith *Bauhine*, that the Spleene is a great helpe to the Liuer for the confecting of blood; partly becauſe it maketh blood anſwerable to his owne Nature, partly becauſe it auerteth or draweth aſide vnto it ſelfe the thicker part of the aliment, not ſo fit to make pure blood, and by that meanes the Liuer, vnburdened of ſuch a clogge, performeth his office of ſanguification with more facility. And thus it may be ſayde verie well to purge and defecate the blood, and to make it more pure and bright. And heerupon the Ancients placed the ſeate of laughter in the Spleene: and *Plato* ſaith, that the ſpleen poliſheth and brightneth the Liuer like a Looking-glaſſe, that it might make a more cleare repreſentation of the Images of the paſsions from thence exhibited vnto the ſoule. *Plato.*

Ariſtotle alſo calleth it a left Liuer, and obſerueth that thoſe creatures which haue no Spleene, haue as it were double Liuers: and *Galen* remembreth in his fourth Book of the vſe of parts, and the 7. chapter, that *Plato* calleth it the expreſſe Image of the Liuer. *Ariſtotle.*

It is therefore not to bee wondered at, if the diſeaſes of the Spleene doe no leſſe (haply more) hinder ſanguification then the diſeaſes of the Liuer it ſelfe, becauſe by howe much the better the Spleene doth his duty, by ſo much the bloode in the Liuer is more pure and cleare.

In Diſſections alſo we often finde, that the Spleene exceedeth the Liuer in magnitude, or is equall to it, being yet ſound in colour and conſiſtence.

Notwithſtanding, albeit in both theſe entralles, when a man is ſound and hayle bloud is generated, yet it muſt needs be confeſſed, that there is more ſtore of good and hot bloud fit for the nouriſhment of fleſhy parts made in the Liuer then in the Spleen, whoſe bloud is neyther ſo much, nor ſo hot, nor all out ſo good; which *Hippocrates* intimateth when he ſaith, that the ſame things which make the Spleene to flouriſh, make the body to wither and conſume.

And thus I haue acquainted you with *Bauhines* conceit of the vſe of the Spleen, wherein me thinks he acquitteth himſelf, as *Bellarmine* doth in his diſputations of the ſufficiency of works in our Iuſtification, who after that in diuers Books, and by manifold arguments he endeuoureth to proue that works may iuſtify, yet in the end he concludeth, that it is more ſafe onely to truſt to iuſtification by faith; ſo *Bauhine* for all his former arguments, yet you ſee concludeth, that the more, better and warmer bloode is made in the Liuer: as if hee ſhould ſay, there is a little & cold blood made in the Spleen, not fit to nouriſh the fleſhy parts, but onely his owne ſubſtance, which I thinke no man will deny vnto him. But of this queſtion we ſhall ſee more heereafter in the Controuerſies; we will now put an end to our diſcourſe of the Spleene, adding this one vſe more of it; That with his in bred heate, and the many Arteries wherewith that heate is encreaſed, it furthereth the concoction of the Stomacke. *Bauhines* cautelous concluſion. *Bauhine* likened to *Bellarmine.*

CHAP. XII. *Of the Liuer.*

THE Liuer is called in Greeke ἧπαρ, from a word that ſignifieth *Want*, becauſe it ſupplyeth the want of al the parts; or from making merrie, becauſe in this part is the ſeate of concupiſcence. The Latines call it *Iecur*, as it were *Iuxta Cor*, becauſe next to the heart his power is moſt eminent. The notation. It is worthily numbred among the principall parts, as being the ſeate of the naturall faculty, and of the nouriſhing part of the ſoule, common to all ſanguine or bloodie creatures: and firſt of all the Entralles or bowels it is perfected in the mothers womb. A principall part. The beginning of veins.

It is the beginning of Veines, not in reſpect of their originall, which is ſeed (for the veſſels are made before the *Viſcera* or entrals) but in reſpect of their rooting & diſtribution; for from hence ſpring two great and long Veines; below out of his cauity or hollowneſſe the Port or Gate veine; aboue out of his convexity or embowed ſide, the hollowe veyne is ſayde to proceede, albeit indeede the hollow Veine groweth to his backe [Tab. xiii. Fig: 2, FG Fig: 3 MN] part, with two notable branches diſperſed through his ſubſtance, which two veſſels

veſſelles ariſe out of the Liuer, the *Parenchyma* or fleſh of it being compaſſed about their roots as the earth is about the roots of a tree, and doe miniſter nouriſhment to the vvhole body, wherefore the Liuer is called the ſhop of ſanguification or blood-making.

His ſcituation. It is placed in the [Tab.6.lib.2 FF Tab.9.CC] vpper part of the lower belly, that being ſet in the middeſt as it were of the body, it might ſend bloud equally vpward and downeward; it is about a fingers breadth diſtant from the *Diaphragma* leaſt it ſhould hinder his motion; in dead bodies ſometimes it toucheth it, and is couered wholly by the ribbes. It taketh vp the greateſt part of the right *Hypochondrium*, partly that it may leaue the left for the ſtomacke [Table 6. *Lib.* 2. FF. Table 9. FF] and the ſpleen [Tab.9.°] (for theſe three occupy both ſides; whence it is, that when any of them, much more when all are ſwelled, ther followeth great difficulty of breathing) partly becauſe the bloud might be better carried to the right ventricle of the heart. It leaneth but lightly vpon the vppermoſt, foremoſt, and right ſide of the ſtomacke [ſee the Tab.6.*lib.*2. and Tab.9.] leaſt it ſhould preſſe it with his waight, and driue forth the matter contained in it. A little part of it alſo reacheth toward the left ſide, that the body might be ballanced. In Dogs it taketh vp well neere both ſides, becauſe their ſpleenes are long and narrow, but the greateſt part is compaſſed below with the baſtard ribs which defend it from iniuries.

The figure. His Figure is diuerſe, becauſe of the parts [Table 13. figure 1.2.] adiacent, for his office

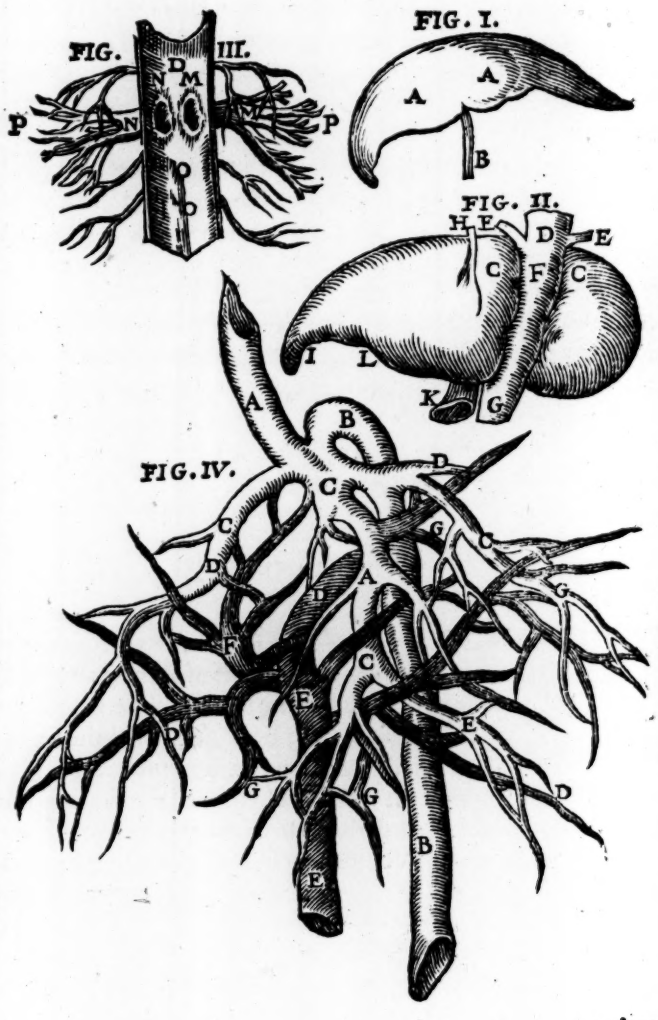
Table xiij. ſheweth the Liuer with his Veines.

The firſt Figure, the Gibbous and forepart.

The ſecond Figure, the Gibbous and hinder part, together with a part of the trunk of the hollow veine.

The third Figure, a part of the hollow veine faſtned to the backſide of the Liuer, and is opened with a long ſlit, to ſhew the holes of his branches where they open into the Liuer.

A A 1 The Gibbous and foreſide of the Liuer.
B 1. The Vmbilical veine.
CC 2. The Gibbous and backſide of the Liuer.
D 2.3. The ſeate of the hollow veine where it paſſeth through the midriffe.
E E 2. The veines of the midriffe called *Phrenicæ*.
F G 2. In this diſtance is the place where the trunk of the hollow veine groweth to the backeſide of the Liuer.
H 2. A Ligament which tieth the Liuer to the midriffe.
I 2. A Ligament tying the left ſide of the Liuer to the midriffe.
K 2. A part of the Gate veine.
L 2, The boſome of the Liuer into which it admitteth the left orifice of the ſtomack.
MN 3. Certaine braunches of veines proceeding out of the Liuer.
OO 3. Smal braunches which are thruſt out of the Liuer to the hollow veine.
PP 3. The roots of the hollow veine diſperſed thorough the Liuer.



The fourth Figure ſheweth the rootes of the Hollow and Gate veines, diſperſed through the Liuer and their Anaſtomoſes or innocculations.

A. The trunke of the hollow veine ariſing vpward from the Liuer.
BB The trunk of the hollow veine, as it getteth out of the Gibbous part of the Liuer, which is bent downwards, and watereth al the parts of the body vnder the Liuer.
CCCC. The roots of the hollow veine which are in the ſubſtance of the Liuer.
DDDD. The ends of the roots of the hollow veine which pierce or open into the midſt of the roots of the gate-veine.
E E The principal trunk of the gate vein.
FF The roots of the gate veine, euen all thoſe that are black, diſperſed through the ſubſtance of the Liuer, which vnder the lower part of the Liuer do meet, and make one trunk.
GGGG The endes of the rootes of the gate veine which pierce or open into the midſt of the roots of the hollow veine.

requires

requires no proper figure, but a ſufficient magnitude and thickneſſe.

The form of it is outward or inward; the outward forme or ſurface which is the vpper & more backward part is ſmooth, equall and conuexe or embowed [Tab.viii. [BG] Tab. 2 lib. 4 [bb], Tab, xiii. Fig.1 [AA], Fig:8 CC] round (which is called *pars gibba*, the gibbous part or the head) that it may giue way to the *Diaphragma*, and may agree with the cauity of it; but backward it hath a [Tab.xiii, Fig.2 at [FG]) long boſome ſufficient to embrace the ſtumpe of the hollow veine [Tab:xiii, Fig.2 [FG]] leaſt it ſhold be preſſed eyther with the Liuers waight or the motion of the Midriffe. The Figure.

The inward face of the Liuer which is the lower, is [Tab.8 CC. Tab,xi, [BB]. Tab:xv, Fig.1 [BC]] hollow, vnequall, and is called the *Simus* or ſaddle ſide, that it may giue way to the ſtomacke ſtrutting [Table 9. [FF]. Tab. xi [B]. Tab.2, lib.4 [CC]] with plenty of meat, and couer it immediately to cheriſh the firſt concoction of the Chylus.

In this part there are two hollowes or boſomes, one on the right ſide to receiue the body of the bladder of Gall. [Tab.xv: Fig.1, [F]] the other on [Tab: xiii: Fig:2 [L]. tab:xv. Fig;1 [H]] the left ſide, where it giueth way to the paſſage of the ſtomacke. In Dogs it hath a priuate hollowneſſe, whereinto it admitteth a part of the right Kidney. But where the gate-veine getteth out of it, it is vnequall, becauſe it riſeth ſomewhat high, leaſt the Veines ſhould be preſſed by the rack-bones. On the Right ſide it is round [Tab.9 [CC] Tab: xiii, Fig: 1, [AA]] and very thicke; on the left it groweth thinner by degrees, and endeth ſomewhat ſharpe in an acute Angle; [Tab. xiii Fig: 2. from [L] to [I]] in the forepart alſo it is thin in the bought or compaſſe. There is but one Liuer, for the largeneſſe makes recompence for the number; and it is the greateſt in a man of any creature for his proportion, and in the biggeſt men biggeſt, becauſe it muſt make blood for the vſe of the whole body; not onelie for his nouriſhment, but alſo to ſerue for his expence of ſpirits: for there are more functions of the ſoule in a man, then in any other creature; which functions ſpend more animall Spirits, and thoſe are engendred of the vitall ſpirits, and the vitall ſpirits of blood; therefore a man had neede of good ſtore of blood, and by conſequent of a great Liuer wherewith to make it. In fearefull men and ſuch as are giuen to their paunches, it is greater then in other men. In fearefull men, becauſe the weakeneſſe of their vitall faculty comming of the cold temper of the body, might be ſupplyed by the ſtrength of the natural faculty. In rauenous gourmandizers, becauſe of the aboundance of the meate they eate; for as the Liuer is more plentifully nouriſhed, ſo it groweth greater. For the moſt part the Liuer of a man is whole (that when a man goes right vp, it might couer the ſtomacke with the hollow part of it) [as is ſhewed in the 6 Tab.lib.2. and in Tab.5] excepting the fore and right part wher there [Tab xiii. Fig:1. at [B] Tab.xv Fig.1, [F]] is a cleft like an outlet, which was neceſſary for the paſſage of the vmbilical or nauil veſſ. [Tab.6, lib.2, from [D] to [B], Tab.5 [C]. Tab 8 I. Tab. xiii. fig:1 [B]] On the backſide a part of it filleth the cauity, which both the mouths of the ſtomacke do leaue. The waſte of ſpirits in man aboue other creatures. The quality of it. In what men it is greater or leſſer.

But in bruite beaſts it is diuided into foure, fiue, or ſix Lobes or Finnes, which are continuated or coupled together, onely by the mediation of Veynes, within which lobes their ſtomackes are couered as it were with the fingers of a hand, becauſe they haue no cloathes to keepe it warme, as men haue. For if in them it were whole, when they go groueling it would not ſo lap about the ſtomacke, but hang off. Wherefore Birds becauſe they ſtande more ſtraight vp, haue it diuided but once. It hath in me no Lobes or diuiſions.

It is knit to the ſpine bone of the Loynes, to the *Diaphragma*, and to other parts by the helpe of the rim or *Peritonæum*, of whom it receyueth three ſtrong Ligaments, leaſt being heauy, it ſhould at any time fall. The firſt and right is thin [Tab, 5 [D], Tab.8 [H], Tab. 2 lib. 4. [d]. Tab xiii. Fig: 2 [H]] like a Membrane, broad, nerueous, and very ſtrong, proceeding from the Rim where it compaſſeth the Midriffe; and tyeth the Liuer (into whoſe coates it doth degenerate) forward to the *Diaphragma*, and is called *Suſpenſorium* or the heauing Ligament: wherefore, when the Liuer growes heauy, the Midriffe is drawne downe, and in reſpiration there is more difficulty when a man ſtands, then when he lies along. The ſecond and left Ligament is alſo very ſtrong, round, [Table xi. C. Table ii, lib. 4. [c]. Table xiii, figure ii, I. Table fifteene, figure one, [C]] and proceeding from the Rim; it knitteth alſo his thinner part to the *Diaphragma*, that the ſides of the Liuer may on either hande bee held vp, it ſometimes alſo eleaueth to the Cartilages of the baſtard ribs. The third Ligament is the vmbilicall or Nauell veyne, now dryed after [Tab.6 lib 2. from [D] to [B]. Tab.5 [E], Tab.xii: Fig.1 [A]] the birth, whereby at the Nauell it is tyed down to the *Abdomen*. [Tab: 23 The Connexion. Three Ligaments.

Fig.

Fig:7,8.from ᶻ to ʸ]leſt the Liuer falling down ſhould draw the *Diaphragma* after it. Moreouer, where the beginning of the gate-veine is [Table 11. ᵗ] there groweth to it a portion of the *omentum*. So on the backſide in the compaſſed face or gibbous part where the hollow veine paſſeth through it, it cleaueth to the rim.

The membrane.

It hath a moſt fine and ſlender membrane, and but one, growing from that membrane of the veines which ariſeth from the *Peritonæum* or rim; and this incloſeth all his ſubſtance.

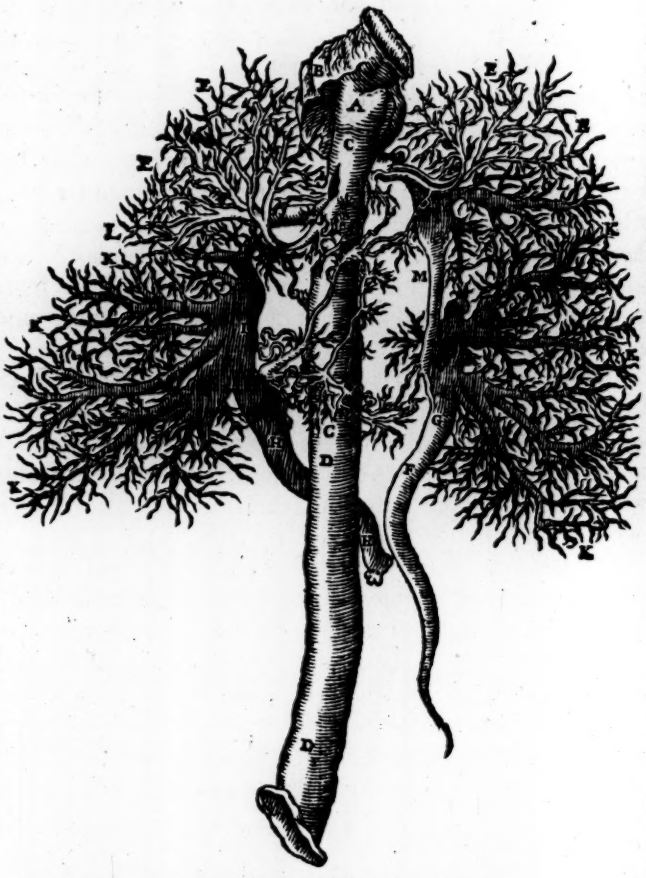
The *Parenchyma*.

That ſubſtance is nothing elſe but bloud poured out of the veines, whence it is red and ſoft, and ſtandeth round about and betwixt them, as the earth about and betwixt the ſmall bearded rootes of a tree; which bloud being held in by the membrane wee laſt ſpake off, cloddeth together, and therefore of *Eraſiſtratus* is called παρέγχυμα, that is, an affuſion or pouring out. *Galen* cals it fleſh, *Hippocrates* a fleſhie *viſcus* or entrall: wee with *Galen* call παρέγχυμα, the fleſh as well of this as of the other entrals.

The empty ſpaces betweene the rootes of the hollow and port veine this ſubſtance filleth vp, as may appeare when the fleſh is taken away, for ſo it may be as we haue ſeene elegantly performed, eſpecially by that occulate Anatomiſt *Petrus Pauius* of *Leydon* neere xx. yeares ſince, then my firſt Maiſter & Moderator in Anatomie; a liuely reſemblance whereof wee haue here annexed, albeit it may partly be perceiued by the precedent Table.

Table xiiij. Sheweth the rootes of the Hollow and Gate veines, diſſeminated through the Parenchyma or fleſh of the Liuer, & their Anaſtomoſes or inoculations: alſo the trunkes of the Nauell, Hollow, and Gate-veines. Into euery one of the trunks you may put a ſticke before you boyle the Liuer and ſeparate his ſubſtance from the veſſels, that ſo the veſſels may appeare open, and not corrugated or crumpled vp together.

TABVLA. XIIII.



A The trunk of the hollow vein where it pierceth the midriffe

B *A* part of the midriffe.

CC A parte of the trunke of the hollow veine which groweth to the back part of the Liuer.

DD The trunke of the hollow veine which is carried thorough the lower belly, his brãches being remoued.

EEEE The roots of the hollow veine diſperſed through the ſubſtance of the Liuer: theſe appeare here all white.

F G The vmbilicall veine, without the Liuer at F. within the Liuer at G.

HH The trunke of the gate vein without the liuer.

I I A part of the right ſide of the gate veine torne from his left ſide, that the veſſels might better bee demonſtated: but the trunke of the gate veine HH. ſhould haue ridden ouer the hollow veine D D.

KKKKKK The roots of the gate veine diſperſed through the ſubſtance of the Liuer, which here appeare all blacke.

LLL The *Anaſtomoſes* or inoculations of the rootes of the gate veine with the rootes of the hollow veine.

M This innocculation is like a Pipe or trunke, & it is a common and continued paſſage, into which you may put a good big Probe: from this there are open paſſages into the laſt ſtrings of the gate or hollow veine.

The roots of the great veines.

There are a few Arteries inordinately ſhed through his ſubſtance amongſt the other veſſels: But there are more rootes of the port veine [table 13. figure 4. Table 14. the blacke rootes belong to the gate veines] in his lower part, and fewer in his vpper, and on the contrary

trary many more [Tab:xiii, Fig.4. Tab.xiiii the white rootes belong to the Hollow veine] roots of the Hollow veine in his vpper parts, then in his lower, (wherefore there is more plentifull ſanguification or making of blood in the hollow ſide, and more aboundant diſtribution in the conuex or embowed part) but all of them committed acroſſe or mixt together by Anaſtomoſis, [Tab.xiii: Fig.4. ^{oooo}, Tab. xiiii: ^{lll}] which moſt reſembleth the inoculation of plants; althogh ſomtimes the roots of the hollow Vein do faſten their ends into the midſt of the roots of the Gate-vein, by which the bloud runneth out of the roots of the Gate vein into the Hollow vein, ſo that theſe roots do make *plexum mirabile*, or the wonderfull web, texture, or plat of Veines (in reſpect of which it is likely the Liuer is ſaide to be the beginning or originall of veynes) for the perfecting and abſolute confection of the blood. But there is one peculiar and notable Anaſtomoſis or inocculation to bee obſerued [Tab.xiiii, ^{M}] which is a manifeſt and open pipe and continuated paſſage into which you may paſſe a good bigge probe, and from which there lyeth an open way through all the leaſt threds of the Gate and hollow Veines. And ſo much the rather are theſe inocculations of the Veines one with another, more diligently to be obſerued, becauſe through them the humors offending paſſe, when the habite or vtmoſt region of the body is by purgation emptied by the ſiedge.

Anaſtomoſis what it may beſt be compared to.

The lower [Tab.xiii, Fig.4, ^{FF}. Tab:xiiii. ^{kkkk}] of theſe roots, are by little and little gathered into greater, and theſe into other, till at length in the lower part of the Liuer they conſent together into the trunke of the port or the Gate veine [Tab.xiii, Fig.4. ^{ZZ} Tab:xiiii ^{mm}] as broad as a thumbe or broader.

The port or Gate-veine. The Hollow veine.

The vpper roots are in like manner [Tab:xiii. Fig:4. ^{cccc}, Tab.xiiii, ^{zzz}] vnited by degrees, till at length they fall into two notable and great [Tab.xiii, fig:3, $^{M\,N}$] braunches, reaching to the fore-ſeate of the Hollow veine, where it groweth to the Liuer, and lyeth vpon the *Diaphragma*, and there make one trunke [Tab. xiii. figure:2. ^{F}, fig:3, ^{D}. fig:4 ^{B}. Tab, xiiii, ^{AC}.] Hence it is that the Gate veine [Tab: viii, ^{a}] is ſaide to ariſe out of the hollow ſide of the Liuer, and the Hollow veine, [Tab: viii, ^{N}] out of the conuex or embowed part.

Amongſt theſe roots, certaine fine tendrils [Tab:xv fig:2, ^{qq}. Table xvi, figure 1, ^{DDD}, figure 2, ^{aaa}] hauing the bodies of Veines, and being gathered into one ſtumpe or ſtalke [Tab: xv, figure 2^{a}. table xvi, figure 1, ^{B}] are diſſeminated, which carry the choler from the Liuer to the bladder of gall, which alſo are ioyned with the rootes of the gate-veyne, that the blood before it come into the branches of the Hollow veine, may bee purged and clenſed from that cholericke excrement.

The paſſage of Choller to the bladder, or Gall.

The ſame ſubſtance of the Liuer whereof wee ſpake before, by compaſsing about theſe veſſels, ſtrengthneth them, and warranteth their tender threds from danger; by whom alſo it receyueth in lieu a proportionable good, for it is nouriſhed by blood laboured in the roots of the Port veine, and out of thoſe ſmall ends powred on euery ſide into his lap: the remainder which he refuſeth, is carried into the roots of the hollow vein, and thence both thruſt out, and drawne for nouriſhment into the whole body.

How the Liuer is nouriſhed.

There are a few ſmall Arteries [Table 4, figure 1 ^{M}] from the *Cæliaca* diffuſed in his ſubſtance (which do appeare more vvhite then the Veines) on the hollow ſide where the braunches of the Gate [Table 4, figure 1^{t} and figure 2, ^{y}, table xi. ^{L}] veine do ioyne together into their common trunke or ſtumpe, that they might ventilate and ſo preſerue the naturall heate of the Liuer, wherfore they runne onely through the hollow part; for the embowed part is wafted with the continuall motion of the *Diaphragma*, as with a Fan. They alſo carry vitall heate, that the heate being doubled, the ſanguification might better ſucceed; and that the Liuer alſo might not be deſtitute of the vitall faculty: for in the whole bodye, the Veines and Arteries are in a league and helpe one another: theſe miniſtring ſpirits to the veines, the veines blood to them.

The Arteries of the Liuer.

It hath two ſmal Nerues [Tab: iiii, fig:2. ^{y} tab: xi ^{M}] from the ſixt paire: one from that branch that is ſent to the vpper mouth of the ſtomacke; [tab:xv. fig:1 ^{o}, tab. xvi, fig:1 O] the other from the branch [table xv. Figure 2 ^{f}] which paſſeth to the roots of the ribbes of the right ſide, both of them diſperſed into his coate, that he might not be altogether like a plant without ſenſe, albeit ſeruing onely for nouriſhment it ſtoode in no need of any quick or notable ſenſe wherefore his Nerues are ſo very ſmall. Hence it is, that the paines of the Liuer are not acute or ſharpe, but obtuſe or dull, and grauatiue onely. But the bottome or center of the Liuer is altogether without ſenſe, becauſe of the many motions of the humors therein.

The Nerues of the Liuer.

The vſes of the Liuer.

The vſe of the Liuer is by his affuſed ſubſtance to part and ſeparate the veſſels that they cleaue not together; to ſuſtaine and eſtabliſh them; to cherriſh them with his heate, becauſe in that place their coats are thinner, ſayth *Galen* 4. *vſu partium*, 13. than in any other part of the creature. For by this helpe, ſanguification which is celebrated in the rootes of the gate veine, which are in the ſubſtance of the Liuer, is duly adminiſtred: to affoord vnto them the naturall Faculty as it were by irradiation, euen as the veſſels of ſeede receiue the faculty of Seed-making from the Teſticles; as alſo to procreate the Naturall ſpirite, which

Columbus.

ſome deny but *Archangelus* by many arguments doth eſtabliſh: and laſt of all to preſerue and maintaine the Nouriſhing Soule as they call it, which is ſeated in euery particular part of the body.

But becauſe there are many opinions concerning the manner of ſanguification, I haue heere thought good to ſet downe *Bauhines* conceite, as the opinion of a man to whome I am eſpecially in this worke beholding.

The maner of ſanguification as *Bauhine* hath deſcribed it.

All Aliments aſwell ſolid as liquid are taken by the mouth and after maſtication or chewing as there is more or leſſe neede, are ſwallowed into the ſtomacke and there concocted and turned into Chylus. This Chylus, afterward when the *pylorus* or lower mouth of the ſtomacke is opened, is thruſt downe into the guts; and if any part of it eſcaped elaboration before, is there reuiſed and re-concocted. The thin and lawdable part of the Chylus (for the thicke excrements called *Aluina fæces*, are forced into the great guts) together with that humour which is as it were a watery excrement, and was engendred in the concoction of the ſtomacke, is ſuckt away by certaine branches of the Gate-vein deriued from his trunke (which is fixed in the hollow part of the Liuer) vnto the ſtomacke, but eſpecially vnto the guts. Theſe veynes which are called *Vena Meſeraicæ*, and wee muſt call the Meſeraick veines, do attenuate the Chylus which they receyue, prepare it and giue it the fyrſt rudiment of blood, ſo that now it beginneth to be called *Chymus*, that is, a *Humour*: which when it approacheth to the trunke of the Gate-veine, is vnburdened of his thicke part, the Spleene drawing it away by the Spleenicke branch, as hath beene ſayde in the vſe of the Spleene.

When the Chylus becõmeth *Chymus.*

That which remaineth of this *Chymus* or *Humour*, is conueyed out of the trunke of the Gate-veyne into his rootes which are very many and very ſmall, diſperſed through the hollow part of the Liuer. Their coate alſo is very thin (as is alſo the coats of the veſſels of the Spleene, the Teſticles and the Paps) that the ſanguifying Faculty might more eaſily inſinuate it ſelf into them from the *Parenchyma* or fleſh of the Liuer, without which the blood cannot be made profitable for nouriſhment; and from which thoſe veſſels receiue by irradiation the ſanguifying Faculty, as the ſpermaticall do the Faculty of Seede-making from the Teſticles. In theſe veſſels therefore the *Humour* is changed into blood, for no Chylus is powred out of the roots of the Gate-veines into the fleſh of the Liuer.

Why there is no cauitie in the Liuer, but a web or net of veſſels.

Now that this *Humour* might be longer reteyned, and paſsing through many alterations be diuided into as ſmall portions as was poſsible, or rather be perfectly laboured, Nature ordained no ſuch cauity in this place as in the ſtomacke; but of infinite & ſlender branches of Veines made a texture-net or web wherein the Chylus is better thinned, mitigated and parted into ſmall portions, that the fleſh of the Liuer on euery ſide compaſsing his diſſeuered parts, might better worke it into a Maſſe of blood. For if there had beene a cauity formed in the Liuer, then muſt the Chylus haue had a Canel or pipe for his egreſſe and regreſſe through which it woulde haue falne away crude and not perfectly ſanguified, and therefore vnfit for the nouriſhment of the parts.

The naturall inſtinct of veſſels.

After the blood is thus abſolued and perfected in the roots of the Gate-veine, they haue a naturall inſtinct to part with it, partly to powre it into the fleſh of the Liuer for his nouriſhment that before did them ſo good an office; partly to vnloade their burthen into the rootes of the Hollow Veine, which are eſpecially diſſeminated through the Conuexe or gibbous and embowed part of the Liuer, which rootes alſo haue an inſtinct or deſire to draw it into themſelues, and to deliuer it ouer into their boughes and branches (in which it receyueth a farther degree of elaboration) pure and defæcated from all excrements, to be diſtributed vnto the parts of the body.

The rootes of the Hollow and Gate veines, although they be hand ouer head as we ſay, without any preciſe order diſtributed through the fleſh of the Liuer, yet in manie places they are ioyned by Anaſtomoſis or inocculation (excepting the branches which ſerue for the nouriſhment of the Liuer it ſelfe) as they touch in their paſſage ouerthwart one another,

ther, or elſe the extremities or endes of the gate veines are faſtned into the middeſt of the rootes of the hollow veine; or contrarily the ends of the hollow veines into the middeſt of the gate veines: for after no other manner but this, can the bloud be tranſlated out of the rootes of the gate veine into the rootes of the hollow veine. *Anaſtomoſis* how it commeth.

But that the bloud might better paſſe through the narrow and ſtraight paſſages of the veſſels, it is wafted by a thin and watery humour which is moſt like to whay; and therefore is called *ſerum ſanguinis*, we call it commonly the Vrine; a humour which is not fitte for the nouriſhment of any part, but onely mingling it ſelfe with the bloud, it maketh it more thin, and ſo readier to paſſe along: wherefore *Hippocrates* called it ὄχημα τῆς τροφῆς, *The Wagon of the Nouriſhment.* The vſe of the whay.

And whereas no Aliment is ſo ſimple, but that it conſiſteth of diuers and different parts; we muſt know, that all thoſe parts cannot be changed into laudable bloud; wherefore as in the firſt concoction celebrated in the ſtomacke and the ſmall guts, there was a ſegregation of the excrements of the belly: ſo in the beginning of the ſecond concoction, which was in the meſeraicke veines, there was a ſegregation made of the craſſe and fœculent part of the Chylus, from the pure and laudable, which was ſent away to the ſpleene. But in the concoction which is accompliſhed in the veines of the Liuer, two excrements are ſeparated, leaſt if they remayned mingled with the bloud, they ſhould be with it tranſported into the whole body. Theſe through their proper paſſages are conuayed and ſtored vp in peculiar and appropriated receptacles or places of receipt. The firſt of which, is the bilious or cholericke excrement, which is diſpoſed partly into the bladder of gall, partly ſent away into the gut, as we ſhall ſay in the next chapter. The ſecond is, the *ſerous* or whaey humor, the greateſt part whereof, when the bloud is ariued out of the rootes of the gate-veine into the hollow veine, becommeth an offenſiue burden vnto it; and therefore the Kidneyes by the emulgent veines and Arteries draw it out of the hollow veine and the great Arterie into themſelues.

The bloud thus cleanſed and depured from all manner of excrements, is diſtributed by the trunkes and branches of the hollow veine through the whole body, in which paſſage it receiueth an alteration or diſpoſition of nouriſhment, that no time ſhould bee loſt. Theſe branches of the hollow veine doe with the bloud carry alſo a part of the aboue mentioned whay or vrine, to make it more fluxible, that it might the better paſſe through the Capillarie veines of the parts to nouriſh them; where when it is ariued, it is as it were ſprinckled vpon the fleſh, into which by little and little in manner of a vapour or dewe it ſoaketh and ſinketh, cleauing like glew till it bee wholly conuerted into their proper Aliment; which glew by nouriſhing and reſtoring, maketh good the Radical moyſture and the ſubſtance of the parts. But the whay which accompanied the bloud thither in the third concoction, that is, in nouriſhment which is accompliſhed in euery particular part, as an vnprofitable excrement is exhaled in ſweat and inſenſible tranſpiration: thus far *Bauhine.*

Of the Bladder of Gall. CHAP. XIII.

THE Bladder of Gall [Table 15. Figure 1.2.rr] called *veſica biliaria*, or *folliculum felleum*, in grecke κύστις χολήδοχος, is the receptacle of pure choller; and hath his ſeate in the right and hollow part [Table 15. ss] of the Liuer, that it may be fitter to receiue the choller, which being a mad and hare-brain'd humour, had needs at the firſt generation of it be ſent away, leaſt it ſhould ſet all the body in an vproare; and therefore Nature placed his receptacle in the very boſome of the Liuer; his own acrimonie alſo haſtneth his euacuation. The Liuer therefore hath as it were engraued in it a certaine cauity or boſome, wherein the vpper and middle partes of the bladder are tyed firmly to it; the lower part in the meane time hanging looſe from the body of the Liuer, ſo as it toucheth the right ſide of the ſtomacke and the Colon, dieth them both oftētimes with a yellow colour; yea further affecteth them with his iuice ſweating through his coates; whence it is not vnlike, that the burnings and flaming heates of ſome mens ſtomacks doe ariſe. The Figure of it is [Table 15. Fig. 2.] long, that it might not bee preſſed by the ſtomacke, round alſo with his length and hollow, which hollowneſſe by degrees becommeth narrower, till at length it endeth in a necke. The ſcituation. The flaming heats of ſome mens ſtomacks whence it commeth. The figure.

It is ſmall in reſpect of the ſpleene and the Kidneyes, albeit it drawe a iuyce both of a middle quantity and conſiſtence in reſpect of the iuyces drawne by them both: but the rea- Why ſo ſmall.

Table xv. The first Figure sheweth the lower belly, wherein the stomacke with the guts are thrust into the left side: the Liuer is lift vp also, that you may better see the hollow side of the Liuer, the bottome of the bladder of gall, the vessels which passe thereunto, and the passage of gall called Porus biliarius, *which goeth vnto the duodenum, and certain branches beside of the gate veine, together with a part of the mesenterie. The second figure sheweth the bladder of gall, his passages and vessels, as commonly Anatomists make demonstration of them.*

AA 1. A part of the Rimme of the belly, with the ribs is here turned back.
BB C 1. The hollow side of the Liuer.
D 1. A part of the gibbous side of the Liuer.
E 1. The fissure or cleft of the Liuer, made for the ingresse of the vmbilical veine.
FF 1. Certaine inæqualities in the hollow side of the Liuer neare the original of the gate-veine.
G 1. A Ligament of the Liuer, tying his left side to the midriffe.
H 1. The bosom of the Liuer which giueth place to the stomacke.
I K 1. The stomacke thrust to the left side.
L 1. The left orifice of the stomacke, with the vessels which compasse it about.
M 1, 2. The right orifice of the stomacke or the *Pylorus* ioyned to the *duodenum*.
N 2. The gut called *duodenum* ioyned to the *pylorus*.
O 1. A nerue inserted into the hollownes of the Liuer proceeding from those Nerues which compasse the mouth of the stomacke.
P 1, 2. The bladder of gall.
QQ 2. The holes of the bladder of gall dispersed through the Liuer, betwixt the rootes of the hollow and gate veines.
R S 2. The rootes of the gate and hollow veines in the Liuer, of the gate vein at R, of the hollow vein at S.

a 2. The concurse or meeting of the passages of choler into one branch
b 1, 2. The necke of the bladder into which the passage is inserted
c 1. 2. The passage of the gall into the *duodenum*.
d 2. The *Duodenum* opened, that you may see the insertion of the *porus biliarius*, or passage of choler.
e 2. An artery going to the hollow part of the Liuer, and the bladder of gal.
f 2. A small Nerue belonging to the Liuer and the Bladder of Gall, from the ribbe braunch of the sixt paire.
gg 2. The *Cysticke* twins from the gate veine.
i 1. The *Pancreas* growing to the *duodenum*.
k l m 1. The *mesenterie*, but *k*. sheweth the distribution of the right trunk of the gate veine into the *mesenterie*.
m 1. A part of the *mesenterie*, to which is ioyned the right side of the collicke gut.
n 1. A veine going to the backe part of the right gut.
o 1. A part of the bottome of the bladder of vrine.
p 1. The right Kidney couered with a fat membrane
q 1 The right vreter from the kidney to the bladder.
r 1. The right spermatical veine and arterie.
s 1. Branches from the foresaid vessels to the *Peritonæum*.
t 1. The vessel of seed called *deferens*, or the *Leading Vessell*.

FIG I.

FIG II

son of his smalnes is, because the number of his drawing orifices is both greater and more commodious then those of any other instrument whereby the Liuer is depurated or purged.

His substance

His substance is membranous, to the end that being full, it might be dilated or stretched, and when it is empty it might fall together againe. For it hath a double membrane; one

The membranes.

common from the *Peritonæum* (*Vesa ius* sayth from the coate of the Liuer) wanting Fibres wherewith that part onely which hangeth off from the Liuer (which onely stands in neede of a defence) is cloathed; and with this coate it is tyed to the cauity or bosome of the Liuer. Another proper, thin indeede, but firme and strong and of such a nature that it is not to be hurt or offended by choller, by which other membranes are much affected. Wherefore though it be but single, yet the number is supplied by the strength and fastnes of it; for it hath all kindes of fibres, that the substance might be stronger and fitter for dilatation; the inmost are right, the outward transuerse, the middle oblique and those not many. It is

The crust of the vesicle.

within incompassed with a crusty substance ingendred of the excrements of the third concoction of the bladder it selfe, least it should be hurt by the acrimonie and sharpnes of the choller

choler conteined therein.

His Veſſels are. Two ſlender Veines from the trunke of the Gate-vein, called *Cyſticæ gemellæ*, the twins of the bladder [Tab.xv: fig:2 ss. Table xvi. fig.1 P P] which (as in the vvhite coate of the eye) are diſtributed for his nouriſhment. For it is nouriſhed as all other parts of the body with blood not with choler: and by other veſſels [table xv, fig:2. ᵠᵠ. Table xvi fig,1, ᵖᵖ. figure 2 ᵃᵃᵃ] draweth his proper excrement pure and vnmixed, ſaith *Galen* 5. *vſu part.* 7. blended with blood, as do the Kidneyes. The veſſel'es. The twin-veines.

The Arteries it hath are very ſmall, from the Cœliacall Artery which aſcend [Table xv. fig: 2 ᶜ. Tab. xvi, figure 1 ᴺ] vnto the hollowneſſe of the Liuer, that beeing (as it were) wrought by their continuall motion, it might be kept from corrupting. Arteries.

A Nerue it hath, but ſcarſe conſpicuous or viſible [Tab:xv, figure 2 ᶠ Tab, xvi, figure 1, ᵒ] from a little branch of the ſixt paire, that creepeth ouer the coate of the Liuer. All theſe veſſels are faſtned in the ſame place at the neck [Tab:xv, fig: 2 ᵇ, table xvi, figure 1, C] to the body of the bladder, and diſperſed into his coate do reach vnto his bottome, [Tab. xv, fig: 2 ᴱ. table xvi, figure i, ᴬ] Nerues.

A 1. The bottome of the bladder of Gall, in his naturall ſcituation.

B 1. *A* boſome or denne at the beginning of the necke of the bladder, at which place within are the values placed.

C 1. The necke of the bladder of gall.

D D D D. The holes or paſſages of the bladder of gal diſtributed through the ſubſtance of the Liuer between the roots of the Gate-veine at F. & the Hollow veine at G.

E 1. The meeting of the paſſages aforenamed.

F G 1. The roots of the gate-veine at F. the rootes of the hollow veine at G. al diſtributed through the Liuer.

H 1. The *Porus Biliarius*, whoſe mouth made of the concourſe of the paſſages marked before with D D D. is wider then the necke of the bladder.

I I A common paſſage or hole (aſwell of the *Porus Biliarius* H. as alſo of the necke of the bladder C.) reaching to the gut *duodenum*.

K 1. The right orifice of the ſtomacke ioyned to the gut.

L M 1. The gut *duodenum* opened, that the inſertiō of the forenamed common paſſage at M. might appeare.

N 1. An artery diſperſed into the hollowe part of the Liuer, and into the bladder of gall.

O 1. *A* ſmall nerue common to the Liuer and his bladder proceeding out of the ſixt pair: the cutter hath made it a little too big.

P P. 1, The veines called *Cyſticæ gemellæ*, or the twin veines of the bladder of gall, which are braunches of the gate-veine deriued to the bladder. They ſhould haue beene made much leſſe.

qq 2, The hollow part of the Liuer.

r 2. The bottome of the bladder opened.

ſ 2. The outſide of the bladder of gall.

t 2. The boſome or denne proper to the veſicle or bladder of gal.

u 2. The neck of the bladder

x 2. Three values at the necke, ſometimes but two.

yy 2. The *porus biliarius* open, which carrieth the thicker choler directly from the Liuer, to the end of the gut *duodenum*.

Z 2. The meeting of the necke of the bladder, and of the *Porus biliarius* into one.

aaa 2. Certaine ſmall paſſages out of the bottome of the bladder, carying the thinner part of the Choler into the Liuer.

The firſt Figure ſheweth the Naturall ſcituation of the bladder of Gall taken out of the Liuer, his faſhion and veſſe'ls.

The ſecond Figure ſheweth the bladder of Gall growing to the Liuer, but opened, that you may ſee his values: it alſo ſheweth the Porus biliarius, *which paſſeth from the Liuer to the* Duodenum.

TABVLA XVI.

FIG. I.

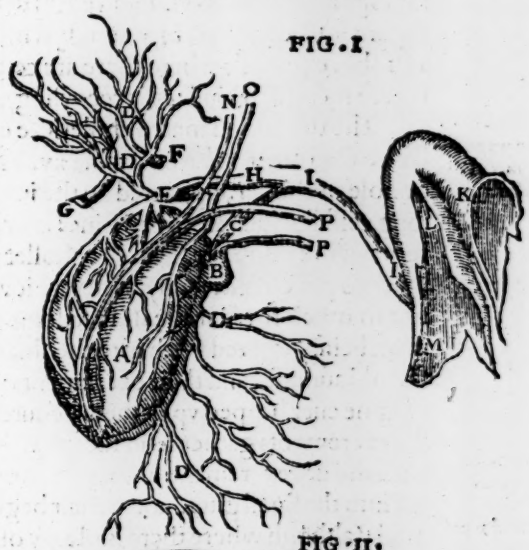


FIG. II.

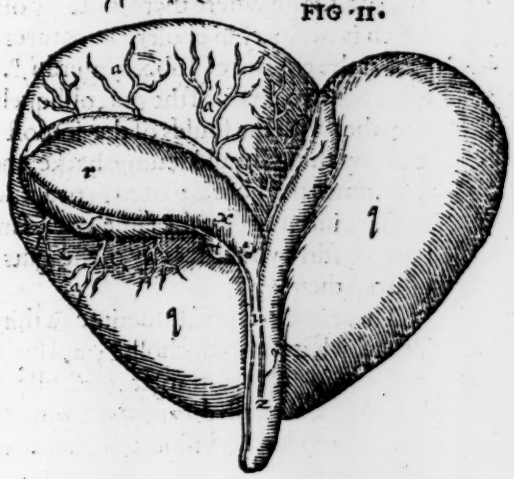


It is diuided into a bottome, a necke, and the paſſages of choler, which are called *Meatus* or *pori Bilarij*. The bottome is the greateſt [Tab: xv. fig: 1, 2. [y]. Table xvi: fig. i, [A]] part of the bladder, and looketh downward [as appeareth table xvi, fig: i] when with the Liuer it remaineth in his naturall ſeate. It is round, and dyed with the colour of the yellow choler it containeth; ſometimes it is blacke, when the choler being long kept in the place is aduſt or burnt, which alſo now and then is condenſed or hardned into ſmooth ſtones of diuers formes, which ſtopping the lower paſſages, wee haue knowne to breede perpetuall Iaundiſes and incureable.

The necke. The necke is the narrower part [Table xvi. figure 2, [b]] of the bladder, much harder then the bottome, to whoſe end is ſet a peculiar boſome or cauity. [Table xvi. figure i, [b]. figure 2, [c]]

The figure. It is alſo long, looking vpward, and by degrees ending in a narrow paſſage [Table xvi. figure 1, C] which making a ſemi-circular Figure, as of a halfe Moone, determineth into the paſſage of choler, called *Porus* [table xvi. Fig: 1, [M]] *Biliarius*, where the common paſſage is made [Table xvi, Figure 1, I]

The paſſages of it. The paſſages of the bladder of Gall are double (called πόροι χοληδόχοι, becauſe they carry choler) for that the cholericke excrement is two wayes purged out of the Liuer, to wit, pure and vnmingled, or mingled and thicke according to *Galen*, 4 *vſu part.* 12, and 13. For the vnmingled and pure choler is drawne by ſmall veſſels [Table xv. Figure ii, [qq]. tab, xvi. Figure 1, [ppp], Figure ii, [aaa]] ſent into the Liuer [Table xvi, Figure ii] with infinite ſtrings: ſhed abroad between the roots of the hollow [table xv, Figure ii, S. Table xvi, [L]] and Gate-veines, [table xv, Fig: ii, [x]. table xvi, Figure 1, [r]] and at length ioyned together into one [tab: xv, Figure ii, [b a]. table xvi. Figure 1, [a]] paſſage, and thence powred into the Bladder, and ſo it is continually filled and as continually emptied (the Bladder being preſſed as ſome ſay in thoſe creatures that go vpright by the Liuer, in others by the ſtomack) by a paſſage [tab xv, Figure ii, [b]. table xvi, Figure 1, [c]] determining into the pore or hole of choler, [table xv, Figure ii, C. table xvi, Figure 1, I] which is very fine and threddy, that it will ſcarſe admit a Probe, eſpecially where there are certaine ſmall Membranes about the necke [table xvi, Figure ii, [x]] which hinder the recoyling or regurgitation of the choler.

The way of the pure choler.

The way of the mixed choler. The thicke and mixed cholericke excrement is drawn from the Liuer by another paſſage called *porus Biliarius* [table xv. Figure 1, 2. [c]. table xvi. Fig. 1. [M] Fig. 2, [rr]] the pore or hole of choller, ſupported by the inferior membrane of the *omentum* or Kall. This is a long veſſell, which from the Liuer is inſerted in a circular or round figure, not into the bottome of the ſtomacke, leaſt the choller with his biting ſharpneſſe, ſhould prouoke the ſtomack to put ouer the Chylus before it were concocted; nor into the ſeat or place of ſeidge, not ſo much for feare leaſt in ſo long a paſſage it ſhould be broke; as becauſe this excrement being powred forth into the ſmall guts (for this paſſage being ſtopped men become full of Iaundiſe, and their excrements white) attenuateth and cutteth a great quantitie of Flegme euer heaped vp in them, ſcoureth their inward ſuperficies, and being mingled with the excrements gathered in the great guts, doth prouoke thē to excretion, that ſo together with the dry excrements it may be auoyded by the ſtoole. But this pore of choler is inſerted into the ſmall guts, not at their beginning, leaſt the Choler ſhould flye vp into the ſtomack (althogh where there is plenty of it it vſeth to regurgitate or recoyle to the ſtomack, which is ordinary in cholericke natures when they faſt long) but into the end of the *Duodenum* at the entrance [Tab. xv, figure 2, [n]. Table xvi, fig. 1 [M]] of the *Ieiunum* or emptie gut betwixt the two coats of the gut, obliquely, the orifice being couered with looſe membranes or rather with the foulds of the inmoſt coate ſtraightly ioyned and cloſing vp the paſſage leaſt any thing ſhould returne backe, much like the paſſage of the water into the bladder. Somtimes the pore is parted in twain, with a ſmal diſtance betweene the partitions & both of them inſerted into the ſame gut. And it carrieth mingled choler together vvith more pure, to ſtirre vp the faculty of the guts to auoyde the excrement after the Chylus is ſucked from them.

The cauſe of the laundiſe.

The vſe of choler in the guts.

Why the paſſage of the choler is ſo inſerted.

A third paſſage not perpetually foūd. There is alſo found ſometimes a third paſſage, inſerted into the bottom of the ſtomack, into which it powreth choller; and ſuch men doe continually vomit choller, and are called πικρόχολοι ἄνω, that is, purgers of choller vpward, as thoſe men who haue it at the end of the empty gut, are called πικροχολοι κάτω, that is, purgers of choller downward, and theſe men to ſtooles are alwayes bilious.

The vſe. The vſe of this bladder of gall is to receiue and expel yellow choler

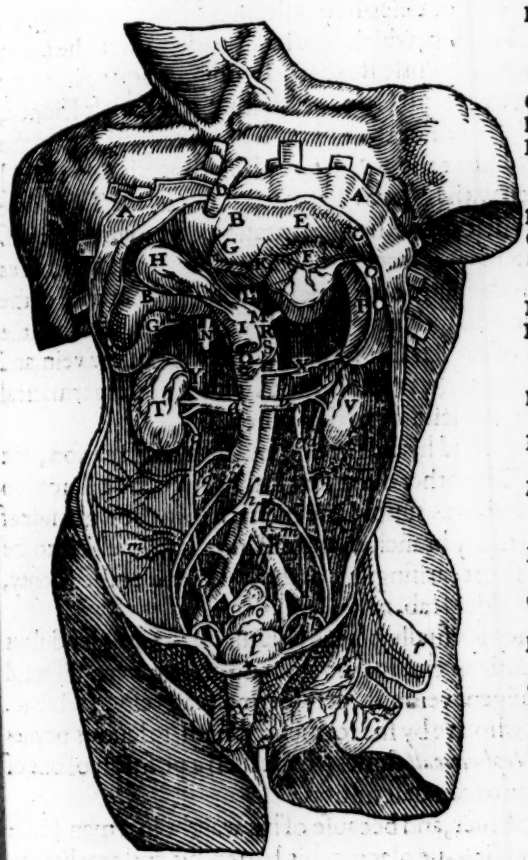
choller exactly ſincere vnmixt and familiar vnto it ſelfe immediately from the Liuer and ſo out of the whole body, which otherwiſe running at randon through all, would defile the ſpirits, raiſe a continuall vlcerous ſence his acrimony gnawing the fleſh and rending the membranes, cauſe all our motions to be head-ſtrong and giddy, our ſenſations phrenetick and mad; and beſide diuerſe other inconueniences would breed a continual Iaundiſe.

Of the Kidneyes. CHAP. XIIII.

THE Kidneyes are called *Renes* of a word which ſignifieth to flow, becauſe the vrine flowes away by them; and *νεφροὶ*, as it were Piſſers. All men and foure-footed beaſtes which beget by generation haue them, but no fowle or fiſh with ſcales, ſaue onely the Tortoyſe, ſaith *Ariſtotle* in his fourth book *de partibus animalium*; for their humour is ſpent into ſcales and feathers, and beſide The names.

The lower Belly emptied of the Membranes, Guttes, and Stomacke, together with many of the veſſelles which are therein.

TABVLA. XVII.



A A The midriffe turned backe with the ribs & the *Peritonæum*.
B B The caue or hollow part of the Liuer, for the liuer is lifted vppe, that the hollow part of it may be better ſeene.
C The left ligament of the liuer.
D The vmbilicall veine.
E The hollowneſſe in the Liuer, which giueth way to the ſtomacke.
F The left orifice of the ſtomack.
G G Certaine knubs or knots & impreſſions in the hollow part of the Liuer.
H The bladder of gal.
I The gate veine cutte off, and branches which go to the bladder of gall.
K A nerue of the Liuer comming from the ſtomachical nerue.
L An artery common to the Liuer and the bladder of gall.
M A nerue common alſo to the both, comming from the right *Coſtal* nerue of the ribs.
N The paſſage of the gall to the guts cut off
O O The hollow and forepart of the ſpleene.
P The Line where the veſſels of the ſpleene are implanted.
Q The trunk of the hollow veine
R The trunk of the great artery.
S The *Cœliacal* artery cut off.
T V The Kidneyes yet wrapped in their membrane.
X Y The fatty veines called *vena adiposa*.
a b The emulgent veines togither with the arteries vnder th m.
c c d d The vreter from either kidney to the bladder.
e f The ſpermaticall veines to the Teſticles, the right from the hol low veine, the left from the emulgent.
g g Veines comming frō the ſpermaticall veines to the *Peritonæū*.
h i The ſpermaticall arteries.
k The lower meſenterical artery.
l The aſcending of the great artery aboue the hollow veine, & the diuiſion of it & the hollowe veine into two trunks.
m The artery of the loynes, called *Lumbaris*.
n The holy artery called *ſacra*.
o A part of the right gut.
p The bladder of vrine.
* The connexion of the bladder, with the *Peritonæum*.
q A part of the veſſels which lead the ſeede from the teſticles, is here reflected.
r ſ The *ſcrotum* or codde, that is the skin which inueſteth the yarde and the teſticles.
t The fleſhy pannicle or membrane which is vnder the Cod.
u The coate which is proper to the teſticle with his veſſels.
x A part of the yarde excoriated or flayed, and hanging downe

they drinke little becauſe their longues are not ſo bloudy as other creatures are. The kidneyes haue ſeldome the ſame ſcite or poſition in men; and doe lye behinde the guttes and the ſtomacke, a little vnder the Liuer and Spleene [table 17. ᵒᵒ] cloſe vppon the backe, at the ſides of the hollow veine and the great Arterie [Table 17. ᵠ ʳ] yet not in an equall di- The ſituatiō.
ſtance (hauing their hollow partes turned toward one another) that they might more readily draw away the whay, that all the bloud that is receiued into the hollow veine, might be preſently purged and ſo carried pure, with a little water onely to weſt it, into the whole body.

For this watery humour, albe it be an excrement and no part can be nouriſhed with it, The vſe of yet is it very neceſſary as long as the nouriſhment is contayned in the veines of the meſen- the whay.
tery and the Liuer, that by the thinneſſe of this humour or whay being made fluxible, it might

might passe those straight veines, whereupon *Hippocrates* calleth it *vehiculum alimenti*, or the wester of the nourishment, as before is sayd. But when the bloud is gotten into the hollow veine, it then needeth not so much helpe, because it is to passe through large and patent passages, and beside is made of it selfe more fluxible by the heat of the heart and the Liuer.

Why placed one aboue another.

They often stand not one opposite to the other [table xx. and table 2. *lib.* 4.] least in their ioynt strife they should hinder one the others attraction, as *Galen* hath conceiued; but wee, sayeth *Bauhine*, imagine that the cause of this position is rather to bee attributed to the arising of the vessells [Table xx.^{h}] and properly of the emulgent or sucking veines, because their attraction is greater and of more vse. They lye with their flat sides vppon the muscles of the loynes which they call ψόας, appointed for the bending of the leg; about their heads not much lower then the lowest ribs, in those voyde spaces which are betwixt the rootes of the ribs and the hip-bones. They lie betweene the two membranes of the *Peritonæum*, one of which lyeth vnder them, the other vpon them; whence it is that in fits of the stone, the legge on that side where the stone lyeth is benummed, sayeth *Hippocrates*, because of the compression as well of the muscle we spake of before, as of a sinew which descendeth that way.

Their position.

An vncouth forme of the kidneyes obserued by *Bauhine. An.* 1589.

But before we proceede further in the particular description of the Kidneyes, giue mee leaue to insert a story out of *Bauhine*, wherein hee describeth a strange fashion and position of a Kidney, with all the vessels thereto belonging; which wee haue caused also to be cut in the following Table for thy better satisfaction, gentle Reader. In our publique Anatomy sayth he, *Anno Dom.* 1589. we found a very vncouth forme and scituation of a left Kidney, as also of the emulgent and spermaticall vessels: For the Kidney was placed iust vppon the diuision of the great Artery and hollow veine at the *os Sacrum* or holy-bone [table 18.^{de}] in that cauity wherein the bladder marked with [^{f}] was scituated; but in the Table wee haue remoued the Kidney a little from his place, that the implantation of the emulgent vessels might better be demonstrated: for there were three emulgent veines, and two arteries fastned into it. Two of these veines proceeding out of the middest of the trunke of the hollow vein [table 18. 6.6.] and descending directly downeward, were implanted into the right side. The third emulgent arising out of the left side [tab. 18.9.] of the hollow vein, and descending vnder the trunke of the great arterie, was a litle mixed with the left spermatical veine [table 18.16.] and after inserted into the left side of the kidney.

As for the emulgent Arteries, one of them had his beginning vnder the bifurcation, out of the right Iliacall branch [table 18.7.] The other did arise a little aboue the bifurcation out of the great artery; [table 18.8.] the first was simple and inserted into the right side of the Kidney; the second was diuided into many branches and did insinuate it selfe into the left side. So also the left vreter was very short, arising out of the lower end of the Kidney, [table 18.19.] and was inserted into the bladder [tab. 18.10.]

Finally, in that place where the left Kidney is vsually placed, Nature had set a glandulous and fat substance [table 18.^{c}] to which both an emulgent veine and arterie were disposed [table 18.4.5.] as also from the vpper emulgent veine, the left spermaticall veine [table 18. 4.] did arise. It may be that those men who are by fits tormented with grieuous paynes about the Holy-bone, and haue all the *Nephriticall* signes, haue such a position of one of their kidneyes as this was: now we returne to our description.

The seate of the right kidney.

The right Kidney lyeth iust vnder the Liuer, and because of his waight in a man [table xviii.] it is lower then the other Kidney, as if it gaue place to his better; his end reacheth to the third racke-bone of the loynes. It is very rarely higher then the left, and then onely when it is shorter, or when the part of the Liuer lying next it, is hollowed: they are also rarely of an equall height, because of the different position and quantity of the Liuer and Spleene; some also, adde because of the higher or lower beginning of the emulgent vessells.

Of the left.

On the left side, the Kidney lyeth vnder the Spleen, and is often (yet not alwayes) higher then the other, because there the Spleen is thin and slender; so that the Kidney ascendeth sometimes to the first racke-bone of the loynes, sometimes to the xi. of the breast; yet neuer is one so farre aboue the other, that the middle of the higher doth reach aboue the top of the lower. But in bruite beasts because of their groueling gate, and because their spleen reacheth further downeward the scituation of the Kidneyes is contrary; so that in Doggs there is a hollownesse or bosome made in the Liuer (which in a man hath neyther hollow-

ne

The firſt Figure ſheweth the diſpoſt of Nature in the ſeminary veſſels, the emulgents, and the poſition of the left Kidney, as wee met with it in a publicke Diſſection.

The ſecond Figure ſheweth the ſeminary veſſelles, with the Teſticles.

The third Figure ſheweth the diuers formes of the Teſticles, and their ſeuerall parts.

TABVLA. XVIII.

neſſe nor diuiſion) that the right Kidney might aſcend higher. Indeede the true cauſes of their diuerſe ſituation, are the different magnitude of the kidneyes, the different length of the veſſels, and their poſition either more or leſſe oblique. They are knit by the help of an externall Membrane ariſing from the Rim (which like a Ligament ſtayeth them firmely

The true cauſes of their diuers poſition.

Their connexion.

ly in their proper places) to the loyns, the *Diaphragma*, and the right to the blind gut, somtimes to the Liuer; the left to the Colon (whence it is that nephriticall paynes, that is, inflamations or other paynes of the Kidneyes become more grieuous by reason of aboundance of wind or excrements, & the collicke is often hardly distinguished from the paines of the Kidneyes) and to the spleene.

Their fibres. Beside the membrane aboue named, they haue also other fibres from the *Peritonæum* inserted into their gibbous part, which are happely those *Hippocrates* calleth Nerues, in his booke *de natura ossium*. They are also tyed by the emulgent vessels to the hollow veine and the great Arterie [table 17.[a b], tab. 2. *Lib.* 4.[m n], table 22.[h i].] Finally to the bladder it selfe by the vreters or passages of vrine, of which wee shall heare more by and by [table xvii.[d e k], table xxii.[d a e].]

Why two. The Kidneyes are two, because one would not haue beene sufficient for the euacuating of so great a quantity of waterish excrement, which is farre more aboundant then both the excrementitious chollers, yellow and blacke. By this meanes also there is a stronger attraction of serous bloud, and both sides draw alike; and if one happen to bee stopped with the stone or grauell or ought else, yet the worke of attraction standeth not, but the vrine is auoyded; (although *Archangelus* will not yeelde to this, because Nature hath created nothing against casualties;) whereas if there should bee but one (which is very rare) it must haue beene of necessity as big as both, because of the aboundance of this excrement, and so the body should not haue beene equally ballanced, vnlesse that one had beene seated in the very middest of the backe, iust vpon the hollow veine and great Artery, which scituation would haue hindered the free descent of bloud and spirits by compression. Wherefore Nature for one greater made two smaller, that neither the belly should bunch out, or the creature incline and hang too much to either side. It is also as rare to see three or foure, which when it hapneth they keepe not their ordinary conformation. *Eustachius* obserued three together, the right was naturall, the left had nothing like a Kidney, but onely the substance of a triangular form, and wanting an vreter, for the vreter proceeded out of the third which was almost foure square.

One would haue bin ewayed on one side.

The figure. The Figure of the Kidney is long and broad, yet broader aboue then below; before and behinde pressed somewhat flat, yet a little more rising before like a bean which therevpon we call a Kidney beane. On the outside (which they call the backe [table xxii. figure 1.[a].] of the Kidney) towarde the flankes gibbous or embowed and round: on the inside where they looke toward the hollow veine, partly gibbous and partly concauous; flatte or sadled, and as it were crooked into the forme of a line turned with a blunt angle, for such must it of necessity be, both for the admission of the vessels, and for the forming of the hollownes or cauities therein.

The magnitude of the kidneys. Their magnitude is proportionable to their office of purging the whaeye humor, although for the most part they are not of a like [table xxii. figure 1.] bignesse, nor their proportion answerable to the body; yet the greatest disproportion is in their longitude, which commonly equalleth foure rack-bones; but their breadth for the most part is but of three fingers, and the left is often shorter then the right.

The fat of the kidneys. About the kidneyes cleaueth fat plentifully [table 2. *Lib.* 4, [oo pp]] because it hath peculiar vessels by which it is nourished; so that in fat men they are almost all couered: the vse of which is to cherish the heate of the Kidneyes, least by reason of the continuall distillation of so great quantity of the vrine or whay, the heate by degrees languishing might at length be extinguished, & so al their action faile; and beside, least the vessels should be endangered by distention; wherefore in a man it is on the inner side of the Kidney layde as a soft bed or couch between the membrane compassing about the distribution of the vessels and the braunches of the vreters: in a Dogge betwixt the membrane which formeth the saddle side of the Kidney; besides, this fat with his smooth and slippery moysture dulleth the acrimony of the whay or vrine.

The vse of it.

The glandule of the kidney. There cleaueth to both the Kidneyes in the vpper part, where it regardeth the hollow veine, a glandule or kernell, the inuention or finding whereof is due to *Eustachius*, which sticketh fast to their outward membranes, so that oftentimes if a man take not heede in the taking out of the Kidneyes, he shall leaue it hanging to the membrane of the *Diaphragma*. This glandule somewhat answereth in substance and figure to the Kidneyes themselues, yet is often more flat and liker to a cake then to a kidney; as long it is as two fingers, as broad as one, of a moderate thicknesse; but they are not alwayes of an equall greatnes, but most com-

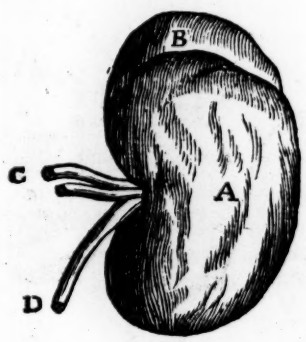
commonly the right is the larger. Among the new writers (ſome ſay) there are manie of them, but will not haue them to be found in euery body, but to bee engendred when the matter is too plentifull; but howſoeuer we haue the things, yet hitherto we want their vſe, or at leaſt the knowledge thereof. The vſe of theſe Glandules not yet knowne.

To this Glandule there is ſometime ſent a certaine Tendril from the hollow vein neere the Liuer, ſometimes it taketh it from the Veine which we call *Adiposa*, which goeth to the fat of the Kidneyes to nouriſh it, of which wee ſpake euen now: ſometimes it hath both Veines.

Table xix. ſheweth the Kidney of a man. The firſt figure the whole Kidney; with the Glandule ſet aboue it. The ſecond Figure ſheweth the Kidney Diſſected, that you may ſee the inward face of it.

TABVLA XIX.

FIG. I



A 1. The Kidney of a man whole.

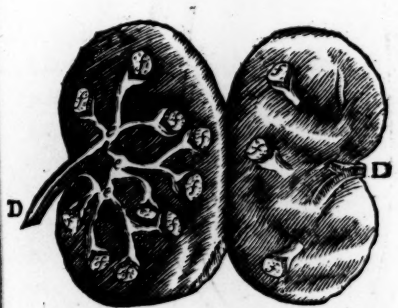
B 1, The Glandule placed vpon the Kidney.

C 1, The emulgent veine and Artery.

D 1,2. The Vreter.

eee 2. The Vreter open, and howe it parteth it ſelfe into the ſubſtance of the Kidneyes, as it were with many pipes.

FIG. II.



fff 2. Caruncles or teats, with very fine perforations, which opening into the foreſaide pipes of the Vreters, doe as it were through a fine ſtrainer paſſe the Vrine into them, to bee conueyed to the bladder.

The Kidnies are coueted with a doub'e Membrane, one outward, ariſing from the *Peritonæum* neere the lower part of the *Diaphragma*, where it is knit vnto the *Peritonæum*: this cleaueth not very ſtraightly to them [tab, 2, lib. 4 oo, pp] but they are as it were wrapped in it, whence it is called *fascia renum*, that is, the Kidneyes ſwathing band. This Membrane reyueth the *vena adiposa*, [table xvii, xy, table 2, lib. 4, 1h] and is rowled in plentifull fat, & ſerueth the Kidneyes inſtead of a couering, of a tye, and of a ſoft pillow or bolſter. The Membranes.

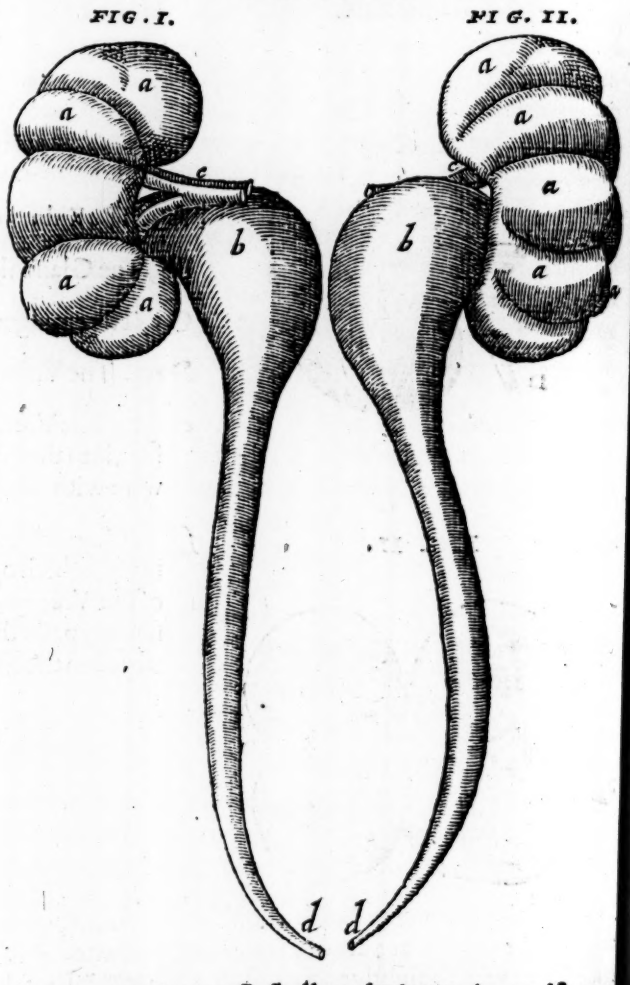
The other Membrane which is proper to the Kidnies is very thin, and produced out of the common coate that cõpaſſeth the veſſels (but dilated) and growes to them exceeding ſtrongly, ſo that it maketh their fleſh otherwiſe of it ſelfe firme, yet more faſt and compact. And although it make the outſide glib and ſhining yet it wanteth fat, neyther is it wouen with any veſſels. This accompanieth the veſſels, bent inward pierceth into their hollow-neſſe and compaſsing them round about, makes them more ſtrong.

The ſubſtance of the Kidnies [table xxi, figure 2] is a hard fleſh moſt like the heart, ſaue that it wanteth fibres, which yet the threds of the veines do ſupply. Faſt and compact that the inherent heate may more ſtrongly and eaſily draw that which was ſo neere (for to draw an excrement from farre, a looſe and laxe inſtrument is more meete) and expell it; and againe, leaſt the blood which is their nouriſhment ſhould ſlippe away with the vrine, which would come to paſſe if their fleſh had beene immoderately looſe, whereas now it is fitly Their ſubſtance.

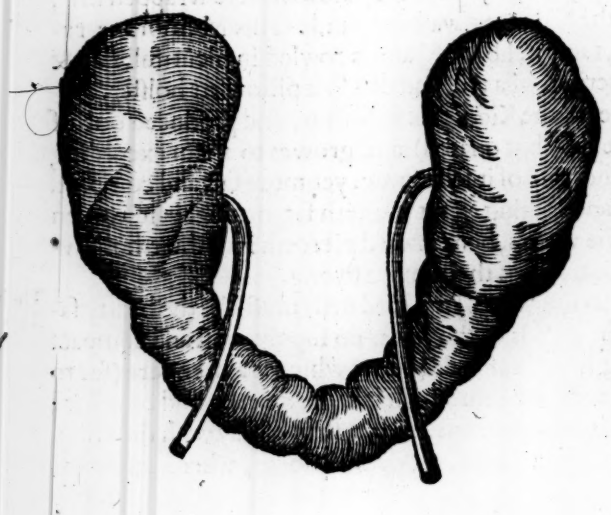
fitly reteyned, and hath time to bee diffuſed all ouer their ſubſtance. But on eyther ſide at the hollowneſſe [Tab, xxii, ee] where the emulgent veſſels are diuided into greater braunches, their ſubſtance is but looſe and vnequall, and is on the inſide perforated with paſſages running through it from the Nerues, where are obſerued certaine partes riſing ſomewhat from the fleſh, which in their ſubſtance, figure, and office do imitate the nature of glandules or kernels, whence ſome of the ancients haue eſteemed theſe parts of the kidneyes to bee Glandules. Without, his ſuperficies or face is like the Liuer ſmooth and glib: his colour duskiſh in a mans health, and not much vnlike a red Beane, ſeldome very red and ſhining. It is alſo very rare that a mans kindnies ſhould be outwardly vnequal, and made as it were of many kidnies or ſmall glandules like the Liuer of a Beare or Oxe, yet *Euſtathius* found

TABVLA XXI.

Fig. 1. ſheweth the foreſide of the right Kidney. Fig. 2. ſheweth the backſide.
a The body of the Kidney, conſiſting of eight lobes or partitions.
b The Vreter diſtended with Vrine.
c The emulgent veſſels.
d The lower part of the Vreter, fat narrower then it vſeth to be.



This Table ſheweth the figure of a Childs Kidney, which died the fourth day after it was borne, in the Hoſpitall of *Argentine*. The child was opened by Doctor *Iohannes Rodulphus Saltzmanus*. He did indeede ſucke, but auoided nothing either by ſtoole or Vrine. His guts were full of wind, but his Fundament was not perforated. His kidneys were by lines diſtinguiſhed into eight parts. His vreters wel ſtretched with water, but at the bladder they were ſo ſmal, that a ſmal probe could hardly without violence be entred into them, which being ſtuffed with ſlime, did ſtop the deſcent of the Vrine, ſo that in the bladder, there was nothing but a little of that ſlime: the kidnies were ſomewhat like the kidnies of an Ox.



It ſhall not be impertinent alſo, to annexe this ſtrange forme of the kidnies which *Bauhine* receiued from that excellent Philoſopher and Phyſitian, D. *Leonard Doldius*, the ordinary Phyſitian of the Citty of *Norinberge*. This kinde of Kidnies and Vreters was obſerued in the body of *Andrew Helm* of *Weiſſenfield*, who dyed at *Norinberge*, the 17. of October, in the year of our Redemption, 1602. and the ſixteenth of his life, hauing lyen long hurt of a blow he receyued in his belly aboue the groyne.

ſuch in two Infants, a Maide of a xi. yeares of age, and a Man at *Rome*. The formie of a kidney of that kind diſcouered in a young Childe by Doctor *Saltzmanus*, and by him ſent vnto *Bauhine*, we haue here a little before annexed.

The cauities of the kidneis.

They haue two *venters* or cauities, the outward and inward: the outward improperly ſo called [table xxii. [d]] which *Fallopius* calleth the Gate, is in the ſaddle ſide, where the kidney being like a bent bow returned at either end, it is moſt what diuided into three partes. The firſt is a bunch or prominence like a ſmal hillocke, at either end of which there is a boſome or cauity ending in another prominence before you come to their gibbous part. Into the corners of theſe boſomes the diuided veſſelles [table xxii. [lh]] doe offer themſelues thence to be diſperſed into the ſubſtance of the kidneyes, one branch into the vpper angle of one boſome, another into the lower angle of the other, out of which alſo the vreter proceedeth.

The veſſels.

The veſſels which are ſent vnto the kidneies are of all ſorts, Veines, Arteries & Nerues.

Veines. *Vena adiposa.*

The Veines proceede out of the hollow veine; one of them [table 17. [xy]] is that fatty vein whereof we haue ſpoken, and it is double; one on the right hand, and another on the left: The right iſſueth very rarely out of the trunk of the hollow veine, but moſt what out of the emulgent; the left alwayes out of the hollow veine, and is diuerſly diſtributed to his vtter coate to water or bedew the ſame; ſometimes alſo it offers a little branch to the glandule which we ſpake of adioyned to the kidney, which when it hath perforated it is againe conſumed in this coate of the kidney.

The Emulgent veines.

The other veine, of his office is called the emulgent or ſucker [table 17. [ab], table 22. [hi]] moſt commonly one on each ſide; for in the framing of theſe veſſels Nature often diuerſly diſports her ſelfe, ſo that they differ oftentimes not onely in ſeuerall bodies, but euen in the ſame.

Why the Emulgent is ſo great.

This emulgent is a notable veſſell, and the greateſt of all that ariſe out of the hollow veine; not that the Kidneyes ſtand in neede of ſo great ſtore of nouriſhment, but that the ſerous bloud may haue a free & expedite paſſage. It ariſeth ſeldom directly out of the trunk of the hollow vein, but is carried with an oblique but ſhort progreſſe downward, and being parted into 2. branches, is inſerted into the ſaddle ſide of the Kidney, carrying thither the ſerous or watery bloud out of the hollow veine. In theſe emulgents wee haue obſerued certaine values or floud-gates which hinder the recourſe of the whay or vrine into the hollow veine. With theſe is vnited a branch one or two of the veine *ſine pari* or without his fellow, (of which we ſhall entreate more fitly in another place) that there might be a conſent betweene the Kidneyes and the breaſt.

Whence the Emulgent ariſeth.

The values of the Emulgent

The arteries of the kidnies

Arteries it hath of each ſide one [table 17. vnder [ab], table 22. vnder [hi], table 18. character [3,5].] from the trunk of the great Arterie; great emulgents or ſuckers alſo, which do purge wateriſh moyſture plentifully contayned in the Arteries from the bloud, and withall doe allow heate to ouercome the cold of the Kidneyes, which *Galen* ſayth they acquired by the paſſage of the watery moyſture through them.

Their vſe.

Theſe veſſels firſt parted into two, do then get into the cauities of the Reynes & are preſently diuided, commonly into foure braunches, and ſo are diſſeminated diuerſly into the whole ſubſtance of the Kidneyes [table xxi. figure 1. [oo]] till at length they are ſo by degrees ſeuered by manifold partitions, that they become as ſmall as hayres; then they approach vnto the Caruncles which are *ſpongy* peeces of fleſh, through which the whay is filtered or ſtreyned.

Why the kidneis haue no particular veins to nouriſh them.

The Kidneyes needed no other third veine differing from theſe whereby they ſhould bee nouriſhed, becauſe they doe not draw a pure excrement as the bladders doe, which therefore needed particular veines to carry their nouriſhment; but theſe veſſelles being full of bloud as well as of whay, doe nouriſh the kidneyes with the bloud, and ſend away the whay to be auoyded.

The nerues of the kidneyes.

They haue nerues on either ſide from the ſtomachicall branch of the ſixt paire (whence comes the great conſent betweene the ſtomacke and the kidneyes, and the ſubuerſion of the ſtomacke, and frequent vomits in Nephriticall paſsions or diſeaſes of the kidneyes) which deſcend downeward to the rootes of the ſpondelles or racke-bones of the loynes; and are diſtributed into the proper membrane of the kidneyes. Moreouer from about the originall of the Arteries of the meſenterie, there doe proceede a fewe tendrils of ſinewes mingled together; part of which goe vnto the kidneyes and the glandules that lye vpon them, the other part together with the emulgent Arteries doe inſinuate themſelues into the hollowneſſe of the kidney, and are diſtributed through their ſubſtance. Hence it is

that Nephriticall patients haue not onely a certaine dull ſence of paine, but alſo moſt vehement torments in their kidneyes; not onely therefore becauſe their holes or dennes, as *Galen* ſayth, are not wide but narrow, and the kidneyes becauſe of the firmenes of their ſubſtance cannot be ſtretched as the bladder may, but eſpecially becauſe of theſe nerues diſtributed through their ſubſtance; notwithſtanding the paine of the ſtone is greater when it entreth into the vreter, both becauſe of his exquiſite ſence, as alſo becauſe of the ſtraightnes of the paſſage through which the ſtone falling, muſt needes teare it almoſt with ſtretching, which paine wee ſee not alwayes to follow thoſe whoſe paſſages are dilated by the often comming downe of ſtones.

Eſpecially.

The inner venter of the kidnies.

The inner venter or cauitie of the kidney, hath a hollowneſſe made of a ſinewey membrane which the emulgent veſſelles doe not produce, for they determine into exceeding hairy threds; but the vreters, which becomming firſt broade in the hollowneſſe [table 21. figure 1.ᵉ] of the kidneyes are the matter of it. At whoſe ſide on either part before the veſſels are diuided into leſſe braunches, the ſubſtance of the kidneyes appeareth looſe and vnequall (the Anatomiſts call it *Cauernoſa, ſpongiformis, eroſa*) when the fat that compaſſeth it about is diligently remoued.

The Vreters.

The vreters are diuided into great braunches, firſt double or treble (as in the next chapter ſhall appeare) and then into many others, not (after the manner of other veſſelles) ſtill leſſened into hairie threds, but broade in the end (ſo that a man may obſerue eight or ten branches like canels or pipes) that they may better receiue the Caruncles before ſpoken of. For thoſe Caruncles which are like ſmall glandules in the endes of all the veſſels (and of a paler colour becauſe they are of a harder fleſh then the reſt of the kidney) being produced out of the ſubſtance of the kidney, and ſomewhat ſharpe like vnto the nipples of breaſts, inſinuating themſelues into the ſaid veſſels in manner of a couer or ſtopple, doe ſtoppe them vp; which if they be cut according to their length, a man may obſerue in them certain furrowes and tunnelles as ſmall as hayres. Wherefore, being ſo finely bored that they will ſcarcely admit a haire; by them the whay or ſerous humour coloured with choler, is ſeparated from the bloud, and is inſenſiblie percolated or drayned into the pipes of the vreters or membranous tunnels (this is called the *Colatorie*) and gathered together in that common hollowneſſe, and thence is ſent downeward by the vreters into the bladder: it may bee theſe furrowie paſſages are hollowed in the ſubſtance of the kidney like as the holes in the nipples of the breaſts. And theſe ſpongie Caruncles had neede to be ſo finely bored, leaſt the bloud which together with the vrine and choler is drawne by the emulgents but for their proper nouriſhment, ſhould with them alſo paſſe away into the bladder (which we ſee ſometimes to happen and that without paine; when either the ſeparating or reteyning vertues of the kidneyes are decayed or thoſe ſmall paſſages widened) conſidering that this ſeparation is made not by concoction where Nature is her owne chooſer, but by transfuſion; although wee doe not deny but that theſe excrements do here receiue a kinde of elaboration though not a concoction.

The colatorie

The ſeparation of the whey is by transfuſion not by concoction.

How the kidnies are nouriſhed.

This bloud thus remayning behind, is as it were ſucked by the fleſh of the kidneyes, and is ſprinkled vpon it like a kinde of dew; from whence by degrees after the manner of a vapour it is ſcattered into his whole body, cleaueth, is vnited to it, and finally becommeth the nouriſhment of the kidneyes. But becauſe being ſo thin it nouriſheth but ſlenderly, it is continually and in great quantity drawne in, together with much vrine, which (the bloud remayning behinde) inſenſibly droppeth through thoſe Caruncles.

The triall of the truth in this diſcourſe of the paſſage of the vrine.

Theſe things, although they differ from the common opinion of ſome others, yet may they fitly be demonſtrated if you put a Probe into the veſſels as they enter in, and the vreter as it goeth out, and then make inciſion at the ſaddle ſide of the kidney; and yet much better & more elegantly are theſe paſſages ſhewed, if you ſeparate the fleſh of the kidney from his veſſelles; which ſeparation hath aboundantly ſatisfied vs in this point: and therefore we haue exhibited it in the xxi. Table and the firſt Figure.

But becauſe theſe things doe not ſo appeare in Dogges as we haue nowe ſaide, and yet young Students for want of Mens bodies are often faine to diſſect the kidneyes of Dogs: we thought it not amiſſe, here briefly to inſert the deſcription of Dogs kidneyes alſo.

The ſtructure therefore of a Dogges kidney delineated in the ſecond Figure of this 21. Table is on this manner.

The deſcription of a dogs kidnie.

The membrane immediatelie couering the kidney entreth into his cauity where it is reflected or returned and on both ſides ſpred abroad, like as is the membranous bodie from which

Fig. 1. *ſheweth the veſſelles of the Kidneyes ſeparated from the fleſh.* *Fig.* 2. *ſheweth the Kidnies Diſſected according vnto Veſalius. The firſt is the Kidney cut according to the length through the gibbous part, ſo as the ſlit reacheth vnto the ſecond* ſinus *or cauity of it, no part of the kidney taken away.*

The ſecond exhibiteth the Kidney where all the ſubſtance or partition which is called Septum renis *is ſliced away in a compaſſe, that the ſecond cauity may better appeare.*

The third ſheweth al the branches of the firſt cauity or ſinus, *the fleſh of the Kidney being quite taken away.*

Fig. 3. *expreſſeth the deuiſe of ſome men concerning the percolation or ſtreyning, of the whey, the firſt ſheweth the Kidney diſſected from the gibbous part toward the Hollow part, together with the* Cribrum *or Siue: the ſecond ſheweth the middle part of the Kidney.*

B B. The *ſinus* or cauitie into which the vrine is ſtreyned out of the firſt cauity.

C C. The cauity into which ſome think the veſſelles do powre the *ſerous* or whaey bloud.

DD. The ſubſtance of the kidney compaſsing this cauity round about.

E E. The *Draine* of the Kidney called *Colatorium*, or the Membrane perforated like a ſiue, through which the vrine paſſeth ſay ſome, together with the Choler that coloreth it out of the cauity marked with B, into the cauity marked with C.

F F. The Vreter which receyueth the vrine out of the ſecond Cauity, and leadeth it into the bladder.

which the Vreters do proceede. To this Membrane cleaueth the fat whereupon the diſtribution of the emulgents into the Kidnies doth leane, as vppon a pillow or boulſter for their ſecurity. It hath alſo many holes through which the veſſels enter into the Kidneyes. Next followeth that which is called *The Membranous body*, which is diuided into manie branches, and as a couer compaſſeth the veſſels, it maketh a cauity which conteyneth the veſſels and the fat.

Vpon this *Membranous body* lyeth the cauity of the Kidney, in the middeſt whereof hangeth a part of the ſubſtance of the Kidney regarding the gibbous ſide, differing in colour from the reſt, and wanting the Membranous couer before named. It is like a new Moone, and hangeth like a partition, ſo leaning vpon the *Membranous body*, that the cauities of the ſame Kidney ſeemeth to be double. But in the Kidney of a man there are no ſuch cauitie to be found, but the emulgent veſſels and the Vreters are diuided through his ſubſtance into many branches, and the cauities which are in the Kidneyes are wrought as it were out of them.

The vſe of the Kidneyes.

The vſe of the Kidneyes is to draw from the whole maſſe of bloode, as well that of the Veines, as that of the Arteries, the ſerous humour through the emulgent veſſels by a proper attractiue faculty ariſing from the ſimilitude of ſubſtance betweene it and the kidnies, and ſo to purge both kinds of the blood, arteriall and venall from that excrement. For thoſe parts which through large orificies do draw their conuenient and familiar iuice, cannot draw it pure, ſimple, & ſincere, but with the admixtion of ſome other of a diuers kind. Wherefore together with the Vrine is drawne both much moyſt and thin bloud out of the Liuer, and much yellow choler, which the bladder of Gall did not attract before. But the Vrine or whey by the force of the kidneyes is ſegregated from the blood in the very concoction of their Aliment, & beſide their attractiue faculty gathereth the blood into their ſubſtance for the nouriſhment of it; but the Vrine as an vnprofitable excrement, the expelling vertue ſtraineth through the furrowes or tunnels of the Caruncles (thorough which alſo the grauell paſſeth from the body of the Kidney together with the Vrine) into the membranous pipes of the Vreters: which vrine is gathered together in the greater hollowneſſe of the Vreters, and from them is ſent into the bladder, where againe it is kept a certaine time, and at length is expelled thence at our diſcretion through the Yard, the Sphincter-Muſcle being relaxed or looſened. The choler alſo paſſeth along with the vrine, from whence they haue their yellow tincture: for when the choler gaddeth vpward to the brain (as in phrenſies it is not very rare) then are the vrines very pale.

How the vrines are colored yellow.

Before *Veſalius* time it was a common receyued opinion, and reteyned yet by ſome, that in the Kidneyes there are two boſomes or cauities running according to their length; one higher, another lower, which are diſtinguiſhed by a tranſuerſe or ouerthwart Membrane perforated like a Siue which they call *Renis colatorium*; and that the emulgents did powre ſerous blood into the vpper cauity, and thence the choler and the vrine did paſſe through the fine ſearcing holes of the Membrane into the lower boſome; the blood remaining behinde becauſe of his thickneſſe. Out of the lower cauity yſſueth the Vreter, which receyueth the ſtreyned vrine, and conuaieth it into the bladder. The manner of which deduction of the vrine we haue expreſſed in the third Figure of the 21. Table. Thus.

The common opinio of the way of the vrine before *Veſalius* time.

The emulgent veſſels which powre the ſerous bloud into the firſt cauity at A. which is ſtrained through E into the lower cauity C. and then receiued by the Vreter which is marked with F. Afterward *Veſalius* (who counſelleth to Diſſect either a Dogges Kidneyes or a Goats, fearing to deale with a mans becauſe of the fat) and almoſt all before *Fallopius*, were of opinion, that the Kidneyes had two cauities, the one wouen of the extremities or ends of the emulgents which paſſe into the kidneyes. This texture is hollow like a Veſſell, and is diſtributed through the body of the Kidney, and at length diuided into a forepart & a backe part, each of which produceth ſixe, ſeauen, or more thick branches equally diſtant one from another, yet ſo that the fore moſt are vnited with the hindmoſt in the out-ſide where they make a circle, and ſo do agree together to make a cauity to receiue the ſerous blood. The other boſome or cauity is on the backe ſide, betwixt the branches of that *membranous* body. And this by the interpoſition of a part of the Kidney, is diuided into two parts, where it receyueth the whey diſtilling from the ſubſtance of the Kidney, and ſendeth it into the Vreters. This cauity in Diſſection is found moyſt, but without bloode, but the former is alwayes found full of blood, and this conceite is anſwerable to the Figure of the Dogs kidneyes. [Tab. 21, fig. 2] And thus much of the Kidneyes.

Veſalius opinion.

CHAP.

CHAP. XV. *Of the Vreters or paſſages of vrine.*

THE Vreters or vrine leaders or veſſels of Vrine, the Greekes call οὐρητῆρας, as a man ſhould ſay the piſſers. *Hippocrates de Glandulis* calleth them ἀχετοὺς or conduit pipes. They are two veſſels [Tab.xvii, c d. Tab: ii, lib.4.qq. Tab.xxii m n] on eyther ſide one (ſometimes, but ſeldome two or more, yet meeting in one before their inſertion) which lying vpon the Muſcles of the Loynes, and a little reflected or turned inward leaſt they ſhould make an oblique paſſage, doe deſcend betwixt the two Membranes of the *Peritonæum* or rimme of the belly vnto which they are knit, and ſo are ioyned to the bladder. [Table xxii, ⊥. Table xvi, char. 18, 20.] The Vreters. Their courſe.

Their figure is round, a palme long & of the bredth of a *ſtraw*; in thoſe that are much troubled with the ſtone dilated to the proportion of a ſmal gut; hollow & running aſide or obliquely like the letter *ſ*. In women broader then in men, but right and ſhort, and hence it is that they auoide ſtones with much leſſe pain then men. Their ſubſtance is properly white (whence ſome call them the *white veines*) without blood thicke and neruous, (whereupon other men call the *neruoſi canaliculi* or the neruous Tunnels) which makes them ſo ſtrong. Figure. Subſtance.

Table xxii: ſheweth the Kidneyes with the veſſels of vrine and of ſeede; a part of the Hollow veine and of the great Arterie, the Teſticles, the bladder, and the yard. The firſt figure ſheweth the fore-ſide, the ſecond the hinder ſide.

TABVLA XXII.

ff 1,2. the trunke of the Hollow veine.
gg 1 2. The trunk of the great artery.
hi, 1,2. the emulgent veine & artery.
kk 1,2. the right fatty veine.
l 1, the left fatty vein.
* *i*. the Cœliacall artery.
m n, 1,2. the vreters.
o p q, 1,2, the right ſpermatick veine which ariſeth neere *p*, the left neere *q*.
r 1, the place where the arteries of the ſeede do ariſe.
ſ 1,2. Smal branches diſtributed from the ſpermaticall veines to the *Peritonæum*.
t 1,2, the ſpiry bodden bodie, cald *Varicoſum vas pyramidale*.
u 1,2, the *Paraſtate* ot *Epididymis*.
x 1, the teſticle couered yet in his coate.
y 1,2, the place where the leading veſſell called *Vas deferens* doth ariſe.
α 1,2. the deſcent of the ſame leading veſſell.
β 1,2, The revolution of the ſame leading veſſell. *γ* 1 2, the paſſage of the ſame veſſel reflected like a re-current nerue. *δ* 2, the meeting of the ſame leading veſſels. *ε* 1,2, the bladder of Vrine, the firſt figure ſheweth it open, the ſecond ſheweth the back parts. *ζζ* 1, the ſmal bladders of ſeede opened. *ηη*, 2, the Glandules called *glandulæ proſtatæ*. *θ* 2, the ſphincter Muſcle of the bladder. 1,2, *ι*, the two bodies which make the ſubſtance of the yard. *κκ*, 1, the veſſels which go vnto the yard, and the necke of the bladder. *λ* 1, the paſſage which is common to the vrine and the ſeede, cut open. ⊥, the implantation of the vreters into the bladder.

This kinde of ſubſtance is found in nó other part of the bodie vnleſſe it be in the bladder, to whoſe inward ſubſtance they are verie like, and to which they are continuated; by reaſon of which ſubſtance and beſide, becauſe they may not be ſeuered from the bladder without breaking, whereas they may from the kidneys whole and ſound, it may be lawfull to ſay, that they haue their original from the bladder, althogh our great Ancients, *Hippocrates*, *Ariſtotle* and *Galen* haue taught otherwiſe, namely, that they ariſe from the Cauitie of the kidnies. This ſubſtance, gifted with oblique fibres for diſtinction ſake, if any man will ſay is the proper and peculiar coate of the veſſell, which a common membrane doth inueſt giuen him for further ſtrength from the *peritonæum*, we will not gaine ſay him.

Hip. de nat. ſœt. Ariſt. 2. Hiſt. Animal 4. Gal. 6. Epid. com. 5. text 4.

The proper coate of the veſſels.

But theſe vreters after they haue incompaſſed [Tab. 21. fig. 1.] the inward *venter* or cauitie of the kidnie and made 8. or 10. pipes, they paſſe out at the ſaddle ſide, or if you will rather ſay thus, when the vreter is gone into the kidnie (of a man not of a dog) becomming ſomewhat broader, it is diuided into three branches like the emulgents, and is diſtributed into the vpper, the lower, and the middle region of the kidnie, of which the vpper and lower are againe ſubdiuided each of them into 3. and the middle into two; theſe being ſhort & large haue broad ends, wherein euerie one of them receiue the glandule which we ſaid was like the nipple of a womans breaſt, ariſing out of the fleſh of the kidnies in the manner of a fleſhie ſtopple, that ſo through them the vrine might be ſtreined into euery one of the pipes or tunnels.

Their diuarication in the kidneyes.

Often many of theſe branches are perforated in the middle likewiſe, wheras in their vtter mouths they receiue a glandule alſo. They are implanted into the backward and loweſt part [Tab. 22. ☿.] of the bladder, (for their implantation could not be more commodious becauſe the bladder cleaueth to the right gut) not farre from the neck betwixt his two proper membranes hauing the diſtance of two fingers betweene them, and ſo with an oblique inſertion they pierce the cauitie of the bladder; but their paſſage or entrãce is very narrow; by which kind of inſertion the returne of the vrine toward the kidnies againe is foreletted. Some aſcribe this hinderance of the refluẽce of the vrine to certaine tranſverſe membranes like vnto values, or the *ſmall mẽbranes of chaffe or husks of corne*, or like the leather latches of bellowes, litle differing from the ſubſtance of the bladder and placed vpon the inſertions of the vreters, whoſe office alſo it is to giue place to the vrine when it flowes into the bladder & to hinder it from returning, either when the bladder is diſtended or in the compreſſion of the belly, by ſtopping the orificies of the vreters; & trulie thoſe orificies are ſo cloſe ſhut vp, that when children blow a hogs bladder and tie it ſtreight at the necke, not ſo much as the aire can be preſſed out. Wherefore *Galen* ſpeaking of theſe paſſages, breaketh out into an admiration of the wiſedome and prouidence of our Creator, whereof he taketh this, and iuſtly to, to be a great document or argument.

Their implantation into the bladder.

The reaſon of this implantation.

In 6. Epid. com. 5. text 4.

Their veſſels.

Their veſſels are very hairie and fine, their veines and arteries they haue from the neighbor parts. Their nerues from the ſixt paire or coniugation and from the marrow of the loynes, whence comes their exquiſite ſenſe and ſo exquiſite paine, when either the ſtone is in them or paſſeth away by the flankes.

The vſe of the vreters.

Their vſe is, that in their channels the vrine together with a chollericke excrement ſeuered from the blood by the power of the kidnies, might paſſe into the bladder which is far diſtant from them, and placed as a ciſterne in the loweſt part of the of the *Abdomen*, they are alſo thought to giue to the vrine a kinde of alteration; but more manifeſt it is that they do good ſeruice in freeing the kidnies from the burden of grauell, or of the ſtone to which all ages and ſexes are very prone and ſubiect.

CHAP. XVI. *Of the Bladder.*

The bladder.

THe bladder of vrine called in Greeke *κύστις* of a word that ſignifieth to hide, becauſe it hideth the vrine, is ſeated in the *hypogaſtrium*, which therefore we cal the watercourſe, in that hollownes [Table vi. lib. ii. ".tab. ii. g. tab. ii. lib. iv. ☿.] which is made by the holy bone, the hip bones and the ſhare bones meeting together, all which cauitie is taken vp by the bladder (for it is a large ciſtern or veſſell) and the right gut, cloſe to which the necke of the bladder lieth connected or faſtened. In women the bladder lieth betweene the wombe [Tab. vi. lib. 4. T. ſheweth the bladder, L the wombe, but Tab. xxvii. of this booke / ſhewes the bladder and p the womb,] and the ſhare bone, as well becauſe the draining veſſels for the excrements of aliment are

The ſcituatiõ.

moſt

moſt conueniently placed in the lower parts for their eaſier euacuation, as alſo becauſe of the entrails ſeruing for nouriſhmēt, that thoſe which are the moſt noble might haue the vp-place. Theſe bones alſo are ordained for defence of a part ſo verie neceſſarie, and of ſo exquiſite ſenſe, albeit the cauity which they make, was made for other vſes, of which wee will heare more heereafter. His ſeate is betweene the two coates of the *Peritonæum* which make as it were a particular *venter* (whence haply it was that *Diocles* diuided the bodie into the head, the cheſt, the belly, and the bladder) vnder the Share-bone when it is empty; and in Diſſection it can ſcarſely bee found at the firſt view, for it exceedeth not the greatnes of a reaſonable peare, but when it is full it is ſtretched out into the hollowneſſe of the very belly, and may be felt aboue the groine.

Between the two coates of the *Peritonæum*. *Diocles.*

The bottome and the fore-part are tyed to the *Peritonæum*, [Tab. vi, lib 2, I. Table 2, ª] but looſely by two ties. The firſt is a Ligament [Table vi, lib 2, ᵇ. Table 2, 1. Table xxiii, fig. 7. 8. γγ.] originally ariſing from [tab. xxiii. fig. 7. 8. ᵠ] his bottome and carried to the nauill, [ta. xxiii. fig. 7. 8. r.] which they cal *Vrachus* in the infant. And this ligament is faſtened to the middle of the bladder. The other tie is of two vmbilical [tab. vi. lib. 2. ª ᵈ, tab. 2. k l. tab. xxiii. fig. 7. 8. x.] arteries dryed, that when a man goes vpright, it might fall vpon his owne necke and ſo hinder his execretion. In dogges the bottome of it groweth not to the *Peritonæum*, but hangeth by a certaine proceſſe, moreouer in them it is very white, ſmoth at the bottome and ſlipperie, as it is alſo on the inſide [tab. xxii. fig. 1. ᵉ.] and lined ouer with a wateriſh humour.

The conneꝛion.

His figure is long, a little round, [tab. xxii. fig. 3. 7. 8. fig. 2. ᵉ tab. 23. ᵠ] which ſome haue likned to a ſphere, ſome to a gourd; for if it were round as a bowle is roūd, it wold be too much preſſed by the parts that lie about it. It is hollow that it might receiue a great quantitie of liquor & frō a large bottom by degrees growing narrower it endeth in a ſtreight neck, wherfore the parts of the bladder are two, the body and the necke. The ſubſtance of it is partly membranous or neruous, both for the commodious extēſion becauſe it is often to be filled & to conteine the vrine, that we might not alwayes be conſtrained, but within conuenient time to yeeld it forth; and for his corrugation or knitting vp together after euacuation: Partly alſo the ſubſtance is fleſhie. It hath three membrances, one common and two proper. The common is the vtter and is from the *Peritonæum*, a ſtrong and thicke one, wherewith it is couered ouer and ſtrengthened, that though it be diſtended with aboundance of water it ſhould not be broken or rent; by this alſo it is tyed in men to the right gut, and in women to the necke [Tab. xxvii. ᵗ is the necke of the bladder inſerted into the necke of the wombe aboue the priuities at u; Tab. viii. lib. 4. fig. 1. o. the neck of the bladder, and fig. 3. ᵉ the necke of the bladder, and ᵈ the neck of the wombe] of the matrix or wombe, and to the bones of the hippes which are next vnto it.

The figure. The part of the bladder. The ſubſtance The mem-branes 3. One com-mon.

The two proper membranes ioyned together are nowe thicker now thinner, as they are diſtended or anguſtated or ſtreightned; which in the vppermoſt part of the bottome and about the necke becauſe of the inſertion of the vreters are harder and thicker. The inner of theſe is tranſparent, very white, thinne, neruous, wouen exceeding thicke with all kind of neruous fibres, as alſo are all other membranes which ſtand in neede to be much diſtended and contracted. The right fibres are inmoſt, the tranſuerſe outmoſt, the oblique in the middle according to the order of the functions as they ſay of attraction, retention and expulſion; which wee ſay are ordayned for the better conteyning and expelling of the vrine.

Two proper. The fibres of the inner mē-brane.

This inner membrane if the bladder be a little blowne, may be ſeparated from the vtter. But that this fine membrane be not hurt by the acrimonie of the vrine becauſe it is of exquiſite ſenſe, the inner cauitie of his bottome is rugous and ful of folds and plights, and mucous or ſlimie, (ſome ſay this ſlime is a kind of *Fibrous* ſubſtance) or rather it is defended with a cruſty coate engendered of the excrements of the third concoction of the bladder. The vtter of the proper membranes is thicker, ſprinkled with fleſhy fibres, yet not red as are the fibres in the muſcles, but whitiſh ſuch as appeare in the coates of the ſtomacke, and the guts: ſuch they ſeeme becauſe they are placed betweene white membranes: although ſometimes by affluxion or affluence of blood they become ſo conſpicuous, that a man would ſay it were a fleſhy membrane.

The vſe of the fibres.

It hath theſe fibres as well for the preſeruation not onely of the heate which otherwiſe would bee very weake; but alſo of the vrine from falling by the fibres of the inner membranes much diſtended in repletion: ſo, that theſe fibres being contracted or drawn toward

their

their originall by like little Muſcles; by ſtrengthening the bladder, which by the helpe of theſe knits it ſelfe together, it might exclude or ſhut out euen the leaſt thinges conteyned therein.

The paſſage. It hath three holes or perforated paſſages, two in the backward and lower part a little before it end in the necke, where the inſertion of the Vreters [Tab:xxii,fig: 1,4, Tab. viii, figure 1,"] betwixt the two proper coates, by which the Vrine driuen downe from the kidneyes, is of it owne accord powred into it, not by reſudation or ſweating through, but by open paſſages. [Tab:viii,lib.4.fig.1 ᴺ] To which (that the Vrine might not recoile or flow backe, no por the very winde when the bladder is diſtended) beſide the oblique inſertion

Tab.xxiii.demonſtrateth the Muſcles of the yard, of the Fundament and of the Bladder, and the three bodies of the yard.
The firſt and ſecond Figures ſhew the yard excoriated, cleauing yet to the bottome of the ſhare bone.
The third ſheweth the ſame ſeparated with his Veſſels.
The fourth and fifth, the yarde cut away, and Diſſected ouerthwart.
The ſixt, the Canell or pipe of the yard, diuided at the entrance into the bladder.
The ſeauenth, the fore-part of the bladder and the yarde, together with the vmbilicall veſſels.
The eight figure ſheweth the bladder of a woman with the vmbilicall veſſels, and a part of the vreters.
The ninth ſheweth the backe parts of the bodies of the yard.

Y 7,8. The nauell or *vmbilicus.*
Z, 7,8. The vmbilicall veine.
a a 7. The veine and artery of the yard.
b 5. The Artery diſtributed through the body of the yard.

of the Vreters, there is ſet on either ſide a ſmal Membrane or value, after the maner of the leather larches of Bellowes; but this is an improper acceptation of a Value.

The outlet of the bladder. The third paſſage or the outlet of the bladder, yeeldeth way vnto the vrine, and is in the necke which is long enough, but ſtraight, conueyed vnder the Share-bones, and placed vnder the ſubſtances or bodies of the Yard, and therefore a little crooked, and is carried

ed vpward from the Fundament vnto the beginning of the virile Member, to make his pipe or hollow Canell, and common paſſage.

In women this outlet is ſhorter [Table xxiii, fig:8.about ᴺ] and broader [Table xxvii, ᵗ] carried right downeward, and is inſerted into the necke of the Matrixe at the vtter and vpper end. Through this paſſage women auoide their vrine; men both their vrine and their ſeede, therefore men haue behind it [Tab.xxii, fig:2, ⁿⁿ, Tab:xxiii, fig:3,7, ᵏ] two Glandules placed, called by *Galen proſtatæ*, thicke and white, receyuing the inſertion of the Veſſels, which leade the ſeede called *vaſa deferentia*. *Gal.16.vſu part.cap.9.*

The necke of the bladder is moſt what fleſhy wouen with many Fibres, ſome right vnder which lye hid tranſuerſe alſo, which are placed at the beginning of this neck aboue the ſaide Glandules, and do contract it ſo, that the Vrine cannot drop out againſt our willes in any compreſsion of the *Abdomen*, and ſtrong retention of the breath; wherefore from the vſe it is called the Sphincter Muſcle, and from the Figure of the Greeke Letter *ſigma, ſigmoides*. Theſe Fibres being looſened not without a voluntary and ſtrong compreſsion of the Muſcles of the *Abdomen* and the *Diaphragma*, the vrine eyther by his quantity or quality and acrimony prouoking the bladder, is with contention or ſtriſe piſſed forth: for if the vrine runne againſt our will, and without feeling, it is becauſe the Muſcle is either paralyticall, or too much cooled. But if this compreſsion of the vpper parts againe do ceaſe, the Fibres are contracted, and ſo the drops or remainders that continue yet in the paſſage are expelled. The necke of the bladder. The ſimilitude of the bladder.

If any man would ſee this tranſuerſe Muſcle lying betweene the right Fibres of the vtter coate and adioyned to the body of the glandules, hee muſt boyle the bladder lightly, or as we ſay parboyle it.

Furthermore below the glandules there are to be ſeen certaine tranſuerſe fibres encompaſsing [table xxii. figure 2 θ, table xxiii. figure 3. 7.8.9. ᴺ] the canale or paſſage which Anatomiſts haue hitherto ſhewed for the ſphincter. But if theſe were ſo, then ſeede coulde neuer paſſe without the vrine, as it hapneth in the *Gonorrhæa* or running of the Reines; for in the accompanying of a man with a woman, *the muſcle in this part muſt needes bee dilated*, which being ſo, the vrine together with the ſeede muſt needes fall away, as it commeth to paſſe in them that want the vpper ſphincter.

His veſſels are veines, arteries, and ſinewes; the veines and arteries are on both hands at the ſides of the necke, that they might not be carried farre without a conuoy, and might bee alſo ſafely inſerted; and are doubly diuided; one part of them is diſtributed into the whole bladder with many ſmall threds. The other part which is the greater in man becauſe of the yarde, and the leſſer in women is carried downeward according to the deſcent of the necke. The veines ſerue for his nutrition, for it is not nouriſhed with vrine, neither doth it as the Kidneyes receiue any portion of bloud with the vrine, but onely the pure excrement, and therefore ſtands in need of proper veines for his nouriſhment. The Arteries ſerue for the recreation and refreſhment of the life and heate: both of them proceede from the doubly diuided *Hypogaſtricall* braunch [table 8. ᵘᵘ] of the hollow veine and great Arterie: wherefore in the inflamation of the bladder the inner ankle veine is to be opened, but in women they ariſe from the veſſels which come vnto the necke of the Matrix. The veſſels of the bladder. Veines. Arteries. A good obſeruation.

It hath notable Nerues from the branches of the ſixt coniugation which reach to the rootes of the ribs and from the marrow of the holy-bone, that the ſence of excretion might bee ſtirred vp at thoſe thinges which moleſt it; whence alſo come thoſe exceeding ſharpe paines that a man ſuffers when it is vlcerated, or but raw Nerues.

His vſe is to receiue like a bottle not only the vrine, which is the excrement of the moiſt Aliment, by degrees ſtrayned through the Kidneyes and brought downe by the vreters; but alſo all dry excrements of which the ſtone is ingendered; which excrements the bladder doth not draw downe, but they are partly put downe by the kidneyes, partly they fall with their owne waight and of their owne accord, whence ſome call it the vrinall of the body. It alſo by conſtriction of the paſſage keepeth the water till a fit time of excretion, which it doth with a faculty mixed, that is partly Naturall and partly Animall, but the retention belongeth more properly to the Animall faculty, and the expulſion or excretion to the Naturall. The vſe of the bladder.

CHAP.

Of the Fundament. CHAP. XVII.

3. muſcles of the Fundament.

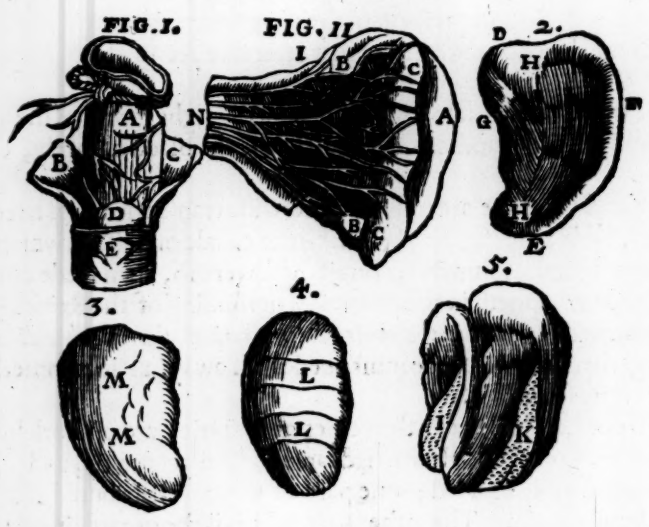
NExt to the Bladder lyeth the Fundament called in Latin *Podex* and *anus*, in Greeke πρωκτὸς ἢ ἄρχων. It is the end of the right gut [table 6. Figure ii, iii, a] and hath belonging to it three muſcles.

1. Sphincter.

The firſt is called the Sphincter [table 24. Figure 1. a] a round muſcle (whence it is called alſo the *Ringe*) cõpaſſing about the end of the right gut to hinder the exiture of the excrements: for it ſhutteth the paſſage ſo cloſe that not ſo much as any winde can get out. This affordeth a beginning [table 23. figure 1 2. M] to the muſcles [table 23. Figure 1, N 1] of the yarde. The other two muſcles are cal-

The firſt Figure ſheweth a part of the right gut, with his Muſcles cut from the body, which par *wen we take away the guts, wee vſe to leaue.*

TABVLA XXIII.



A. A part of the right gut, about which a ſtring is tyed.

BC. Two Muſcles drawing vp the fundament after excretion.

D. A Muſculous ſubſtance which groweth to the roote of the yarde, but in women it ioineth to the very lower part of their lap.

E The Sphincter or round Muſcle of the Fundament.

2. 3. *Leuatores.*

led *Leuatores ani* [table 6. Figure 2. 3. b c table 24. figure 1. a c] the lifters of the fundament. They are inſerted into the vtter coate of the gut, and into the vpper part of the ſphincter, [table 24. figure 1. a] and grow alſo to the roote of the yarde and the necke of the wombe. [table 24. Figure 1. D.] Their vſe is after excretion to retract the Fundament, and if they be weakned, men are conſtrayned to vſe their fingers to doe that office; but becauſe we ſhall ſpeake more of theſe muſcles in another place, this at this time ſhall bee ſufficient.

The Muſcles and Nerues ſcituated in the cauitie of the lower Belly. CHAP. XVIII.

BEſide the Muſcles of the *Abdomen* mentioned and but mentioned in the ninth Chapter of the ſecond Booke, and the muſcles of the Fundament named in the former Chapter, there are alſo other muſcles appearing in the lower belly when the parts aboue named are remoued. And thoſe are two paires lying vpon the ſpondels or rack-bones. The firſt is the ſixt muſcle mouing the thigh or the firſt of his *benders*, they are called in Greeke ψοαι, in Latine *Lumbales*. The ſecond is the ſeauenth mouing the thigh or the ſecond of his *benders*, and it is called *Iliacus internus* the inward flanke Muſcle, of which wee ſhall heare more in the hiſtory of the muſcles of the thigh.

Lumbales.
Iliacus internus

Latiſſimus.
Quadratus.
Obturator internus.

At the ſides of the loynes on either hand is a portion of the broade muſcle called *Latiſſimus*, which draweth the arme backeward and downeward, vnder which lyeth the ſquare muſcle called *Quadratus*, which is the firſt muſcle of the back. But in the very denne or cauity it ſelfe is the muſcle of the thigh, according to *Veſalius*, called *obturator internus*, and it is

is the ſecond muſcle of thoſe that turne the thigh about.

There are alſo two ſorts of nerues diſperſed through the lower belly. Some proceeding from the ſixt paire of the marrow of the braine, from which are diſtributed branches to all the entralles herein contayned, of which wee haue ſpoken particularly in the particular hiſtorie, yet their production and continuation ſhall bee better inſiſted vppon afterward. Other ſinewes there are ariſing from the marrow of the backe, as it is contayned in the racke-bones of the Loynes and the holy-bone; wherfore theſe nerues are of 2. ſorts, ſome of the loyns others of the holy-bone: Of the loynes ſometimes foure ſometimes fiue paire, of the holy-bone alwayes fiue payre, of which we ſhall entreate in their proper place.

The nerues of the lower belly.
2. kinds of the loynes of the Holy-bone.
Of the loynes 4. or 5. paire.
Of the Holy-bone 5. paire.

The Bones of the lower Belly. CHAP. XIX.

THE Bones which together with the fleſhy partes doe make the lower Belly, although they compaſſe not the belly round about as the other two Regions are compaſſed, yet are there ſome of them on his back part, ſome on his ſides, and ſome before. On the pack part are the Loynes, the Holy-bone, and the Rumpe.

Of the Loynes there are fiue rack-bones [table 25. Figure 1, 2, from [b] to [c]] which are knit together with Cartilages and thicke ligaments, and aboue are tyed with the ſpondels [table 25. Figure 2.[a]] of the Cheſt, below they reſt vpon the Holy-bone. [table 25. figure 1,2.[c].] The firſt of theſe Loyne racks is called νεφρίτης from the Kidneyes which leane vppon it, the laſt ſome haue called ὑποκλίτης, that is the Vnder-propper.

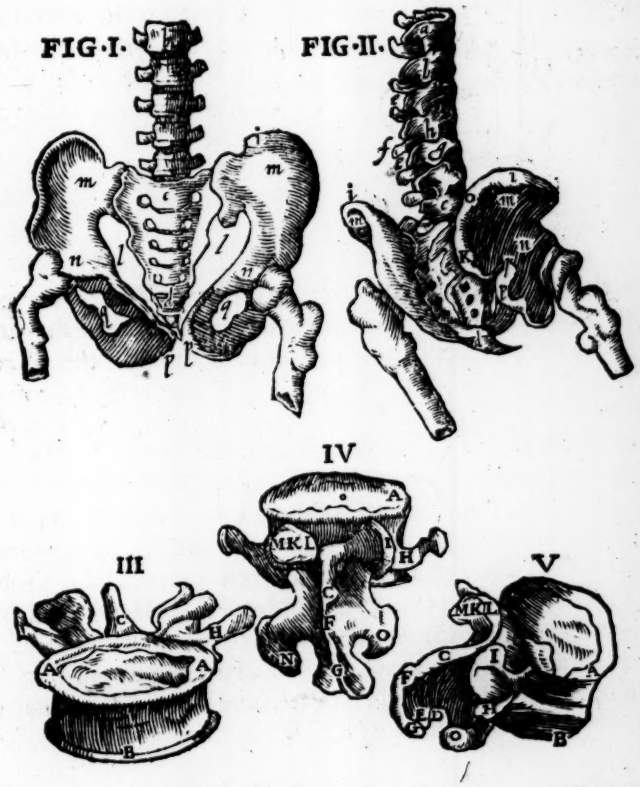
The bones on the back part.
Lumborum vertebræ.
νεφρίτης
ὑποκλίτης.
Their proceſſes

They haue aſcendent proceſſes [table 25. figure, 4,5,] deſcendent [table 25. Figure 4.[N]] and tranſuerſe, [table 25. Figure 2,[e e] Figure 3,4,5,[N]] the ſharp end of which they call the ſpine [table 25. Fig. 3,4,5.[c D].]

The Spine.

The firſt figure ſheweth the fore-part of the Bones of the lower Belly. The ſecond figure, the back-part. The third, fourth, and fift ſhew one of the fiue racke-bones of the Loynes, the third the fore-part, the fourth the backe-part, and the fift the ſide.

TABVLA. XXV.



The Holy-bone called ἱερὸν & πλατὺ, that is, the broad bone, is made of ſixe ſpondels [tab, xxv, Figure ii. from [c] to [d], table xxvi. Figure 6. from [A] to [P].]

Os ſacrum.

The Rumpe bone called κόκκυξ, or *os Coccygis* [tab. xxv. Figure 1,2, [d], table 26, Fig. 8,9.] it conſiſteth of three or foure bones [table 26. Fig, 6, 7, from [o] to [K]] and two griſtles; one, where it is ioyned to the Holy-bone [table 26, Figure 6, 7, [a]] the other at his end or beake, [table xxvi, Figure 7, [c]] ſometimes alſo between his firſt and ſecond bone,

Os Coccygis.

At the ſides of the lower belly there are twoe bones, whoſe vpper and broader parts committed to the Holy-bone, [table xxvi. Fig, 13. [A B CC DD]] are called *oſſa Ilium*; [table xxv, Figure 1.[mm], table 26, Figure 13. aboue T at ſ] the hanch bone, and their circumference is called *Spina oſſis Ilii.* [table 25, Figure 1, 2, [ii], table 26. 13. [K L M N].] The lower and vtter parts of theſe bones are called *oſſa Coxendicis* [table 25., Figure 1.[nn] tab, 26,

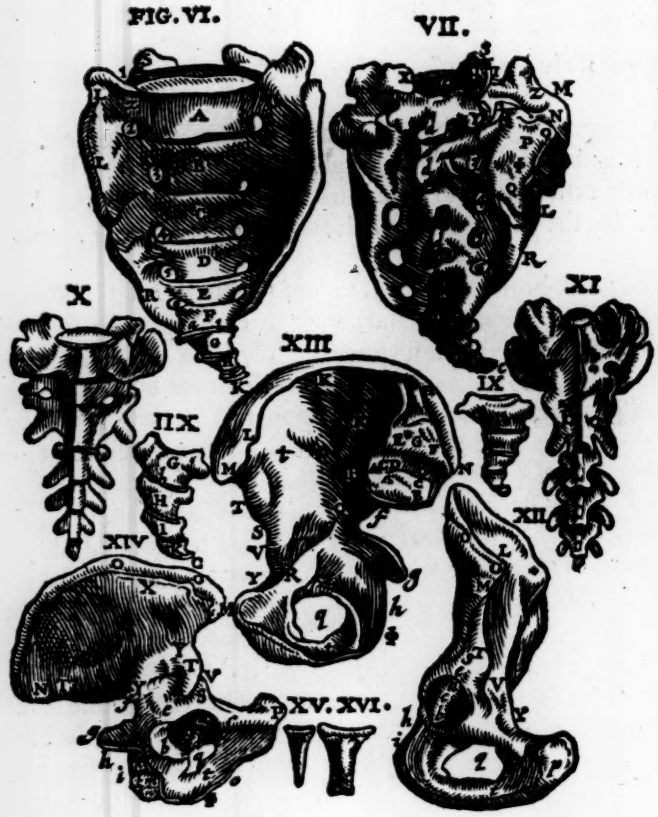
Figure

The ſixt Figure ſheweth the fore-part of the Holy bone, together with the rumpe bone. The ſeuenth figure the back part. The eight the rumpe of a man. The ix. the rumpe of a woman. The x. and xi. the fore-part and back-part of the Holy & rump bones of an Ape. The xii. the foreſide, the xiii, the inſide, the xiiii, the outſide of the great haunchbone, the xv the griſtle betwixt the ſhare bones of a man, the xvi. *the ſame in a Woman.*

TABVLA XXVI.



Os pubiet.

Peluis.

Fig. xiii, below [r] and [f] vnto [R] and [P]] or the Hippe bone, which hath in it a notable boxe or cup [table xxvi, fig 12,14, [a b c]] whereinto the head of the thigh is copulated.

Finally, the bones in the fore-part of the lower belly are called *Oſſa pubis*, [Tab: xxv, fig. 1,2, [pp]. Tab: xxvi, Fig: xiii, xiiii. that which is below [R] and [φ]] the Share-bones; they are tyed together in the middeſt of the ſhare with a Cartilage [tab. xxvi, Figure. xv,] they are very thinne, and haue the greateſt perforation of the whole body. [Table xxv. fig 1,2, [qq]. Table xxvi, fig, xii, xiii, xiiii, [q]] Theſe bones, together with the Holy bone, make that *peluis* or Diſh which conteyneth part of the guts, the bladder, and the wombe, marked in the xxv. & [Table in the firſt figure.

Of all which, wee haue heere giuen you but a view, reſeruing the fuller Diſcourſe vnto our Booke of Bones.

CHAP. XX. *Of the Breſts or Paps.*

The reaſon why the Diſcourſe of the breſts is here placed.

ALthough the breſts or paps are not conteyned in the lower Venter or compas of the *Abdomen*, yet as before the Gullet, ſo now theſe, becauſe they be parts which ſerue chiefly for nouriſhment, wee haue thought this place fitteſt for their hiſtory. But becauſe there is nothing ſo much vſe of them in men as in women, therefore we will firſt intreat of the breaſtes or paps of women, and then of men.

Their Names

The Breaſts therefore are called in Latine *Mammæ*, in Greeke by *Hippocrater* μαζὸς, by *Ariſtotle* μασὸι of μασίνω, which ſignifieth to ſeeke, becauſe in them Infants ſeeke their nouriſhment euen by a naturall inſtinct: *Galen* cals them τιτθὸι.

What Creatures haue Breaſts.

No creatures haue paps but ſuch as can beget a perfect creature. And amongſt thoſe that haue them, none haue them ſet afore in the middeſt of their Cheſt but onely a man, and indeede this place is moſt fit for them. For being made for the milke ſake which they containe, it behooued they ſhould be ſeated in that place where ſooneſt and with moſt eaſe, becauſe of the neighbour-hoode of the heart which is the ſhop of heate, the blood might be altred and laboured thereinto; and where alſo the greateſt quantity of the benigne and pleaſant ſuperfluity of the noriſhment may be gathered.

The ſituatiõ.

Moreouer, this ſcituation ſerueth alſo for more convenient ſuckling. For becauſe the infant cannot go, it is neceſſary that it ſhould bee embraced in the handes and armes of the Nurſe; being ſo embraced it can apply it ſelfe to no place ſo fitly as to this; & out of doubt our wiſe Creator by this poſition of the breſts did ſet a marke of diſtinction betweene man

and

and beast, for beasts do onely nourish their young, but afterwards neglect them: but men doe transfuse out of their heart into their young ones στοργήν, that is a naturall affection, which the Latines hauing not beene able shortly to expresse, haue called Pious loue, or pietie. For the Mother doth not onely nourish her Infants, but embraceth them and kisseth them; and so loue being neuer forgotten, at length growes reciprocall and mutuall. But least the heauy breasts should flagge downe too lowe because a woman goes alwaies vpright, they are knit and tyed by their whole *basis* or bottome to the bony part of the chest. They are two, (euen as the whole body almost is diuided into two partes) that like good handmaides they might serue their dame the wombe, which it selfe is as it were parted into two; for the Milke doth not come vnto the brests, till the infant be throughly perfected. And that if there be two Infants, yet they may both at once haue wherewith to satisfy and nourish them; and therefore those creatures which accustomably bring forth more young, haue also more dugges to suckle them with. But if there had beene but one fastened to the middle of the Chest, neyther would the blood haue gotten so well to it, because it should haue had one continuated bone vnder it which we call the breast-bone; and beside the infant could not haue bin so handsomly applyed vnto it.

The piety of parents.

Why two.

Why not one

Their forme is somewhat round, they are hardish, and are seuered asunder by a middle distance, and in virgins before they be fit to conceyue they are imperfect, so that scarse any thing appeares of them but Nipples; but as they grow fitter and fitter for conception, they begin to strut out, become hard and like pleasant Apples, whereupon *Aristophanes* calles them μῆλα. They represent as it were a halfe bowle, and when they arise two fingers high, then commonly the monthly courses begin to flow. In women that haue neuer conceiued, they remaine knit and as it were gathered vp, but they grow as the belly and infant in those that be with childe. When the Infant is perfect and that the time of deliuerance draweth neere, they swell proportionably as much as the wombe: for there is great consent betweene them by the mediation of vessels, as we shall heare afterward. This consent appeareth, when the infant in the wombe either is not well, (for if it be weake, the breasts are full of milke before their time, sayth *Hippocrates*) or perisheth. Neyther is it maruell, seeing their officies haue so great affinity, for the wombe was made to receiue the seede, and to perfect the creature, and the breasts to nourish it, being brought into the worlde. Also when the infant begins to moue, then beginne they to rise, and the nipples to strut: and moreouer the infant is lodged on that side where the brest growes greater, whether it bee the right or the left.

Their Figure.

Their magnitude.

Howe the Breasts shew the weakneſse of the Infant.

In fat folke they are greater, and in some because of their great weight they hang lowe downe, as it is common among the women of *Ireland*, who neuer vse to tye vp their brests. In some they grow euen to a monstrous greatnesse as long as they giue sucke and fal afterward. In olde women they be long and flaccid or loose, so that in extreame age the Kernels and the fat being consumed, onely the skin and the nipples do remaine; sometimes, in such people they are knit wrinkingly vpward.

Irish women haue long and flagging Breasts.

The parts of the breastes are externall or internall: without, they are cloathed with the Slough or Cuticle and the true skin, in the middle is the nipple, of which afterward: the internal, are the fleshy Membrane or panicle, the vessels, the kernelly substance and the Fat. The Membrane inuesteth their glandulous substance and their fat and knitteth them vnto the Muscles vnderneath by certaine Fibres sent thorough their substance, betweene which Membrane and the skin are the vessels, the Glandules or Kernels and the fat dispersed.

The parts of the Breasts.

Their Vessels are two sorts of veines [table 27, αβ.] The first are *cutanious* proceeding from the branch of the Axillarie & Humerarie veins which often look very blew, especially in women with child and in nurses, and are distributed into the skinne of the Chest and into the breasts. Their inward veines are about the rootes, which doe not arise from the trunk of the hollow veine at the *Diaphragma*, but when the hollow veine hath first attained to the heart and thence to the coller or patell bones, it lendeth two braunches accompanied with two Arteries downward through the whole Chest, and two veines from them are inserted into the Paps, which therefore go so long a iourney that in them the bloud might be perfectly boyled; for as it goeth vpward it passeth by the heart, and againe defcending it is mooued and wrought by the motion of the *Thorax* or Chest which helpeth his more perfect concoction; and these are called the *Mammarie* or Pap-veines and Arteries.

Their vessels.

Their outward Veynes.

Their inward Veynes.

The *Mammarie* descending veine commonly ariseth one on each side from the trunke of the veine called *sub clauia*, that is, the veine vnder the coller-bones which are called *cla-*

The mammarie Veyne.

ues or *clauiculæ*, and is carried vnder the breast-bone close by the gristles of the ribs, & getting out of the Chest, is vnder the right muscles of the *Abdomen* about the nauell inoculated by *Anastomosis* with the *Epigastricke* veine (which ariseth from the same braunch with those which are propagated to the matrix and the necke thereof) which creepeth vpward vnder the right muscles with certaine small tendrils. From the *Mammarie* veine betwixt the fourth and the fift ribbes, sometimes higher sometimes lower, there are sent certaine outward boughes through the middle spaces of the Cartilages which ioyne the ribs to the breast bone; in men for the nourishing of the interior muscles; but in women (in whome sometimes they perforate the very breast-bone it selfe) both for the nourishment of those muscles, as also to carry the matter of the Milke to the glandules of the breasts in those that giue sucke and to nourish the breastes, for through them an infinite number of webs of veines are deriued, which nature hath endowed with faculty of Milke-making. By these vesselles sayeth *Bauhine* (although others are of other minds) is made the consent betweene the wombe and the breasts (which is so great that onely contrectation of them wil prouoke lust) which are by them ioyned as it were together, so that when the Infant groweth in the wombe, certaine common veines arising from them both doe affoord it nourishment; and when the Infant is born, that attraction of bloud ceasing which was strong whilst the Infant remayned in the wombe, all the ouerplus of bloud floweth towardes the breasts, and the breasts like cupping glasses doe draw and pul it backward and from below. For *Hippocrates* sayth. The Milk commeth from the wombe to the breastes, which after the birth is to be the nourishment of the Infant; and when the woman hath brought forth, the beginning of the motion being once made, that is, if she haue once giuen sucke; the Milk is carried with full streame to the breasts. And this it doth not only voluntarily, but the Paps draw more bloud then their nourishment requireth: which traction or drawing is caused by the Infants sucking, by the amplitude of the vesselles, by the motion of the Pappes, and for the auoyding of vacuity or emptinesse: for the veines being exhausted by sucking, doe draw bloud into themselues on euery side.

The *Anastomosis* of the mammary veines with the *Epigastrick*

The consent betweene the wombe and the breasts.

The milk cometh from the womb to the breasts.

How it is that the breasts draw more bloud then is needfull for their owne nourishment.

Hence it is that a woman cannot well at the same time haue her courses and giue sucke, and *Hippocrates* sayth that milke is German Cousen to the menstruous blood. But to speak as the thing is; the bloud is not carried to the Pappes so much by reason of this consent of vessels, as that when the motion of the bloud from the whole body to the wombe ceaseth, then the whole body exonerateth or emptieth it selfe into the glandules of the breastes. Wherefore their substance like that of a sponge is very rare or porous, that they might be able to receiue the greater quantity of liquor.

Why a milk nurse hath not her courses.

The mammary arteries.

The nerues of the breasts.

There are also internall Mammarie Arteries from the vpper trunke of the great Artery, which doe accompany the veines and are ioyned with some branches of the ascendent *Epigastricks*. It hath nerues from the sinewes of the Chest which are carried through the skinne partly to the nipples; but the thicker nerue is that which commeth to the nipple from the first nerue of the Chest, and doeth communicate thereto exquisite sence, and is the cause of the pleasure conceiued by their contrectation.

The *Glandules* of the breasts.

The Glandules or Kernels (which they call in Latin *mamillæ* or *mammæ*, or rather glandulous bodies) which make the body [table 27.♪,] or bulke of the Pap, are the greatest of the whole body, white, and do not as in most of the other creatures make one body, but are many and distinct, spongious and rare or porous that they might better drawe the Aliment vnto them and conuert it into milke; of these one is the greatest, placed vnder the nipple, and about it are set all the other small ones which cleaue to the muscles of the *Thorax* or Chest.

Among these are infinite vesselles with many windings and turnings wouen together, that the bloud before in the veines and arteries perfected & receiued by the breasts, might in these boughts and turnings through the glandulous bodies, bee conuerted into milke, which is a surplusage of profitable Aliment.

The small outlets of the breasts.

These Glandules in Virgins are hard, in women with Child especially such as haue giuen suck when they are ful of milke they strut more, afterward they grow flacced and loose, and are as it were consumed. About these is a certaine fat disposed, that it might cherish the heate of the vessels and glandules and also make the breasts equall. But that the milke that is ingendered in the breasts might better passe out, the breastes are foreward acuminated or sharpned, and that it might not runne at wast but the Infant get it out by sucking, they haue exceeding narrow and straight outlets which are perceiued when the breast head

ε ε The Mammarie veſſelles deſcending from the Patell bones vnder the breſt bone.

is preſſed that the Milke ſpinneth out, but eſpecially when the Nipples are vlcerated in a woman that giueth ſucke. And becauſe the childe cannot take holde of the Pap it ſelfe to ſucke out of it, therfore Nature hath prouided the nipples to ſtand out, as it were the heads and teates of the breaſtes, which the Infant may encloſe with his lips, and lap his tongue about them, and ſo draw the Milke through the outlet or paſſage. But leaſt this nipple or teate ſhould euer and anon ſlip out of the childs mouth, it is made rough and rugous, and more vnequall then the reſt of the skin. The Nipples. Why rugged.

Plato calleth it θηλὴ of θάλλειν to bud forth, in *Latine Papilla*, becauſe it is like a *Papula*, that is, a pimple, whelke, or wheale. It is of a fungous or Mozy ſubſtance, ſomewhat like that of the yard, whence it is that by touching or ſucking it groweth ſtiffe, and after will againe grow more flaccid or looſe. In virgins this teate ſtandeth not much out from the breſt, & is red and vnequall, very like a ſtrew-bery; in Nurſes, becauſe of the childes ſucking, it groweth longer and blewer: in old folkes it is long and blackiſh.

About this teate is a circle, called in Latine *Areola*, in Greeke φῶς, we know no Engliſh name it hath, vnleſſe we call it the ring of the Pap, but in Virgins it is pale or whitiſh, in women with childe and nurſes it is duskiſh, in olde women blacke, and the skin more rugous and vnequall. The circle of the Teate.

From the diſeaſe of the Wombe it is alſo ſometimes yellow, ſometimes blacke. For *Hippocrates* ſaith, a man may iudge of the wombe by the colour of the Nipples, for if the nipple or his ring which was wont to be red grow pale, then is the womb affected. The colour of the nipples and the ring about them is alſo often made duskiſh and black by ſetting drawing glaſſes, drawing heades or ſuch like vppon them to make them ſtand out that the Infant may take them, which may notwithſtanding bee preuented if care be had. A good note for women. The euill euent of drawing glaſſes to the Nipples.

The proper vſe of the breaſts, is to be a Magazine or Store-houſe of meate for the Mothers owne childe, or, that in them ſo long milke ſhould bee generated, as the Infant for his The vſe of the breaſts.

nouriſhment ſhould ſtand in neede of it. For whereas it was accuſtomed in the wombe to be nouriſhed by the Mothers blood conueyed vnto it by the vmbilicall veines, it cannot ſo ſuddenly change that liquid for more ſolid nouriſhment, for it could not digeſt it, becauſe when it is newe borne, it is but tender and weake; beſide ſudden changes are very daungerous, wherefore it had neede of ſuch a nouriſhment, as ſhould not be too remote from the nature of blood: and that it might more eaſily bee nouriſhed, ſhould alſo bee liquid, ſweete, and after a ſort familiar vnto it; but ſuch is milke which is made in the breſts. For ſo in growne men and women, the Aliments are in the ſtomacke turned into Chylus, which is a Creame or ſubſtance like vnto Milke. Wherefore according to *Galen*, the firſt and chiefe vſe of the breſts, is the generation of Milke, that they may be aſhamed, who for nicity and delicacie do forfeite this principal vſe of theſe excellent parts, and make them onely ſtales or bauds of luſt.

A Secondary vſe of them, is in reſpect of their ſcituation, that they might be a kinde of couering and defence for the heart, and that themſelues hauing receyued heate and cherriſhment from the heart, might again returne vnto it warmth, ſuch as we get by garments we buckle about vs; eſpecially this vſe is manifeſt in women, in whom theſe breaſts growe oftentimes into a great maſſe or waight, ſo as they being farre colder then men, their Entrals vnder the *Hypochondria* are warmed by them. It may alſo be added, that they are giuen for ornament of the Cheſt, and for a mans pleaſure, as is partly touched before.

Note this. *Hippocrates* in his booke *de Glandulis* addeth another vſe of the Pappes, that is to receiue excrementitious moyſture: for if ſayeth *Hippocrates* any diſeaſe or other euent, take away a womans Pappes, her voyce becommeth ſhriller, ſhe proueth a great ſpitter, and is much troubled with payne in her head.

The Paps of Men. And thus much of the Pappes of women. Now men likewiſe haue Paps by Nature allowed them, ſcituated alſo in the middle of the breaſt, and lying vpon the firſt muſcle of the arme called *Pectoralis*. They are two, a right and a left, but they riſe little aboue the skinne (as they doe in women) becauſe they haue ſcarcely any Glandules, for they were not ordayned to conuert or conteine milke. Yet we do not deny but in them is generated a humour like to milke, which *Ariſtotle* in the xii. booke of his hiſtorie of Creatures cals Milk, but it will not at all nouriſh, albeit we haue ſeene it in ſome men ſomething plentifull.

What humor is in them.

Their compoſition. The Pappes of Men are compounded of skin, fat, and nipples, which appeare yea ſometimes hang forth in them becauſe of the abundant fat which in corpulent bodies is more about that place then in any part of the Cheſt beſide: the nipples of men are ſomewhat fungous and alſo perforated.

They haue Veines, Arteries, and Nerues, for their nouriſhment, life and ſence.

Their Vſes. Their vſe is to defend the heart as with a Target or Buckler; or it may bee ſayed, that they are giuen for ornament, that the breaſt ſhould not be without ſome repreſentation in it. The Nipples are the Center in which the veines and nerues doe determine, which alſo are therein conioyned.

And heere we will put an end to the Hiſtory of Parts belonging to Nutrition or Nouriſhment, and proſecute our intent to diſcuſſe the Controuerſies and Queſtions which may ariſe concerning them.

THE

A Dilucidation or Expoſition of the Contouerſies concerning the parts belonging to Nutrition

QVESTION I.

Whether the Guttes haue any common Attractiue faculty.

THE Phyſitians of old time haue beene at great difference among themſelues, whether the Guttes haue onely an expulſiue faculty, or all thoſe foure which ſerue as Hand-maydes to Nouriſhment, the Drawing, Reteyning, Aſsimulating, and Expelling. The occaſion of the ſtrife was giuen by certaine places of the Greekes and Arabians which were of doubtful conſtruction; for ſometimes they acknowledge thoſe foure faculties, ſometimes deny them. Our purpoſe is to skanne and fan this queſtion as near as we can, beginning our diſputation at the Attractiue or drawing faculty. But becauſe wee would not be puzled in the equiuocall or want way betwixt a Faculty and Action: it ſhall not bee amiſſe to ſticke downe ſome ſtakes, to lay ſome foundations for our better direction: ſuch are theſe.

Two kinds of actions. Common or officiall.

Of Actions ſome are Common or Officiall, others Priuate or peculiar. The common actions were ordained either for the behoofe of the whole, or at leaſt for more partes then one. So the Liuer doeth ſanguifie the Aliment, not for his owne vſe alone, but for the nouriſhment of the whole body. The Heart and the Braine doe ingender Vitall and Animall ſpirits, to giue life and ſence to the whole man; not onely for their owne particular and priuate vſe. The ſtomacke chylifieth the meate, not for it ſelfe (though it take ſome pleaſure in it) but for the Liuer. The Spleene, the Bladder of Gall, and the Kidneyes, do not draw the melancholy iuyce, the fiery choler, and the whaey vrine for their owne nouriſhment, but to depurate and cleanſe the Liuer and maſſe of bloud: wherefore theſe Actions are called Officiall, becauſe they ſerue and miniſter vnto many.

Priuate or particular.

Priuate Actions or peculiar, are ſuch as ſerue onely for the conſeruation of priuate and peculiar partes. So the Stomacke beſide his Chylification hath alſo a particular Action whereby it intendeth his owne proper nouriſhment, drawing, reteyning and concocting bloud familiar vnto it ſelfe and expelling the reliques of the ſame. Theſe things are ſo notoriouſly knowne to all men that they neede no curious demonſtation.

There is no need of fibres to the performance of priuate actions.

Another foundation to be layde is this: that for peculiar and priuate Traction and expulſion, there is no neede of the helpe of fibres, but onely for the common and officiall; becauſe the priuate is accompliſhed alwayes without locall motion, but the common with it either alwayes or for the moſt part. Bones, Griſtles, and Ligaments, doe draw and expell without any contraction of fibres; for who euer obſerued them to moue in their traction? But as the Load-ſtone although it moue not, by an inbred and occult proprietie draweth yron; and plants which ſticke immoueably in the earth, doe ſuck and draw out of the ſame earth a iuyce familiar vnto their nature: after the ſame manner the particular and ſingular partes of the body out of the maſſe of bloud by a proprietie of their owne, doe draw and drinke into themſelues a proper and peculiar nouriſhment. But the common and officiall traction or expulſion, becauſe they are almoſt alwayes made with locall motion doe therefore ſtand in need of the help of fibres. So the motion of the hart although it be naturall, yet is not accompliſhed without the helpe of fibres, for in his *diaſtole* or diſtention, it draweth by right fibres blood through the hollow veine into the right ventricle and ayre by the veynall Artery into the left; againe by the tranſverſe it expelleth ſpirits, blood and fumed vapors. In like manner the wombe by right fibres draweth the ſeed of man, and by tranſuerſe is contracted for the excluſion or birth of the Infant.

The ſtate of the queſtion.

These foundations being layde, the ſtate of the queſtion ſtandeth thus. When it is demanded whether the Guttes haue any attractiue facultie, wee doe not enquire about the priuate and peculiar Attraction of the guttes for that is beyond controuerſie, conſidering that life is ſuſtained by nutrition, which is alwaies accompanied by thoſe foure in-bred faculties, Attraction, Retention, Concoction, and Expulſion; but the queſtion is concerning a common or official Traction, that is, whether the Guts haue power of drawing the Chylus from the ſtomacke. We thinke they haue not, and *Galen* fauoureth alſo our opinion; for in his bookes of the *vſe of Parts*, he ſayeth, *The Guttes ſtand not in neede of an attractiue facultie*, and againe, *The Guttes hauing no neede either to draw or to reteyne becauſe their motion is ſimple, haue alſo but ſimple Fibres*; and in another place euery Gutte hath in each coate circular fibres, *For they are contracted onely but draw nothing*; the ſame alſo hee auerreth in his 6. booke *de Locis affectis*.

Galen.

There is no common Tractiue faculty in the guts.

3 *de nat. facult.*

Obiection.

But you will ſay, if the Guts draw not the Chylus, what power or faculty is it which bringeth the ſame vnto them? Doth the ſtomack driue out of it ſelfe ſo profitable an Aliment? We anſwere, *Galens* meaning is, that the Chylus is boyled in the ſtomack, and that the *Pylorus* or lower mouth all the time of concoction is cloſely ſhut vp, that nothing either thicke or thinne may be able to paſſe away before it be concocted, leuigated and perfectly laboured. When this concoction is throughly celebrated, then is the ſtomack delighted with the Chylus, imbraceth it a while, as being now become familiar vnto it; afterward Nature in a wonderfull prouidence openeth a certaine ſmall membrane, and then the Chylus as it were an ouerplus or ſuperfluitie, is driuen forth and falleth into the guts; in whoſe boughts and circles while it maketh ſtay, the thinner part like vnto creame is ſucked away by the veines of the meſenterie; but the thicker by his waight falleth vnto the great guts, and by the circular fibres is thruſt forth. Such is *Galens* true and ſound Philoſophy concerning this queſtion, whereby we are taught that the Chylus is not *drawne* by the guts, but *driuen* into them by the ſtomacke.

Galen expounded.

The opinion of late writers.

Notwithſtanding there want not many among the late writers, who perſwade themſelues that the guts, eſpecially the ſmall ones, haue this common Tractiue faculty inherent in them, and I am perſwaded that they build their opinion vppon the authoritie and ſome light reaſons of the Arabians. *Auicen* writeth that the Chylus falleth from the ſtomacke into the guts, by the helpe and aſsiſtance of two faculties; one expulſiue of the ſtomacke, and another attractiue of the guts; and this alſo he repeateth in his thirteenth booke *de Animalibus*.

Auicen Fen. 1. primi.

Their reaſons.

To this authoritie they adde a threefold reaſon: Firſt, no man will deny but all the parts do draw a familiar iuyce vnto themſelues. Now, the Chylus, ſay they, is the familiar Aliment of the guttes, by which they are nouriſhed as the ſtomacke is. Againe, if the Chylus be onely driuen out or excluded by the ſtomacke, then is that motion violent; but it is abſurd that nouriſhment ſhould be made by force or violence, for then it would not endure; the nouriſhment therefore is drawne, not driuen. Laſtly, the guttes haue right fibres extended in their length and thoſe we know are onely prepared by Nature where traction is neceſſarie as being their proper worke.

Anſwer to the arguments.

But thoſe arguments are ſo ſleight and triuiall as a nouice may ſee their weakneſſe as he runnes. For, firſt wee may not admit of that *paradox* which they obtrude concerning the nouriſhment of the guttes and the ſtomacke; for indeede the ſtomacke is not nouriſhed by the Chylus, but only delighted with his preſence, otherwiſe, for his nouriſhment, it draweth bloud by the *Gaſtricke* and *Coronarie* veines, which alſo it aſsimulateth as in due place we ſhall proue. And for the guttes neither are they nouriſhed by the Chylus, but by bloud which is brought vnto them by the meſaraick veines; the guts therefore draw not the Chylus for their nouriſhment. Whereas they ſay that the motion of the ſtomacke driuing out the Chylus is violent, I thinke they are farre out of the way; it is rather Naturall becauſe it followeth his contraction; againſt which the naturall forme of the Aliment, that is, his grauitie or waight doth not repugne.

Laſtly, we altogether deny that which they affirme concerning right fibres, for in either coate of the guts there is onely one kinde of fibres and thoſe circular; and if any right Fibres do appeare, yet is it not in the ſmall guts which conteine the Chylus, but onely in the laſt which is called the *right gut*, in which the excrements are reſerued for immediate euacuation.

But let vs grant, that in both the coates of the guts there are right Fibres, yet it follow-

eth

eth not that there is any ſuch drawing faculty as they dreame of, for right Fibres are not alwayes ordained for traction. And this *Galen* doth excellently declare in his fourth booke of the vſe of parts, where he ſaith, *That the right gut onely hath right Fibres allowed it, not for traction, but for preſeruation of the tranſuerſe.* For it was to be feared, leaſt the circular Fibres ſhould ſeparate or be drawne aſunder, vnleſſe on the outſide they had been ſtrengthned by right, as it were by bands or ties; ſo the Coates of the Veines haue right Fibres not for attraction, but onely *ad ſuendum* as wee ſay, that is to hinder an inconuenience. So Chyrurgions for the better reteyning in their due place circular bands, do ſtrengthen them with right Ties or Deligations. And thus much ſhall be ſufficient to haue ſaide concerning the attraction of the guts.

Right fibres are not onely ordained for traction. *Galen.*

QVEST. II. *Whether the Guts haue any common Retentiue Faculty.*

THE authorities of *Galen* aboue alledged do prooue but one facultie of the guts, to wit, the Expulſiue; yet there are ſome which ſtriue out of *Galen* him ſelfe to prooue common and officiall-Retentiue and Concocting Faculties alſo. Concerning the Retentiue we will firſt ſee and then of the other. *Galen* diſcourſing about the nature and cauſes of the *Lienterie* (a diſeaſe wherein the meat is auoyded whole and vndigeſted as it was eaten, without any notable alteration) referres it to the weakeneſſe of the retentiue vertue; not of the proper Aliment that is of bloud, but of the Chylus contayned; the ſame alſo doth *Auicen* determine. Moreouer *Galen 3. de ſymptomat. cauſis* ſayeth, that the concoctiue facultie in Children is ſtronger, but the retentiue and expulſiue weaker, becauſe they haue tender bellies, or doe oftentimes vnburden nature; now thoſe things that are auoyded are contayned in the guts, the retentiue facultie therefore of the guttes is the weaker.

Concerning the retentiue faculty of the guts. Arguments to proue it. *Galen. Auicen. Com. ad Aphor. 22. ſect. 3. ad Aphor. 12. ſect. 4. ad Aphor. 1. ſect. 6. ad Sent. 53. ſect. 3. lib. 3. Epid.* alſo *1. de Criſib. 22. Fer. tract. 5. c. 5.*

Againe in his booke of experienced medicines he preſcribeth ſtipticke or binding medicaments for the fluxe of the belly, to roborate or ſtrengthen the vertue of the guttes; and wee in the *diarrhœa* doe apply outward ſtrengthening and aſtringent things. Adde hereto that moſt men are ſomewhat bound rather then ſoluble, the cauſe of which aſtriction they referre vnto the ſtrength of the retentiue vertue, out of *Galens* commentarie vppon the xx. *Aphoriſme* of the ſecond ſection. Laſtly the retention of the Chylus and of the excrement is neceſſary; of the Chylus, that the Aliments ſhould not ſuddenly ſlip away and wee thereby become ſlaues to our inſatiable throates and paunches; of the excrements, leſt we ſhould be conſtrayned continually and vnſeaſonably to auoyde them.

Galen.

The former arguments anſwered.

Theſe and ſuch like things they propound, to teach that there is ſome force and power in the guttes to reteine the Chylus and the excrements, which becauſe they ſeeme to bee very ſtrange, and abhorring from the determinations of *Galen* and the ancient Phyſitians, it ſhall not be amiſſe to make interpretation of *Galens* wordes. The *Lienterie* is a diſeaſe not of the guttes but of the ſtomacke, and it is a *ſymptome* in the ouer haſty egeſtion or expulſion of meates ſcarcely at all altered or changed; for *Galen* thus defineth the *Lienterie*, *When the meate is auoided by the ſiedge not at all altered or concocted*; and therefore they doe ill that call it a *leuitie* or ſmoothneſſe of the guttes, becauſe it may be ſometime when they are rough, being an affection of the ſtomacke onely and not of the guts; for although they be ſmooth and ſlippery, yet if the ſtomacke doe ſufficiently boyle the Aliment, wee are neuer troubled with the *Lienterie*, becauſe the nature of it conſiſteth *In the priuation of the firſt concoction*, which is celebrated in the ſtomacke, and in a heady or ſodaine egeſtion; wherefore they conclude amiſſe that the *Lienterie* proceedeth from the weakneſſe of the retentiue facultie of the guttes, for that *Galen* conceiteth not; who diſcuſsing the cauſes thereof, referres them to the diſtemper of the ſtomacke diſſoluing the ſtrength of all his faculties, and to a light and ſuperficiall exulceration, whereby that commeth to paſſe in the ſtomacke prouoked by the *Lienterie*, which hapneth in the bladder through the ſtrangurie. It is true that the diſtemper of the guts do alſo breed a *Lienterie*, but not at the firſt hand, vnleſſe the ſtomacke alſo doe ſympathize with them, or bee drawne into conſent by reaſon of their mutuall ſociety communion and neighbor-hood.

Galen expounded. The nature of the *Lienterie*, *Galen.*

And whereas *Galen* writeth that Children are often troubled with vomitings and looſeneſſe, hee referres the cauſe thereof to the weakeneſſe of their retentiue vertue; not of the guttes but of the ſtomacke, for their fibres are ſofter; beſide their liquid eiections are cauſed

Why Children vomit & ſcoure often.

by

by their continuall eating and greedy appetites, the ſtrength of their naturall heat deſiring more then it can conteine or concoct; whence it commeth to paſſe that the fibres, as it were the raynes of the ſtomacke being looſened, they are ouertaken with manifold vomitings and frequent deiections.

Thoſe things which they obiect concerning ſtipticke medicines which coroborate the guts, and ſtay the fluxe of the Belly are but of ſmall moment; for we doe not therefore apply them to ſtrengthen the Retention of the guts which is none at all, but to bind or Contract the veines of the meſenterie, which are diſperſed in infinite braunches through the coates of the guttes, and doe empty into them malignant and ſuperfluous humors; or elſe to thicken, refrigerate, or appeaſe thoſe raging humors which in ſubſtance are very thinne, in their Temper very hot, and in their quality very ſharpe and coroding; that ſo they might become more vnapt to moue with ſuch violence and force as they are wont. And what I pray you is more abſurde, then to referre the cauſe of the aſtriction of the belly to the ſtrength of the Reteining vertue? Let them rather harken to *Galen*, who in the third book of the cauſes of *Symptomes*, elegantly aſſigneth the cauſes of ſlowe deiection, ſometime to the weakneſſe of the expulſiue power, ſometime to the dull ſence of the guttes, ſometime to the thickneſſe, ſtipticke, or binding nature and ſmall quantitie of that which is eaten; ſometime to the weakneſſe of the muſcles of the *Abdomen*, who haue a great hand & beare a great part in the auoyding of the excrements; but concerning the Retentiue power of the guts he addeth not a word, neither maketh mention thereof.

The vſe of ſtipticke medicines in fluxes.

Galen. The true cauſes of coſtiuenes.

Laſtly, whereas they obtrude vnto vs, the neceſsity of their Retention of the Chylus and the excrements, we admit is very willingly; but doe not aſcribe it to the retentiue faculty of the guts: for toward the reteyning of the Chylus, the wiſedome and prouidence of Nature hath prouided the manifold boughts, doublings, and conuolutions or writhen complications of the guttes; ſo that in ſo long a iourney and intricate a paſſage, it is not poſsible that almoſt any part of the Aliment ſhould arriue at the port Eſquiline which before was not met withall by the ſucking mouthes of the almoſt infinite veines of the meſenterie. And for the Retention of the excrements, it is not a naturall but an Animall action; becauſe it is performed by the helpe of muſcles, to wit, the ſphincters, which doe conſtringe or gather together the lower part of the right gut, that the excrement might not bee auoyded without the commandement of reaſon and conſent of the will. It is therefore hence manifeſt that the guts haue no Naturall power to reteine the Chylus or the excrement.

The reaſon of the conuolutions of the guts.

The concluſion.

QVEST. III. *Whether the Guttes haue any Concocting Faculty.*

THat in euery Concoction there are three things neceſſarily required; a Preparation, the Concoction or boyling it ſelfe, and a Perfection after it, *Galen* is a plentifull witneſſe. So the preparation of the firſt Concoction is in the mouth, the Coction it ſelfe in the bottome of the ſtomacke, and the abſolution or perfection in the ſmall guts: the preparation to the ſecond Concoction is made in the veines of the meſenterie, the Coction it ſelfe in the *Parenchyma* of the Liuer, and the abſolution or perfection in the great veſſels. In like manner the ſeede atteineth a kind of rudement in the *Preparing veſſels*, but his *Idea* or form in the teſticles and his perfection in the *Paraſtatæ*. The Animall ſpirite hath a delineation in the wondrous nettes or webbes of Arteries, his forme in the middle ventricle, his abſolution in the latter ventricle of the braine; ſo that in the workes of Nature theſe manifold degrees of operations do euery where appeare.

Three things required in al concoctions

This Concoction of ſpirites or of Alement whether it bee priuate or officiall is performed without the helpe of fibres, onely by the aſsiſtance and inbred proprietie of our naturall heate, and therefore by *Galen* it is called *Alteration*, and by him not denyed vnto the guts, for ſo he writeth in his fourth booke of the vſe of partes: *The guttes though they were not ordained to Concoct the Chylus, but onely to containe and diſtribute it, yet becauſe Nature is neuer idle, it attaineth in the paſſage through them, a more perfect elaboration, euen as in the greater veſſels there is a certaine facultie of perfecting the bloud which was before made in the Liuer.* And this opinion of *Galens* doeth *Areteus* and *Auerrhoes* follow, which alſo is ſeconded by good reaſon: for the ſubſtance of the guts and the ſtomacke is all one, whether you regarde the Temper or the Coulor or the frame and texture of their coates. Where-

Galen. 4. de vſu part & 3 de natu facult.

Aret. lib. 1 de cauſis et Signis Chronic. morb. cap. 15.

fore

fore the Chylus is concocted in the ſtomacke, and there attaineth the ſpecies and forme of Chylus, but as it ſtayeth in the convolutions of the guts, and the rugged foldes of their inmoſt coate, it acquireth alſo a further alteration.

I am not ignorant, that there is a new Paradoxe maintained by ſome, to wit, that the guts haue more power to concoct the Chylus then the ſtomacke, and that in the time of concoction, the *pylorus* is not ſhut, but that the Aliment not yet throughly boyled, falleth thorough the ſtomacke into the guts; and they inſtance in wounds of the *Hypochondria* & ſmall guts, whence (ſay they) doth iſſue a Chylus not yet perfectly concocted, & therefore it had not his forme or perfection in the ſtomack. A paradoxe.

Furthermore, in *Exomphaloſi* or the rupture of the Nauell, the meate paſſeth foorth not perfectly laboured; and in the heighth of Summer when we drinke ſmal drinke, we doe inſtantly feele the cold in our guts. We anſwere, that they do not perceiue that in the caſes inſtanced, the guts are ill affected, and the ſtomacke out of hand drawne into conſent with them, as well becauſe of their communion and ſimilitude of ſubſtance, as alſo becauſe of their vicinity: for *Hippocrates* in his Booke of humors hath this golden ſaying, *Thoſe partes which are neere Neighbours, or haue community of ſubſtance, are at the firſt hand and verie notably affected.* Obiection. *Exomphaloſis.* Anſwere. *Hippocrates.*

It is therefore no wonder that crude or inconcocted and liquid Aliment ſhould flowe from a wounded gut. I confeſſe that liquid things do ſodainely fall downeward, ſo alſo is their alteration ſodaine and quicke. But they can hardly be perſwaded, that the great abundance of meate deuoured by Rauen-ſtomackes and Trencher-friends can be conteyned in the ſtomacke alone, ſeeing *Hippocrates* ſaith, that the amplitude thereof exceedeth not fiue handfuls. But they muſt know, that the ſubſtance of it is Membranous, and is eaſily diſtended into all dimenſions: beſide, theſe great gourmandizers do not perfectly concoct the Chylus, becauſe the portall Membrane is looſed before due time by the weight of ſo great a quantity. We conclude therefore, that the Chylus is concocted in the ſtomacke & perfected in the ſmaller guts. Obiection. *Hippocrates.* Anſwete.

QVEST. IIII. *Of the Expulſiue vertue of the guts, and their Periſtaltick motion.*

THat all the guts haue their expulſiue faculty very ſtrong, not onely for the auoyding of their proper, but alſo of common excrements; is ſo manifeſt, that it needeth no demonſtration; as that wherein we are conuinced by the authority of learned men, by the ſtructure & frame of the guts themſelues, and by the neceſsity of this kinde of action. To repeate *Galens* words out of his ſixt Booke of the vſe of parts in many places, out of his Bookes *de locis affectis, & Naturalibus Facultatibus*, were to abuſe my owne time and your patience. In the ſtructure of the guts if it be well conſidered, we ſhall finde both coates wouen onely with circular and ouerthwart Fibres, ordained for expulſion. Authorities. *Galen.*

And if theſe things will not mooue the froward minds and headſtrong wits of men, yet the neceſsity of the action, which is the finall cauſe (and cheefe in Nature) muſt neceſſarily conuince them. For the excrements being of neceſsity to bee avoyded, the Facultie by which they are auoyded, muſt needs alſo be neceſſary; yea more neceſſary then the attractiue, Nature being euer more diligent to expel that which is noxious or hurtfull, then to attract that which is profitable or behooueſull; and that is the reaſon why in men that lye a dying, the expiration is ſtronger then the inſpiration, becauſe in expiration the fumed or ſmoaky vapour which is offenſiue to the heart, is thruſt out; in inſpiration ayre is drawne in, which is naturall and familiar vnto it. The expulſiue vertue therefore of the guttes, is ſtronger then the reſt. Arguments. The neceſsity of the expulſiue faculty. Why in the inſtant of death the expiratiō is greater then the inſpiration.

But all this while the maner of this expulſion is not manifeſted, which in the next place we will endeauour to make plaine vnto you. The excrements are expelled by locall motion; and this motion is double, one naturall another animall. The Naturall is proper vnto the guts, the Animal to the Muſcles of the *Abdomen*. I call that natural which is not voluntary, and that animall which is done with choyſe and diſcretion. The naturall motion, which the Ancients called περισταλτικὸν is accompliſhed by tranſuerſe and orbicular Fibres contracting the guts. And this naturall motion is againe double, *One According to nature, another Againſt nature*. The firſt is accompliſhed when the guttes doe contract and gather them- The motion of the Guts double. Naturall motion double.

themselues from aboue downward, in which motion offensiue humors, winde and excrements are driuen downe; the other quite contrary when the circular Fibres do gather themselues from below vpward, which is called ἄνω εἴλησις: and in this motion the wind, the Chylus, and the excrements are auoyded by the vpper parts, nothing by the lower although such euacuations be prouoked by sharpe Clisters. *Galen* saith, *This motion hindreth the wind from comming downward, yea it maketh it flye vpward.*

Galen.

Hippocrates acknowledgeth a threefold cause of this depraued motion, *Inflammation, a confirmed oppilation or stopping, & sometimes a light exulceration.* Inflammations streighten the passages, Oppilation altogether shutteth them. So then the excrements hauing no currant passage, the expelling faculty following first of al the order instituted by nature, beginneth her contraction in the vpper part, to expell the excrement downeward; and this it endeuoureth againe and againe, but being frustrated because of the streightnes or stoppage which opposeth her; she inuerteth the order, and begins her contraction from below, and that with such violence, that (alas the while) the Chylus & the excrements are thrown out by the mouth: so diligent and circumspect is Nature to vnburden it selfe of that which is noysome or offensiue.

Hippocrates.

The causes of the depraued motion.

The manner.

Againe, a light exulceration may cause this depraued motion; as, when the gut is afflicted by the proritation or goading of the vlcer it transmitteth vpward such things as would offend it, & as it were altring her sail, beareth her course vpward against Nature, which before she held downward. This *Peristaltick* motion which is contrary to the naturall, those haue miserable experience of which are afflicted with the lamentable and odious disease called *Ileos* or *Mesereri mei Deus*, wherein the seate or fundament is so closed, that a Needle cannot be thrust into it, and if any Clisters bee with much adoo administred, they are incontinently suckt vp, the circular Fibres contracting themselues from below vpwardes. This disease *Hippocrates* in his booke περὶ παθῶν, calleth a head-strong, sharpe, and daungerous affect.

The Ileos.

Hippocrates.

There is another motion whereby the excrements are auoided, which is Animall & voluntary, wrought and accomplished by the helpe of the Muscles of the *Abdomen*; which being contracted do presse and straine the guts and so shut out the excrements, which motion is also furthered by the Midriffe and the Rim of the belly. For the eight Muscles of the *Abdomen*, compressing equally the paunch and the guts, do alike & indifferently driue the excrements both wayes, as well toward the stomacke as toward the seate; it was needfull therefore that there should be some assistant part which should driue it downward & turne it from aboue, which office the Midriffe performes.

The naturall motion of the guts.

The manner of it.

The vse of the midriffe in the auoyding of excrements.

QVEST. V. *Whither Clisters can passe vpward vnto the Stomacke.*

BEcause I haue sometimes heard Physitians disputing about the ascent of Clisters, and haue read *Galen* and *Rhasis* their contrary determinations concerning this matter, I haue thought it fit a little to discusse the question in this place, the rather because the truth may be demonstrated by Anatomicall Euidence. *Rhasis* is of opinion, that Clisters may ascend vnto the stomacke, and are often cast out by the Nosethrils, his words are these. *If a Clister bee vvith great force and violence shot vp, it will ariue at the Stomacke: if it bee put vp gently and by degrees, it scarse reacheth aboue the great guts.* *Galen* on the contrary iudgeth, that though the Liquor be neuer so forcibly driuen vpward, yet it will scarse reach vnto the empty gut. For in the first Booke of his Method, he cureth Vlcers of the Lunges, Chest and Stomacke by Medicines taken at the mouth: but the vlcer of the guts, both by things taken at the mouth, and also iniected at the fundament with this difference, that if the vlcer be in the great guts he vseth rather Clisters; if in the small, then he sticketh more to Medicines at the mouth. The like he repeateth againe in the 13. of his Method, and to him wee rather listen in this case then to *Rhasis*; for I haue obserued that the guts are seuen times as long as the body of the man whose guts they are, and *Hippocrates* measureth them to be thirteene cubites; and yet that is not all, for the manifold girations or convolutions whereinto they are circled do breake the force of any iniected liquor.

Rhasis opinion 9. *Continentis.*

Galens opinio.

The great length of the guts.

I thinke therefore that such liquors do not reach aboue the blinde gut. For proofe heereof saith *Laurentius*, I will tell you that which haply few hitherto haue obserued. Let

the

the guts bee dryed and blowne vp a little, and poure ſome water into the gut called *duodenum* and it will preſently iſſue out at the right gut; but on the contrary if it be powred into the right gut it wil ſtay in the appendix of the blind gut becauſe it can can get no farther; which proueth that in the end of the blind gut there is a value which Nature in great wiſedome hath ſet to hinder the refluence or returne of the excrements and vnprofitable humors, ſuch an one as appeareth in the paſſage of the Choler into the Guts & in the veſſels of the heart.

Laurentius his inſtance that Cliſters cannot paſſe vp to the ſtomack.

The values of the guts

But it will be obiected that *Galen* in his third booke of the Cauſes of *Symptomes* ſayeth, *That ſome haue had Cliſters ſo giuen them, as they haue beene caſt vp by the mouth*; euen as the *fæces* or excrements in that miſerable diſeaſe called *Ileos* or *volunlus*. Wee anſwere that *Galen* here doth not contradict himſelfe: for it is one thing to ſpeake of the ſtomacke when it is well affected, and another when it is ill affected. For if the ſtomacke bee well affected the liquor can neuer ariſe vnto it, but if it be ill affected or affamiſhed, as in the diſeaſe called *Boulimos*, it draweth from below not onely ſuch humours as are iniected by the fundament but alſo the excrements themſelues. For as the pined or greedy Liuer draweth from the veines crude and vnconcocted iuyces, ſo is it with the ſtomacke, yea with the mouth: for we ſee what riffe raffe and what odious viands hunger maketh toothſome to ſuch as are pinched therewith.

Obiection.

Anſwere, and *Galen* expounded.

The force of hunger.

Againe, if the naturall motion of the guttes bee depraued, the circular fibres gathering themſelues from belowe vpwarde may make a Cliſter or other liquor aſcend vnto the ſtomacke. If it be obiected that nouriſhing Cliſters are carried vnto the Liuer, I anſwere that they ariſe not thither either of their owne accorde, or by the violence of the liquor iniected, but they are drawne by the veines of the meſenterie and thence tranſported into the Liuer.

Another cauſe that draweth liquor to the ſtomacke.

How nouriſhing Cliſters come to the Liuer.

QVEST. VI. *Of the Euill Sauour of the Excrements.*

MAny men that are but ſleightly ſeene into the courſe of Nature, doe wonder much why in a ſound body and in a Temperate man the excrements of the Belly become ſo vnſauourie and abhominably ſented, becauſe all ſtench is the conſequence of corruption; and corruption or putrifaction hath for her efficient cauſe outward and acquired not inbred heate.

Of the ſauor of excrements.

For whoſe better ſatisfaction we ſay that Phyſitians acknowledge a double cauſe of this *fœtor* or ſtench, an Efficient and a Materiall. Concerning the efficient they ſay, that our heate though it be one in regard of the ſubiect, yet in different conſiderations it is diuerſe, and may be two wayes conſidered, either ſimply as it is heate, or elſe as it is inbred heate and the inſtrument of all the functions of the ſoule. As it is heate, it continually feedeth vpon and conſumeth the moiſture, as it is inbred it boyleth or concocteth, aſsimulateth and ingendreth; ſo from the ſame heate doe flow diuerſe yea contrary motions.

A double cauſe of it.

The efficient cauſe is heat.

Whileſt the Chylus is made in the ſtomacke, the naturall or inbred heate inſinuateth it ſelfe equally and a like into all the parts of the matter; gathereth together thoſe thinges that are correſpondent to our nature and ſeparateth the reſt: the firſt are drawn away into the Liuer by the veines of the meſentery, but the other which cannot bee aſsimulated are thruſt downe into the great guttes, and there as vnprofitable are forſaken by the naturall heate; wherefore the heat worketh vpon it no more as it is inbred or direct from the ſoule, but ſimply as it is heate taking the nature of an outward heate, and thence comes the ſtench. Adde hereto the fitneſſe of the matter; for theſe ſuperfluities are crude and verie moyſt whence comes putrifaction; but if the humour bee drawne away the putrifaction is leſſe, and the ſauour not ſo noyſome.

And this is the only reaſon why the excrements of a man moſt temperate, haue a worſe ſauour then thoſe of other creatures; becauſe a man vſeth very moyſte nouriſhment and very diuerſe, that is of ſeuerall kinds, and leadeth a life more ſluggiſh and ſedentarie: other Creatures feede vppon dryer Fother and ſo their excrements become dryer. And this cauſe *Ariſtotle* aſsigned in his *Problemes*: where asking the queſtion why the excrements of the Belly the longer they are reteined are leſſe vnſauourie, and on the contrary the vrine the longer it is kept ſmelleth the ſtronger, he reſolueth it thus. Becauſe ſayeth hee, in the long ſtay, the excrements are dryed, and ſo the nouriſhment of putrifaction is ſubtracted or drawne away, which is not ſo in the vrine.

Why the excrements of men are more ſtinking then thoſe of other creatures

Ariſt. Probleme ſect. 13.

A probleme.

Now

Now the reason of the forme and figuration of the Excrements, is because of the Chambers and cels of the Collicke gut, wherein it swelleth into round & broken peeces.

QVEST. VII. *Of the substance and the scite of the guts.*

Galen.

What the substance of the guts is.

BEfore we passe from the guts, it will not bee amisse to reconcile some different places of *Galen* concerning their substance. In his Bookes of Method he saith, that if the guts be wounded or vlcerated, they do very hardly ioyne togither againe, especially the smaller, because their substance is neruous and membranous: but in the 14. Booke of the Vse of parts, he writeth, that *the Guts and the Stomacke because they are Instruments of concoction, haue a fleshy Composition.* And the same *Hippocrates* insinuateth in his *Aphorismes*, wher he saith, *That if vpon a Dysenterie or bloody Flixe little Caruncles or ragges of flesh doe passe away by seidge, it is a mortal signe.* The trueth is, that the substance of the guts is neruous or sinnowy, but yet throughout also repleniſhed with fleshy Fibres, so as it may bee saide to be both Membranous, and also fleshy. Like as *Galen* calleth the wombe somtime a Membranous, sometime a Fleshy part.

Hippocrates. Aphor. 26 sect. 4

Certaine places of *Galen* & *Hippocrates* reconciled.

Concerning the scite or position of the guts, the Ancients seem to haue erred, because they thought that the great guts did occupy the lower part of the belly, and the smaller the vpper: but the truth is, that the Colon which is the greatest of all the rest, runnes vp vnto the hollownesse of the Liuer, and the bottome of the stomacke; but the Ileon is extended downward vnto the Share bones. I conceyue that the Dissection of Dogges and foure-footed Beasts deceyued them. *Galen* himself speaking to the capacity of the common people, calleth the great guts the lower, the small guts the vpper, yea and many Physitians at this day are mistaken, distinguishing the Dysentery of the smal guts from that of the crasse or thicke, by this, that if the paine be in the vpper parts then the disease is in the smal; if in the lower, then in the great guts.

The errot of the Ancients about the situation of the guts.

Galen. Com. in 3. Epid.

Diuers opinions.

Concerning the situation of the Collick gut, there are diuers opinions; some do therefore thinke it ascendeth vnto the bottome of the stomacke, that by his contaction as also by that of the neighbor parts, the concoction of the stomacke might be furthered; others imagine, that it is therefore conueyed to the hollow of the Liuer, where the bladder of gal is seated, that the expulsiue faculty of the Colon, which lyeth as it were asleepe, might by the sweating yssue of choler be better awaked and set on edge.

Different conceits about the ascending of the Colon.

Another sort there are who imagine, that the Colon giueth way to the smaller Guts, walling them about in manner of a fence or rampert, comming not neere the center of the Mesenterie, and that therefore it taketh vp the left side of the body, that the greater branch of the Port-veine called *Mesentericus*, might with a shorter cut be inserted into the guts and carrie or transferre the meate vnto the Liuer by a nearer way.

Some there are, who thinke that the Colon adhereth or cleaueth to the bottome of the stomacke and hollow of the Liuer, that by their contaction the remainder of the Aliment which stayeth in the chambers of the Colon, might receiue more perfect concoction. Moreouer, they giue this reason of his scituation aloft, that that part of the Chylus which is therein contained might not so soone passe away, and so there might be more perfect & accomplished exsuction of the creame for which cause also the cels and chambred conuolutions of the Colon, as also the blinde gut were ordained.

Why the pressing of the Spleene makes melancholy bodyes to auoid wind downward.

This Collick gut is indeede the largest or most ample of all the rest, but where it toucheth the Kidnies and the Spleene it becometh narrower, lest it should compresse the spleen, whence it comes to passe, that those whose Spleens do swel or be notably stuffed, can hardly auoide any winde downward, vnlesse the Spleene bee pressed.

And thus much concerning the difficulties or curious questions about the guts, wherein we haue beene somewhat more prolixe, that such as delight in the contemplatiue part of Anatomy, might not go away from vs altogether vnsatisfied. The stomack followeth.

QVEST.

QVEST. VIII. *Whither the vpper mouth of the ſtomacke be the ſeate of Appetite.*

SEeing the liue-tide of euery creature is inconſtant, and like a poaſte paſſeth ſwiftly away, becauſe of the continuall effluxion or expence of the threefold ſubſtance wherein it conſiſteth, Nature being vigilant and carefull about her owne preſeruation, endeuoureth continually to make vp the breach by Reſpiration and Nouriſhment. By reſpiration the ſpirituous, by nouriſhment the fleſhy and ſolide ſubſtaunce is reſtored. And hence it is that our nouriſhment is threefold, *Aer*, *meate*, and *drinke*. But becauſe there can be no nouriſhment without Appetite, nature hath diſpenſed to euery part a certaine deſire, whereby as by goades they are pricked forward to draw and ſucke into themſelues conuenient and familiar Aliment. But this deſire in the particular parts of the body is without ſenſe, for they feele not neyther perceiue when they draw or ſucke ſuch conuenient aliment. Wherefore, leaſt the parts ſhoulde pine away when they are exhauſted and as it were hunger-ſtarued, nature hath framed one part of exquiſite and perfect ſenſe, which alone fore-apprehending the ſuction and ſo the want of the reſt, ſhould ſtirre vp the creature to prouide and cooke their nouriſhment for them. For if the ſenſe of this ſuction or traction were in euery part, then in the time of affamiſhment or thirſt they would perpetually languiſh, & ſo the creature leade his life in a perpetuall diſeaſe.

The reaſon of our threefold nouriſhment.

The vpper mouth of the ſtomacke the ſeate of appetite.

This part ſo by nature ſet out, is the vppermoſt mouth of the ſtomacke, which the ancient *Græcians* as *Galen* witneſſeth, called κραδίαν. And all men doe concurre, that in it the Animall appetite and hunger, which is nothing elſe but a ſenſe of ſuction, haue their peculiar reſidence. And this ſenſe is exhibited in this place by two notable nerues called *Stomachici*, or the *Stomacke Nerues* ariſing from the ſixt paire or coniungation of the Braine. *Galen.*

But after what manner this Animall appetite is ſtirred vp, *Galen* hath elegantly taught vs in his firſt Booke of *the cauſes of Symptoms*. For the better vnderſtanding of which place, theſe things are firſt to be obſerued, that the animall appetite is double; one naturall, another depraued: to the firſt, theſe fiue ſignes or ſymptoms muſt neceſſarily concurre: firſt, an exhauſtion or deepe expence of the ſubſtance of the parts, next there muſt bee in the ſame parts a ſuction or traction; for the exhauſted parts do draw from their next neighbors and thoſe from others, till by continuation it do come to ſome extreame; which extreame is the vpper mouth of the ſtomacke where the traction ceaſeth: from this traction ariſeth the third ſigne, which is a diuulſion or kinde of violence offered to the mouth of the Stomacke, which diuulſion or violence ſtriketh the nerue, whence commeth the ſenſe, and from the ſenſe the appetite.

The Animall appetite double.

5. ſignes or Symptomes required to appetite.

In the depraued appetite, the ſame order and degrees of Symptoms are not obſerued. For in the diſeaſe called *Boulimos*, there is hunger without appetite, and in the Dog-appetite, there is appetite without hunger. In the *Boulimos* all the parts being exhauſted or hunger-bit, do draw from the ſtomacke, which on euery hand is torne and as it weee launced, yet doth not that diuulſion ſtrike the ſenſe, and ſo no appetite followeth; in the mean time the other parts being defrauded of their aliment, doe waſt away and conſume. The cauſe of this inſenſibility is the refrigeration of the nerue, the obſtruction of the ſame, and the exolution or fainting away of the appetitiue Faculty.

What *Boulimos* is.

On the contrary, in the Dogge-appetite there is no Inanition or emptineſſe of the parts, but an exquiſite ſenſe of ſuction, by reaſon of a coole and ſowre humor there impacted, and it is cured *Theorexi*, that is, by drinking of wine as *Hippocrates* witneſſeth. Hence therefore it is manifeſt, that the animall appetite is ſtirred vp in the mouth of the ſtomack, which is endued with ſo exquiſite ſenſe, that it is called the Organ or inſtrument of touching by *Hippocrates* in his Booke *of the Inſtruments of ſmelling*.

The cauſe of the dog appetite.

Hippocrates. Apho. 21 ſect. 2

Hippocrates.

There remaineth yet one ſcruple, how the appetitiue faculty ſtanding in reference to the ſenſitiue, ſhould haue his ſeate in the mouth of the ſtomacke, ſeeing it is of al hands determined that the ſeate of all the animall faculties is in the braine. The anſwere is eaſie and at hand, to wit, that the faculty it ſelfe is in the braine, but the worke, efficacy, and action thereof in the ſtomacke. So the faculty of ſeeing is in the braine, but the ſight is accompliſhed in the eye. The mooving Faculty is likewiſe in the braine, yet is the Muſcle the immediate organ of voluntary motion.

Obiection.

Anſwere.

Obiect. If any man obiect that the Liuer is the ſeate of the appetetiue faculty; wee anſwere that the appetite reſiding in it is concupiſcible and without ſence, and not ſenſitiue at all.

Anſwere.

Caution. But we muſt not here forget that though this appetite of the ſtomacke bee with ſence, yet it is not ioyned with knowledge or diſcretion.

QVEST. IX. *Of the ſcituation and conſent of the vppermoſt mouth of the ſtomacke.*

THE difference or controuerſie concerning the ſcite of this Orifice is neither light nor vnprofitable, becauſe the reſolution thereof ſtinteth the ſtrife among the Phyſitians concerning the application of Topicall or locall medicines.

The ſcite of the vpper orifice. All men doe agree that it inclineth rather to the left hand then to the right, but the queſtion is, whether it bee nearer the ſpine of the backe, or the griſtle and blade of the breaſt. Some thinke that Nature framed this griſtle to be a defence for it and for no other cauſe, and therefore hath placed it there-under: for ſay they, thoſe that vomit or reach for it, doe finde a paine at this griſtle and none at the ſpine or racke of the backe. And *Hippocrates* conceiueth that the extuberation or diſtention of the ſtomacke at the *orifice* is not backeward but forward; whereas he ſayth, *That the repletion of the ſtomacke is a direction for broken ribbes.* Wee with *Galen* doe aſſigne the place of this *orifice* to bee in the left part toward the ſpine, not that it lyeth or reſteth vpon it as the gullet doeth, but becauſe it commeth nearer to the ſpine then to the breaſt-blade. And therefore it is that when the gullet or the vpper *orifice* are affected; we thinke it fit to apply locall medicines both to the backpart and to the fore-part. That that was propounded concerning the paine of them that reach to vomit, and the direction for the ribbes, is to be referred to the bottome, and not to the vpper mouth of the ſtomacke; for as we haue obſerued, the meate which wee eate is not conteyned in his mouthes or *orificies* but in his cauitie, which wee doe not deny doeth rather leane to the breaſt-blade then to the ſpine.

Hippocrates. Lib. de artic. ſect. 3.

Where to apply local medicines.

The reaſon of the paine at the breaſt bone when the mouth of the ſtomack is affected. But the reaſon why the breaſt bone is payned when the vpper orifice is affected is meerly Anatomicall; the midriffe being tyed to the bone, and the mouth of the ſtomacke adhæring to the large paſſage made in the midriffe for his conueyance thereout; and therefore the breaſt-blade is payned by this continuity, becauſe paines are rather felt in the extreamities or ends then in the middeſt, as is to bee ſeene in ſtreatched membranes.

The conſent of the mouth of the ſtomack, with the heart and the braine. Concerning the ſympathy or conſent of this orifice with the heart and membranes of the brain *Hippocrates* and *Galen* are very plentifull; for this mouth being affected, the ſyncope or ſounding, the exolution or fainting of the ſpirits, and ſuch like *ſymptomes* doe ouertake vs as when the heart it ſelfe ſuffereth violence, whence this part amongſt the ancients as wee ſayd before, is called *καρδία*.

Why vomitings follow the wounds of the braine *Galen.* In wounds of the head, the skull being either broken or ſhiuered, and the *Dura meninx* or thicker membrane of the braine expoſed or layde open to the ayre, which is vncouth or ſtrange vnto it, the Patient preſently vomiteth yellow and *Aeruginous* or greene choler, becauſe the ſtomack by reaſon of ſocietie, is drawne into conſent and ſympathizeth with the membrane, as well becauſe of the ſimilitude and likeneſſe of the ſubſtance, as alſo of the community of veſſels, which are the chiefe cauſes of conſent or ſympathy; as *Galen* obſerueth in his *Commentaries* vpon the firſt ſection of the 3. Booke of *Hippocrates Epidemia.*

QVEST. X.

Whether the Chylus be made by the heat, or by the forme of the Stomacke: and why the ſtomack doth not breede foure ſubſtances and excrements as well as the Liuer.

Why the ſtomacke is incompaſſed with warme parts. THE remouing of theſe two obſtacles and diſſolution of the doubts ariſing in them ſhall neede no great curioſity; the firſt wee will determine thus. The Chylus is formed not ſo much by the power of the heate, as by the ingenite property of the ſtomack. True it is that all concoction is accompliſhed by the help and aſsiſtance of heate, and therefore Nature hath prouided that the ſtomacke ſhould be cheriſhed and comforted on euery ſide, aboue and below, on the right hand and on the left, before and behinde; but this concoction belongeth not to the heate as it is heate (for by that reaſon fiery and aguiſh heate which corrupteth all thinges, ſhould be

be the cauſe of concoction) but as it is the inſtrument of the ſoule. But that which wee call chylification or making of the Chylus, proceedeth alone from the forme and proprietie of the ſtomacke, becauſe in other parts ſauing this, the naturall heate though it be very ſtrong and intenſe yet doth not chylifie. Now why the ſtomacke as the Liuer doeth not beget or breede foure kinds of ſubſtances, there may bee a double reaſon aſſigned; one from the matter, another from the efficient. A double reaſon why the ſtomack breedeth not 4. ſubſtances.

The Efficient or working cauſe is naturall heate, which if it be very ſtrong, it powerfully and effectually or really ſeparateth *Hetrogenia*, that is partes that are vnlike or of different natures. But all men know that the Liuer is ſo much hotter then the ſtomacke, as bloudy parts are hotter then thoſe without bloud; for the Liuer is a fleſhy bowell and the ſtomack a membranous: wherefore the heate of the Liuer diuideth the Aliment into more particles, which the weake heat of the ſtomacke cannot doe. The first frō the efficient.

To this efficacy of the Efficient may be added as we ſayd the diſpoſition of the matter; for liquid things are more eaſily altered then ſolid: nowe the ſtomacke receiueth the Aliment when it is ſolide which with great labour it boyleth, breaketh, and altereth; but the Liuer receiueth it already, attenuated and wrought vnto an equality when it is no great labor to ſeparate the diſimilar and *Heterogenie* parts, or being ſeparated to driue them into their proper receptacles. The 2. from the diſpoſition of the matter.

QVEST. XI. *Whether the Stomacke be nouriſhed by the Chylus or by Bloud.*

FInally, that we may paſſe from the ſtomack, we will end with that great controuerſie which is amongſt Phiſitians concerning his nouriſhment. Some there are who thinke that the Stomacke and the Guttes are nouriſhed by the Chylus, ſome by crude or raw bloud not laboured in the *Parenchyma* or ſubſtance of the Liuer; but onely hauing an inchoated mittigation in the braunches of the port or gate veine. Diuers opinions about the nouriſhment of the ſtomacke.

Auicen thought that the vtter coate was nouriſhed with bloud and the inner with Chylus. *Zoar* writeth that the vpper or neruous part is nouriſhed with the Chylus, and the lower which is more fleſhy, with bloud. We with *Galen* determine, that the whole ſtomack as all other membranes is nouriſhed with pure bloud, which hath had his vtmoſt and perfect elaboration in the Liuer. For the proofe whereof beſide the vulgar and ouerworn arguments which Phyſitians vſe, theſe of no light moment may be caſt vnto the heape. *Auicen.* *Zoar.* *Galen.*

The firſt is taken from Diſſection, becauſe through all the coates of the ſtomacke and his two orificies, there appeare notable and aboundant veines diuerſly diſperſed, which doubtleſſe were not idely or in vein ordayned by Nature, neither yet to tranſport the Chylus to the hollownes of the Liuer, howſoeuer *Bauhine* be conceited, (vnleſſe happely in extreamity of hunger) for then they ſhould carry it rawe, not yet hauing receiued his perfection in the guts. 1. Reaſon.

Moreouer if the veines were eſpecially appointed for the tranſportation of the Chylus, it being made rather in the bottome then at the ſides or top of the ſtomacke, there ſhould haue beene more veines and more conſpicuous in the bottome then in the top, which experience teacheth vs to be otherwiſe; for the whole baſis and circumference of the vpper mouth is incompaſſed with an ample veſſell called *Coronaria ſtomachica* or the garland vein of the ſtomack, becauſe the coats of the orifics are thicker then thoſe of the bottome, and therefore neede more plentifull Aliment. We reſolue therefore that theſe veines were ordained for the nouriſhment of the ſtomacke; but wee will vnder-prop this reaſon with a ſtronger.

In the Chylus although it be laudable and well diſpoſed, yet there remaine ſome vnprofitable and excrementitious parts; to wit, Choler, Melancholy, and whay or vrine, which cannot be ſeparated or purged there-from but by the heate of the Liuer. Now nothing can nouriſh perfectly vnleſſe it be cleanſed from thoſe recrements: how therefore ſhal the Chylus not yet defœcated, be ſayd to be conuenient Aliment for the ſtomacke? And this *Galen* ſeemeth to intimate when he ſayth; ***That nothing can perfectly nouriſh which hath not paſſed through all the concoctions.*** 2. Reaſon. *Galen.*

A third argument to proue our aſſertion, that the ſtomacke is nouriſhed by blood, is becauſe thoſe creatures that mew themſelues vp all winter in holes and rockes and ſuch ſecret 3. Reaſon.

places are nouriſhed by blood, and not by Chylus, becauſe al that time they feed not at al. The infant likewiſe as long as it is conteined in the womb, hath his ſtomacke without controuerſie noriſhed with pure blood brought vnto it by the vmbilical vein. Hereto *Valetius* in his Controuerſies anſwers, that the Stomacke is nouriſhed by the more crude or rawe part of the Mothers blood which is not much vnlike vnto Chylus. But as well might he ſay, that the Braine, the Bones, and al the Membranes haue their refection there from, becauſe they are nouriſhed with Flegmatick and crude blood.

Valetius diſe proued.

Furthermore, in great weakeneſſe of the ſtomacke and loathing of meate, that the patient ſhould not vtterly conſume, wee preſcribe nouriſhing Cliſters of the beſt ſortes of fleſh, Capons, Patridges, and ſuch like boyled to a broath. This liquor ariueth not at the ſtomacke, but is ſucke away by the Veines of the guts, and tranſported to the Liuer where it attaineth the forme of bloode, and after being carried in the veines as in water-courſes vnto the parts, it watereth, nouriſheth and refreſheth them. Nowe who will ſay; that at this time the ſtomacke is nouriſhed by Chylus when there is no chilification therein: and yet I hope they will not deny that it is then alſo nouriſhed as well as the other parts. Finally this opinion of ours may bee demonſtrated by the ſimilitude or correſpondencie of the nouriſhment of other parts like vnto it; and therefore ſeeing all the membranous parts of the body are nouriſhed by blood, why ſhould the Stomacke among all the reſt bee exempted? We do therefore conclude, that the Stomacke is nouriſhed by blood, and that not onely hauing an initiation or rudiment in the Port-veines, but laboured and perfected by the power and efficacy of the *Parenchyma* or ſubſtance of the Liuer.

4. Reaſon.

How Cliſters do nouriſh.

5. Reaſon.

Notwithſtanding theſe things are ſo, ſome learned men among the new Writers, as *Thomas Veiga* and *Laurentius Iobertus* doe thinke, and mightily contend by manie arguments, that the Stomacke ſhould be nouriſhed by the thinner part of the Chylus, to which we will make ſome ſatisfaction.

Their reaſons who auouche the ſtomacke to be nouriſht with Chylus.

In the firſt place they oppoſe the authority of *Galen*, who in the third Booke of the naturall faculties, and in the fourth of the Vſe of parts in plaine words teacheth, that the ſtomacke hath his refection and nouriſhment by the Chylus. For anſwere to *Galen*, out of *Galen* we ſay; that there is a double nouriſhment; the one perfect, which is *Aſsimulation*, the laſt vpſhot and accompliſhment of natures endeauours in this kinde; the other imperfect, as it were the *Ape* or imitator of the former, which is a kinde of delight the part conceyueth from a quality that is of kinne vnto it; and this kinde of refection *Galen* calleth *Laſciua*, as if the entertainment were rather for dallience then procreation. And in this latter kinde the ſtomacke according to *Galen* is refreſhed by the Chylus, not in the former.

First.

Anſwere

Galen expounded.

Secondly, they obiect that no branches of the Hollowe veine are deriued vnto the ſtomacke and the guts, but onely certaine ſmall rills from the Gate-veine, who haue but one vſe, which is, to tranſport the Chylus vnto the Liuer, and therefore (ſay they) the organs or inſtruments of nutrition are not nouriſhed with blood perfected in the Liuer (for there is no commerce by veſſels betweene them) but onely with Chylus. This Argument I take to be very ydle and friuolous: for if onely the riuerets or channels of the Hollow-vein did containe Alimentary blood, and the branches of the Gate-veine were onely ordayned to tranſport the Chylus, then ſhould the Spleene, the Meſentery, and the Kell bee likewiſe nouriſhed with Chylus, becauſe they haue no allowance of Veſſels from the hollow vein. In like manner the great guts ſhould aſsimulate Chylus into their nouriſhment, in which it is certaine there is nothing conteyned but the excrements, the iuice being before drawn from them.

Second.

Anſwered.

Their third Argument is taken from Diſſection, becauſe (ſay they) the Veines do only open at the Stomacke, and are not diſſeminated through his coates, and therefore they ſuck iuice from it, rather then nouriſh it with their owne allowance. But (alas the while) what new Anatomy is this? Is there not a double Gaſtrick or Stomacke-veyne ſtretched through all the Coates of the ſame? Beleeue me, the inſertion of theſe and other veines is altogether alike.

Third

Anſwere.

The fourth Argument is that of the Learned *Veiga*. The Organs (ſaith hee) of the firſt concoction are more ignoble, and are framed of farre impurer iuyce then the Fleſh; and therefore it is fit they ſhould be nouriſhed alſo with impurer iuyce, before it is concocted in the Liuer. But this reaſon drawes many abſurdities with it; for the bones are more ignoble then the ſtomacke or the guts, and colder by farre, and yet are nouriſhed by blood conuey-

Fourth.

Anſwere.

conueyed vnto them from the Liuer by the Hollow-Veine, yea, and alm oſt all the Membranes colde and baſe though they be, do draw that blood and no other, which is perfectly concocted in the Liuers *parenchyma* or ſubſtance.

The Fifte reaſon followeth, which they put great confidence in, and it is ſuch. If the Stomacke bee not nouriſhed with Chylus, how then commeth it to paſſe, that preſently vppon the taking of Meate both hunger and thirſt is appeaſed. Wee Anſwere, that there is a Double hunger, one Naturall, and another Animall: the Naturall is without ſenſe, and placed in the particular partes of the bodye. The Animall is with moſt exquiſite ſenſe, and proper onely vnto the Stomacke, yea eſpeciallie to the mouth thereof: the firſt is appeaſed onely by Aſsimulation; the latter, becauſe it is a ſenſe or apprehenſion of Divultion, when the Divultion ceaſeth, then it is alſo appeaſed.

Fift.

Anſwere.

A double hunger.

Vpon the eating of meate, the Animall hunger of the Stomacke preſently falleth, becauſe the Stomacke being filled, his divultion and compreſsion ceaſeth: but the Naturall hunger is indeede appeaſed ſome-what when the inwarde coates are moyſtened as it were wi h a pleaſant Dew e, yet not altogether before perfect Aſsimulation, which is not accompliſhed without ſome diſtance or interpoſition of time. Thus farre theyr Arguments.

Now becauſe *Galen* ſaith, that *whatſoeuer nouriſheth muſt paſſe through three concoctions*. *Veiga* to ſaue his owne Stake, would interprete *Galen* as if hee meant this onelie of the nouriſhment of fleſhie parts, when as in a thouſand places he witneſſeth that blood alone is the fit and conuenient Aliment of all the parts.

Galen amiſſe interpreted by *Veiga*.

Againe, to eſtabliſh his falſe Opinion, hee coyneth verie cunninglie, a three-folde Concoction in the nouriſhment of the Stomacke. The firſt (ſayth hee) is Chilification, which is made in the bottome: the ſecond, is Sanguification and perfourmed in his Veynes: the third, is Aſsimulation, which is accompliſhed in his coates. So that his pleaſure forſooth is, that the Chylus is ſucked by the Veynes, in them they are turned into Blood, and from them againe are they drawne by the Stomacke for his nouriſhment.

A quaint conceite of *Veiga*.

But in this Triple faigned Concoction, there is a three-folde errour. For firſt, it is moſt certaine that the bloode by no meanes becommeth redde but by contaction or touching the *Parenchyma* or Fleſh of the Liuer. Againe, I ſee no reaſon why that the Chylus ſhoulde bee rather drawne by the Veynes then by the Coates of the Stomacke, if there bee ſo great ſimilitude of ſubſtance betwixt the Chylus and his Membranes.

Wherein is a threefold errour.

Finally, if the Chylus were to bee drawne by the Veynes, and there get ſome rudiment of bloode, it followeth neceſſarily that the Stomacke is not immediately nouriſhed by Chylus but by blood. And ſo much concerning the Appetite, Scituation, and Conſent of the mouth of the Stomacke, as alſo of the Chylification and nouriſhment of the Stomacke it ſelfe. Now proceede we to the Liuer.

QVEST. XII. *What is the Nature of a ſpirit, and whether the Liuer do breede or beget a Naturall ſpirit.*

BEcauſe in the Schooles of Phyſitians the Controuerſie concerning the naturall ſpirit is ſufficiently bandyed, I will not ſpend much time in a thing ſo notorious: onely for their ſatisfaction to whom theſe ſubtilties are moſt ſtrange and leſſe obuious, I will giue a taſte or ſhort aſſay concerning the nature of ſpirits.

Galen in his ſixt Booke of the *Vſe of Parts*, defineth a ſpirite to bee *A certaine exhalation of benigne or wel-diſpoſed blood*: The Stoickes call it, *The tye or band of the ſoule and the bodie*, for the diſtance is not ſo great betweene the higheſt Heauen and the loweſt Earth, as is the difference betwixt the Soule and the Bodye. It vvas therefore verie neceſſarie that a ſpirite ſhould bee created, by vvhoſe intermediate Nature, as it vvere by a ſtrong though not indiſſoluble bonde the Diuine ſoule might bee tyed to the bodie of Earth. Wherfore there are ſome that ſay it is an Aetheriall body, the ſeat and band of heate and faculty, and the prime inſtrument whereby all the functions of the ſoule are performed. But to ſay as the truth is, it is called Aetheriall onely Analogically, be-

Galen. What a ſpirit is.

How the immortall ſoule, and the mortal bodie are ioyned.

A definition of a Spirit.

because of his tenuity and diuine manner of working, for by his nature and in his originall he is meerely Elementary. Our definition of a spirit shall be this, *A subtle and thinne body alwayes moueable, engendred of blood and vapour, and the vehicle or carriage of the Faculties of the soule.*

Hippocrates.

That it is a body *Hippocrates* witnesseth, when hee reckons it in the number of those things whereof the body is compounded; for he diuideth the body into *Continentia, contenta & impetũ facientia*, that is, into parts conteining, conteined, and such as moue with a kinde of impetous violence. Another argument that it is corporeall, is, because it stands in neede of a channell or passage wherein it may be transported, because it distendeth the parts in which it is entertained and occupieth a place; for when the creature is dead, both the ball of the eye is corrugated or wrinkled, and the Membranes thereof doe also fall. being no more illustrated by the beames of the spirits. It is therefore a body, but the finest and subtilleſt substance that is in this Little world. For as the winde it passeth & repasseth at his pleasure, vnseene, but not vnfelt; for the force and incursion thereof is not without a kinde of violence; so the seede although it be thicke and viscid, yet passeth thorough vessels which haue no manifest cauities; the reason is, because it is full & as it were houen with spirits. *Galen* in his third Booke of *Naturall Faculties*, saith, *That blood is thin, vapour thinner, and Spirits thinnest of all.*

That they are corporeall.

Like the wind.

Resemblance.

Galen.

That the spirits are in perpetuall motion.

I saide moreouer, that it was alwayes in motion, for the spirits are continually moued, not by another onely as the humors (which whither they be drawne or driuen are alwaies moued by a power without themselues;) but also by themselues, that is, by an inbred principle of their owne. So that there is a double original of the spirits motion, on homebred another but a stranger; by the homebred principle they are mooued as the flame vpward and downward, as *Galen* teacheth. Vpward, because light; for they are fiery and airy: and downe-ward towarde their nourishment. If either of these motions bee hindred, the spirit is corrupted, and that by consumption or extinction; by consumption for want of nourishment when it cannot mooue downward; by extinction from his contraries, when it is choaked by cold and moysture because it cannot mooue vpwards. Againe they are moued by an externall principle, when they are Drawn hither or Driuen thither. They are driuen, the Naturall from the Liuer; the Vitall from the heart in his *Systole*, the Animall from the Braine when it is compressed. They are drawne, the naturall by the veines, the vitall by the particular parts together with the Arteriall blood; the Animall verie rarely, vnlesse a part be affected either with paine or pleasure. For in such a case neyther dooth the vehemency of the obiect suffer the faculty to rest, nor the heate cease to draw the spirits vnto it. The spirits therefore haue a body mooueable.

A double principle of their motion.

How the Spirits are corrupted by consumption.

By extinction how the Spirits are driuen.

The Animall spirits howe drawne to a part.

It followeth in the definition, that they are engendred of blood and a thin vapour; so that they haue a double matter, an exhalation of the bloode and aire; and therefore it is, that all our spirits are cherished, preserued and nourished by aire and blood.

Whereof Spirits are ingendred.

The Vse of spirits.

Binding of the vessels intercepteth not the Faculte it selfe.

The last part of the definition designeth the vse of the spirits, as being the last and finall cause for which they were ordained. For the spirits are the vehicles or carriages, not of the soule, but of the faculties thereof; for if the Vessels Veines, Arteries, or Nerues be tyed, the life, motion and sense of the parts to which these vessels passe do instantly abate & are in short time vtterly extinguished vpon the interception of the spirits, not of the faculties themselues which are incorporeall, because the band or tye dooth neither interrupt the continuity of the vessell with his originall, neither yet his naturall disposition. And this is the nature of spirits in generall.

Spirits double ingenit or in-bred.

Argenterius his opinion that there is but one sort of spirits.

Opinion of the Ancients, that there are three sorts of spirits.

That there is an Animall spirit. Reasons.

Now some spirits are ingenit or in-bred, which are so many in number as there are seuerall kinds and sortes of parts; some influent, which flowe as it were from diuers Fountaines, and serue to rowze and raise vp the sleepy and sluggish operations of the former. Concerning the number of the influent spirits, Physitians are at great difference among themselues. *Argenterius* thinketh that there is but one sort of spirits, because there is but one soule and that hauing but one organ, one bloode and one ayre which is breathed in. But the Ancients farre more acutely haue recorded three manner of spirites, because there are three faculties of the soule, the Naturall, the Vitall, and the Animall; three principles, the Braine, the Heart, and the Liuer; and three kinde of Vessels, Veines, Arteries, and Sinnewes.

That there is an Animall spirit, beside that *Galen* inculcateth it in sundry places, many reasons do euict it. For to what purpose else was the braine hollowed or bowed into so ma-

nie

ny arches? To what purpose are those intricate mazes and laberynthes of small Arteries which in the Braine we call *Rete mirabile*, the wonderfull Nette? And why are the sinewes propagated into so many braunches? But of this we shall haue occasion to speake more hereafter, as also of the vitall which no man yet euer opposed, and of which the Poet maketh mention, calling it a *diuinitie*. *Ouid.*

Est Deus in nobis, agitante calescimus illo.
In vs there is spirit seated,
And by his motion we are heated.

Onely concerning the naturall spirit there hath been some difference, many labouring to blot his name out of the rowle; whose arguments we will here scite before the tribunall of Reason to see how they acquite themselues. First they say that the naturall faculty needeth no vehicle or weftage, because it is inbred in euery part, for which they auouch *Galen*. Againe, there is no matter whereof this naturall spirit should bee made, because there bee no vessels whereby ayre may be conuayed vnto the Liuer; neither is there any place for his generation, there be no such cauities in the Liuer as are in the Heart and the braine. Adhereto that there be no currents or channels to be found whereby it should be led through the body: for the coates of the veines are too thinne to hold or contain an ætherial spirit. And truely *Herophilus* well conceiteth that therefore the Artery is manifolde (sixe fold sayth he) thicker then the veine, because it was made to conteine the spirits, which by reason of their tenuity, if they had not beene inclosed within stronger wals, would easily haue vanished away.

That there is no natural spirit. 1. *de loc. affect.* 12. *meth.* & *in arte parua.* 1. Reason. 2. Reason. 3. Reason. 4. Reason. *Herophilus.*

Moreouer, seeing the spirits as *Hippocrates* sayth, haue in them a kinde of nimble violence and impetious motion, if they were contayned within the veines, they would make the veines to beate as do the arteries. Finally, if it be granted that the spirits doe passe and repasse through the veines, yet with what nourishment shall they bee preserued? For heate sayth the great *Dictator Hippocrates* is nourished by moderate cold; nowe there is no ayre led vnto the veines to serue that turne.

5. Reason. *Hippocrates.* 6. Reason. *Hippocrates.*

Answere to the former arguments.

These and such like are the arguments whereby they cashеere this naturall spirit, which if they be weighed in equall balances will be found too light to sway an established iudgement. For first, *Galen* doth not absolutely deny that there is a Naturall spirit, only he casteth in a doubt as it were by the by, as also he doeth concerning the vitall spirite, in the fift chapter of the 12. booke of his *Method*, when yet notwithstanding it is beyond all controuersie that it is conteined in the arteries. But more plainly in the sixt of the *vse of Parts*, he writeth that there is a spirit conteined in the veines; yet are there but few of them, and those darke as he sayeth and cloudy. We confesse that there is a naturall faculty bred and seated in euery part, but because the heate and naturall spirit of the partes wherein this inbredde faculty doth consist is but vncertaine like a fugitiue, and dull or stupid; it standeth in neede of another influent yet like vnto it selfe, whereby it might bee stirred vp, established, and from a potentiall vertue brought into an operatiue act.

To the first. *Galen.* The naturall spirit but cloudy.

The Arabians imagine that the blood is transported and guided through the whole body vnder the conduct of the spirit; for although euery part like a Load-stone doe draw vnto it selfe such iuyce as is familiar vnto it, yet if the distance of place be too great, neither can the Load-stone draw yron, nor Amber chaffe, nor the part his nourishment. To their second argument that there wanteth nourishment both for the generation and preseruation of this spirit because no ayre is conuayed vnto the Liuer; we answere with *Hippocrates*, that all bodies are *Transpirable* and *Trans-fluxible*, that is, so open to the ayre as that it may easily passe and repasse through them, though not so aboundantly as it doth by the winde-pipe, of which aboundance there is no neede, because this thicke and cloudy spirit needeth but a litle ayre for his refection, which is supplyed by transpiration. This Transpiration is made in the hollow parts of the Liuer by the Arteries. In the round or gibbous although there be no arteries, yet the midriffe with his continual motion as it were with a fanne, ventilateth or fanneth, not the Liuer onely, but all the entralles.

The Arabians conceit. To the second *Hippocrates.*

Thirdly, whereas they say there is no cauity, no Cisterne, no place for generation of such a spirit in the Liuer; it is truely a very bold conclusion. But let vs sticke to them with as great confidence hauing *Galen* on our sides equiualent to a whole army of such inexperienced *Tyrones*. It was not necessary sayth he that there should be any cauity or cell in the Liuer such as are in the heart, because those bowelles onely which were either to receiue from others, are to affoorde and impart together-ward and at once a plentifull and aboundant

To the third.

dant sourse of matter stood in neede of an ample cauity wherein it should be either treasured & stored when it is receiued, or wrought and framed when it is to bee conuayed. The vitall spirit as it is very fine and thinne and therefore quickly exhausted; so it behoued that it should as sodainely bee regenerated that there might neither want plenty for necessity, nor aboundance for sodain expence: it was therefore necessary that it should haue a large cauitie or Cauldron wherein it should be boyled and prepared for vse; as wee see Nature prouided large and ample vessels for the nourishment of the Lungs, because of their continuall motion, which requireth a supply answerable to the expence: but the naturall spirit as it cannot so sodainely spend it selfe, so there was no neede of any abundant affluence thereof, and therefore the beds or webs of the veines were sufficient for his generation.

Why the vessels of the Lungs are large.

To the fourth

Fourthly, whereas they say that the thinne coates of the veines are too weake to guide and safe-conduct the naturall spirit; we answere in a word, that a thicke & grosse substance or dull prisoner is easily held in durance.

To the fift.

To the fift argument we answere, that the veines are therefore not moued, because the faculty of pulsation is not deriued vnto them from the heart; for we do not thinke that the Arteries are moued by the heate and spirits which they containe, but onely by a vitall faculty streaming through them by irradiation from the heart, as we shal prooue hereafter.

To the last.

Finally, they aske how we think these spirits should be nourished? We answere, that it is transpiration which preserueth, refresheth, and maintaineth them, for euery veine hath his artery accompanying him continually, beside the manifold imbracements and inoculations, whereby they are as it were wedded one vnto another.

The Conclusion.

Wee conclude therefore that there is a naturall spirit, the vehicle or guide of the Naturall faculty and of the thicker sort of the blood which is from the Liuer diffused into the whole body.

QVEST. XIII. *Whether the Bladder doe draw the Choler vnto it for his Nourishment.*

The seate of the bladder of gall.

THat there is a small Bladder tied to the hollow part of the Liuer, repleniſhed with a yellow bitter iuyce which we call *Choler* or *Gall*; there is no man ignorant who hath touched *Anatomy* as they say, but with his vpper lip. But whether this iuyce doe passe vnto the Bladder of it owne accord, or be drawne by the bladder, or abligated and sent by the Liuer, it is not altogether so manifest. That a meere Elementary forme should lead it by a kind of instinct or natural choice (for some choyces may be naturall) or election vnto that place, I thinke fewe men of reason will auouch. More likely it is that it is either drawne or driuen; *Galen* is for both, so is reason also; although *Fallopius* that subtle and occulate *Anatomist*, contendeth that it is onely driuen from the Liuer and not drawne by the bladder, to whome and his arguments we will set our feet in the next exercise.

Galen.

Falopius.

That the choler is driuen from the liuer

That the choler is driuen from the Liuer, the very natue of the iuyce doeth sufficiently proue; it is an excrement, in his whole nature and quality hurtful and noxious, to the Liuer especially; and therefore it ought to be auoyded and that sooner and with more expedition, then the other two excrements, because his sharpe prouocations are more offensiue, and for that reason the receptacle of choler is tyed or fastned close vppon the cauity of the Liuer, but the spleene and the Kidneyes which receiue the other two, are set further off.

Why the bladder of gall is fastned to the Liuer.

That it is drawn by the bladder of gal *Galen.*

Againe that this choler is drawne by the bladder of Gall, *Galen* teacheth in his fourth & fift bookes of the *vse of Parts*; and beside the fashion and conformation of the bladder it selfe and his passages doe aboundantly perswade vs thereunto; for because there be diuers Choler-conduits bending rather down to the guts thē to the bladder whose seite is higher; vnlesse the bladder had a peculiar & in-bred traction, vndoubtedly the choler would rather fall downe into the guts then arise vnto the bladder. The bladder therefore draweth this bitter iuyce, and that sincere without admixtion of any more benigne or pleasant humor.

Iobert his opinion.

But whether this Traction of the Choler by the vesicle or Bladder bee for nourishment, or from a certaine consanguinity betwixt their qualities, or rather by a hidden and vnknowne propriety, it hath beene a question of old, and yet is not determined vpon record. *Laurentius Iobertus* set forth a paradox concerning this matter, wherein hee determineth that this bladder is nourished by Gall, as the spleene by melancholy, and the Kidneyes by *serous* or whaey blood, which opinion may bee established by these reasons. First, it is an axioune in Philosophy and Physicke, which *Galen* often inculcateth and vrgeth in his

His reasons. *Galen.*

bookes

bookes of naturall faculties, *That nothing draweth for the drawing it selfe, but for the enioying of that which is drawne*, that is to say, all traction hath some particular end for which it was instituted.

Now the Bladder draweth the choler: to what end? No doubt but for his nourishment; and this the colour of the bladder perswadeth, which is altogether yellow by reason of the choler assimulated vnto it. Secondly, the Veines that are dispersed and dissemirated through the coates of the Vesicle are so small and hairy, that a mans eie can scarse finde them out, and therefore by them the Bladder, especially the inner part cannot bee nourished. Thirdly, *Galen* witnesseth that the Lungs are nourished by choler, why then may not the bladder a more ignoble part be nourished with more impure choler? These and such like are their arguments, who imagine that the traction of the choler is for the nourishment of the bladder. *Galen.*

On the contrary, we being guided by authority, and established by *Galens* weighty arguments, do not thinke that the bladder is nourished by Gall but by blood, conducted or led vnto it by the Veines; and that this traction whereof we haue spoken, hath some other end for which it is vndertaken & not for norishment. *Galen* in his 5. book of the vse of Parts and the 7. chapter writeth, that both the Bladders because they draw a sincere excrement altogether vnprofitable for nourishment; do stand in needle of bloody vessels or vessels full of blood by which they may be nourished. And againe, in the 12. chapter of the 5. book, he askes the Question why the stomacke and the guts haue double coates, and both the bladders but one, and that proper? He answereth himselfe thus. Because in the Bladders there was to be no concoction made of those things conteined in them; If no concoction of the substance, then no nourishment by the same. To these authorities reason also lendeth her assistance on this manner. All nourishment is by assimulation; but choler cannot be assimulated because it is an excrement; not offensiue onely by reason of his quantity, but also in his quality distastfull and vnsauoury. The conclusion we leaue for them to gather who hold the contrary.

That the bladder is not norished by the gall. Authorities out of *Galen.* An argument out of *Galen.* Reasons.

A second reason may be, because Nature neuer attempteth any thing in vaine, why the were the two Cysticke twinnes or veines which leade vnto this bladder ordained, if it were not for his nourishment? I confesse there are very small (though our grauer hath cut them large) but yet great enough for the nourishment of so small and vnbloody a part; and so much for the establishing of the truth.

Let vs now another while make answere to the arguments of our aduersaries aboue alledged. The bladder of Choler say they is yellowish, and that commeth by the assimulation of Choler. The Conclusion hangeth not well vpon the proposition. For the Colon also in that place where it toucheth the bladder of Gall groweth yellowish by the transudation or sweating through of the yellow iuice abounding therein; yet who will say for all that, that the colon is norished by the Choler? And whereas they compare the nourishment of the Lungs and the bladder of gall, they forget that choler is one thing, and cholericke blood another. The Lungs indeede are nourished with cholericke blood, that is verie thin and laboured to a height of heate in the left ventricle of the heart, but with excrementitious choler no part is nourished.

The first opinion confuted. To the first argument. To the third.

If they obiect that the Spleene and the Kidneyes are nourished, the one with excrementitious and fœculent blood, the other with *Serous* and whaey; we answer, that we will make any man iudge whether there be the like reason of all these partes, the Kidnies, the Spleene, and the bladder. For albeit the Spleen doth draw vnto it fœculent blood, and the Kidnies a *serous* excrement, yet are not these pure and vnmixed; for their vessels, to wit, the Splenick branch and the Emulgent veines are very large. Now we may remember that *Galen* saith, that those parts which draw any iuyce through ample and large orificies cannot draw it pure and sincere, and therefore the Spleene and the Kidneyes do draw their excrements mingled with much benigne and alimentary blood, with which blood they are nourished, but the vnsauoury excrement they separate and auoid. But the bladder draweth vnto it selfe pure and sincere choler, not mixed or adulterated with any other humor, as well because the narrowne esse of the passage will not admit any thing thicker, as also for that the attraction is stirred vp by a familiarity betwixt the bladder and the humour. It remaineth therefore cleared as we hope, that the bladder drawes not the choler for his nourishment. Obiection. Answer *Galen.* Howe the Spleene and Kidneyes are nourished.

If it be demanded why then it draweth? We answere, that *Galen* thought it was by reason

Similitude. ſon of a familiarity and ſimilitude betweene them to vs vnknowne, it may bee alſo incomprehenſible. For as the Load-ſtone draweth yron, and Amber chaffe; ſo the bladder draweth choler, with whoſe preſence it is delighted and tickled as it were with a ſence of pleaſure. For ſo he ſayth in the 10. Chapter of the 5. Book of the *vſe of Parts*; *Choler is drawn by the Bladder, by reaſon of a communion of qualities.* For as long as the Creature is a liue, though he liue very long, yet alwayes there is choler contained in the bladder of Gall, yea and after death, if wee will keepe the Gall long, wee may preſerue it beſt in his own bladder; neither of them ſuffering violence by other in any reaſonable tract of time, for thoſe things that are familiar and as it were a kin, will not offer violence one to another.

Galen.

Why gal keepeth beſt in his own bladder.

Obiection. If any queaſie ſtomacke ſhall aske the queſtion how the bladder can be delighted with ſuch an excrement whoſe rage and acrimony is ſo fierce that if it ſtay but a little in the guts it vlcerateth them, & if it be poured into the habit of the body, by irretating the pannicle or fleſhy membrane it ſtirreth vp a rigour or generall ſhiuering? How the bladder which is membranous and therefore of exquiſite ſence, ſhould not feele that acrimony or be offended with ſo impure a humor? We anſwere firſt with *Lucretius*, *That Nature conueth many things vnder a ſacred veyle*, and that in this great vniuerſe, the ſympathies and antipathies of things are ſecret and wonderfull. Againe, the Bladder is delighted with the preſence of the choler, and therefore is not hurt by his acrimonie. Happely alſo becauſe it is vſed to it, it is not afflicted by it; ſo thoſe men that are accuſtomed to poyſon, doe not feele the poyſonous power thereof, and a drop of liquor ſtrangleth well-nigh the Arterie, whereas full cups delight the ſtomacke. Againe, the ſtomacke is pained with a little ayre, and the guts torne aſunder with cruell torments, but the Lungs becauſe they are accuſtomed vnto it, do ſwallow the aire in great aboundance and are refreſhed thereby.

Anſwere. *Lucretius.*

Cuſtome taketh away ſence.

Similitudes.

Thoſe men that will not admit of this familiarity or acquaintance betweene the choler and the bladder, doe referre the cauſe of this Traction to the neceſſity and prouidence of the vniuerſall Nature; to wit, that the blood may be purged, leaſt being defiled with ſuch an excrement, it ſhould become vnprofitable for nouriſhment.

QVEST. XIIII. *Of the paſſages by which the Choler is purged, againſt Falopius.*

The commendation of *Falopius.* GAbriel *Falopius*, the moſt acute and ſubtle Anatomiſt of our age, hath deſerued exceeding wel in opening vnto vs many things which in the former ages were not knowne. He firſt of all men did acurately deſcribe the Hiſtory of a mans Eie, and obſerued that griſtly body which they call *Troclea*. Hee firſt found out the yarde of the wombe called *Clitoris*, beſide the manifold nicities foulded as it were in a thouſand difficulties, which hee hath manifeſted and brought to light in the Hiſtoryes of the Muſcles, the Veines, and the Sinewes; yet notwithſtanding this great learned man in his Aſſignation of the vſe of the Bladder of Gall, whileſt hee deſcribeth the paſſages wherby the choler is led, in falling from the authority of the Ancients, falleth into an error whereof he cannot be excuſed.

Dangerous to vary from the ancients.

The ancient opinion and indeede the very trueth is, that there are two paſſages of the Gall, one diſtributed into the Liuer with aboundante ſhootes, the other paſſeth from the veſicle vnto the Guts. By the firſt the Bladder draweth the Gall vnto it ſelfe; by the ſecond it diſchargeth it again into the *Duodenum*. *Falopius* on the contrary, conceiteth that thoſe paſſages of choler which are diſſeminated through the Liuer runne directly not vnto the Bladder but to the *Duodenum*, and doe continually thruſt out the choler thereinto. And becauſe it hapneth full oft, that the guttes are either diſtended with winde, or in the time of diſtribution are fulfilled with Chylus; ſo that the paſſage or out-let ordained for the auoyding of choler is intercluded or ſhut vp; leaſt ſayth he, the choler ſhould flow back and returne vpon the Liuer to defile the blood, Nature hath framed the Bladder as it were a diuerticle or ciſterne out of the way, wherein the choler might bee gathered and reſerued together, whileſt the out-let in the *duodenum* ſhould be opened.

The two paſſages of choler. *Falopius* his opinion.

Wherefore there be two things which *Falopius* would haue; the firſt that the Choler paſſeth directly from the Liuer to the *duodenum*: the ſecond that the Bladder draweth not choler, but that it returneth thither from the guttes when they are diſtended. Which two aſſertions, by the fauour of this learned man, we cannot ſubſcribe vnto; becauſe we thinke that we are able to demonſtrate the contrary both by reaſon and ſence, the two moſt cer-

Arguments againſt *Falopius*

taine Iudges and determiners of all controuerſies. Firſt therefore wee ſay and lay as a ground, that in the whole frame and ſtructure of the body there is nothing done or generated as accedentary, but onely vpon certaine ground and neceſſary vſe. Now the vſe aſſigned to the bladder by *Falopius* is but accedentarie and caſuall; for it is not perpetuall that the guts are diſtended with winde and their paſſages intercluded; but this happeneth rarely and but to ſome bodies and thoſe of good conſtitution. Hence it will follow that the bladder muſt be vnprofitable, and idly framed by Nature, which true and ſolid Philoſophy will never grant. For Nature at no time endeuoureth againſt the cauſes of diſeaſes, but againſt ſuch as doe dayly and neceſſarily happen. For it was the originall determination of the great Arificer of this noble *Fabricke*, to create a ſound and not a ſickly habitation for the ſoule: and therefore he generated the parts at the firſt hand for themſelues, and not afterwarde or at aduenture, albeit one and the ſame particle haue many and diuerſe by vſes.

Nature endeuoureth a ſound body not a ſickly.

The ſecond engine which we conceiue theſe paper walles cannot withſtand, ſhall bee this, that it is neceſſary that the *Bilious* excrement ſhoulde paſſe vnto the bladder before it went to the out-let in the *duodenum*. For if it ſhould flowe by degrees and perpetually vnto the guts, it would not moue them to excretion, becauſe a little choler and that falling by droppes, would haue beene too weake for this motion. But becauſe it is drawne by the bladder, therein gathered and at length aboundantly and at once powred foorth into the waies of the excrements, it moueth their diſpoſition by certaine diſtances and with a kinde of ſuddainnes.

The cauſe of euacuation.

Thirdly, vnleſſe wee admit the Traction of the bladder, and a propriety whereby it is conteined & reteined to a certain time, what would it haue auayled it to be ſeparated from the blood? For if it alwayes deſcend directly from the Liuer to the gutte, then muſt it bee mingled againe with the Chylus and defile it; for the way is open, neither can the diſtribution of the Chylus as *Falopius* dreameth, interclude the paſſage of ſo thin and ſubtle a humor. Againe, if the choler ſhould returne vnto the bladder, onely when the paſſage into the *duodenum* is ſtopped, then ſhould not the bladder be alwayes found ful of choler, which is euermore to bee ſeene in ſound and healthy bodies. Ad hereto, that if the bladder were onely prouided for a diuerticle to ſet the choler as it were out of the way; what neede was there of ſo great a cauity? A little bodie would haue ſerued that turne, the firſt intention of nature being not to ſend it thither but vnto the gutte. Furthermore if the bladder had no power of Traction, why ſhould the choler rather returne vnto it then vnto the Liuer, when the paſſage to the veſicle is longer, more crooked & oblique? For if there be nothing but a ſimple refluxion, it is moſt reaſonable that ſhould be by the broader and the ſhorter way, which ſeeing it is not, we conclude that it is drawne.

Finally, if the Choler did onely regurgitate and flowe backe and were not drawne, it would not be reteined, but diſpatched away againe in the ſame moment as an vnwelcome gueſt, and ſo this refluxion ſhould be in veine. For if it be not familiar vnto the bladder, why ſhould it not prouoke it as it doth the guts and the ſtomacke.

Galen his obiection. *cap. 4. lib. 5. de vſu part.*

Nature ſayth *Galen* vnburdneth not the Gall into the ſtomack becauſe it was offenſiue, for if with his bare touch hee moueth the guttes to excretion, ſurely it would haue ouerthrowne the concoction of the ſtomacke. *Galen* asketh the queſtion why the guttes haue two coates, and the bladders which conteine ſo ſharpe humors as the vrine and the choler but one a peece? hee anſwereth himſelfe, becauſe the choler is noyſome to the guttes, but pleaſant and familiar to the bladder, a little of it prouoketh the guts, and not the bladder, becauſe they draw it not, neither is it familiar vnto them as it is vnto the bladder.

His owne anſwere.

I thinke that the onely reaſon which moued *Falopius* to father this conceite, was becauſe he ſaw that the paſſage from the Liuer to the bladder was crooked or oblique, but direct and ſtraight from the Liuer to the Gut; and that therefore it could not ariue ſo ſoone at the bladder by that crooked paſſage as at the gut by the ſtraight. Yet againe me thinks this argument or reaſon ſhould bee too light to tranſport ſo wiſe a man; for the motion of the expulſiue faculty is one, and that of the tractiue another, and the motion of the Elementary forme different from them both. That motion which followeth the Elementary forme is ſtraight and direct, and rather followeth the ſhorter, more ample and ſtraighter paſſages. In the motion of the Tractiue faculty which is from the ſoule, neither doth the obliquity of the paſſages withſtand it, nor the grauity or waight of that which paſſeth; for phlegmaticke blood, although it be heauy aſcendeth vnto the braine, and in the time of famine

The motion which followeth the elementary form

The tractiue faculty.

mine the ſtomacke recalleth the thicker excrements. Seeing therefore that choler is drawn by the bladder, the crooked paſſage cannot hinder his ready obedience. Beſide, the way from the Liuer to the bladder could not be direct, becauſe it is placed in the hollowneſſe of the Liuer, ſo that the paſſage muſt firſt deſcend, and then aſcend.

Obiection.

It will be obiected, if the bladder do draw the choler becauſe it is familiar vnto it, why doth it then diſcharge it ſelfe of it againe? For by the ſame propriety by which it draweth, it ſnould alſo retaine and delight it ſelfe therewith. I anſwere, that the choler is not excluded vnleſſe it be offenſiue either in quantity or quality; and ſure it is, that by long continuance in the bladder, it becommeth more ſharpe.

Solution.

Creatures hauing no bladder or Gall.

Now whereas it is obiected by ſome, that the bladder draweth not the choler, becauſe many creatures haue it not at al, they heereby conclude nothing. For where the bladder is wanting there hee were wood that would ſay the bladder drew it; but wee acknowledge this vſe of drawing the choler in thoſe creatures, at the cauity of whoſe Liuer a bladder is ſet. That this bladder is wanting in ſome creatures, *Ariſtotle* writeth 2. *de hiſt. Anim. cap.* 15. The bladder of gall (ſaith he) in ſome is tyed to the Liuer, in ſome not: in the Hart and the Hinde it is obſerued to be wanting, as alſo in the Horſe, the Mule, the Aſſe, & the ſea-Calfe; the Harts called *Achaini*, are thought to haue it in their taile; the Elephant and the Dolphin haue no gall in their Liuers. In *Euboea Chalcide* an Iſland in the midland Sea neere *Greece*, the Cattle haue none; in *Naxus* they haue it double and very large. Finally, if as *Falopius* thinketh, it be ſo likely that the choler is at firſt hand led away from the Liuer to the gut becauſe that paſſage is the ſhorter, let him giue me leaue to retort vppon him his owne weapon. It ſhall therefore, ſay I, returne from the gut vnto the Liuer rather then to the Bladder, becauſe the paſſage is not ſo oblique, and ſo there will become no vſe at all of the bladder, if it be onely deſtinated for a Diuerticle.

Ariſtotle.

Cerui Achaini. Gall in the taile.

Falopius argument retorted

Arguments againſt *Falius*.

But let vs at length paſſe from reaſon to experience, which we will exhibite as plainly as we haue often found the ſame in our Diſſections. I ſay therefore, that from the Liuer to the Bladder, there is an open or through paſſage and very conſpicuous, but not from the Liuer to the gut. Again, from the Bladder to the *Duodenum*, there paſſeth another hollow pipe, but none from the *Duodenum* to the Liuer, and in each of theſe paſſages there are Values which hinder the refluence of the choler. That this is ſo, may eaſily be ſeene if you put a pipe or Bugle into the paſſages of the Liuer, and then blow it, for the bladder wil ſooner be puffed vp then the gut, becauſe the way is open from the Liuer to the bladder. Againe, if you put your Bugle into the bladder and blow it, then will the paſſage of the gut be diſtended, not that of the Liuer. So then, the choler paſſeth firſt from the Liuer to the Bladder, and after from the bladder to the *Duodenum*.

p

The Values of the paſſages of Choler.

Inſtance.

The concluſion.

To conclude therefore, the Bladder draweth the choler from the cauity of the Liuer, retaineth the ſame for a certaine time, and after in a ſeaſon onely knowne and appointed by Nature, diſchargeth it againe into the guts. And this was the opinion of the ancient ſages of our Art. *Hippocrates* in his fourth Booke of diſeaſes, *Galen* in diuers places, and in a word the whole Schoole of Phyſitians haue receiued it without oppoſition. Now, where there is ſo great a conſent of learned and wiſe men ioyned with the authority of all antiquity, I am not eaſily drawne to dance after the nouell muſicke of a wanton wit, which ſhall varie there from.

Hippocrates. *Galen.*

The duplicitie of the lower paſſage of choler.

But that there may be nothing wanting in the hiſtory of theſe paſſages, it is woorthy our obſeruation, that the latter way by which the bladder emptieth himſelfe, is ſometimes found double, that is, there be two branches thereof, of which one paſſeth vnto the bottome of the ſtomacke, and the other to the *Duodenum*. *Galen* made mention of both theſe in his ſecond Booke of *Temperaments & in arte parua*: and *Veſalius* affirmes that hee ſaw it once. Sometime this channell of choler is but one, and is by nature framed amiſſe, being inſerted in ſome men vnto the bottome of the ſtomacke, in others below the *Duodenum*, the former ſort do continually vomit choler, the latter as continually auoyde it by ſeidge; the firſt are called πικρόχολοι ἄνω *Cholericke vpward*, the other πικρόχολοι κάτω *Cholerick downward, both cholericke* (ſaith *Galen* ἕξει, that is) *in their habite and conformation.*

Galen. *Veſalius*

Hip de victus ratione in acut.

Two ſorts of cholerick mẽ.

A cholerick Temper.

A cholericke Habite.

To make theſe things more plaine, we muſt obſerue that according to *Hippocrates* and *Galen* there are two ſorts of cholericke men, ſome are ſo by nature, ſome by euent or accident. By nature cholericke, is either in Temperament, or in Habite. In Temperament thoſe are cholericke, whoſe Liuers are hot aboue meaſure; for a hot Liuer engendreth abundance of choler. In habite, thoſe are called cholericke whoſe bladder of gall is ſo formed

med, that the Canell or passage of the gall runnes either to the stomacke, or to the emptie gut, and yet both these thus habitually cholericke, may in their temperament be Flegmaticke. There is an elegant history in *Galen*, in his Commentary vpon the second section of the Booke, intituled *de victus ratione in morbis acutis*, concerning *Paul* the Rhetoritian, and *Eudemus* the Philosopher; the Rhetoritian was altogether Flegmatick, yet vexed with continuall vomitings, and for the most part costiue: the Philosopher had many cholerick euacuations downeward, but none by vomit. All these are called *Bilious* or cholericke by nature. There are also some cholericke by euent, that is by a temperament acquired, as by labour, watchings, anger, sharpe, salt and spiced meates.

A Storie out of *Galen*.

Bilious by euent.

But whether the bladder do draw and driue the choler by one and the same way, many haue made question. A certaine new writer, a great interpreter of *Hippocrates*, but not so well practised in Anatomy writeth, that there are two passages inserted into the bodye of the bladder, by one of which it draweth, by the other it drieth forth the gall. But these are meere imaginations, for the passage of the bladder is onely one, whereby it both draweth and auoydeth choler, though at seueral times: yet from this common passage do spring two small twigges, the one diuersifyed into the Liuer, by which it draweth onely, the other inserted into the *Duodenum*, by which it onely expelleth. And this *Galen* vnderstood right well, as appeareth in the thirteenth Chapter of his third Booke of Naturall Facultïes. *It is not hard* (saith he) *to conceiue how traction and expulsion should be made by the same passage at seuerall times, if we consider that the gullet doth not onely leade meate into the stomacke, but also in vomiting casteth it out by the same way.* And thus much of the Bladder of gall, now we proceede to the Spleene.

An idle conceite.

The truth.

Galen.

QVEST. XV. *Concerning the vse of the Spleene against the slanderous calumniations of Galens Aduersaries.*

THere be diuers opinions as well of the Ancient as Moderne writers about the vse of the Spleene, *Erasistratus* thought it not of any great moment. *Aristotle* in his third Booke *de partibus Animalium*, confesseth it to be necessary indeede, yet not absolutely, but by euent, although hee sayth it sometime draweth the excrement from the stomacke, and worketh it vnto his nourisnment. Both these opinions haue beene hissed out of the Schooles of Physitians, as being neither established by reason, nor agreeing with the maiesty, wisedom, and policy of Nature, who vseth not to create any thing in the frame of our bodies, which is not neceffary for the better gouernment and order of the common wealth of the same. *Alexander Aphrodisæus sect. 2. problem*, and *Aretæus lib 1. de causis & signis chronicorum*, and the author of the Book *de Respiratione* do conclude, that the spleene is the organ of sanguification, and they call it the bastard Liuer. In this say they is the veinall blood prepared and concocted, yet doth their beleefe rest vpon coniecture, because the frame and structure of both the bowels is alike; because in both of them there are large and ample vessels; because nature vseth to make the common ministers or seruiceable partes of the bodie, either double, or if but single then that one is placed in the middest, as the heart, the stomacke, the wombe, the bladder, the mouth, the tongue, and the nose; because the Liuer is in the right side and the Spleene in the left, they seeme to bee two organes ordained for one and the same action. But these bare coniectures are too weak to make a party that should hope to preuaile against a common receiued opinion. For how could nature haue set two so ample bowels which were to serue the whole bodie in the midst vnder the heart, and how again should she not haue bin idle if she had made more instruments then one for sanguificatiõ, when one was sufficient? *Rondeletius* was of opinion that the Spleen is not the receptacle of the melancholy humor, because that humour remaining in his naturall integrity, is spent vpon the bones & other hard and dry parts of the body, and because there is left of that humor in vs, there is no part appointed to receiue the superfluities thereof, like as there is no place ordained to receiue the recrements of the blood, which for the most part do passe away by sweats and insensible transpiration. *Bauhin* runneth a middle course between these whose arguments we haue heard before in the history, & may receiue answer partly by himselfe, partly by the answere to others. *Vlmus* a Physitian of *Poytiers* in France, in an elegant and wittie Booke which hee set out of the Spleene, hath deuised a newe and vncouth vse thereof, that is, That in the Spleene the Vitall spirite is prepared: hee meaneth that the thinnest part of the Bloode, which is the matter of the Vitall spirite, passeth from the Spleene thorough

Erasistratus.
Aristotle.

Alexander and *Aretæus.*

Their reasons.

Confuted.

Rondeletius his opinion.

His Reasons.

Vlmus his opinion.

the Arteries into the leſte ventricle of the heart, where it is mingled with the aire, and perfected & ſo powred foorth through the arteries, as it were thorough chanels and watercourſes into the body. And this new paradoxe he eſtabliſheth with reaſons, which carry a ſhew of great ſtrength and euidence of truth.

His reaſons.

The matter (ſaith he) of the vitall ſpirit is double, Aire and Blood, and both theſe ſtand in neede of preparation and attenuation: the Aire is prepared in the Lunges, but the Blood not in the right ſide of the heart as *Galen* would haue it, becauſe there are no manifeſt paſſages from the right to the left ventricle: not in the Lunges as *Columbus* thought, and therefore in the Spleene.

Moreouer, we are perſwaded (ſaith he) heereunto both by the ſtructure of the Spleene it ſelfe, and by the Symptomes or accidents which follow thoſe that are ſplenetick. For the ſtructure, *Hippocrates* in his firſt Booke *de morbis mulerum* ſaith, that *the Spleene is rare and ſpongy, as it were another tongue.* Beſide, there are innumerable foulds of Arteries therein; now theſe foulds are no where ordained but for a new elaboration, and therefore in the Braine is the wonderfull or admirable web formed, in the teſticles mazy veſſels, in the Liuer millions of veines; wherefore it followeth that Nature hath ordained the ſpleene for the preparing and attenuating of vitall bloode. Add heereto, that all the Symptomes of ſplenitick perſons as a liuid or leaden colour, vnſauoury ſweate, aboundance of lice, puffings or ſwellings of the feete, palpitiations of the heart, are demonſtratiue ſignes of a languiſhing or decayed heate and impure ſpirits.

Hippocrates.

The probability of theſe arguments hath made many to ſtagger in their reſolution concerning this point, and yet notwithſtanding if they be called to the touchſtone, wee imagine they will proue no current Coine. For how may it be that the vitall ſpirit prepared in the webs of the Spleene, ſhould be conueyed by the great Artery vnto the left Ventricle of the heart, when at his orifice there are three Values or Membranes ſhut without and open within, which hinder the ingreſſe of any thing into the heart? And this *Hippocrates* in his Booke *De corde* plainly auoucheth, whoſe words becauſe they are ſweeter then Nectar and brighter then the midday Sun we will willingly tranſcribe. *At the mouths or ingate of the Arteries, there are three round Membranes diſpoſed, in their top like a halfe circle, and they that prie into theſe ſecrets of Nature, do much wonder howe theſe orifices and ends of the great Arteries do cloſe themſelues: for if the heart be taken out, and one of thoſe Membranes be lift vp and another touched downe, neyther water nor winde can paſſe into the heart: and theſe Membranes are more exactly diſpoſed in the mouthes of the left ventricle, and that for very good reaſon.* Thus farre *Hippocrates.* From whence I gather, if nothing can paſſe through the Artery into the heart, how ſhall the bloode attenuated in the Arteries of the Spleene paſſe thereinto, as *Vlmus* conceiteth? But I know what the anſwere will bee, that thoſe Membranes are not ordained altogether to hinder the paſſage too and fro; but that nothing ſhould paſſe or repaſſe together or at once after a tumultuous manner. But this is idly to decline the force of the argument, for the blood that is brought into the heart for the generation of vitall ſpirits, muſt both be aboundant, and at once aboundantly exhibited vnto it; which theſe *ſemicircular* Membranes will not admit. But concerning this queſtion, wee ſhall haue occaſion to diſpute heereafter when we entreate of the preparation of the vitall ſpirit., for this time therefore thus much ſhall ſuffice.

Vlmus opiniõ confuted.

Hippocrates.

Obiection. Anſwer 4. vſes of the Arteries of the Spleene.

Notwithſtanding, whereas he obiecteth that the large and manifold Arteries which are in the Spleene were not ordained in vaine but for a further elaboration of blood, I anſwer that the vſe of the Arteries of the Spleen is fourefold. The firſt, that by their pulſation they might purge and attenuate the fœculent and droſsie blood; the ſecond to ſolicit or cal this blood out of the Veines into the ſubſtance of the Spleene; the third to ventilate or breath the naturall heate of the Spleene defiled and almoſt extinguiſhed by ſo impure a commixtion leaſt it ſhould faint and decay; and finally, to impart vnto the Spleen the vitall faculty. And ſo wee ſee how theſe notable Arteries are not without eſpeciall Reaſons ordayned.

Anſwere to the argument of the Symptomes.

As for the Symptoms which follow Splenitick Patients, they happen from the impurity of the blood, not yet cleanſed from this fœculent excrement, and are rather effects of a fault in ſanguification then of the ſtore houſe of the ſpirits. Moreouer, if the Spleen had beene ordained for the preparation of the vitall ſpirit, it ſhould haue been found in all perfect creatures, becauſe that ſpirit is of abſolute neceſsity for the maintenance of life. Yet *Laurentius* ſaith, that a few yeares before he wrote his Anatomy, hee cut vppe at *Paris* in *France*

Perfect Creatures may liue without their Spleenes.

A Hiſtory out of *Laurentius*.

France the body of a young man corpulent and full of flesh, wherein he found no spleen at all: the splenicke braunch was there and that very large, ending into a small glandulous or kernelly body, and the two *hæmorrohidal* veines which purged the fœculencie of the bloud. *Pliny* in the 11. Book of his *Naturall* history, writeth that the Spleen is a great hinderance to good foot-man-shippe or swift running, and therefore some doe vse to seare it, yea and they say that a creature may liue though it bee taken out of the side. Againe those creatures which haue lesse of this drossie slime haue no spleenes, and yet it is not to bee denyed but they ingender vitall spirites. Hereof *Aristotle* is a witnesse, in the 15. Chapter of his second booke *de historia Animalium*, where hee sayeth that the Spleene is in all creatures which haue blood, but in many of those which lay egges it is so small that it cannot almost be perceiued, as appeareth in Pigeons, Kites, Hawkes, and Owles.

Pliny.

Aristotle. Creatures that lay egges haue smal spleenes.

These thinges being so, let vs now lay downe our opinion concerning the vse of the spleen. We will therefore with *Galen*, that the spleene is ordayned for the expurgation of fœculent blood; and therefore Nature hath placed it opposite to the Liuer, that the thicke and muddy part of the iuice being drunk vp and exhausted, the blood might be made pure. This melancholy iuyce by a wonderfull prouidence and vnknowne familiarity the Spleene inuiteth vnto it selfe, yet not pure and vnmingled as the bladder draweth choler, but allayed with much benigne iuyce and laudable blood; because as wee sayed before, where the draught is made through large orificies, there the iuyce is neuer sincere, but mixed with some other humour.

Concerning the vse of the spleene, agreeing with the truth.

This bloud thus drawne and brought by the *Splenicke braunch*, the aboundance of Arteries doe attenuate, mitigate, and concoct, making it like vnto the Spleene which is nourished with the purer part thereof. This *Galen* witnesseth where he sayth, *That the Spleen draweth thicker blood then the Liuer, but is nourished with thinner, and the impurer part sometime belcheth backe into the bottome of the Stomacke, sometime falleth into the Hemorrhoidall veines*: and this is the true and vniforme opinion of *Galen* and the most Physitians concerning the vse of the Spleene, which it shall not bee amisse to proue also by some arguments. It is most certaine that in the Liuer there are ingendred with the blood three kinde of excrements, one thinne and more ayrie which swimmeth aloft and is called *Choler*; another thicker and more earthy answering to the lees of wine, the third waterie and whaey. The Choler because his acrimony is more prouoking, is first of all sent aside; the melancholly iuyce as being more myrie and impure, needes the more forcible expurgation; for this expurgation, it was necessarie there should be some receptacle and that not far distant from the place of concoction.

Galen.

Confirmed by reasons.

The first.

This receptacle is neither the stomacke nor the guts, nor the Kidneyes, nor the braunches of the hollow veine: it remaineth therefore that it must bee the Spleene, which receiueth a notable splenicke branch from the trunke of the gate veine and the lower partes of the Liuer. An argument hereof is the couler of the spleen, which is almost in all creatures blacke or brownish, as also sowre to taste: now such as the couler is of any part, such is the humor that hath dominion therein.

From the couler and taste.

Moreouer that the Spleene is ordained for the drawing and purging of the lees of the blood, these things doe sufficiently witnesse; because it is most subiect to obstructions and schirrous tumors, not by reason of his substance, for it is rare and fungous like a fast sponge or a smooth pumie-stone; not by reason of his vessels which are very large: wherefore by reason of the humor contained therein, which if it were thin would neyther beget obstructions nor such scirhous hardnesses. This *Galen* teacheth in the 13. booke of his Method. *The substance* sayeth hee *of the Liuer is very liable to the scirrhus, as Naturally conteining some myrie and grosse iuyce: the substance of the spleene is more rare and open then that of the Liuer, but yet is oftner afflicted with scirrhous tumors, because of a kind of Aliment wherewith it is refreshed.* And againe in his 5. Booke of the *Faculties of simple medicines*: *The Spleene hath ample passages.* From whence then proceed these frequent obstructions but from the grosse and fœculent blood? In respect of this thicke humor, *Galen* in his 5. Booke *de sanitate tuenda* sayth, *That the Spleene is helped by the exercise of the vpper and lower partes to attenuate it.* And in *Plutarch Orchomenes* the *Lacedemonian* was very spleeniticke, yet hee so exercised himselfe in running, that at length he obtayned the prize in a race.

2. Argument.

Why the spleen is subiect to obstructions & scirrhous Tumors. *Galen.*

Plutarch.

Furthermore, that the spleene is the receptacle of fœculent blood may thus be demonstrated: If the spleene bee obstructed, this muddy blood floweth presently backe vnto the Liuer, and infecteth that which is pure and laudable with his couler, and hence the habite

3. Argument.

The cause of the black and yellow iaũdise

of the body becommeth melancholy, and the patient ouertaken with the blacke Iaundise, euen as when the passage of gall is obstructed the choler returneth into the Liuer, whereupon the whole body becommeth yellow in a yellow Iaundise. For this cause I thinke it was that the Ancientes placed the seate of laughter in the Spleene, for it is a knowne disticke.

Cor sapit ac pulmo loquitur fel continet Iras,
Splen ridere facit, cogit amare iecur.
The seate of wisedome is the Heart, the Lungs our Tongues doe moue:
The Gall our Rage, the Spleene our Mirth, the Liuer holds our Loue.

Plato.

And the Diuine *Plato* aluding hereto, writeth that the Spleene is placed next vnto the Liuer to keepe it alwayes pure and bright and shining like a mirrour, fitte to returne the Images of those things that light vpon it.

Obiections.

But there are many things obiected against the trueth of this opinion, which it is very reasonable we should answere and dissolue. If the Spleene had beene ordained for the drawing and purging of the melancholy iuyce, then Nature would haue prouided some passages to leade it from the Liuer; there should haue beene also some cauity to receiue it, and some wayes by which it might be thrust forth. So there are certaine passages of the gall dispersed through the whole body of the Liuer, and hollow like Arteries which leade the choler from the Liuer: there is also a notable cauity in the bladder recieuing it, & wayes by which it is thrust downe into the *duodenum*. In like manner, Nature for the vrine prouided the emulgent vessells to leade it from the hollow veine: the membranous cauities of the Kidneyes to receiue it, and the vreters and bladder to expell and auoyde it; but for the melancholy iuyce there are no proper and peculiar passages to leade it to the Spleene, no cauity or hollownesse in the Spleene to receiue and conteine it, nor any wayes whereby it might be auoyded; and therefore the Spleene is not ordained for the drawing and expurgation of this humor. That there is no pipe, passage, or vessell appointed for the transportation of these lees of the blood may be proued thus. Nature is so prouident that as soon as sanguification is perfected, she prouideth that the noysome and *heterogenie* parts should bee purged and separated from the laudable blood, that it might not bee adulterated with their contagion. But if the melancholy iuyce should passe away by the splenicke braunch, this councell and law of Nature should be vtterly ouerthrowne, because it must needs passe through the trunke of the Gate-veine, and defile with his slimy muddines all the braunches that belong to the stomacke, the kall, and the neighbor parts. Neither can the Spleene be a fit receptacle for this melancholy iuyce, because in it there are no hollow veines, whereas this thicke excrement would occupy a greater place then a thinne. Finally, there are no passages by which these lees might be thrust forth, for it is not returned into the *hemorrhoidall* veines, nor into the bottome of the stomacke; because if it were thrust into the *hemorrhoidall* veines, then all men should be trobled with hemorroids, because all men haue this fœculent blood: adde hereto, that the blood that floweth by these veines is thinne and purple, not blacke and thicke. Againe, if the Spleene should belch out the reliques of this fœculencie into the bottome of the stomacke, it should at length bee auoyded either by vomit or by siege, and so we should continually haue sowre vomits or eructations, and black stooles.

Answeres to the former arguments.

These and such like are the arguments by which the aduersaries of *Galens* opinion doe contend against him. But their blunt weapons will not fasten in the flesh, *Nulla sequitur de vulnere sanguis*. For we answere, that the splenicke branch is a fit vessell for the conueyance of this melancholy iuyce, from which although almost all the veines of the stomacke and the Kall doe arise: yet those parts doe not draw into them this impure blood, but only the Spleene which by a kinde of familiarity challengeth it as his proper guest. So the kidneyes alone do sucke through their ample vessels the whay, not pure but mingled with the blood.

Galens obiections.

His owne answere.

As for a cauity, we doe not thinke it necessary in the spleene, because there are an infinite number of beds and webs of veines and arteries therein, in which the slime and muddy blood is boyled and attenuated: so in the Liuer there are many of these webbes and yet no cauity, as also in the breasts and the testicles. *Galen* in the 4. booke of the *vse of Parts*, and the 6. Chapter, asketh the question why there be two Kidneyes and but one bladder, and one spleene? he answereth himselfe, because the serous or whaey humour is in greatest quantity, the choler lesse, and the melancholy least of all. The whay thinnest, the melancholy

choly Lees thickeſt, and the choler betwixt both. And therefore for a little and thicke humor which was hard to be mooued, a great and rare organ was moſt fit; but it needed not to be hollow, becauſe the melancholy iuice was not ſodainly to bee remooued, but by degrees and length of time to be changed and altered. Now, if there be any reliques of this melancholy bloode, who will deny that it is auoyded by the Hemorrhoidall veines at the ſeige, or by the veinall veſſell into the bottome of the ſtomacke. Neither doth it hence follow, that the ſtooles ſhould be alwaies blacke, or the vomits ſowre; becauſe a little quantity of this fœculent blood by the heate of the inward parts may bee digeſted and ſpent in a vapour, as the excrements of the bones, the griſtles, & other parts. But if it abound as it happeneth in melancholy men, then the excrements of the belly, the bladder, and the hemorroid veines appeare blacke.

Why there is no notable cauity in the Spleene.

Tis true indeede, that ſometimes a right thin and purple bloode paſſeth away by the Hemorrhoides, becauſe the Leeches ſucke that which is thin, the thicker ſetling becauſe of the ſtreightneſſe of the wound: or els we ſay, that there are two kinds of Hemorrhoids, the one externall, the other internall; the internall arife from the ſplenick branch, and the externall from the Iliack: the firſt do euacuate ill diſpoſed and fœculent bloode, the other do empty the turged and full veines, and therefore the bloode that paſſeth from them is pure and lawdable.

External and internall, Hemorrhoids

QVEST. XVI. *By what wayes the Melancholy iuice paſſeth from the Spleene to the bottome of the ſtomacke, and for what vſe.*

ALmoſt all Phyſitians do agree, that a part of the Melancholy humor is diſcharged into the ſtomacke, but by what paſſages and to what end, they cannot ſo well accord. *Auicen* thought, that it is carried vnto the mouth of the ſtomacke by the Coronary veine, before it enter into the Spleene. *Auicens* opinion.

Tis a ſtrange thing (ſaith he) *that the light choler ſhould be ſent downeward vnto the guts, to redeeme the ſtomacke from his acrimony, and the heauie and dull Melancholy ſhould riſe vpward to the mouth of the ſtomacke for the commodity thereof.* *Galen* ſeemeth to haue thought diuerſly concerning this matter. In the third Booke of *Naturall Faculties* he writeth, that it paſſeth from the Spleene vnto the Kall, thence into the guts, and by them to the *pylorus*, and at length to the bottome of the ſtomacke. In his Bookes of *the vſe of Parts*, he openeth a nearer way, to wit, the *Vas breue & venoſum*, that is, the ſhort or venall veſſell, reached from the vppermoſt branch neere the ſpleene to the bottome of the ſtomacke. *Galens.*

In his Booke of *the Diſſection of Veines and Arteries*, hee affirmeth that this ſhort veſſell is not found in all creatures. For mine owne part (ſaith *Laurentius*) I haue alwaies obſerued it neuer to be wanting. This paſſage therfore being ſo ſhort and conſpicuous, is moſt like to be ordained to conuey a part of the Melancholy iuice, which is like vnto the Lees of Wine into the bottome of the ſtomacke which could not be mittigated and attenuated by the power of the Spleene. Yet I will not deny but that when this ſhort veſſel is ſtopped the groſſe iuice returneth into the ſplenicke branch, and from it ſometimes into the Coronary veine of the ſtomacke, ſometimes into the Hemorrhoidall, and ſomtimes into the veynes of the Meſentery. But why ſhould this melancholy iuice bee ſent backe into the bottome of the ſtomacke? the common and true opinion is, that it is done to ſtirre vp appetite, for it is cold and ſowre; now all cold things becauſe they aſtringe or binde and corrugate or contract the mouth of the ſtomacke, doe prouoke appetite. So *Hippocrates* in *Epedimis* ſaith, *That water is deuouring, and melancholy men are great eaters.* *Auicen* thought that this melancholy did not onely by his aſtriction ſtirre vppe appetite, but alſo further retention and concoction; and of the ſame minde is alſo *Galen* in the 5. booke *de vſu partium*, *It ſtreightneth the ſtomacke, & contracteth it into it ſelfe, and maketh it ſtreightly to embrace the meate, and to retaine it till it be concocted.*

What wee ought to thinke of it.

Why the Melancholy humor returneth into the bottome of the ſtomack.

Cold things prouoke appetite how. *Hippocrates.* *Auicen.* *Galen.*

If it be obiected, that if it ſtirre vp the appetite, Nature ſhould haue implanted the veinall veſſell into the mouth of the ſtomacke, which wee determine to bee the ſeate of appetite? We anſwere, that it is not ſo placed by the prouidence of Nature, leaſt continually gnawing and prouoking the mouth of the ſtomacke, it ſhould induce a perpetuall and rauenous appetite. By the benefit and help of this branch, thoſe who are diſeaſed with a quartane Ague (who for the moſt part haue it very large) are much eaſed by vomits, whether they come of themſelues, or are procured by Art both before and after the Poroxiſme or fit,

Obiection.

Anſwer.

How Quartane agues are often eaſed.

fit, especially in the declination of the disease. This same branch also is the cause why in Quartanes not onely the Spleene is affected, but also the mouth of the stomacke, yea, almost in all diseases which proceede from Melancholy the Stomacke beareth a part of the burthen.

The stomack ill affected in quartanes.

QVEST. XVII. *How those that are splenitick are purged by Vrine, and by what wayes those purgations passe.*

Hippocrates calleth the Melancholie humor water.

THat all splenitick and melancholy persons do abound with Vrine, as well the authority of *Hippocrates*, as also reason and experience doe perswade. *Hippocrates* calleth the Melancholy iuyce *Aquam*, that is, Water; in his fourth Booke *de Morbis*, where he saith; *both the man and the woman haue foure kinde of moistures, Flegme, Blood, Choler, and Water.* And in his Booke *de genitura*, there are foure kindes of moistures, Blood, Choler, VVater, & Flegme. By water all Interpreters vnderstand the melancholy humour, because that of all humours hath most whay or vrine in it, for it is cold: wherefore when that aboundeth, the naturall heate of the Spleene, the Stomacke, the Liuer, and neighbour parts is wasted and dissolued, from whence proceedeth a great encrease of crudities and waters. Adde hereto that it behoued this crasse humour to haue much whay mingled with it, to be a wastage or vehicle thereunto. Common and dayly experience addeth strength to this opinion, for in quartane Agues there is much sweate and much water made, and melancholy men are all of them *spatatores maximi* great Spitters: therefore *Galen* out of *Diocles* in his 3. Booke *de locis affectis*, reckoneth aboundance of spittle to be the principall amongst *Hypochondriacall* signes.

And why.

Much sweate and vrine in Quartanes.

Melancholie men great spitters.

This therefore is to be resolued of, that splenitick persons doe abound with serous humour. Furthermore that it is purged by vrine, *Hippocrates*, *Galen*, *Auicen*, *Paulus*, and *Rhasis* doe teach, and we finde it true in our dayly practise. *Hippocrates* in his Booke *de internis affectibus*, writeth that the medicines which are prescribed to the splenitick persons, ought to purge by the bladder; and in his Booke *de externis affectibus*, he willeth that those choliricke Patients who haue great and turgid spleenes, and thereuppon are ill coloured or troubled with malignant vlcers, should haue their vrine prouoked. The moderne Practitioners doe cure the vulcers called *sceletyrbica*, which are contracted or gotten by the fault of the spleene, by *diuretical* and *diophoretical* medicines, that is, by such as prouoke vrine and sweate.

How to purge it.

Vlcera sceletyrbica, how cured.

Hippocrates relateth an elegant History of *Bion*, in the second Booke of his *Epidemia*, and the second Section. *Bion* (saith he) *did make much water without any residence, and the bloode yssued out of his left nosethril; for his Spleene was puffed vp and hard.* *Galen* in his second Booke *ad Glauconem* cures quartane Agues with Diureticall Medicines, such as prouoke Vrine. *The guts* (saith he) *are to be purged by the seige but the Spleene and the Kidnies by the Vrine.*

Hippocrates story of *Bion*.

Auicen.

The same *Galen* in his Commentaries in *sextum Epidem*: writeth, that Blacke Vrines are signes of a colliquated or resolued spleene. *Auicen Fen. 15. tertij. When splenitick persons* (saith he) *do vse much exercise, the Melancholy humor is deriued to the passage of the vrine, and the vrines become blacke.* And we our selues haue obserued many splenitick persons to haue recouered their health by a liberall and free profusion or euacuation of blacke Vrines. But we must obserue that such Vrines are not blacke in their proper liquor, nor in their Generation (because those according to *Hippocrates* in his Prognosticks, Prorrheticks & Aphorismes are all mortall, for that they bewray eyther an extraordinary heate, torrifying all things as it were into a blacke Cinder, or else an extinction of naturall heate, and a *Morticinium*, that is, an *vtter deadnesse*) but they are blacke through a permixtion of a blacke humor, which the Spleene hath purged and put downe into the Kidneyes.

Experience.

Black waters. *Hippocrates.*

How Criticall waters becom blacke.

Now by what passages or wayes this *serous* and melancholy iuice is purged from the Spleene vnto the Kidneyes it is not so easily knowne. There are two kindes of vessels dispersed through the substance of the Spleene: Veines arising from the splenitick braunch, and many Arteries.

The passages.

Betweene the splenitick branch and the emulgent veines, there is no communion vnlesse it be a farre off; for the splenicke branch ariseth out of the trunke of the port or gate-veine, but the emulgent from the descending trunke of the *cana* or hollow veine: now betweene the hollow and the gate-veines wee know there is no communion vnlesse it bee by the

the mingling of their mouthes in the substance of the Liuer; for some of the new writers haue obserued many such inoculations betwixt them in that place. Wherefore if the expurgation or auoydance of this melancholy humor be made by the veines, it must be returned from the spleene to the gate, from the gate to the hollow, and from the hollow to the emulgent veines, and so vnto the Kidneyes, which were a long and tedious course.

The most likly way.

Our opinion therefore is, that this expurgation is rather made by the arteries then by the veines, because the humour contained in the spleene, may by a nearer and more open passage be deriued from it vnto the emulgēt arterie. So the *Empyici, pleuritici et peripneumonici*, that is, such as haue suppurations in their chest, are afflicted with the pluresie or inflamation of the Lungs, haue the matter or quitture euacuated not through the veins but through the arteries: and beside, our eyes teach vs that there is more serous and whaey humor conteined in the arteries then in the veines.

Why the emulgent arteries were made so large *Galen.*

And for this reason I thinke the emulgent arteries were made so large and ample, not so much to leade and bring down the vitall spirit (for if they had been but small, they would haue serued that turne) as to purge the whay contayned in the arteries away by the kidnies: for so *Galen* teacheth vs in his 5. Booke *de vsu partium*, and in his Booke against *Erasistratus*. And so much concerning the vse of the spleen, & the way of the melancholy vnto the Stomacke and the Kidneyes. Nowe followeth that wee should treate of the Kidneyes themselues.

QVEST. XVII. *Of the vse of the Kidneyes, and the matter of the vrine.*

Erasistratus. *Asclepiades.* *Aristotle.*

ERasistratus and *Asclepiades* as *Galen* witnesseth in his Booke *de Naturalibus facultatibus*, ascribed no vse at all almost to the Kidneyes. *Aristotle* in his Booke *de partibus Animalium*, supposeth that they were at the first intention ordayned to hold or conteine and establish the veines, and that in the second place or by the bye, Nature abused them for the excretion of a superfluous humor.

Hippocrates. *Diocles.* *Galen.*

We with *Hippocrates*, *Diocles*, and *Galen* 1. *de naturalibus facult.* 5. *de vsu partium*, and in his Booke *de locis affectis*, doe thinke that they were framed for the expurgation or cleansing of the veinall and arteriall blood. For whereas in the Liuer after concoction, there ariseth a threefold excrement; one *bilious* or cholericke, another *fæculent* or melancholy, and the third *serous* or whaey; and the two former as soon as concoction is celebrated are purged away, but the third remaineth to conduct the thicke and sluggish blood, that it might more easily and freely passe into the narrow and threddy veines: It was meet that at length hauing performed this his office, it should also be separated and purged as an vnprofitable superfluity, and discharged into his proper receptacles. These receptacles therefore are the Kidneyes, which is euident enough because their substance is hollowed into diuers caues or dennes, and perforated or pierced through with many drayning pipes; as also because of the continuity they haue with the great bladder of vrine by the mediation of the vreters.

Of the vse of the kidneyes.

The vse of the whaey humor

How vrine is made.

But how this expurgation is made, whether by the traction of the Kidneyes, or by the expulsiue power of the veines, or by the proper motion of the whay, or after what other manner, it is not yet fully agreed vpon.

Erasistratus.

Erasistratus conceiued that this expurgation came to passe by a necessary succession of one part of that which was euacuated to another, that is to say for auoyding of vacuity. But we will not so much as vouchsafe any answere to this opinion.

Hippocrates opinion *Diocles.* *Praxagoras.* *Galen.*

Hippocrates, *Diocles*, *Praxagoras* and *Galen*, 1. 2. and 3. *de facult. natural.* 4. *de vsu partium*, and 6. *de locis affectis*, doe all conclude that the kidneyes by a kinde of ingenit propriety, doe draw the whay vnto themselues, not pure but mingled with bloud. The blood is there reserued and applyed to the substance of the Kidneyes like a dew, after it is assimulated and turneth into their substance; but the whay being vnprofitable for nourishment, is first of all separated, next because of his thinnesse is deriued through certaine fleshy caruncles strutting out like the nipples of breasts, into very many pipes or fistules, and from these into a membranous hollownes, as it were into a Cisterne, and out of it through the vreters into the bladder.

New writers. Vrine auoyded by the expulsion of the veines. Their reasons

Some of the new writers haue thought this expurgation of the whay is not made by the Traction of the Kidneyes, but onely by the expulsion of the veines: because nothing draweth, *propter ipsum trahere*, that is, *for the drawing it selfe, but that it may enioy that which it draweth*: but we know that the kidneyes are not nourished with the whay neither with serous blood, because their substance is dense, solid, and compact, and the serous blood verie thinne

thinne; and therefore the vrine is drawne to the veines, by the power and force of Nature, which is either burdned with aboundance thereof, or prouoked by his ſaltnes & acrimony.

That there is no expulſion at all.

There want not alſo ſome which defend the quite contrary, that there is no vſe of expulſion in this expurgation, becauſe then there ſhould be a compreſsion of the veines and arteries, the vppermoſt being contracted and the lowermoſt relaxed, and by that meanes not onely the whay but alſo the whole maſſe of bloud ſhould bee driuen downe into the Kidneyes.

1. Reaſon.

2. Reaſon.

Againe, the ſcituation of the Kidneyes ſeemeth to contradict this conceit of expulſion; for if that had beene their end, then their fitteſt poſition had beene directly vnder the hollow veine and the great artery, and not at the ſides.

3. Reaſon.

Adde hereto, that this expulſion of the whay ſhould not onely haue beene into the emulgent, but alſo into all the crurall and Iliac braunches, yea rather into the lower and neather veſſels. And therefore this ſerous humour, ſay they, is neither drawn by the Kidneyes nor by them driuen, but of it own accord paſſeth vnto them, which paſſage ſome haue thought to be by accident, as *Eraſiſtratus* of whoſe opinion we made mention euen now: others by it ſelfe, that is, by a proper faculty as *Auerrhoes* that acute Arabian, who thought that the Aliment was not drawne by the parts, but by an ingenite power and vertue of it owne did paſſe vnto them. For as in concoction the Aliment getteth a new forme, ſo it alſo getteth a new faculty, whereby it is moued to this or that particle of the body: ſo the Eliments by their proper formes are moued each to their proper place. But neither *Eriſiſtratus* nor *Auerrhoes* can be approoued, becauſe they both take away the faculties of the ſoule, eſpecially the Tractiue which miniſtreth vnto nutrition.

Eraſiſtratus.

Auerrhoes.

Compariſon

Reconciliatiõ

We as our manner is, to reconcile the different opinions of theſe great learned men do ſay, That the Vrine is partly drawne and partly expelled; but the force of the Traction is greater then that of the expulſion. And yet wee affirme alſo, that ſome is onely expelled not drawne at all; and ſome againe neither drawne by the kidneyes nor expelled by Nature, but onely paſſeth on by a beaten way, which of long time it hath beene vſed vnto. The Vrine when it is naturall and no way tainted, and is onely the whay of the blood, is partly drawne by the Kidneyes, partly driuen by the expulſiue power of the veines, eſpecially if all the frame of our naturall and legitimate health doe ſtand as they ſay in right tune: but yet in this expurgation the attractiue vertue of the Kidneyes is very great, and the expulſiue of the veines very light and weake.

For why ſhould the whay rather fall into the Kidneyes then into any other part, vnleſſe there were a peculiar Traction in the Kidneyes? In *Perirrhœa* or the Criticall fluxe of the Vrine, it is onely driuen and not drawne by the Kidneyes: but in a *Colliquation* it is neither driuen into the Kidneyes, becauſe the expulſiue faculty is too weake, neither drawne by the Kidneyes, but as the Poet ſayth, of the winde. *Qua data porta ruit.*

Where way is made,
It followeth glad.

The threefold matter of Vrine.

Theſe things that they may be made more manifeſt and apparant, it ſhall not be amiſſe to bring them againe to the hammer and the anuile. The matter of the Vrine is very manifold: firſt all our drinke, ſometimes raw and crude and of the ſame couler it was taken in, ſometimes a little altered: ſecondly, the *ſerous* liquor of thoſe humours which are contained in the veines: thirdly all kinde of humours, yea and bodies that are melted, as fleſh and fat. This threefold matter *Hippocrates* comprehended in the firſt ſection of the 6. Booke *Epidemiõn*, where hee ſayeth, *The Vrine is of the ſame couler with the meate and drinke, as well when it is as it ſhould bee, as when it is a colliquation or melting of the moyſture.* A wonderfull, ſhort, playne, and yet abſolute ſentence, ſo as I think it vnpoſſible to expreſſe more in fewer words.

Hippocrates.

Why ſome thinke the drink the only matter of vrine.

Whereas he ſayeth that the Vrine is of the ſame couler with the meate and drinke, it ſhoweth the firſt matter of the vrine, to wit, the drinke which ſome haue thought to be the ſole and onely matter, being perſwaded thereto by theſe reaſons. Firſt, becauſe thoſe creatures which doe ſeldome or neuer drinke haue no bladders, but thoſe that drinke much, do alſo auoyde much vrine. Secondly, becauſe according to the rule of Phyſitians, the quantity of the vrine ſhould be anſwerable to the drinke. Thirdly, becauſe in the ſuppreſſion of Vrine we interdict our Patients drinke, that the quantity of the vrine ſhould not bee encreaſed. Theſe things truely proue that the greateſt part of the matter of the vrine is ſupplyed by the drinke and liquid meates; but they do not conclude neceſſarily that thoſe are

Anſwere.

the

the onely and alone matter of it. For the infant auoydeth water in the Mothers wombe by the veſſell called *Vrachos*, yet it drinketh not; and againe in winter we make more water by much then in ſummer, and yet we drinke leſſe. And *Galen* in his firſt Booke *de locis affectis*, telleth a tale of a young man who euoyded as much water as came to foure *Hemixæ*, that is, 36. ounces aboue a quart, and yet in three whole dayes hee had taken neither meate nor drinke.

The ſecond particle is (*when it is as it ſhould be*) whereby *Hippocrates* ſheweth the ſecond matter of the Vrine which is the true and legitimate matter thereof, and that is the whay of the foure Humors which are conteined in the Veines, and therefore *Galen* defineth the vrine, to be ὄρρον τῶν καλὰ τὰς φλέβας χυμῶν, that is, *The whey of the humor in the Veines*. As for *Lycus* the *Macedonian*, he is not to be harkened vnto, who affirmed, that the whay was onely the excrement of the Kidneyes. For how was it poſsible that ſo ſmall bodies as the Kidneyes are, ſhould beget ſo great a quantity of whaey humor? And if it be obiected, that *Galen* in ſome place hath ſaide, that the Vrine is the proper excrement of the Kidneyes and the bladder. We will anſwere, that it is therefore called proper, not becauſe it is engendred in the Kidnies, but becauſe it is drawne and ſeparated by them alone.

The ſecond matter of the Vrine, the whey of the foure humors

Obiection out of *Galen*.

Anſwere.

The laſt particle in *Hippocrates* expreſſeth the third matter of the Vrine, to wit, *All Humors and bodies which are melted or colliquated*: the humors are all of them purged by the vrine verie often, as in criticall euacuations by the bladder, in a purulent *peripneumonia*, and ſuch as is accompanied with a Strangury, or the Symptomes thereof. There remaineth vpon record cõcerning this matter a ſolemn edict of *Hippocrates* in the ſecond ſection of his firſt Booke *Epidemion*, where he ſaith, *Many doe auoid vrines bilious, watery, purulent, fretting, and ſtrangurious or yſſuing by drops*, becauſe as *Galen* interpreteth it, *The whole body did put downe by the vrines great abundance and varieties of euil humors*. But of this expurgation we ſhall haue occaſion to ſpeake in another place.

The third matter of the Vrine are the humors of the body.

Hippocrates.

Galen.

Neither are the humors onely, but alſo ſuch bodies as are colliquated and melted the matter of the vrine, ſuch as are fat and fleſhy: and hence come thoſe fat and oyle waters, when a conſuming Ague melteth the body, which are called ſignes of colliquation, whereof *Hippocrates* ſpeaketh in his prognoſtiques on this manner; *That Vrine is ill which is Oylie or fat when it is made*: now by Oylineſſe he doth not vnderſtand either the colour or conſiſtence of Oyle, but melted or colliquated greace ſwimming in the ſurface of the VVater. Concerning this threefold matter of the vrine, *Ludouicus Duretus* a great learned man of *France*, hath written at large in his elegant and learned Commentaries in *Coacas prænotiones* of *Hippocrates*.

Hippocrates.

What an oyly Vrine is.

Ludouicus Duretus.

The concluſion.

Theſe things therefore being ſo, and the matter of the Vrine ſo manifold, we conclude that all Vrine is not drawne by the Kidneyes, but that onely which is naturally diſpoſed, to wit, the whey of the foure humors contained in the veines. Notwithſtanding the Kidneyes are not therewithall nouriſhed, for all traction is not for nouriſhment: the Loadſtone draweth iron and amber chaffe, yet are they not nouriſhed by them. But the Vrine which hath for his matter crude humors or any other, which is freely & aboundantly poured forth on the criticall daies, we thinke is onely driuen and not drawne. But if the vrine do flow from the colliquation or Liquefaction, either of the humors, or of ſome more ſubſtantiall part, it is then neyther drawne by the Kidneyes, becauſe it is not *According to Nature*, neyther is it expelled by the power of the veines, becauſe there is a generall exolution or weakeneſſe of the ſpirits: but it paſſeth of his owne accord through moſt patent and ample veſſels to the kidnies, becauſe thoſe places are moſt accuſtomed to that euacuation. And this I take to be the ſum and ſubſtance of this Controuerſie.

QVEST. XIX. *That the reaſons of diuers Symptomes which follow ſuch as are afflicted with the Stone, are to be required for Anatomy.*

IT belongeth neyther to this place nor time to diſpute about the cauſes and generation of the ſtone, we rather ſticke to thoſe things that concerne Anatomy. But becauſe *Nephritical* patients, that is, ſuch as are troubled about their Kidneyes, eſpecially with the Stone, haue diuers accidents, wherof there can no reaſon be giuen but onely from Anatomy, I haue not thought it amiſſe briefely to lay them open with their ſeuerall cauſes for the ſatisfaction of ſuch as are not ſo well exerciſed in our Art, who notwithſtanding may deſire ſatisfaction in this point.

The

The *Nephritical* paine doth oftentimes immitate that of the Collicke, ſo that by the ſimilitude not onely the ignorant but ſuch as are right skilfull are often deceiued. Notwithſtanding they are diſtinguiſhed by their particular Symptomes, by thoſe things which are auoided, and thoſe that are applyed. The moſt greeuous Symptom of all the reſt is paine, which in the Collicke is wandering, but fixed in the Stone. The Collick paine aſcendeth like as the Collick gut aſcendeth, from the bottome of the belly to the ſtomacke, and ſo runneth vnder the bottome thereof; that of the Stone deſcendeth, becauſe of the continuity of the Vreters, eſpecially if the Stone begin to mooue. The Collicke paine poſſeſſeth all the lower belly, the Nephritick may be couered with ones hand; the Collick greeueth the region of the *Hypogaſtrium* and of the nauell, the Stone lyeth ſorer in the Loines backward.

Paine wandering & fixed.

Some haue obſerued out of the *Arabians* that the Collicke paine is leſſe when the Stomacke is empty, but the other then is exaſperated. And againe, when the ſtomacke is filled the Collicke encreaſeth, which muſt be thus vnderſtood. That the Collick paine euer abateth when the ſtomacke and guts are empty, but the Nephritick not alwaies; becauſe the ſtone lyes goading in the ſame place. Yet ſometimes after meate the nephritick paine is abated, becauſe if the ſtone be fixed in the Kidneyes the waight of it preſſeth downward, and thence the paine proceedeth; but when ſuch men haue eaten, the guts which ſupport and ſuſpend the Kidnies do ſwell, and ſo the paine is mittigated. There are alſo ſome Nephriticall paines which are exaſperated vpon the eating of meate, as when the Kidneyes are inflamed the diſtention of the ſtomacke and guts do encreaſe it. Againe, the paine of the Kidneyes beginnes dully, that of the Collicke is alwayes a cutting and a ſharpe paine. If it be obiected, that *Hippocrates* in his Booke *de interuis affectibus* affirmeth, that the pain of the Kidneyes is ſharpe; we may anſwere out of *Galen* that there is a double kinde of dulneſſe, the firſt is occaſioned by the Tartnes of the humor, or ſharpeneſſe and aſperitie of that which is contained, (imagine it to be grauell) and both theſe make the paine ſomwhat acute or ſtinging; the other is by reaſon of the waight when the Kidneys are oppreſſed with abundance. The paine which proceedeth from Tartnes and acrimony, is both in the generation, and alſo in the expulſion of that which offendeth: that which is from the weight taketh vp all the time betwixt the generation and the expulſion. Or thus, the paine of the Stone is dull whilſt it reſteth in the Kidney, and acute when it mooueth into or toward the Vreter. There are alſo other Nephriticall Symptomes; for the thigh that is on the ſame ſide wherein the ſtone lies, is as it were benummed or aſleepe, which is not ſo in the Collick paine, wherein the vomitings, loathings of meate, and diſtaſtfull belchinges are more frequent and greeuous; and ſo much of the ſymptomes.

An obſeruation out of the Arabians.

Obiection out of *Hippocrates*

Anſwere out of *Galen*.

2. Anſwere.

Secondly, theſe paines are diſtinguiſhed by thoſe thinges that are auoyded; for in the collicke the excrements are more obſtinately retained, that not ſo much as a little winde can finde paſſage, but in the Nephriticall paine the vrine is rather ſuppreſſed. In the collicke paine the vrines are thinner in the beginning, and afterward become more thick; and if any winde or Flegme be auoyded, the paine is either mitigated, or elſe ceaſeth: but the nephritical is not appeaſed til the ſtone be auoided. Finally, thoſe thinges that are taken inwardly or applied outwardly, do diſtinguiſh theſe paines.

Another meanes to diſtinguiſh theſe paines.

Now the ſtone of the Kidneyes is knowne or diſcerned from that of the bladder by *The propriety of the paine, by the ſcituation, and by the dulneſſe*. The bladder is placed in the *Hypogaſtrium*, the Kidneyes in the Loynes; the generation of the ſtone in the bladder is without any ſenſe of paine, becauſe of the largeneſſe and capacitie of the bladder: in the kidneyes it is engendred with paine, becauſe of the narrowneſſe and ſtreightneſſe of the Kidney. In the ſtone of the bladder, the vrine is euermore ſuppreſſed not ſo in the ſtone of the Kidneyes becauſe there are two of them, that if one bee ill affected, the other might ſerue the turne. Againe, the Strangury and the *Teneſmus*, that is, the piſsing by drops and a vaine deſire of going to the ground, do alwayes accompany the ſtone of the bladder becauſe of the vicinity or neighborhood of the right gut, which is not ſo in the ſtones of the Kidneyes.

How the ſtone of the Kidnies is diſtinguiſhed from that of the bladder

Some there are which make a difference betweene them in regarde of the grauell, becauſe that of the Kidneyes is redder, that of the bladder whiter: the ſtone alſo of the Kidneyes is ſofter, that of the bladder harder. But this is not alwayes true, for the hardneſſe and heate of grauel are to be referred to the power or efficacy of the efficient, and the condition of the matter. And ſo according to the degree of heate the grauell is eyther white

The grauell of the Kidnies red, and that of the bladder white.

or

or yellow or blacke, and according to the condition of the humour; when they are made of phlegme they are aſh-coloured, and red when they are made of blood. But I may ſeeme here to haue grazed beyond my teather, I therefore returne.

The cauſe of the ſtupor of the thigh in the paine of the ſtone, out of *Langius* & *Iacotius*.

There are two *ſymptomes* which follow the *Nephritical* paine, a ſtupor or ſleepines in the Thigh on the affected ſide and a Vomiting. The cauſe of this ſtupor, the learned *Langius* in his Epiſtles, and *Iacotius* in his Commentaries in *Coacas prænotiones* of *Hippocrates*, doe referre to the repletion of the veines. The large veſſelles ſay they of the hollow veine and the great arterie as they diſcend downward, doe lye vpon the ridge of the backe, and from them there be notable branches ſcattered vnto the Kidneyes and the thighes, in whoſe repletion (which happeneth when the Kidneyes, the Vreters, or the emulgent veſſels are obſtructed) the nerues and the muſcles are ſtraightned, and thence that ſtupor or ſleepineſſe proceedeth. But this reaſon ſeemeth not to me very *Anatomicall*; for the ſtone in the kidneyes doth not cauſe the veines ſo to ſtrut that they ſhould preſſe the muſcles, becauſe that many which are waſted with a conſumption of the Lungs or ſome other part whoſe veins are exhauſted, doe notwithſtanding in fits of the ſtone feele this dulneſſe or ſtupidity in their thighes or legges. Adde hereto, that thoſe that are *plethoricall*, whoſe veines are turgid to the outward appearance, haue yet no ſuch ſtupidity in the legges or armes. Confuted.

A double cauſe of the ſtupidity aſſigned.

Wee muſt therefore finde out ſome other cauſe of this ſleepineſſe, and I thinke that it is double; the firſt is the compreſsion of the muſcle called ψοάς, vpon which both the kidneyes do reſt, which alſo all Anatomiſts doe obſerue to bee inſerted into the inner part of the thigh, and appointed to bend the ſame. The other reaſon is the compreſsion of the nerue which is diuerſified into all the muſcles of the thigh; and this compreſsion is made by the hardneſſe and waight of the ſtone, for while the ſtone is ſmall and but a growing, this ſleepines happeneth not.

Why the ſtomacke is ſubuerted in the fits of the ſtone.

Now the reaſon why in the fit of the ſtone there is ſo great a ſubuerſion or turning of the ſtomacke, that the Patient loatheth all meates, and preſently caſteth vp whatſoeuer hee receiueth, is the ſympathy or conſent betweene the ſtomacke and the kidneyes; and the cauſe of this ſympathy which is ſimple, is not to be referred to their vicinitie or neighbourhood, becauſe there is a good diſtance betweene them, not vnto the ſimilitude or likenes of their kindes or ſubſtances, for the ſtomacke is membranous and the kidneyes fleſhy; not vnto the ſociety or entercouſe of their operations, for they are not occupyed about one & the ſame labor; it is therefore to be referred to the communion and continuation of their veſſelles and membranes. For there are certaine ſmall nerues which are carried from the ſtomack nerue to the kidney; and the outward coate inueſting the kidneyes which is commonly called *faſcia* or the *ſwath*, hath his originall from the *Peritonæum* or rim of the belly, which all men know is continued with the bottom of the ſtomacke.

QVEST. XX. *Whether the bladder doe drawe the Vrine.*

Whether the bladder haue any tractiue faculty.

Galen.

COncerning the Tractiue, Retentiue, and Expulſiue faculties of the Bladder, in reſpect or reference to the vrine, there are ſome ſmall difficulties which had neede to be made plaine. And firſt there may bee queſtion made of a Tractiue faculty, for *Galen* ſometime alloweth, ſometime denyeth it. In the third Booke *de natural. facult.* and the fift *de vſu part.* he writeth that both the bladders of the gall and of the vrine haue a proper power to draw their owne excrement. And this the ſtructure or frame of the bladder doth alſo conuince, for it appeareth to be wouen of three ſorts of fibres, right, oblique and tranſuerſe. And in the 7. Chapter of the 5. Book *de vſu part*: *The Bladder ſayeth Galen, as well that which receiueth the vrine as that which receiueth the Choler, becauſe both of them doe draw their proper excrements pure and ſegregated from the reſt, do both of them by due right make clame vnto other veſſelles which ſhould conuay nouriſhment vnto them.* *Ariſtotle* in the 15. Chapter of the third Booke *de hiſtor. Animal.* ſayeth, *That after death no humour falleth into the bladder, but whilſt men are aliue not onely humour, but alſo dry recrements doe paſſe downe, of which ſtones are ingendred.* Nowe if the whay did only diſcend and were not drawn, why ſhould it not diſcend alſo in dead bodies? *Galen* in the 6. Booke *de locis affectis*, ſeemeth to be of a contrary opinion. For ſearching into the nature of the diſeaſe called *Diabetes*, that is an exceeding fluxe of vrine, and the cauſes thereof, he affirmeth, that the bladder doth not draw the vrine vnto it ſelfe. But I vnderſtand *Galen* that where he ſayth in the *Diabetes*, *The bladder draweth no whay vnto it ſelfe*, his meaning is, that the cauſe of the *Diabetes* is not to be referred to the Tractiue power of

Galen.

Ariſtotle.

Galen.

Thecauſe of *Diabetes*. *Galen* expounded.

the

the bladder, neither that it is at all any affection of the bladder, but rather a ſymptome of the exceeding ſtrength of the Traction of the Kidneyes, and of the weaknes of their retention, and therefore in that diſeaſe the bladder draweth not ſo great a quantity of vrine, but the hot and boyling Kidneyes draw more whay then they are able to conteyne, whence either of it owne accord it falleth through the vreters into the bladder, or is thruſt downe by violence.

How the bladder is nouriſhed.

But if all things ſtand in good order according to the lawes of Nature, then there is no reaſon but to think that the vrine is drawne by the vreters and the Bladder. Neither doe I thinke that the bladder is nouriſhed by that excrement, conſidering that from the *Hypogaſtricke* branch there are many ſmall rillets of veines and arteries diſperſed through both his Coates.

QVEST. XXI. *Of the Retention and Excretion of the Vrine, whether it be accompliſhed by a Natural or by an Animal faculty.*

Retention & excretion are natural actiõs

THE proper vſe of the Bladder is to retayne the Vrine to a certaine time, and afterward to auoyde it; but by what power it doth this, Animall or Naturall, there lyes the controuerſie. Some conceite that both the actions, as well the Retention as Expulſion are Naturall, becauſe there is the ſame reaſon of both the bladders of gall and of vrine, but the bladder of gall reteineth and expelleth onely by the faculty which we call Naturall. Adde hereto that the triple kinde of fibres which are in both the bladders doe perſwade vs that there is a threefold Naturall action in them and not an Animall. On the contrary, it may bee demonſtrated that both theſe actions are Animall on this manner. The Retention is made by Animal inſtruments, and therefore the action is Animall, this Animall inſtrument is a muſcle. Now we know that the necke of the bladder is compaſſed about with a *ſphincter* muſcle, who playes the Porter and ſtoppeth the gate leaſt the Vrine ſhould paſſe away without our good pleaſure.

That they are animall.

That the Expulſion is Animal is witneſſed as by other arguments, ſo by this, that according to our arbitrary wil it is either ſlower or quicker, weaker or ſtronger, as alſo becauſe it is not acompliſhed without the help of the muſcles of the *Abdomen*. *Galen* in his firſt Book *de locis affectis*, and 6. Chapter, ſtinteth this ſtrife, and ſayth that the action is mixt; the Retention, Animall, and voluntarie, as being performed by the helpe of a muſcle, the Excretian Naturall which is vndertaken and performed by the expulſiue faculty: For my owne part I thinke that both actions as well the Retention as the Expulſion, as partly Naturall & partly Animall, but the Retention more Animall, and the Expulſion more Naturall. The Vrine is retained in the bottom of the Bladder by the help of the oblique fibres; now that Retention is naturall; but beſide it is retayned alſo at our pleaſure by the helpe of the *ſphincter* muſcle, and this action is meerely Animall. The vrine is Expelled by the ingenite power of the Bladder, where by it is prouoked to auoyde that which is noyſome or grieuous vnto it, & this Excretion is altogether Naturall. Again, the Vrine is Expelled at our pleaſures by the help of the muſcles of the *Abdomen* preſsing the *Hypogaſtrium* or water-courſe, and ſome thinke that thoſe ſmall muſcles of the *Abdomen* called *Pyramidales* or *ſuccenturiati*, that is, ſpirie or aſsiſtant muſcles were ordained by Nature to further the excretion of this humour, and therefore both theſe actions are mixed.

Galen.

What our reſolution is.

The vrine.

Some will obiect that excretion can be no way naturall, becauſe all naturall actions being perpetuall and indeſinent the vrine ſhould bee continually auoyded. *Galen* anſwereth that all vrine is not the obiect of the expulſiue faculty, but that onely which either fretteth or ſtreatcheth, that is, which is offenſiue either in quantity or in quality: and ſo much concerning the Bladder; now follow the Paps.

Obiection. Anſwere out of *Galen*,

QVEST. XXII. *Of the action and vſe of the Breaſts or Paps.*

The queſtion

ALL men I think are reſolued that there is in the Breaſts an in-bred faculty of making Milke. This onely is queſtionable, how they which are but kernels ſhould performe an officiall or common action, which is accompliſhed by alteration and concoction; ſeeing *Galen* denyeth vnto theſe glandules all action and yeeldeth vnto them onely a vſe. Now that the Breaſts or Paps are to be reckoned among the glandules, their ſubſtance and vſe doe manifeſtly declare. For their ſubſtance it is rare, friable, and ſpongy; and for their vſe *Hippocrates* in his Booke *de*

Galen. The breaſts glandules.

Hippocrates.

Glan-

Glandulis aſcribeth the ſame vnto the Dugges which other kernelly parts performe, where he ſaith, *The Vſes of the Paps and of the Glandules before mentioned are alike, for they all ſucke vp the ſuperfluities of the whole body.*

For the Solution of this Queſtion, we ſay there are two kindes of Glandules, for vvhich we haue *Galen* our Author, in his ſecond Chapter of the ſixteenth Book of the *vſe of parts*. There are ſome Glandules which are ordained onely to eſtabliſh and vnder-prop the Veſſels, or to receiue ſuperfluous humors, or to water and moyſten the parts. There are others which are prouided by Nature for the generation of certaine iuices or humors which are profitable for the creature. The former haue neyther Veines, nor Arteries, nor ſinnewes: theſe latter haue very conſpicuous veſſels, and are of exquiſite ſenſe. The former are properly called Glandules; the latter may better be ſtiled Glandulous bodies. So the Teſticles and the Kidneyes by *Galen* are called Glandulous bodies; and *Hippocrates* in his Booke *de Glandulis* ſaith, that the braine it ſelfe in reſpect of his ſubſtance is glandulous. The former are onely of ſome vſe, the latter affoord both vſe and action, amongſt which wee conclude the dugs or breaſts to be.

The ſolution of the queſtiō. *Galen.* Two kindes. *Galen.* *Hippocrates.*

And whereas *Hippocrates* ſaide, that theſe dugs doe receiue or ſucke vp an excrementitious humor, we vnderſtand that this is not there primary or chiefe and maine vſe, but onely ſecondary: for Nature often abuſeth one and the ſame part to diuers vſes; ſo the braine in manner of a *Glaſſe-ſtill* or *Cucurbita*, doth draw and ſucke vp the expirations of the lovver parts, and yet notwithſtanding there is another and more diuine vſe of the braine. So nature often abuſeth the guts for the expurgation and vnburdening of the whole body, whereas they were Originally ordained for another purpoſe, to wit, for diſtribution of the Chylus.

Hippocrates expounded. The braine Glandulous.

The Breaſts therefore or Paps haue a proper action and vſe. Their action is the generation of Milke, which is performed by a moderate and equall coction or boyling. Their vſes are either primary or ſecondary: The primary vſe *Galen* ſaith is for generation of milk, but *Ariſtotle* would haue them ordained for the defence of the heart, the moſt noble of all the bowels; and I thinke he was miſſled with this argument, becauſe men had breaſtes, and yet did not ingender milke. Wee with *Galen* do determine, that theſe glandulous bodyes compaſſed with fat, and wouen with many thouſand veſſels, were firſt and originally ordained for Milke, and are not alike in men and women. And yet I conceiue that they were ſcituated in the breaſt rather to add ſtrength to the noble parts conteined vnder them, then for the generation of Milke. For in moſt creatures they make Milke not in the breſts but in other parts.

The primarie vſe of the breaſts. *Galen.* *Ariſtotle.* *Galen.*

You ſhall therefore reconcile *Galen* and *Ariſtotle*, if you ſay, that the Dugges were created originally for the generation of Milke, and ſecondarily for the ſtrengthning & defence of the heart. And againe, that the originall cauſe of their ſcituation in the breaſt was for the defence of the heart, and the ſecondary for the generation of milke.

Galen and *Ariſtotle* reconciled.

QVEST. XXIII. *Whether Milke can be generated before conception.*

IT was diſputed of old, and is yet a queſtion amongſt the multitude, whether Milke can be engendred in a womans breaſts before ſhe haue had the company of man and conceyued. And this doubt is occaſioned by ſome different places in *Hippocrates* and *Ariſtotle*. *Hippocrates* in his firſt Booke *de Morbis mulierum*, inquiring after the ſignes of the *Mola* or Moon-calfe, reckoneth this as one of the principall, *When in the Breſts there is no Milke engendred*. And therefore the generation of Milke is according vnto *Hippocrates* a certaine ſigne of conception. *Ariſtotle* in his Bookes *de Hiſtoria Animal*, confirmeth the ſame, where hee ſayth, *That no Creature engendereth Milke before the womb be filled.*

Hippocrates. *Ariſtotle.*

And reaſon ſeemeth to conſent with their authority. For if nature do neuer endeuour any thing raſhly, but all things for her proper end, what neede is there of Milke before the infant be perfected, it beeing onely ordained for the nouriſhment thereof? Notſtanding *Hippocrates* in his Aphoriſmes ſeemeth to be of a contrarie minde. *If a woman* (ſaith he) *which is neither big with childe, nor hath yet conceyued, haue milke in her breſts, it is a ſigne that her courſes are ſtopped*. And *Ariſtotle* in his Bookes *de Hiſtoria Animal*: affirmeth, that Milke may be bred in the breſts or dugs of men which alſo *Albertus* and *Auicen* do witneſſe.

Hippocrates. *Ariſtotle.* *Albertus.* *Auicen.*

Hieronimus Cardanus in his Bookes *de ſubilitate* ſaith, that hee ſaw a man about thirtie

A Storie out of *Cardanus.*

The men of *America* haue milk in their breaſts.

foure yeares old, out of whoſe breaſtes ſo great a quantity of Milke did flow, that it was almoſt ſufficient to nouriſh a childe. They that haue trauailed into the new world do report that almoſt all the men haue great quantity of Milke in their breaſts.

Reaſons.

If therefore men doe breede Milke, much more Virgins and Women before they doe conceiue. For their Dugs are more rare and large, and beſide they haue a greater aboundance of ſuperfluous bloud; Reaſon alſo fauoureth this opinion, for where the materiall cauſe of Milke is preſent, and the ſtrength of the efficient not wanting what ſhould hinder the generation thereof? Now in Virgines that bee of ripe yeares, the veines of the Cheſt which water the Dugges haue great aboundance of bloud, they haue alſo the ſtrength of the glandules to alter and to boyle it: for after the fourteenth yeare, *The Dugges* ſayth *Hippocrates doe ſwell and the Nipples ſtrut*, and young wenches are then ſayd κνᾳμίξειν, that is *ſtrutare*, to grow together like twinnes. Wherefore Milke may ſometimes be bredde, in ſuch women eſpecially whoſe courſes be ſtopt as *Hippocrates* writeth. But theſe diſagreeing places of *Hippocrates* it will not bee hard to reconcile out of *Hippocrates* himſelfe. There is a double generation of Milke according to *Hippocrates*, and a double nature thereof. One kinde of Milke is true and laudable, another not true nor perfectly boyled. The former is made by a great alteration and true concoction of the breaſtes, and that not priuate but officiall; the latter ariſeth of a remainder of the proper nouriſhment of the breaſts; the firſt is perfectly white, ſweete, and moderately thicke, and fitte to ſuckle an Infant; this other is white indeed becauſe it beareth the colour and forme of the part from whence it floweth, but it hath neither the true nature of a nouriſhing *Chymus* or *humour*, nor the ſweetnes nor the power or vigour of nouriſhment, and therefore it deſerueth the name of Milke, not by his quality or ſpecificiall forme, but onely for his colour, for it is thinne and wateriſh, altogether vnprofitable to nouriſh an Infant. The former is begotten by the expreſſion and refluence of the blood from the wombe to the dugges, as alſo by traction: this latter onely by the Traction of the proper Aliment; the former cannot be generated before true conception, becauſe there ſhould be no vſe of it before. The latter may bee ingendered in growne & ripe maydens, and well blooded men, whoſe bodies and veſſels do abound with laudable iuyces. This double kinde of generation of Milke, I gather out of *Hippocrates* his Bookes *de natura pueri & de glandulis*. *The Nature ſayth hee of womens breaſtes is very rare and ſpongy, and the Aliment which they draw vnto themſelues they turne vnto Milke.* This is the firſt kinde of generation.

Hippocrates.

Hippocrates.

A reconciliatiõ out of *Hip.* Two kinds of milke according to *Hip.*

The other he deſcribeth in the ſame place. *The Milke commeth from the wombe to the breaſts, which after the birth muſt be the nouriſhment of the Infant: this the Kel preſſeth out and ſendeth vpward, being ſtraightned by the growth of the Infant.* Wherefore the blood is preſſed or ſtrayned, and ſo returneth in women with Child by a wonderfull prouidence of Nature from the wombe to the Pappes, and that as ſoone as the Infant begins to moue. After it is brought into the world there is no more expreſſion made, but the blood floweth of it owne accord to the Pappes, according to his accuſtomed motion, which *Hippocrates* ſheweth in theſe words, in his Booke *de natura pueri*. *After a Woman hath borne a childe, if ſhee alſo haue giuen ſucke before, the Milke wil ariſe into the breaſtes as ſoone as the Infant begins to moue*: ſo that after the birth it is therefore led vnto the breaſtes, becauſe it was accuſtomed to bee his courſe that way all the while the Infant did moue in the mothers wombe. Neither doth the blood onely of it owne accord preſſe vnto the Pappes, but they alſo drawe a greater quantity then is ſufficient for their peculiar nouriſhment.

How the milk commeth vnto the breaſts, and why.

Hippocrates. The firſt generation of milk

Of this Traction there bee diuers cauſes; the Infants ſucking, the largeneſſe of the veſſels, the motion or exerciſe of the dugs, and at length the auoyding of vacuity. For when the veines of the breaſts are exhauſted by the Childs inſtant ſucking, then they draw bloud vnto themſelues from euery ſide.

Wee conclude therefore that true Milke and perfectly concocted is not generated before conception, but that there may be a thinne and raw Milke ſometimes made of the reliques of the proper nouriſhment of the dugs.

QVEST. XXIIII. *Wherein certaine Problemes are vnfoulded concerning the generation of Milke.*

COncerning the firſt generation of Milke, there is vpon record a ſolemne edict of *Hippocrates* in his Booke *de natura pueri*. *As ſoone as the Infant beginneth to moue, the milk giueth warning thereof vnto the mother.* For the explication of which ſentence, there

are

are two Problemes to bee discussed. The first, why at that time the Milke should begin to be generated. The second why the infant should not be nourished out of the wombe with the same wherewith hee was nourished in the Wombe. The resolution of the first question will haue some difficult passages in it. For seeing that the Milke is onely ordained for nutrition, and that therewith the infant in the womb is not nourished, but onely after the birth, why is the Milke generated before the seauenth month, til when there is no vse of it, or why doth it not flow from the womb to the brests presently, or soone after conception, as well as in the third and fourth months. *Hippocrates* in the Booke before quoted, answereth this Question thus, *That the infant in the third or fourth month becomming great, dooth straine or presse the vessels which are ful of bloode, and by this compression there is an expression made vnto the vpper parts.*

Why the milk is generated the 3 or 4. moneth.

Question. *Hippocrates.* Solution.

This reason is indeede very true, but verie subtile and obscure, wherefore we wil paine our selues a little to make it manifest. In the first months, Natures expence of blood is very great. First of all, because the *Parenchymata* or substance of the bowels and all the fleshy parts are generated, and afterwardes for the nourishment and growth of them all, so that there remaineth little or no ouer plus of the Mothers bloode. But when the infant beginnes to mooue because there is alreadie a perfect conformation of all partes, Nature thereafter onely entendeth nourishment, which nourishment requireth but a small quantity of Aliment, because there is but small and slender exhaustion or expence in the parts, and therefore in the veynes of the Wombe, there must needes be an ouer-plus of bloode: these Veines being pressed by the motion and weyght of the Infant, which now is growne great, doe driue the blood vnto the vpper parts, and rather into the Dugges then into any other, as well because of the commodiousnesse and fitnesse of the way, as because of the societie and simpathie that is betwixt the wombe and the breasts. Add heereto a third cause which also is the finall, and that is the wonderfull prouidence of Nature, whereby the blood is accustomed by little and little to be transported vnto the place where it shall bee turned vnto Milke, and so remaine a plentifull fountaine for the nourishment of the infant after it is borne into the world.

A darke sentence of *Hippocrates* explained.

Why the blood returneth from the wombe rather to the Dugges then to any other part.

The prouidence of Nature.

And that is the reason why women are not so much troubled with bleedings at the nose, and with Hæmorrhoides, because bloode affecteth the way vnto the wombe, to satisfy the ende or intent of Nature, which is the generation and nourishment of an infant. Giue mee leaue also to giue another reason of this refluence of bloode from the Wombe vnto the Dugges, which is, That the infant might haue occasion offered it to seeke a way out of the Wombe. For, if all the blood were still reserued in the vessels of the wombe, and no part of it discharged or sent away other whether, the Child would neuer striue to come foorth, hauing alwayes nourishment enough at hande to content it: for *Hippocrates* saith, that the onely cause of the strife of the Infant in the byrth is the vvant of Nourishment.

Why women bleed not at the nose, nor are troubled with Hæmorhoids.

Hippocrates. The true cause of the trauel.

It behoued therefore, that in the thirde and fourth Moneths Nature should by degrees transferre the bloode vnto the Dugges to accustome her selfe to leade it thether for the nourishment of the Infant when it is borne, as also to defraud the infant nowe becom'd better growne of his nourishment, whereby hee might bee prouoked to seeke for it other where. Some thinke, that the blood returneth vnto the brests after the infant beginnes to mooue, to bee kept as it were in store, that thereby at time of neede, and in great want the infant might haue blood so prepared and whitened into Milke to sustain his necessity.

And this *Hippocrates* seemeth to intimate in his Booke *de Natura pueri*, where he saith, *That the infant with this milk, is somewhat and sometimes norished*, which saying of *Hippocrates* I do thus interpret, *The childe is nourished with milke*, that is, with the blood conteyned in the veines of the dugs, which is the next and most immediate matter of the milke, or, if the infant should bee extreamly affamished before the time of the birth, I thinke that the white milke may returne from the paps to the vessels, and be there boiled and conuerted into blood by the sanguifying vertue of the veines, which is neuer idle or asleepe. And that the milke may returne from the paps vnto the vessels, and be againe altred into blood, is approoued by the daily experience of nurses and women in child-bed.

Hippocrates expounded.

The second Probleme was, why the Infant is not nourished with the same Aliment without and within the VVombe; for within the wombe it is nourished with verie pure bloode, vvithout the wombe with sweete milke. *Dinus* answereth, That the bloode being

The second probleme.

Dinus answ.

hotter then the Milke, if it ſhould paſſe all the three concoctions in a childs bodie, it would at length become vnmeete for nouriſhment, becauſe by too much heate it would contract a bitternesſe: but the Milke which is of a more cold temper is more eaſily mittigated, and groweth rather ſweete then bitter by the three-fold concoction. But is it rather an inhumane and beaſtly thing for children to be blood-ſuckers: or ſhall we ſay that therefore the Infant after byrth is not nouriſhed with bloode, leaſt by his ſucking hee ſhould open the the mouths of his Mothers Veines, and ſo the blood which is the treaſure of nature ſhould flowe away.

Another anſwere.

Obiection. And whereas ſome affirme, that after wee are born, it is neceſſary that our Aliments ſhould paſſe all three concoctions, and that it is not poſsible that the ſtomacke ſhould chylefie the blood, and therefore Infants are not nouriſhed by bloode but by milke: I ſay this reaſon is falſe and full of error, for whatſoeuer is taken vnto the ſtomacke, if it may be aſsimulated, it may alſo be turned into a creamy ſubſtance, and many there be who drinke the blood of Swine and Goats, the noyſome excrements whereof are auoyded by the guttes and the ſeidge. Now the excrements of the guts, are onely excrements of Chylification.

Anſwer.

The concluſion of theſe controuerſies. Other things which may conceme this or anie other of the Naturall parts which belong vnto Nutrition, becauſe wee imagine that they are eaſilie knowne, or if hard yet generally agreed vpon, we do willingly paſſe ouer, iudging it ſufficient that we haue thus long detained the Reader in theſe Labyrinthes of Controuerſies, which notwithſtanding as it may be they will not be thought neceſſary for all, ſo we preſume that they wil not be irkeſome to any man, whoſe Stomacke ſtandeth to theſe delicacies of Nature, nor vnprofitable for thoſe to whoſe proper element they belong. Now it is high time to returne to our Anatomical Hiſtory of the Natural Parts belonging to Generation.

The End of the Controuerſies of the Third Booke.

THE FOVRTH BOOKE

Of the Naturall Parts belonging to generation, as well in Men as in VVomen.

The Præface.

BEing ariued at this place in the tract of my Anatomicall Perigrination, I entred into deliberation with my ſelfe, whether I were beſt ſilently to paſſe it by, or to inſiſt vppon it as I had done in the former. On the one ſide I conceiued my labour would be but lame if it wanted this limbe, and a great part of my end and ayme fruſtrated, it being to exhibite the wonderfull wiſedome and goodneſſe of our Creator, which as in all the parts it is moſt admirable, ſo in this (if perfection will admit any degrees) it is tranſcendent. The whole body is the Epitomie of the world, containing therein whatſoeuer is in the large vniuerſe; Seede is the Epitomy of the body, hauing in it the power and immediate poſſibility of all the parts. Moreouer, the knowledge of theſe principles of generation is ſo much more neceſſary toward the accompliſhment of our Art, by how much it is more expedient that the whole kinde ſhould be preſerued then any particular. Adde hereto, firſt that the diſeaſes hence ariſing, as they bee moſt fearefull and fulleſt of anxiety eſpecially in the Female ſexe, ſo are they hardeſt to be cured: the reaſon I conceiue to be, becauſe the partes are leaſt knowne as being veyled by *Nature*, and through our vnſeaſonable modeſty not ſufficiently vncouered. Againe, the examples of all men who haue vndertaken this taske euen in their mother tongues as we ſay, did ſway much with me whoſe writings haue receiued allowance in all ages and Common-wealths. On the contrary there was onely one obſtacle; to reueyle the veyle of *Nature*, to prophane her myſteries for a little curious skill-pride, to enſnare mens mindes by ſenſuall demonſtrations, ſeemeth a thing liable to heuy conſtruction. But what is this I pray you elſe but to araigne vertue at the barre of vice? Hath the holy Scriptue it ſelfe (the wiſedome of God) as well in the old Law particularly, as alſo in many paſſages of the new, balked this argument? God that Created them, did he not intend their preſeruation, or can they bee preſerued and not knowne? or knowne and not diſcoured? Indeede it were to be wiſhed that all men would come to the knowledge of theſe ſecrets with pure eyes and eares, ſuch as they were matched with in their Creation: but ſhall we therefore forfet our knowledge becauſe ſome men cannot conteine their lewd and inordinate affections? Our intention is firſt and principally to inſtruct an Artiſt: ſecondarily that thoſe who are ſober minded might knowe themſelues, that is, their owne bodies, as well to giue glory to him who hath ſo wonderfully Created them; as alſo to preuent thoſe imminent miſchiefes to which amongſt and aboue the reſt theſe parts are ſubiect. As much as was poſſible we haue endeuoured (not fruſtrating our lawfull ſcope) by honeſt wordes and circumlocutions to molifie the harſhneſſe of the Argument; beſide we haue ſo plotted our buſines, that he that liſteth may ſeparate this Booke from the reſt and reſerue it priuately vnto himſelfe. Finally, I haue not herein relyed vppon my owne iudgement, but haue had the opinon of graue and reuerent Diuines, by whome I haue bin per-

Arguments perſwading vs to proſecute the hiſtory of theſe parts.

Obiection anſwered.

How cautelous we haue been herein.

perſwaded not to intermit this part of my labour. My hope therefore is that my paynes in this part ſhall receiue not onely a good conſtruction, but alſo approbation and allowance of all thoſe that are indeed wiſe. As for ſuch as thinke there is no other principle of goodneſſe then not to know euil, I would wiſh them to learne of their horſes, that it is no good mannage to ſtand ſtocke ſtill but to moue in order. We will apply our ſelues to our buſineſſe.

The perfection of euerie thing is perpetuity.

The greateſt argument of diuinity, or of a nature reliſhing thereof is perpetuitie and immutability, the perfection whereof as it is incompetent to any compound creature (for the ſoule is therefore immortall becauſe it hath no parts) ſo it is moſt reſembled in that we cal *Life*; wherein there is a perpetuity though not of all the parts of time *Paſt*, *Preſent*, and *to Come*; (for Time is the meaſure thereof) yet of that which in time is ſubſiſtent, that is the *Preſent*. For as the production of poynts perpetuateth a line, ſo the coherence of *preſent* times make a kinde of eternity. Life therefore ſo long as it is prolonged hath no end, and may be compared to a clew of yarne, ſuch as the Poets faigned the Deſtinies to ſpin, which ſo long as there is flaxe to ſupply, may be drawne into an endleſſe length. Now wee muſt know that the matter of all things is eternall for it neuer periſheth, elſe had the world long agoe beene anihilated. The diſſolution of created things is but a reſolution of one thing into another; hence comes the perpetuity of all things though ſubiect to alteration, a perpetuity I ſay, not of the ſame particular thing diſtinguiſhed by one and the ſame forme, but of the Elementary parts whereof it was compounded.

What life is.

Compariſon.

But ſome will ſay, this is but a ſpeculatiue & imaginary perpetuity, ſhew it vs more really that we may ſee it with our eies, & feel it with our hands. I ſhew it thus. The body of man conſiſteth of matter and forme; by forme I mean, not the ſoule, but the forme ſubſiſting in the matter, and ariſing out of the power of the ſame, which though it be not diuine nor ætheriall as ſome imagine, but meerely materiall, yet ſo neere it approacheth to the puritie & nature of the firſt matter wherout it reſulteth, that it eaſily vaniſheth into an incompounded principle, ſubſiſting afterwards in Nature, not as a forme being forſaken by the ſpirite wherein it had his reſidence and whereby it was nouriſhed, but as a part of the vniuerſall Nature.

The Elementary forme of man.

This forme we call Life, which as it is raiſed out of the matter of the body, ſo it continueth ſo long therein, as it is ſupplied with nouriſhment, which nouriſhment is the radicall moyſture of the ſpermaticall parts. Nature therefore being not able to generate anie part of ſeede whoſe moyſture ſhoulde not in time bee exhauſted, could not produce any particular creature eternall or immutable: notwithſtanding ſhe deuiſed a way by framing parts fit for multiplication of ſeede, to raiſe a perpetuity, though not of any particular *individuum* yet of the kinds of all creatures. Thoſe partes are the ſubiect of our preſent Diſcourſe.

How a man is perpetuall.

So then firſt of all ſhe prepareth a matter euen the ouer-plus of the nouriſhment of the particular parts of our bodie. For the nouriſhment hauing ariued at the parts, and receiued an impreſsion or ſtampe of their nature, is partly aſsimulated into their ſubſtance, partly (at leaſt if there be any ouer-plus when the part is ſatisfied) falleth backe by the Veſſelles vnto the ſpermaticall Veines and Arteries, which receiuing an irradiation from the Teſticles to which they are continued, do giue that matter a kinde of rudiment of ſeede. The lower it fals and the nearer it approacheth to theſe Teſticles, the better is it ſtill laboured, till in the end it receyue from them his vtmoſt perfection both in the colour, conſiſtence, and prolificall vertue; being ſo accompliſhed, it is conueyed by the leading veſſels into the Store-houſe called *Proſtata*, where it is tunned vp and reſerued for the generation of a new creature, which new creature when it is made, is alſo able to affoorde matter for the generation of another, & ſo nature obtained a perpetuity and eternity euen out of mutable and temporary principles.

The proceſſe of Nature in the Frame of Man.

Compariſon.

The like adminiſtration of *Nature* (though the proceſſe of her worke bee not ſo long) we ſee in fruites, and trees, and plants, all of them being able to bring foorth ſeede, which ſhall perpetuate their kindes, a ſeede (I ſay) which though it bee but ſmall, ſhall conteine in it a power to frame anew all the parts of the bodie from whence it yſſued. So an Acorne hath in it the power of a mighty Oake. The quantity of an Emmet of ſeede, the power to grow into a vaſt Elephant. But becauſe whatſoeuer is ordained to bee made a liuing creature, muſt haue not onely one principle whereof it ſhould bee formed, but alſo another whereby it might bee ſuſtained and nouriſhed, as alſo a conuenient place for the growth

growth and extenſion thereof: Nature therefore (vnder which name I alwayes vnderſtand the wiſe adminiſtration of Almighty God) made another ſexe of mankinde, not altogether ſo hot a temper or conſtitution, becauſe ſhe ſhould haue a ſuperfluity of bloode for the nouriſhment of the infant, as alſo that the partes of generation for want of heate to thruſt them foorth remaining within, might make a fit place wherein to conceiue, breede, and perfect the ſame. Why woman was made.

Againe, that there might bee a mutuall longing deſire betweene the ſexes to communicate one with another, and to conferre their ſtockes together for the propagation of mankinde, beſide the ardor and heate of the ſpirits conteyned in their ſeeds, the parts of generation are ſo formed, that there is not onely a naturall inſtinct of copulation, but an appetite and earneſt deſire thereunto, and therefore the obſcœne parts are compounded of particles of exquiſite ſenſe, that paſſion being added vnto the will, their embracements might be to better purpoſe. As for the particulars it ſhall be in vaine in this place to make mention of them, becauſe the following diſcourſe ſhall at large diſcipher them vnto you. In which we will firſt deſcribe the parts of generation belonging to men, and then proceede to thoſe of Women alſo; of which wee would aduiſe no man to take further knowledge then ſhall ſerue for his good inſtruction. And ſo we deſcend vnto our hiſtory. The nature of the obſcæn parts.

CHAP. I. *Of the Neceſsitie of the parts of Generation.*

IT is a ruled caſe in *Hippocrates* his Bookes *de dieta*, *Ariſtotle* in his Booke of the length and ſhortnes of Life, *Galen* in his firſt Booke *de ſanitate tuenda*, and at a word amongſt all Philoſophers & Phyſitians: That all things vnder the Moone which is (ſayth *Cicero* in *Scipio* his dreame) *vltima Cælo citima terris*, the laſt in the Heauen and the neareſt to the Earth; all thinges I ſay contayned within the Elements are ſubiect to corruption and diſſolution. For euery ſingular and particular thing either hath life or is without it: if it be without life it is obnoxious to diuers alterations, in regard both of the firſt and ſecond matter whereof it conſiſteth. For the firſt matter, it is alwayes in loue with new formes, and therefore moſt ſubiect to mutation, which the French Poet *Saluſt* expreſſeth vnder the compariſon of a notorious Strumpet, on this manner. Al Elementary things mortal, and how. *Saluſt.du Bart.*

Or like a Lais, whoſe vnconſtant loue
Doth euery day a thouſand times remoue:
Who's ſcarce vnfoulded from one youths imbraces,
Yet in her thought another ſhe imbraces:
And the new pleaſure of her wanton fire,
Stirs in her ſtill another new deſire.

The general matter of things like a ſtrumpet.

The ſecond matter which conſiſteth of the Elements, becauſe of their inteſtine diſcord (for they are contraries, and from contrariety comes all corruption) vrgeth continually the diſſolution of the mixed body.

The Elements themſelues whilſt they are out of their proper places, although they bee naturally linked together, yet it is not without a kinde of violence and conſtraint, and therfore doe inſtantly long to returne into their proper ſeates.

But if the body be animated and haue life, beſide thoſe already named, it hath alſo other cauſes of diſſolution bred with it; which no art, no induſtry of man can auoyde, no not ſo much as repreſſe: ſo all things which haue any kinde of life, eſpecially liuing and mouing creatures are deſtined to corruption, φύσει καὶ ἀνάγκη, that is, *by Nature & neceſsity*. By *Nature* becauſe of the exhauſtion or expence of the *Primigenie* moyſture by the Elementary heat and the continuall effluxion of the threefold ſubſtance. By *Neceſsity* becauſe of the permixtion of the Aliments and the increaſe of excrements, the ſuppreſsion whereof maketh an oppreſsion of the partes, ſtableth vp a fruitfull nurſery of diſeaſes, and finally induceth death it ſelfe. A double deſtiny. By Nat. By Neceſſity.

Wherefore *Nature* whome *Hippocrates* calleth τὰ Νούσια ποιεῦσαν *Recta facientem* and the ordinary power of God, being a diligent and carefull prouider for her ſelfe, hath giuen to euery thing a certaine appetite of eternity, which becauſe ſhee could not performe in the *Indiuiduum* or particular Creature, becauſe of the mortality of their Nature, ſhe indeuoured to accompliſh by propagation of formes and the *ſpecies* or kinds of things; as in the Elements by tranſmutation of one into another, in Minerals by appoſition, & in Creatures *Lib. Epidem.* The prouidence of Nature, or rather of the God of Nature. An image of immortality.

by

by Generation. For so euery *individuum* extending it selfe as it were, in the procreation of another like vnto it selfe, groweth young againe and becommeth after a sort eternall. The father liueth in the sonne, and dyeth not as long as his expresse and liuing Image stands vpon the earth.

The generation of perfect Creatures.

To passe by the production of other things, the generation of perfect creatures is accomplished when the male soweth his seede, and the female receyueth and conceyueth it. For this purpose Nature hath framed in both sexes parts and places fit for generation; beside an instinct of lust or desire, not inordinate such as by sinne is super-induced in man, but natural residing in the exquisite sense of the obscœne parts. For were it not that the God of Nature hath placed heerein so incredible a sting or rage of pleasure, as whereby wee are transported for a time as it were out of our selues, what man is there almost who hath anie sense of his own diuine nature, that would defile himselfe in such impurities? what woman would admit the embracements of a man, remembring her nine moneths burthen, her painefull and dangerous deliuerance, her care, disquiet and anxiety in the nursing and education of the infant. But all these thinges are forgotten, and wee ouertaken with an extasie, which *Hippocrates* calleth a little *Epilepsie* or falling sickenesse: and the holy Scripture veileth vnder the name of a senselesnesse in *Lot*, who neyther perceiued when his daughters lay downe, nor when they rose vp.

Natural pleasure in generation.

Well, the History of these parts of generation it is our taske in this Booke to describe, ouer which also we could wish we were able to cast a veile, which it should bee impiety for any man to remooue, who came not with as chaste a heart to reade as wee did to vvrite. Howsoeuer that which must needs be done, shall be done with as little offence as possible we may.

The parts of generation in men.

The parts therefore of Generation are of two sorts, some belong to men, some to women. The parts of Generation belonging to men (for of the other we shall see afterwards) are verie many, but all conspiring vnto one end, which is to exhibite something out of themselues which may haue the nature of a Principle; by which, and out of which a newe man may be generated. The Principle exhibited is seed, which becauſe it containeth in it selfe the forme and Idea of all the parts (for it falleth from them all) and beside μοίρων πειρομένην, that is, the fatal necessity of life and death; stoode in neede of manifold preparation, coction and elaboration, and therefore the structure of the parts fit for so great and curious a worke is no doubt very exquisite. For some of them do onely prepare the seede, or as it were rough hew it, as putting thereon a rudiment of seed, which before was nothing else but an ouerplus of the purer part of blood remaining after assimulation in the particular parts of the bodie.

This preparation is made in these permaticall Veines and Arteries, whose admirable implications and complications like the wrethed or wormie tendrils of veines, do forme as it were a twilted or bedded net, wherein the matter is so long retained, till it acquire some beginning of alteration from that it was before. Other parts there are which boyle it anew, as that we call *Epididymis* or *Parastatæ*, others affoord vnto it prolificall vertue, whereby it is enabled to produce and generate a thing like vnto it selfe, & those are the testicles which giue it the true forme of seede; others, when it is thus perfected, leade it downe toward the place of receipt which are called *Deferentia* or *Ejaculatoria vasa*, albeit I see no great reason for the second name, we call them the *Leading vessels*. Others receiue, containe, and store it vp for necessary vse, as the many vesicles or bladderets, and those Kernels or Glandules which are called *Prostatæ* scituated at the necke of the bladder of vrine. Finallie, others deliuer it out, and strew it in the seede plat, sowe it in the fertile fielde of Nature the wombe of the woman, which is called *penis* the yard or virile member. Of all vvhich, if but one bee wanting, yea defectiue, the worke of generation goeth not at all or but lamely forward, wherefore we will endeuour to shew you the naturall both position, disposition, and vse of euerie one in their proper places.

CHAP. II. *Of the preparing spermaticke or seede vessels.*

Two sorts of seede vessels.

THE first Instruments of Generation, are called *vasa spermatica*, the spermaticke vessels. These are larger in men then in women, and they are of two sortes, *Preparantia* or *Deferentia*, Preparing or Leading vessels. The Preparing Vessels [Tab.2.ꝫ x a.Tab.fi1.g.1.°q r] which are called παρασκευάσικα by *Galen*, by *Auicen vasa Lumbaria*, are foure. Two veines [Tab.1.°q.Tab.2.ꝫ x] and two Arteries, on each

Preparing.

side

side one [table 1, r, table 2, r.] The right veine ariseth [Table 1, o table 2, t] a little below the originall of the emulgent [table 1, h i table 2, m n] from the vpper and forward part of the trunke of the hollow veine, as it were with a long and thick knub or knot [table 1, p tab. 2, n] (to which as *Galen* obserued, a certain small branch is conuayed from the emulgent) that it might afford more pure and better concocted blood. Veines. The right.

The left [table 1, q table 2, x] ariseth not from the trunke of the hollow veine, but from the lower part of the emulgent: for if it should haue risen from the same place in the hollow veine where the right seede-veine arose, it must necessarily haue gone ouer the great arterie [table 1, s] by the continuall motion of whose *systole* and *diastole*, that is, eleuation or distention, and depression or contraction, being smal, it would haue been either broken or much hindered from performance of his proper office, or else haue intercepted or offended the Arterie; both which inconueniences are auoyded by his arising, as we haue sayed out of the lower part of the left emulgent: [table 1. t, Table 2, u,] yet hath it sometimes a small braunch reached vnto it from the trunke [Table 2, x] of the hollow veine; the blood also it brings is more *serous* then that of the right spermaticall veine. The left. The great prouidence of nature.

The two Arteries arise neare one another [table 1, z table 2, a] out of the middle trunke of the great arterie a good way beneath the emulgents, that they might bring thinner and better cleansed or defœcated blood. The right spermaticall Arterie climbing ouer [table 1, figure 1. f] the trunke of the hollow veine hastneth obliquely to the seede veine; the left closely accompanieth the veine of his owne side. And this Artery we haue seene sometimes absent, and then the left seede veine is so much the larger; otherwise, generally these arteries are larger then their veines; because it was necessary that many vitall spirites and Arteries.

Table 1. Lib. 4 sheweth the Kidneyes with the Vesselles of Vrine and of Seede; a part of the hollow veine, and also of the great Artery, the Testicles, the Bladder, and the Yarde.

The first Figure sheweth the fore-side, the second the hinder-side.

The vesselles which goe vnto the yarde and the necke of the bladder. *λ*, 1. The passage which is common to the vrine and the seed, cut open. ↓ The implantation of the vreters into the bladder.

much

A great cauſe of barrennes.

much arteriall bloud ſhould be conuayed to the Teſticle, that when the ſeede is perfected, it might be fulfilled with ſpirit and vitall heate. It is obſerued alſo, but more rarely, that in ſome bodies both the Arteries are wanting; and happely it falleth out ſo in them that are barren, becauſe there is no ſourſe of vitall ſpirits falling vpon the teſticles.

The courſe of the Spermatick veſſels.

All theſe veſſels, the right veine with his Artery, and the left with his, not much parted one from another [Tab.3.fig.2 θ θ] do beare vpon the *Peritonæum*, and proceeding downward, are ioyned together with fibrous ties, [Tab.3.fig.3 ΝΝ] and ſo paſſe along obliquely aboue the Vreters [Tab.1. fig:1, mm. Table 2 qq] allowing by the way certaine ſmall braunches [Tab:1.f. Table ii, β] to the *peritonæum*, thorough whoſe productions (which firmely grow to their ſides [Table ii, γ. Table iii, λ] at the groin) they make way, together with a ſmall nerue of the ſixt paire, and the Cremaſter Muſcle [Tab:2,4] and ſo fal to the *Paraſtatæ* [Tab: 1,u. Table ii,ε] and to the vpper part of the Teſticle, where the Veine and the Artery mixing together, do faſhion out betweene them one body like a *pyramis* [Tab. ii, from δ to ε] or ſpire depreſſed and plaine on each ſide. This bodie, becauſe of the innumerable branches of Veines and Arteries ioyned by *Anaſtomoſis* or inoculation, of which it is wouen as it were into a platted web, is called in Greeke κυρτοειδὴς παρασέλιδος by *Galen* in his book *de Semine*, in Latine *Corpus varicoſum* [Tab.1t. Table ii, δ. Tab:3, Fig.ii, μ, fig.3. C. ſheweth the beginning of it, and D the *baſis* or foundation] the bodden bodye, and from the faſhion of the tendrils of Vrine *pampine-forme*, we may call it the *ſpiry bodden or emboſſed body*, to diſtinguiſh it from the *Paraſtatæ*, which are alſo called *corpora varicoſa* or bodden bodies. [tab 1.u Table ii,ε]

The ſpirie bodden bodie.

The vſe of the Spermaticke veſſels.

The vſe of theſe veſſels is not onely to leade downe blood of both ſorts, Veinall and Arteriall, together with vitall ſpirits for the nouriſhment and life of the Teſticles, but alſo to receiue a matter or ſubſtance which falleth from al parts of the body, (the laſt and moſt perfect ſuperfluity of the Aliment) ſome-what to alter it, and ſo to conuey it to the *paraſtatæ* for the generation of ſeede.

Veſalius, Columbus.

Moreouer about the middeſt of theſe veſſels, the blood hath his firſt beginning of *dealbation* or whitening, yea, and a farther preparation alſo in thoſe textures and webbes of which we lately ſpake, wherein by a kinde of irradiation the matter of the ſeede (as alſo the textures themſelues) receyue vertue from the Teſticles. Wherefore this ſpiry body cleaueth, yea groweth at his *baſis* or foundation to the inmoſt coate of the teſticles, beſtowing vpon them certaine ſmall ſurcles, but it entereth not into the body of the teſticle, although ſome woulde haueit ſo, as *Veſalius* and *Columbus*, who alſo thinke that many of the forenamed branches do paſſe through, and are diſſeminated into the ſubſtance of the teſticle, where their coates become exceeding fine and thin, that the power of procreating ſeede might the more ſuddenly and at once flowe from the Teſticles into thoſe veſſels; like as in the Liuer the tunicles or coates of the veines diſſeminated through his ſubſtance are moſt fine and ſubtile, that the blood might more eaſily be altered and concocted in them by the force of the *parenchyma*. And ſo much of the Preparing veſſelles, now followe the *paraſtatæ*.

CHAP. III. *Of the Paraſtatæ.*

Their ſeituation.

THE *Paraſtatæ*, ſo called becauſe they ſtand by the ſides of the Teſticles, are alſo called ἐπιδιδυμίδες, becauſe they are placed aboue the Teſticles. They are bodies ſcituate without the *Abdomen* in the *ſcrotum* or Cod, ſet vpon the Teſticles [Tab.1 n. Table ii,ε] (to which they are alike both in nature and vſe,) as yet wrapped in their inmoſt [Table 1 fig.1.x. Table ii,ζ] coate for their better ſafegard and defence, and are firmely tied to their head and bottome, but diſioyned in the middle.

Their originall.

Theſe *paraſtatæ* do ariſe from the ſpirie bodden body [Table 1,c. Table ii,η] by continuation, and creepe obliquely backward and downward to the *baſis* or bottom of the teſticle, and from thence are reflected or turned backe againe vpward [Tab. 1. figu. ii, γ α β] but without connexion or copulation, and being rowled as it were into a round orbe, carry the forme of the tendrill of a vine crumpled vp together: wherefore *Galen* out of *Herophylus*, calleth them κυρτοειδὴς παρασέλιδες in his 14. Booke *de vſu partium*, and the 11. & 12. chapters.

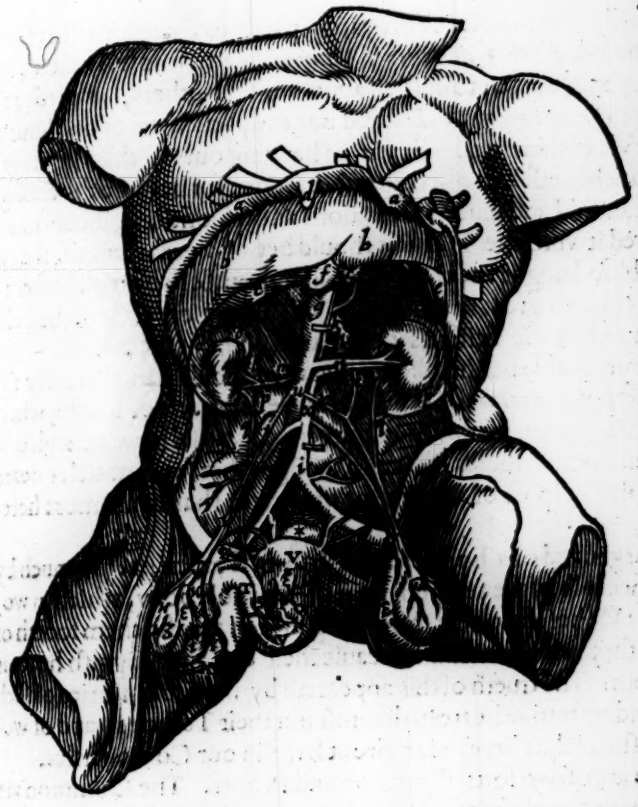
Galen.

Their forme.

For they are white, long, thicke, and rounde, diſtinguiſhed with certaine ſurfles or conuolutions like a wood-worm, and by degrees become narrower, determining on both ſides into the *Vas deferens* or Leading veſſell which is like a round ſinnew. Some there be as *Veſalius* and *Platerus*, who would rather haue them to be the beginning of theſe *vaſa deferentia*

Table 2. ſheweth the lower Belly with the Share-bones parted, that the veſſelles which ſerue for generation might the more plainly appeare.

TABVLA II.



a a A part of the midriffe and of the *Peritonæum* with the ribs broken.
b b c c The Conuex or gibbous part of the Liuer marked with *b b*. the hollowe or concauous part with *c c*.
d e The right and left ligaments of the Liuer.
f The trunk of the gate veine cut off.
g The trunke of the hollow veine.
h l The fatty veines both left and right.
i The aſcent of the great artery aboue the hollow veine, & the diuiſion thereof.
k The *Celiacall* artery.
m n The emulgent veſſels.
o o p p The fat tunicles or coates torne from both the kidneyes.
q q The vreters that goe vnto the bladder.
r u The right ſpermatical veine which ariſeth neare to *u*.
x y The double original of the left ſpermaticall veine *x* from the emulgent, *y* from the hollow veine.
α The originall of the ſpermaticall arteries.
β Certaine branches from the ſpermaticke arteries which run vnto the *Peritonæum*.
γ The paſſage of the ſpermaticall veſſelles through the productions of the *Peritonæum*, which muſt bee obſerued by ſuch as vſe to cut for the Rupture.
δ The ſpirie bodden bodies entrance into the teſticle, it is called *Corpus varicoſum pyramidale*.
ε The *Paraſtatæ*.
ζ The ſtone or teſticle couered with his inmoſt coate.
η The deſcent of the leading veſſel called *Vas deferens*.
θ V The Bladder.
ι The right gut.
κ The glandules called *Proſtatæ* into which the leading veſſels are inſerted. *λ* The muſcle of the bladder. *μ ν* Two bodies of the yard *τ* and *τ* and *υ* his veſſels. *φ χ* The coate of the Teſticle. *ψ ω* The muſcle of the Teſticle *ξ*. his veſſels *ω*.

ferentia or Leading veſſels. And becauſe their ſubſtance is a little more ſolid then that of the Teſticles, they are eſteemed to be of a middle nature betweene the veſſels and the teſticles, that is harder then the latter, and ſofter then the former. Their ſubſtance.

Theſe *Paraſtatæ* are alſo on their outſide membranous and neruous, and where they are without conuolutions ſmooth they are and euen, but within glandulous, and if they be cut they appeare fongous or ſpongy as if they conſiſted of many ſmall glandules. But when they are ſeparated and remoued from the coate of the teſticle, as they may eaſily bee with a ſharpe knife, then are they vnequall. They haue no pores or paſſages to bee ſeen in them; yet there bee that thinke (*Veſalius* among the reſt) that they haue ſmall pipes continuated with the Teſticles, through which the ſpermaticke power ariueth vnto them out of the Teſticles. *Veſalius.*

Their vſe is either to hinder the ſeede not yet ſufficiently laboured from falling downe out of the preparing into the leading veſſels, or to labour the prepared ſeede to a further degree of perfection by the helpe of an irradiation they haue from the teſticles. For they are often found full of ſeede, ſo that they may bee called not amiſſe, little ſtones. Againe, they ſerue to temper and moderate the ouer frequent motion of inordinate concupiſence, as *Ariſtotle* conceiueth in his firſt Booke *de generatione Animal. Cap. 4.* The vſe of the *Paraſtatæ.*

CHAP.

CHAP. IIII. *Of the Testicles or Stones.*

Their names.

THE Stones are called *Testes* becauſe they are witneſſes of *virilitie*, in Greek ὄρχεις, ἀπὸ τῦ ὀργᾶν χεῖν becauſe in wanton Daliance the ſeede powreth it ſelfe forth, and διδυμοι, that is Twinnes, becauſe moſt what they are two for more fruitfulneſſe, but rarely one which yet *Archangelus* found, & very rarely three vnleſſe happely ſayth *Ariſtotle Lib.* 1. *Hiſtoria Animal. Cap*, 13. a little knot or knub in the Cod be miſtaken for a third Teſticle.

Archangelus. Ariſtotle.

They hang out vnder the belly at the rootes of the yarde, partly to abate luſtfull deſires: For thoſe Creatures ſayeth *Ariſtotle Lib.* 1. *de generat. Animal. Cap.* 4. whoſe Teſticles are hidden within the *abdomen* are more giuen to luſtfull appetites then others, as Birds; alwayes remembred that you compare *kinde* with *kind*, and not the particulars of one kind among themſelues. Another vſe of their propendence or hanging out is, that the length and reuolutions of the ſpermaticke veſſels might haue more ſcope: for becauſe the change of blood into ſeede needed manifold and diuerſe alterations and diſpoſitions, it behooued that the veſſels which conueyed it vnto the Teſticles ſhould bee of a great length, that in the length of this paſſage the blood might vnder go more alteration, & ſo be made fitter to receiue the forme of ſeede. Now ſo great length of the veſſels the capacity of the belly could not fitly receiue; and therefore the Teſticles were placed without the body.

What creatures are moſt luſtful. Why the teſticles hang out of the body.

The Cod.

And becauſe it was neither profitable nor handſome that they ſhould hang bare; for the receiuing and cloathing of them, the *ſcrotum* or Cod was made as a purſe or bagge, wherby alſo they are borne vp, whereas their owne waight otherwiſe would haue extended or drawne out into length their manifould foulds; it is alſo thought that ſome muſcles neare hand doe adde ſome helpe to this purpoſe of *N*ature, of which wee ſhall heare more hereafter.

Heat thruſteth the teſticles out of the body.

The Teſticles in men are larger and of a hotter nature then in women; not ſo much by reaſon of their ſcituation, as becauſe of the temperament of the whole body, which in women is colder, in men hotter. Wherefore heat abounding in men thruſts them foorth of the body, whereas in women they remaine within, becauſe their dull and ſluggiſh heate is not ſufficient to thruſt them out. The trueth of this appeareth by manifold ſtories of ſuch women, whoſe more actiue and operatiue heate hath thruſt out their Teſticles, and of women made them men: as we ſhall relate hereafter more at large in our Contouerſies.

The coates of the teſticles.

The coates of the Teſticles are of two ſorts, Common and Proper. The Common are two; which wee call Common, not onely becauſe they are Common to all the parts of the body, but alſo becauſe they inueſt theſe two Teſticles together. The proper coats are alſo two. Thus we will determine of them, albeit we know what great difference there is in Authors concerning the number of theſe coates. *Galen* nameth three in his Booke *de diſſectione vteri*, ὄρχεων δαρτὸν, καὶ ἐλυτροειδῆ. *Veſalius* reckons foure, *Falopius* ſomtimes three ſomtimes foure; *Columbus* three proper coates; *Archangelus* cals them three ſortes of membranes; one ſort common to the Teſticles with all the partes of the body, which is called *ſcrotum*; another ſort common to the Teſticles with the ſeminarie veſſels, which are two; one ariſing from the tendons of the muſcles, another from the production of the *Peritonæum*; a third ſort proper onely to the Teſticles: but we will proceed in our determination.

Diuers authors opinios.

The firſt common coate.

The firſt Common coate [table 17. *lib.* 3. *f*] is called ὄρχεον, as it were a purſe, and in Latine *ſcrotum* or *ſcortum*, becauſe it is like to a leather ſachell, for the Auntients called thoſe thinges *ſcortea* which were made of tanned leather or skinnes; and therefore the leather money which in thoſe dayes was in vſe, was called *nummi ſcortei*. This coate is ſoft and *rugous*, and is diuided as it were with a ſeame, which *Pollux* calleth *Perinæum*, made of the cuticle and the true skinne [table 17. lib, 3. *r*] but thinner then the reſt of the partes, and hath no fat about it that it may eaſily ſtreatch when the Teſticles ſwell with ſeede, or be corrugated and grow thicke, to ſerue in ſteade of many membranes: *Archangelus* addeth toward the compoſition of this *ſcrotum*, the fleſhy membrane falling from the ſhare-bones. For although it haue membranes, and thoſe wouen or chequered with many veſſels which are eſpecially neceſſary for the generation of fat; yet hath it no fat at all, for that there remayneth no oyly ſubſtance that might congeale into fat, becauſe all the ouerplus when the teſticles are nouriſhed is changed into ſeede.

Whereof made.

Scrotum or the Cod. Why it hath no fat about it.

The ſecond common coat

The ſecond Common coate called δαρτὸς, becauſe it may eaſily bee ſeparated from the reſt, is produced from the fleſhy membrane [tab. 17. lib 3. *t*] where it is much thinner then

in

in other parts, and repleniſhed with Veines and Arteries: with both theſe coates are the Teſticles inueſted and ſuſpended, that they might not be iniured either with heate or cold, and ſo become vnfruitfull and barren. Alſo when the yarde is flaccid or looſe they hang

¶ *The firſt Figure ſheweth the diſport of Nature in the ſeminary veſſels, the emulgents, and the poſition of the left Kidney, as wee met with it in a publicke Diſſection.*

The ſecond Figure ſheweth the ſeminary veſſels, with the Teſticles.

The third Figure ſheweth the diuers formes of the Teſticles, and their ſeuerall parts.

V V. the diſtribution of the veſſelles through his ſubſtance.

Why the corrugation of the Cod is a ſigne of ſtrength.

downe, but when that riſes or is diſtended then the skin being alſo contracted and corrugated and with the yarne drawne vp, the Teſticles alſo are ſuſpended and drawne vpward; which ordinarily is obſerued as a token of ſtrength in young Children, who are often ſuddenly diſeaſed; but if their Teſticles be thus gathered vpward, it is commonly and not without reaſon, hoped that their naturall ſtrength remaineth vndecayed; whatſoeuer the preſent cauſe or violence of the diſeaſe may be.

Their proper coates. The firſt and vtter.

The proper coates which doe inueſt each of the Teſticles by it ſelfe are two, yet (*Columbus* maketh three proper, and reprehends *Veſalius* for making but two.) The firſt and vtter is called ἐλευτροειδὴς, that is, *vaginalis*, as it were the ſheath or huskie membrane [Table 17. lib. 3. ᵘ where it appeareth whole; table 3. figure 2. ᵘᵘ. tab. 2. at ♀ χ ♄ cut open] for ſo ſaith *Pliny*, Prouident Nature hath incloſed all the principall bowels, *membranis propriis ac veluti vaginis*, that is, In proper membranes, as it were corne in the huskes. It is alſo called by *Paulus* from the faſhion it carrieth ἑλικοειδὴς, or *Cupreolaris*, that is the Tendrill. It ariſeth from the production of the *Peritonæum*; it is thinne and ſtrong, and outwardly groweth to the ὄρχιν, faſtned with a multitude of membranous fibres [Table 17. lib. 3. from ᵘ to ᵗ,] which *Columbus* thought to be a particular coate, yea and ſome fibres there are which ioyn the husky coates of both the Teſticles together. Inwardly it is alſo thinne but lined with a watery humour and aboundeth with veines. To this coate ſometimes are added certaine ſmall fleſhy fibres (whence it is called by *Oribaſius* the great abreuiater of Antiquity ἐρυθροειδὴς from ἐρυθριάω, which ſignifieth to grow red; for ſuch is the coate where theſe fleſhy fibres are) which goe vnto the bottome of the Teſticle.

Paulus. *Columbus.* *Oribaſius.*

The vſe of the vtter coate.

The Vſe of this Membrane is thought to be, that whilſt it inuolueth the ſtones as it were within a huske or ſheath, the ſpermaticke veſſels are cloſely knit vnto them; or that there might be an infuſion of imperfect ſeede into the Teſticles out of the veſſels, or rather, that from the Teſticles ſome force or faculty might reach vnto the veſſels.

The ſecond & inner coate of the teſticles.

The ſecond or inner proper coate of the Teſticles called by *Veſalius* and *Archangelus* ἐπιδίδυμις, becauſe it immediately encompaſſeth the Teſticle, in Latin *Albuginea*, the white coate [Table 2. ♌ table 3. figure 2. ᵘ figure 3. ᵘᵘ] which ariſeth from the coate of the ſpermaticke veſſels is white, thicke, and very ſtrong; whence *Ruffus Epheſius* calleth it ὑμὴν νευρώδη, πρόσφυσις. It immediately inuolueth the ſubſtance of the Teſticle, that it may firme, ſtay, and as it were knit together his ſoft and laxe fleſh [table 3. figure 3. ᵗ] leaſt otherwiſe it ſhould haue beene too looſe, and ſo haue proued vnprofitable; as alſo by his interpoſition as it were of a meane or middle nature, the harder veſſelles might more fitly grow and apply to the ſofter ſubſtance of the teſticle.

Their figure.

The Teſticles are round of an ouall figure ſaith *Laurentius*, or like egges depreſſed or flatted ſomewhat on either ſide; and they hang obliquely or ſidelong becauſe of the veſſelles which grow vnto them, and becauſe of the protuberation or bunching out of the *Paraſtata* as if they were two ſmall ſtones; which protuberation in laſciuious men is not vnuſuall. The vpper bunching part is called by *Ariſtotle* & *Galen* κεφαλὴ the head, the lower which is blunter and larger is called the bottome; by *Pollux* θυμὸς. The right is the hotter becauſe of his veſſels which transfer from the hollow veine and the great arterie more pure and ſpirituall blood vnto it: it is thought alſo to be more bodden or emboſſed, and the ſeede on that ſide is thought to be better concocted, albeit *Veſalius* denyeth any difference, who doeth not conceiue that the procreation of Males and Females dependeth vppon the greater or leſſer implication of theſe ſubſtances. Yet *Hippocrates* calleth the right ἀρρενόγονος, that is, the Male Teſticle, and the left θυλυγόνος, the female Teſticles which is fuller of ſeede then the other, but that more weake and wateriſh, hauing moſt of his matter from the emulgent; whence it is that the Nature of women ſeemeth to be more intent vppon generation then that of man, euen from the very beginning: witneſſe the childiſh diſports of young Girles in making of Babies, Nurſing, and lying in, as we ſay, and ſuch like paſtimes, wherein they are occupied euen from their infancy.

A note of laſciuious men *Ariſtotle. Galen. Pollux.* The right hotter. 6. *Epid ſect.* 4. The reaſon of young Girles diſports.

Theſe Teſticles being ioyned by the interuening of membranes, do hang down from the ſharebones and the yarde.

Their ſubſtance.

The ſubſtance of the Teſticles is glandulous, white, milky, ſoft, laxe or looſe in men and ſpongious, becauſe of many ſmal veines [table 3. fig. 3. ᵘᵘ] diſperſed through their bodies, but yet there appeareth no cauity or hollownes in them.

Muſcles.

They haue on each ſide one muſcle and that a long one [table 2. ♀ table 3 figure 2. χ] and ſlender, beginning at the hanch bone, or rather from a ſtrong ligament which runneth from

from the hanch to the share-bone in that place where the transuerse muscles of the lower belly doe end, of which these muscles seeme to be a part, and they get out by the out-let of the Tendons of the oblique muscles, and outward neere the leskes they grow to the vessels which attaine vnto the Testicles and vnto the heades of the Testicles themselues. Sometimes from the forepart of the share-bone there are certaine fleshy fibres communicated vnto them, so that they may be obserued to haue (as they haue alwayes in Apes) a double originall. The connexion and originall of these muscles.

By the benefite of these muscles, the Testicles which are pendant, are suspended or hung (whence they are called κρεμαστῆρες) that they should not bee a burthen to the spermatick or seed vessels as we touched before. Moreouer in copulation or coition they draw them back, that the seed-trough becomming shorter, the seed may more easily and readily be supplyed. And *Galen* in his fourth booke *de vsu partium* and the 14. Chapter sayeth that they partake of voluntary motion. *Cremasteres.* Their vse.

For their nourishment and life the Testicles receiue matter from the spermaticke [table 2 ω] veines and arteries. How then may some say are they nourished with bloud? I answere, as the Paps are nourished with Milke; for their bloud is not red but turned into Milke and Seed, as also the bones are nourished with marrow. For all the parts of the body are nourished with bloud, either red or turned into a substance more conuenient for the part which it is to nourish. A reasonable nerue also they haue, from the rib braneh [tab. 6. lib. 2. fig. 1. ιιι] of the sixt paire; sometimes also two other nerues ariue vnto them from the 21. coniugation of the marrow of the loynes (that hanging out of the body they might not yet bee depriued of exquisite sence) which after being ioyned to the spermaticall vessels are carried downward, and implanted into the coates of the Testicles. Their vessels by which they liue.

The vse of the Testicles is (for that without them neither can seede be ingendered nor any absolute Creature perfectly generated) by their inbred faculty to giue to the seede not so much the colour (for it falleth not into the substance of the Testicles as *Vesalius* and *Laurentius* do suppose it doth) as the very form & generating power, and that so strong and vigorous, that a perfect and absolute Creature out of it may bee generated; which power in men is the cause of *virilitie*, and in a woman of woman-hood or *muliebritie*. Moreouer by reason of this faculty the Testicles are esteemed the prime instruments of generation, and also by some, principall parts of the body. The vse of the Testicles.

They adde also to the body much strength and heate as appeareth by Eunuches, whose temperament, substance, habit and dispositions are all altered, as wee shall heare hereafter, and that because of the great consent of the vpper parts with these Testicles mentioned by *Hippocrates* in his second Book *Epidem.* and the first section, in these words. *When the Testicles doe swell vpon a Cough it putteth vs in mind of a sympathy and consent there is between the Chest the Paps, the Seede, and the voice.* And how great the consent is betwixt the parts of respiration and the parts of generation, he sheweth in the fourth Book *Epidem.* and the last Aphorisme saue one on this manner. *They are troubled with a dry Cough whose Testicles doe swell, and that Cough endeth in the tumor of the Testicle if a veine be opened; and when the Testicles are inflamed men do Cough much.* And again, *Those that are agueish with tumors in their leske, haue Coughs follow them continually.* Their consent with other parts. Of their consent with the chest.

For the consent of the Testicles with the head, I can giue you a notable instance of a wanton young fellow, who vpon a small and almost insensible tumor (especially at sometimes) in or about one of his Testicles, fell first into light, and after into extreame fittes of the Epilepsie or Falling sickneese, whose name I suppresse, not for his desert toward them that deserued well of him, but for the reuerence of our Art. The head. A story worthy the obseruation.

Finally, in excellency the Testicles are like vnto the heart; for that Cordiall *Epithymations* applyed to the Testicles in great languishments of the spirits doe little lesse auaile, then if they were applyed to the heart it selfe. The heart.

CHAP. V. *Of the vessels called Vasa deferentia, or Leading vessels.*

THE Vessels which Leade the seede called *vasa deferentia* [Table 3. figure 3. ιι separated from the Testicles] are called by *Herophilus* πόροι σπερματικοί, by *Falopius, Canalis seminarius*, the seede-cane.

They are scituate partly without the *Abdomen* in the *scrotum* or Cod, partly within the cauitie or den of the Hip-bones on either side one, at the head Their scituation.

of the testicle, and are produced from the *Parastatæ*, to which they are continuated, [Tab 1 fig. 1, γ, α, β] as also are the preparing vessels, [Tab. 1. fig. 1. ζ ζ] although their names bee diuers according to their distinct officies and scituations.

Their substace

Their substance is neruous and crumpled or writhen, [Table 2 κ the descent of the Leading vessells, from ι to ρ the reflection or turning of it; and Table 1. figure 2 γ is the original of this vessell, his descent at α, his reuolution at β. Table 3. Figure 3. from τ to ε downward] contorted at the lower end of the testicle; but where they are parted from the Testicles, they are round and white, and their cauity or hollownesse is but obscure [Table. 3. fig. 3 π sheweth the porous surface of the leading vessell, where it groweth to the couering of the testicle] neyther needed it to bee more open, because the seede by reason of his aboundance of spirites wherewith it riseth and houeth or worketh vppe, can easilie passe thorough.

Connexion.

Progresse.

They arise vpward [Table 3. fig. 3, ο] and are tyed to the preparing vesselles [Table 2. at δ ε] by the mediation of a thinne and small Membrane, presently after (by the same way by which the preparers descended) they are carried through the productions of the *Peritonæum* [Table 2. at φ. Tab. 3. fig. 2 φ ξ] to the Share-bone, at which place the bone hath a superficiarie cauity [Table, 26, lib. 3. figure 12, 13, γ] which giueth way vnto the roundnesse of these vessels. After being returned downward [Table 1. Figure 1. from γ to ζ, Tab. 3. Fig. 2. π ς] like Nerues, and tyed on the backe side (where the humour they containe is nowe become white) to the *Peritonæum*, they are led ouer the [Table 3. Figure 2, ν ν] Vreters, and vnder the backe side of the bladder aboue the right gut neere vnto the necke of the Bladder; a little before theyr vniting together [Table 1. Figure 2. ϡ. and Table 3. figure 2, 7, is the vniting of the Leading vessells] they are on eyther side dilated and become thicker, where these small Bladderets of seede [Table 2. Figure 1, ζ ζ] called *Vesiculæ Seminariæ*, are adioyned vnto theyr sides, but the Leading Vessells themselues are spent, the right into the right, the lefte into the lefte *Prostate Glandule*. [Table 1. Figure 2. ν ν. Table 3, Figure 2, φ]

Vniting.

Their vse.

The vse of these Leading vessells, is to carrie or leade the seede after it is laboured in the Parastatæ, and made fruitefull and prolificall by the Testicles, vnto those Prostate Glandules, as it were vnto certaine Magazines or Store-houses, where the right Vessell meeteth and coupleth with the lefte, that the seede of each Testicle might together and at once bee thither conueyed, and so shot together into the Womb by the Virile Member.

Moreouer, their oblique passage furthereth much the seedes perfection; for as in making of Aqua-vitæ or such like strong spirits of wine, wee see the liquor first ascendeth and then descendeth, so the seede being to become a frothy body, was of necessity to bee perfected by such sublimation and precipitation.

CHAP. VI. *Of the Bladders of Seede.*

What the bladders of seede are.

THE small bladders of seede [Table 1, fig. 1, ζ ζ shew them open] are placed betweene the Ligaments of the Bladder of vrine & the right gut at the sides of the leading vessels a little before they become thicke and are vnited. They are compounded (saith the Author of the Definitions) of a veine & an Artery mixed together. They are on either side one, neruous, large and fayre enough to be seene, hauing not as other bladders one cauity, but are full of boughtes and turnings like burst or knotted veines, implicated or folded one within another (and therefore *Herophylus* calleth them παρασάλας κυροειδεῖς, *Adstites varicosos*) so that they seeme to be many, and in them (saith *Fallopius*) seede may be kept many months. For Nature being desirous of the continuance and perpetuitie of mankind ordained, that all times should bee fit for their procreation, and therefore it was verie meete, that a matter rightly for that purpose dispoſed, should at all times be readily supplyed, but because man coulde not alwayes entend that worke, and yet it was necessarie, that euen this excremeut or surplusage should be auoyded, therefore like other excrements it also was to bee gathered together in some place, and there kept till a fit occasion were offered, that from thence it might bee shot foorth.

Why created.

Varolius

And for this purpose (sayth *Varolius*) these Bladderets were created, into which the seed should bee continually emptied out of the Testicles, and therein stored vp against the time of expence.

But

But least so great a quantity remaining in one place should corrupt, there are many turnings & windy boughts and passages in them, which also are a stay vnto the Seed, that in one Coition or accompanying of the sexes, all the seede should not bee spent. For, the seed winding it selfe out of those manifold Labyrinths by degrees, doth passe away more safelie and moderately, and with better stay and deliberation. Their vse.

But we saith *Bauhine* haue hitherto obserued that these bladderets are full of a yellow oily humor wherewith the passage common to the seede and the vrine is illined or smeared least it should be hurt by the acrimony of either of them, or least when it is drie it shoulde close together, and so hinder the next euacuation. For to this end in copulation this oylinesse together with the seede yssueth sensibly and feelingly, at other times it welleth out insensibly; *Galen* addeth in the 14. Booke *de vsu partium* cap. 11. that it prouoketh lust, and keepeth moyst the necke of the bladder of vrine. *Bauhine.* *Galen.*

CHAP. VII. *Of the Prostatæ.*

THE *Prostatæ* as it were *fore-standers*, are called by *Herophylus* προστάδαι ἀδένοειδεῖς. *Columbus* cals them *Parastatæ*. *Fallopius* calleth the *assistant Glandules*, *Varolius* two Testicles smaller then the other. *Vesalius* out of *Galen* calleth them σώματα ἀδένοειδῆ, that is, Glandulous bodies. And so indeede they are two Glandules [Tab. 1. fig. 2. n n] on either side one, placed in the cawtie of the *Abdomen* at the lower part of the bladder [Tab. 2. c] that is in the neck aboue the sphincter [Tab. 2. p. Tab. 1. fig. 2. p] Muscle, or rather betwixt the necke of the bladder, and the lower Muscles of the yard at his roote, where the Leading vessels are vnited. [Ta. 1. fig. 2. s] Their names. Scituation.

These Glandules are depressed before and behinde, but round on the sides, into which as it were into other testicles, the leading vessels do end. Figure.

They are couered with the Membrane which did inuest the leading vessels, but now become somewhat thighter, least the substance of these *Prostatæ* being rare and spongie, the seede should soake out of it owne accord through their open pores, albeit they be very narrow. Yet is this Membrane verie thin, and hath in it verie blinde breathing pores, which at the first sight are not conspicuous, but when the Glandules are pressed, they appeare, for by them the seede may be scruzed in notable quantitie into the common passage, as it were by grains or like final seeds, euen as we see Quick-siluer passeth through leather wherin it is fast tied, if it be strained, whence also in coition great pleasure ensueth; the exquisit sense of the membrane being tickled in the passage with the gentle & pleasing acrimony of the seed Membrane. Comparison. The tru cause of pleasure.

Their substance is hard, spongie, and whiter then the rest of the Glandules, they are also large, as containing in them so much seede (saith *Archangelus*) as will serue for the procreation of foure or fiue infants; three or foure (saith *Columbus*) in those that are fruitful. And therefore it is no wonder (though *Aristotle* writeth it for a wonder) that a Bul after his testicles are cut off, may get a Calf. *Vesalius* hath obserued that the prostate glandules are notoriously large & ful in Monkies; and indeed they are of al creatures the most lasciuious, as we do not only read in authors, but haue also seene by the great Baboons which were heere to be seene among vs; for they would in a maner offer violence euen to a woman. It is therefore a very wicked and inhumane thing for Gentlewomen to cherish them in their bosoms yea in their beds, as I haue seene some doe with mine owne eies. Their substace *Archangelus.* A Bull may get a Calfe when hee is castrated. A beastlie abuse.

The vse of these *prostatæ* say some, is to ad somwhat to the generation of seed, & their reason is, because there is no where found so great quantity of it as in them: but if this wer true then euen gelded creatures would engender seed, and seeke to auoid it, which *Galen* worthily gainsaieth. *Varolius* seemeth to countenance this conceit, who saith, that in the end of the leading vessels there are placed two other final testicles, which giue vnto the seed his vttermost absolution or perfection, the leading vesselles ministring vnto them, as the preparing do to the Testicles. A false vse. *Galen.*

Their true vse is to receiue from the leading vessels the seed now sufficiently laboured and made prolifical or fruitful, and to keepe it till the time of profusion or spending as we say. It may be also they make it more thick, as adding the last hand vnto it, for it appeareth in these thick and white, in the testicles but thin and serous: sure it is, that the seed neuer procureth pleasure till it come from them, witnesse those that are immoderate wantons, who spende themselues so frequently, that there is no time for the seede to bee stored vp in these parts; their minds indeed are more then brutishly lustfull, but their bodies are not so delighted as other more moderate men by their owne confession. Their true vse

How these glandules are pressed

These Glandules being pressed on their backe sides by the lower Muscles of the Yarde, [Tab.4.fig.1,and 2.ᴿ ᴿ] which arise from the sphincter of the fundament,[Table 4,fig.1,ᴹ] do constraine the seede into the common passage [Tab.4.fig.2,ᵒ] which in the forepart of it they open. Into which their insertion can hardly bee discerned, but is opened when the seede flowes foorth.

A story out of *Vesalius*.

Vesalius telleth a tale of a fellow that was hanged at *Padua* in *Italy* who had the running of the reines, in whose body euen after his death all these passages were manifestly open and free,especially those of the leading vessels into the neck of the bladder. Moreouer with their solid and firme substance they support the necke of the bladder,that it should not faile or fall,that so those narrow passages,and for the most part insensible which attain vnto the end of the necke of the bladder, should bee kept streight, that the eiaculation of the seede might not be interrupted in the excretion, although the fall of this doe stay the yssue of the Vrine.

CHAP.VIII. *Of the yard or virile member.*

The names.

THE Yard is called in Latine *penis a pendēdo* of hanging,and *Virga*; in Greek χαυλὸς, and by an excellency μόριον, that is, *virile membrum*, the virile member, because of the fœcundity thereof. Many other names it hath both in Greeke and Latine,a Catalogue whereof *Laurentius* hath put downe vnnecessary for our turne, wherefore we haue spared our owne labour and your eares. The scituation is well knowne to be at the bottome of the lower venter on the outside [Tab.4.fig.1,2] as neere the fundament as it well might, and not be troublesom by falling vpon it in the time of seidge: Not aboue the groine,or in the *Hypogastrium* or watercourse, because there is no bone to establish his originall. It was therefore necessarie it should arise at the very roots of the share bones,as wel for the establishment thereof in the act of generation, as also that it might be more fit to meete with the womans lap, and yet no hinderance to the actions of other parts. And because it was not necessary there should be more of them then one, it is placed alone in the midst. Long it is, [tab.4.fig.1,2] round, but not exactly, for the vpper side of it,which they call the back, is somewhat broader,and endeth in a dudgen or blunt point. The length and thickneſſe of it is diuerse, as well in respect of the kinde or species, as of the particular creature or *individuum*. In respect of the kinde, it is of such a length and magnitude as the necessity of the kinde requireth for procreation: but in men shorter then in many other creatures, because men doe vse *aduersam non auersam venerem*. Of the *individuum* or particular, because it is formed commonlie according to the proportion of the members, yet sometimes it is large in a little man, because of the aboundance of the portion of the fathers seede of which it is framed, for the seede falleth from euery part of a mans bodye, and carrieth in it power of generating that part from whence it fell. Although *Galen* in his sixt Booke *de locis affectis* towards the end, writeth, that continence makes it to encrease,at least in thicknes. It is thought also it wil be longer if the Nauill-strings [Table 4.fig.7.ᵛ ᵛ ˣ] bee not close knit by the Midwife when the childe is new borne; and that because of a Ligament which commeth to the Nauill from the bottome [Tab.4 fig.7,ˣ] of the bladder which they call *Vrachos*, for the straighter that is tyed vnto the Nauell, the more the bladder and the partes adioyning are drawne vpward.

The Figure.

The dimensions.

The cause of the largenes of the yard. *Galen.*

How to make it long.

The coats.

That part of the yard which hangeth out of the *Abdomen*, is couered with a cuticle and a skin not very thicke (which is laxe or loose when it hangs, but in erection is stretched) equall to his length, and knit vnto it at the lower part of the *glans* or nut, it is also couered with a fleshy membrane which heere becommeth neruous. There is no fat betweene the coates,least the member should grow by that meanes to great, and so his action be hindered,or to soft which would hinder erection.

The parts of it

It hath two parts, the one next to the belly which is the more principal,and hangeth not out, and it is called ὑπόστημα,which is below the commissure or ioyning of the share bones, to the middest of which it is fast knit in the *Perinæum*, (that is, the space betweene the cods and the fundament) with strong Ligaments and Muscles,and rising vpward vnder the testicles,appeareth round aboue the *scrotum* or cod.

The other part of the yard is called στῆμα,and hangeth downe without the body from the vpper part of the share-bone if it be flaccid,or if it grow strong and rigid,it is raised vpward and so stands commonly so farre from the body, as the necke of the wombe is in length inward

ward, that so it may yeeld seede vnto the very orifice of the wombe for the propagation of mankinde.

The structure of this member is such as is fittest for his vse and the necessity of Nature. The structure
It is not bony, as in a Dogge, a Woolfe and a Fox; for so it would not be a pleasure but a great troble to the other sexe; besides, being alwayes rigid or stiffe it woulde haue beene both vncomely and haue hindered many actions and postures or positions of the body. Why not a bone.

It is not gristly or *Cartilaginous*, for then it could neither haue beene distended (for a Cartilage hath no cauitie) neither could it haue beene soft and pliable. Gristle.

It is not of the Nature of a veine, for then it could not so soone haue beene filled and emptyed againe; as also for that the simple coate of a veine would not haue endured any strong streatching. Veine.

It is not of the nature of an Arterie although that haue a thicke and hard coate, because of the continuall pulsation, vpon which a man cannot lay a law when he pleaseth. Artery.

It is not neruous, because Nerues haue no manifest cauitie, neither are they naturally dilated; beside that, the softnes would haue hindered the tension or erection. Nerue.

It is not a Ligament, although that would haue been fit for tension or erection, because then it should haue had no cauity; and being beside without sence, it would not haue been capable of pleasure. Ligament.

It is not a Tendon, because they haue no cauity, and are beside softer then Ligaments, and so not so fit for erection. Tendon.

Much lesse could it well be made of flesh, or glandules, or muscles, or membranes.

It was therefore requisite that some other peculiar substance should be found out, such as was not elsewhere in the whole bodie, that should be hard and hollow, that without difficultie or inconuenience, might successiuely at conuenient times according to the presence or absence of the spirits bee raysed vp, or againe sinke or settle downe; and of so exquisite sence beside to breede that pleasure, whereby man is prouoked to rush into so obscoene a peece of buisinesse.

Of such sort and structure therefore there are two bodies [table 1, figure. 2. [ii], table 4. figure 1.2.3.4.5.7.9. ^ [z]] which together with the Cannell or passage doe make the yarde. They are hard, neruous and like ligaments, on either side one, arising from the lower part of the share-bone [table 4. figure 2.3. C C] where it is thicke and round, & the vpper part of the *Coxendixe* or hanch, as well that hauing a substance partaking somewhat of a bone, the yarde might bee better disposed to rigiditie, as also hauing his originall for a stable body, it might bee kept stable and straight in the performance of his action to which it is by nature designed. How the yard is construed. The 2. bodies.

These bodies are on the outside round, on the inside plaine, and below at their original are diuided [table 4. figure 4. and 5. [zz] the two bodies, and [o] the canale or pipe] that they may yeeld way vnto the passage which commeth from the Bladder; by and by they are carried vpward, and about the middle of the share-bone they are ioyned together [tab. 4, fig. 4.5. [z]] yet so as they seeme to bee distinguished by a white Line running in the middest of them if the yarde bee cut ouerthwart. [table 4. figure 4.] From thence they are returned downward to the Nut [table 4. figure 4. 7.9. [D]] and doe inwardly end in an acute angle, and together with the canale or pipe doe fashion out the length of the yarde. Ouer those ends groweth the substance of the glans or nut, and so the whole figure doth in some sort represent the greeke ?, which therefore ought to be obserued because of the vse of the Catheter in the suppression of the vrine. For if the Catheter be not insinuated or gently put in with a kind of dexterity, it either hurteth the pipe or the necke of the bladder so that bloud will follow, or else it will not passe into the cauity of the bladder. The Catheter

The substance of these bodies is excauated or hollowed like a pipe (from whence they are called the hollow nerues) but of a fungous or spongy matter [tab. 4. figure 4. 5. [zz]] and filled with blacke bloud: so that naturally it is blackish. A remarkeable obseruation for Chyrurgians, that in the section of a putride yarde, they doe not take that for rotten which indeede is but Naturall; the want of which knowledge I am perswaded hath cost many a man a good ioynt, which otherwise might well haue beene saued. It is also wouen like a Net made of innumerable braunches [Table 1. figure 1 [xx], table 4. fig. 5. [b]] of veines and arteries diuersly intangled together which are very notable vessels, and ariue here from the region of the great or holy-bone [tab. 8, lib. 3. [cc]]. A good note for Chirurgions. The vessels of the yarde.

These bodies are also rare and porous, that they might suddenly bee filled with spirites and

The vse of the structure of his bodies.

and with venall and arteriall bloud when the yeoman is irritated or incensed; and his violence being appeased, the same spirts and blood being partly dissipated and partly returned into the vessels, settle and shorten again. For if the member were alwayes strong and stiffe it would be a great hinderance to men in many labours of this life, especially such as are violent, and beside it selfe would bee alwayes subiect to mischiefes, euen as the arme or hand would be if it were continually streatched forth. On the other side, if it were alwayes flaccid or loose, it would be vnprofitable for that imploiment for which God and Nature haue ordained it. Wherefore onely in the time of coition it ought to bee swolne and rigged or erected: swolne and extended to a iust magnitude that it might fill the neck of the matrix, *quo vtriusque pudenda incalescant*. For it is mutuall heate which calleth and prouoketh the seed out of the inner parts: Rigid and straight not onely *ad commodiorẽ coitum*, but also that the passage being open and direct, the seede might more freely and directly bee eiaculated or shot foorth from the very *Prostata* wherein it is contained. For if it were either oblique or crooked, (as it is in those which are called ὑποσπαδίαιοι in whome the passage is retorted by reason of a bridle at the end of the yarde, who therefore cannot procreate vnlesse that bridle be cut) or did in any place not stand open but fall together, then would the seed stay or make stop in the passage.

The coates of the yarde.

But againe, least the spirits which flow vnto it, and by which it is distended, should bee too soone disipated or scattered through the fungous or spongy substance, it is couered and strengthned with membranous coates thight and very strong (which some men imagine doe arise from the commixtion of those vesselles which passe vnto the yarde,) which are therefore called the neruous bodies of the yarde, and they are also thicke and substantiall, that they might more easily be distended.

Comparison.

For when as in venerious appetites, the bloud & the spirits do in great quantity assemble themselues out of the veines and arteries, that member is as it were a gutte filled with winde, presently swelling and growing hard, which no question commeth to passe when as the sphincter muscle (which encompasseth the necke of the bladder, the roots of the bodies of which the yarde is made, and the ends of the guttes) is contracted and presseth out the spirits abounding in those parts, vnto the yarde; for so wee see the iugular or veines of the throate to be distended, when in laughter the chest is compressed and straightned. So also the veines of the arme by reason of the constriction of a Ligature or tye are distended and growe hard and full: so then it appeareth that voluntary motion is not onely requisite for erection, but also for induration.

The Pipe of the yarde. *Galen.*

The Pipe or Canale of the yarde [Table 4. figure 1.4.5.7.°] which in greeke they call ἐρήθραν, the vrinall pipe, or as *Galen* in his 15. Booke of the vse of parts and the 3. Chapter, the *spermaticke pore*, commeth from the bladder [table 1. fig. 1.λ from the bladder ᶜ table 4. figure 6.] whose necke is long. This Pipe scituated vnder the bodies of the yarde [table 4. figure 4. and 5.° vnder ᵃᵃ] is reflected together with them (in which reflection or returning if putride or rotten seede in a *Gonorrhea* or running of the reynes, doe subsist or make stay, it there vlcerateth the passage) and becomming in the middle betweene them, it passeth along the length of the yarde vnto the outside of the Nutte, where it is embraced by those bodies ioyning together [table 4. figure 4.5.ᵉ] in narrow angles, and so maketh the whole yarde perforated as was necessary for the emission of seede.

How the seed putrifieth in a *Gonorrœa.*

The membranes of the pipe.

This Canale or Pipe hath two membranes (of which none almost of the Anatomistes make any menton, saue *Bauhine* onely, and *Archangelus* of the inner) one inward and thinne wherewith also the nut or glans is couered, bred out of the thin meninx or *pia mater* of the braine, which inuesteth the nerues of the yarde, in which certaine circles are to be seene; & beside there is in it an exquisite sence to make it capable of the pleasure which the seed in his passage through it stirreth vp, and againe it circumscribeth or limiteth the circumference of the Canale or pipe.

The other Membrane is outward and fleshy, compounded of transuerse fibres for the better expulsion of the seed and vrine.

The middle substance of this pipe is lax [table 4. fig. 6] fungous or spongy and blackish so that it readily distendeth it selfe togither with the neruous bodies in the effusion of seed, and againe as readily faleth in the euacuation of vrine.

A common passage.

This passage is common to the Seede, the oylie humor issuing from the final bladders before spoken off and the vrine; and in the forepart of the Nut it hath a yawning out-let, by which these substances are auoyded. It is narrow in young folk, in others so much broader

Tab. 4. demonstrateth the muscles of the yard of the fundament and of the bladder, and the three bodies of the yard.
The first and second figures shew the yard excoriated, cleaving yet to the bottome of the share bone.
The third sheweth the same separated with his vessels.
The 4. and 5. the yard cut away, and Dissected ouerthwart.
The 6. the canel or pipe of the yard, diuided at the entrance into the bladder.
The 7. the forepart of the bladder and the yard, together with the vmbilical vessels.
The 8. the bladder of a woman, with the vmbilical vessels, and a part of the Vreters.
The 9. sheweth the backe parts of the body of the yard.

TABVL A IIII.

b 5. the artery distributed through the bodye of the yard.

der as the skin is more or lesse retracted or drawne backe from it. *Vesalius* maketh mention of a student in the Law at *Forum Iulij*, who had two distinct passages, one for vrine another for seede, but that is indeede very rare. For, becausse the bladder was scituated so neere, it was not necessary that another passage should bee made for the auoyding of vrine, but Nature contented her selfe to vse that already prouided for the effusion of seede. Wherefore the necke of the bladder is carried vpwarde from the Fundament, vnto the beginning of the yard.

A straunge thing obserued by *Vesalius*.

But becausse these officies are perfourmed by voluntary motion, it was requisite that it should also haue Muscles. It hath therefore diuers Muscles, of which no doubt *Galen* wrote precisely in his Books *de Anat. administrationibus*, but we haue lost fiue Books and a halfe of that worthy labour, beside other peeces of excellent vse, as wee may gather by those that remaine. In the fifteenth Booke *de vsu partium*, he reckoneth but two Muscles of the yard, which saith *Vesalius* I could neuer finde. *Laurentius* describeth foure, so will we also according to *Bauhine*. Two Collaterall on each side one, which do arise neruous from the appendix of the hips, [Tab. 4. fig. 1, 2 K L, in the first figure they cleaue to their originall, in the second they hang downe to their insertion] below the originall of the bodies whereof the

Two collaterall.

yard

yarde is made; afterward they become fleshy, short and thicker then those that follow; and being obliquely carried vpward, they are inserted into the bodies of the yarde not far from their originall [table 4. figure 2. ᶜᶜ] and being together contracted in the act of generation, doe bend the yarde and sustayne it whilest the worke be performed; as for the erection it selfe, we haue sayed before it is made by a voluntary constriction of the sphincter muscle of the fundament, driuing the blood and spirits vnto it. *Columbus* also saith that these muscles haue some vse in our making water.

Columbus.

The other two muscles of the yarde are called *inferiores*, becausе they are scituate vnder the pipe, [table 4. figure 1. 2. ᴺ ᴵ in the first figure they appeare yet cleauing vnto it, but in the second they hang downe from their originals] on each side one, arising fleshy from the sphincter of the fundament. [table 4. figure 1. ᴺ] They are somewhat long and are on their insides vnited and so carried along directly vnder the Canale, and implanted at the sides [table 4. figure 1 °] of the same, (and being diuided one from another, doe a little embrace the bodies of the yarde) that they may dilate the lower part of the Canale on both sides drawne downeward, the yarde remayning erected, and so make it shorter least in the repletion of the neruous bodies, especially in the oblique reflexion of the yarde, that passage should be stifled and so the issue of the Seede hindered, which comes indeed leaping forth, and yet is continued one part of it with another as a company of Antickes holding hand in hand, do vault vpon a stage.

2. Inferiors

Comparison.

Moreouer these muscles do compresse the Prostate glandules [table 4. figure 3. and 7. ᴺᴺ] and straine the Seed that filleth them in the time of eiaculation through their membranes by graines as wee sayed before, into the Canale where they are all mingled and issue together.

The vses of the muscles.

In miction also or making of water these muscles haue their vse; for some say they distend the passage as *Vesalus*, others as *Falopius* and *Archangelus*, that in the end of miction they expresse or driue out the reliques of the vrine which remained in the end of the necke of the bladder. But if they worke all foure together, they draw the root of the yarde, which as well as the body thereof hath a power or faculty of erection.

Betweene these muscles in the *Perinæum* [table 4. figure 1. between ᴺ and ᴺ] or distance betweene the Cod and the Fundament are the stones of the Bladder taken foorth. They call the place also *inter-fœminium*, and in it Fistules and other vlcers are very ordinary. I saw a Knight of Lincolnshire of good place suddenly perish within few dayes of a gangreene new risen in this place, and it was credibly told me that his Father a Knight likewise, about the same age of his life was in the same place taken sodainely after the same manner and so perished. Wherfore this place is diligently to be considered of before a Chyrurgion work vpon it.

Where they cut for the stone.

A story.

A caueat for Chirurgions.

The vessels that come to this virile Member are of 2. sorts, some outward others inward. The outward veines and arteries [table 8. lib. 3. ᵗᵗ] arise from the veine and arterie called *Pudendæ*, and are distributed through the skin. They are many and sometimes blackish like vnto bodden, bursten or varicous vessels.

The vessels of the yarde. Veines.

The internall veines are double, and spring from the veine called *Hypogastrica* [Table 8. lib. 3. ᵘᵘ.] These when they come vnto the middle bifurcation at the Crotch, doe almost alwayes vnite into one, which is carried along the body of the member in the middest among the arteries. From this veine a notable braunch atteyneth into the capacity or cauitie of the *Abdomen*, and is disseminated through a Ligament which tyeth the bladder to the share-bones.

In like manner two internall Arteries and those very notable are inserted into the bodies of the yarde, from the Artery called *Hypogastrica* [Table 8. lib. 3. ᵘᵘ] at the byfurcated originall of the same. The invention of these arteries *Vesalius* attributeth vnto himselfe, as also the demonstration of their vse, whome *Columbus* taxeth; but *Archangelus* auoucheth that all the three sortes of vessells in the yarde are so conspicuous that hee that is halfe blinde may see them; for being nourished sayeth hee, why should it not haue veines as wel as other parts; liuing why should it not haue Arteries, and mouing why should it not haue Nerues. *Bauhine* is of another minde, to wit, that the arteries are the vehicles of his nourishment which is thicke bloud, and that the same arteries doe also deriue vnto it the mouing faculty, but of that more hereafter. We will return. Between the forenamed arteries in the middest passeth a veine through the backe of the yarde euen to the Nutte or glans, where it is implicated or foulded together with a nerue (which haply make the substance

Arteries.

Vesalius. Columbus. Archangelus.

Bauhines conceite.

of

of the Nut fungous) all which conuey bloud and ſpirites into the ſpongy ſubſtance of the yarde when it is prouoked or chafed.

It hath alſo Nerues ſo notable ſayth *Falopius* that he that hath but halfe an eye may ſee them; *Galen* alſo in his 14. Booke *de vſu partium* and the 13. Chapter taketh knowledge of them. They proceede from the marrow of the great or holy bone, of which ſome that are cutaneous doe paſſe into the skinne of the yarde and the Teſticles, to make them ſenſible of outward iniuries, others are inward on each ſide one and that very notable, which aſcendeth vnder the ſhare-bone through the middle bifurcation to the coate of the yarde, and from thence runneth diuerſly diſperſed to his muſcles and to his whole body, togither with the arteries through his back, as farre as to the Nut or glans, to giue it a more exact ſence, eſpecially the Nut where it is of moſt vſe to ſtirre vp pleaſure in the act of generation. In theſe Nerues hapneth that tumor which we call γάγγλιον, that is a knotty tumor of a ſinew reſiſting the finger that preſſeth it, yet not dolorous; which *ganglia* here are the cauſe that when the yarde is erected ſtiffe like a Rams horne as *Falopius* ſpeaketh, it is not diſtended beyond his ordinary magnitude, but onely groweth full and turgid.

His nerues. *Falopius.* *Galen.*

Ganglia what they are.

Finally, the vpper part of the yarde is carnous or fleſhy [table 4. figure 1.2.3.4.5.7.9.D] and looketh alwaies as if it were ſwollen; and indeede it hath a greater compaſſe then any part of the whole trunke as *Archangelus* calleth it, of his body, that like the bottome of a glaſſe Still or cupping glaſſe, it might gather more heate vnto it ſelfe then any other part. It is equall, ſmooth, and turbinated, that is, broad at the baſis or bottom, and growing ſmaller, yet keeping his roundnes euen to the top, much like a Turkes cap or turbant, and it is called glans or the Nut of the yarde, and it is girt with a circle like a crowne. It is very ſoft that it might not offend the wombe, ſomewhat acuminated or ſharpned alſo at the top the better to fit it for the orifice of the matrixe; of exquiſite ſence it is, that in the attrition and motion, together with the intention of the imagination (which is moſt powerfull in both ſexes in the matter of procreation) the ſeede might be more plentifully eiaculated.

The glans or nut of the yarde.

His figure.

Subſtance.

It is couered with a fine membrane, produced from that membrane which wee ſayed before did encompaſſe the pipe or Canale; and it groweth not vnlike to a muſhrum vppon the heads of the two bodies of the yarde. It is as we ſayed of a ſpongy ſubſtance, which yet is not hollow within, but ſomewhat more ſolid and firme then other ordinary ſpongy bodies.

His mẽbrane.

But that it might be kept ſmooth, ſoft and glib, it hath a couering which ariſeth from the skinne of the yarde brought forward, and againe reflected or returned, which the Grecians call ποσθή, *Galen* in his 15. Booke of the vſe of Parts calleth it *Cutis epiphyſin*, in Latin *præputium*, we cal it the fore-skin; that part which hangeth ouer the end is called ἀκροποσθιον, becauſe in coition it is mooued vp and downe, that in this attrition it might gather more heate and increaſe the pleaſure of the other ſexe. Some ſay it was ordained for ornament alſo, and not without good reaſon, becauſe vpon the more diſhoneſt part, God & Nature, or rather the God of Nature, hath put the more honour, that is the more couering.

The prepuce or fore-skin.

This fore-skinne in the end of it is ſometimes ſo contracted or drawne together, that it cannot be drawne backe, nor the Nut diſcouered without the helpe of a Chyrurgion. But when the Nutte is vncouered, that it may recouer his couer againe, this prepuce is tyed in the lower part with a membranous band or tie, which the greekes call χαλινὸν ſome κυνὸν and κυνόδεσμον, *vinculum caninum*, the Latines *frenum*, in Engliſh the bridle. *Archangelus* calleth it a Ligament, others will haue it to be made of the extremities or ends of the ſinewes, and this is it which bridleth or reyneth vp the fore-skinne on the lower ſide to the toppe of the Nut. It alſo furthereth the profuſion of ſeede, communicating by the Canale motion and heate to the proſtate glandules which conteine the ſeede ready for eiaculation. For oftentimes in luſtfull diſports or imaginations, if this bridle be but lightly moued, the ſeede will incontinently iſſue foorth; euen as after a full meale, if a man but touch the end of his throate with his finger, the ſtomacke by reaſon of the continuity of the parts, contracteth it ſelfe and returneth the *crapula* or vndigeſted gobbets into the lap by vomit.

In the middeſt of this Nut is a paſſage or hole through which both the ſeede and the vrine is powred foorth, for it compaſſeth the common Canale at which place it is larger, but preſently is contracted againe, that the ſeede hauing there a kinde of momentanie ſtay or ſtop, might procure more pleaſure in this part. Wherefore thoſe that labour of the *gonorrhœa* cauſed by the acrimony of rotten ſeed heaped vp in this large place, are here tortured with vlcers.

The

The vse of it.

The vse of the Yard is as hath beene saide in the particular parts thereof; onely wee will add, that the auoiding of vrine was not the cause of the making of this member. (For we see women make water without it) but for procreation. Euen as Nature hath ordayned the nose for smelling, yet shee vseth it secondarily for purging the mucous excrements of the braine. So vpon a second intention this member serueth to deriue away the vrine wherewith otherwise we should lightly defile our selues.

And thus much shall suffice for the parts of Generation in men, wherein I haue bin indeed as particular as the Anatomicall History did require, but yet withall hope I shall finde pardon, because the Reader may perceiue (at least if he haue any knowledge) that I haue pretermitted many secrets of Nature, which I could and would heere haue somewhat insisted vpon, if I had imagined that all into whose hands this worke should come had bin competent and fit Auditors for such kinde of Philosophy.

CHAP. IX. *Of the proportion of these parts both in Men and Women.*

The same parts of generation in men and women.

IT was the opinion of *Galen* in his 14. Booke *de vsu partium*, and the 11. Chapter, that women had all those parts belonging to generation which men haue, although in these they appeare outward at the *Perinæum* or *interfœminium*, in those they are for want of heate reteined within; for seeing a woman is begotten of a man, and perfect also in makind (for Natures imperfections are not so ordinary) it is reasonable that the substance, yea and the shape of the parts in both sexes should bee alike, as comming from one and the same *set* as it were of causes. Neither is it so vncouth in Nature, that those partes which in some creatures are prominent and apparent, should in others be veyled and couered: for Moles indeede are not without eyes, but haue them lying deeper in their heads and ouercouered, whence *Virgil* saith, *Aut oculis Captis fodere cubilia talpæ*, that is;

Virgil 1. *Georg*

Or hood-winkt Moales haue dig'd their Bowers.

So we call captiues, not those which are not at all, but which are in restraint or in bands. Although heerein Nature hath excellently acquitted her selfe, that the abatement of naturall heate, which in men is the onely naturall and necessary cause of their dissolution, should so admirably become in women the original of generation, whereby we should attaine a kinde of eternity euen of our bodies, against the destinated corruption of the matter, arising from an importunate discord of contraries. For so it pleased the Diuine Wisedome to create for the eternall soule (the most excellent of all formes) if not an eternall habitation heere, yet so absolute and admirable a structure, as might so long bee perpetuated below, till it come to be eternized aboue after an ineffable manner of recreation.

The wonderful prouidēce & wisedom of God.

To bring a kind of eternity out of imperfection.

Wherefore to return. In this other sexe, there are some partes which bring downe the matter of seede out of the whole bodie, to wit, the spermaticall Veines and Arteries; others worke and labour it into good seede, as the body called *Varicosum* and the testicles; others leade the perfected seede, called as in men *vasa deferentia* or leading vesselles; Lastlie, the wombe or Matrixe which receyueth the seede together with the mans, reteyneth it, and worketh vpon it for the generation and preseruation of mankinde. This wombe is likened by *Galen* in his 4. Booke *de vsu partium*, and the sixt chapter, to the *scrotum* or cod of a man [Tab. 11. fig. 1] as if the cod were but a womb turned the inside outward, and hanging forth from the Share-bone; and *Archangelus* maketh no other difference betweene them but of scite and insertion. For if a man doe imagine the cod to be turned and thrust inward, betwixt the bladder and the right gut, then the Testicles which were in it will nowe cleaue to it outwardlye on either side, and so that which was before a cod will now bee a perfect Matrixe.

The particular partes of Generation in women.

Galen. The womb is like the *scrotū*.

The necke of the womb like the virile member

Againe, the necke of the wombe (saith he) is in stead of the yard, for they are both of a length, and by friction and refriction the seede is called out of the like parts, into the same passage, onely they differ in scituation which is outward in men, inward in women. *Fallopius* frameth the comparison of the parts somewhat after another sort, as we shall see heereafter when we come to the Controuersies.

The cause of the procreation of a woman.

So then, in the first conception or soon after, whether it be in man or woman, the same Members are generated, but the fruite prooueth male or female, because of the temper of the seede and the parts of generation, either by heat thrust out, or for want or weakenes of the heate reteined within: wherefore a woman is so much lesse perfect then a man by how much her heate is lesse and weaker then his; yet as I saide is this imperfection turned vnto

per-

perfection, becauſe without the woman, mankinde could not haue beene perfected by the perfecter ſexe. The great Maiſter workman therefore of ſet purpoſe, made the one halfe of mankinde imperfect for the inſtauration of the whole kinde, making the woman as a receptacle of the ſeede of which a new man was to be created. Wee haue therefore in this fift Table exhibited the lower belly of a Woman, and remooued the guts that all thinges might be more conſpicuous, but now let vs come to the particular partes in a woman, beginning firſt with the ſpermaticall veſſels.

CHAP. X. *Of the preparing Spermatical veſſels.*

THE ſpermaticall veſſels which bring the ſeede from the whole bodye, and prepare it for further vſe, are foure. Two Veines, and two Arteries. *Galen* in his Booke *de diſſectione vteri*, maketh mention of foure other veſſelles obſerued by *Herophylus* in ſome women. which ariſe (ſaith he) from thoſe veſſels which go vnto the Kidnies, and ſo paſſe into the womb, which ſaith *Galen* I could neuer finde in any creature, but onely in Apes. The right veine buddeth out of the [Tab. 6.dd] trunke of the hollow vein below the emulgent, nere the great or holy bone; the left proceedeth [Tab. 6.ee] from the left Emulgent, becauſe on this ſide the great Artery is ſcituated neere the hollow veine, which Artery mooueth or beateth continually, ſo that if this left ſpermaticall veſſell had proceeded out of the trunke of the hollow veine, it muſt of neceſsity haue bin carried ouer the great Artery, and then this thin veine had bin in continual danger of breaking by the inceſſant motion of the arterie. The ſpermaticall Veines.

But both the Arteries [Tab. 6.gh] ariſe from the trunke of the great Arterie vnder the emulgent neere the great bone, and are full of ſprightfull blood. *Galen* recordeth, that *Ariſtotle* and *Eraſiſtratus* thought they conteined nothing but ſpirits, with whom *Bonacciolus* and *Mercatus* ſeeme to conſent. And although theſe haue the ſame originall with the Arteries of a man, yet do they not, as in men, fal out of the *Peritonæum*, neyther reach vnto the Share-bones (for it was not needfull that women as men ſhould caſt their ſeede out of themſelues, but onely into their matrix) neither are they mingled together, or growe one into another before they come vnto the teſticles, althogh *Veſalius* would haue it ſo. Wherfore they vary in their inſertion and diuiſion. For in women they are ſupported with fat The ſpermaticall Arteries.

membranes [table 7. figure 1.[zz]] and so are carried to the Testicles [tab. 6.[ii] tab 2. fig. 1.[r]] but before they come there, after an inoculation or Anastomosis made between the veine and the arterie; they are diuided saith *Galen* in his 14. Book *de vsu partium* & chap. 9. into 2. parts; one part maketh the seminarie vessell [table 7. figure 1.[kk]] and the *corpus varicosum*, communicating to the Testicles & their coat certaine smal branches for their nourishmēt.

Diuided into two parts. The first.

The other part reacheth to the membrane cleauing to the bottom of the wombe [tab. 6.[ll] table 7.[ll] fig. 1. fig. 2.[ff] fig. 3[bb]] and so is distributed into the sides of the matrixe, and carrieth nourishment especially to the vpper part of the bottome or soale of it; as also for the nourishment of the conception, that it may be fitly cherished with laudable bloud; by which vessels also a part of the menstruall courses especially in women, but not with child, is purged, but in men they are all consumed into the *corpus varicosum*.

The second.

They differ also from mens vessels in the shortnes of their course or way: for because the seede of the women stoode not in neede of so great elaboration as the mans did, therefore there was no necessary vse of the same length; beside if they had beene so long they could not haue beene contained within the belly. These vessels being enfoulded and enwrapped one within another by an admirable *Anastomosis* or inoculation for the *delineation or perfection* of the seed, make (sayth *Galen* in his 14. Booke *de vsu partium* the 14 chapter) if any, yet very small *parastatæ* and scarcely discerned, because the Testicles themselues are small and the spermaticall vessels small also: *Archangelus* sayeth that from these vessels goe vnto the Testicles certaine small branches.

How they differ from the arteries in men.

The *Parastatæ* in women very small.

CHAP. XI. *Of the Testicles.*

THE Testicles which because of the in-bred coldnes of women are included within the lower venter [table 5.[MN] table 6.11. table 7. figure 2.[ii] figure 3.[ff]] that they might be kept warme and bee made fruitfull, doe lye one on either side at the sides of the matrix [table 5.[L] sheweth the bottom of the wombe, and [MN] the Testicles, table 6.[P] sheweth the wombe, and [ii] the Testicles, table 7. figure 2. and 3.[c] sheweth the wombe, and [ii], [ff] shew the Testicles] aboue the bottom in women not with childe, but in those that bee, they are about the place where the hanchbones are ioyned to the great or holy-bone, and are contained in loose membranes [table 5.[ooqq] table 7. figure 1.[zz] table 10.[MN]] arising from the *Peritonæum* which couer also the middle part of the Testicles.

The position of the testicles.

They differ from mens Testicles in scituation, for they lye vpon the muscles of the loynes within the *Abdomen*; in Figure because they are not so thicke or rounde, but before and behinde broad and flatted; [Table 7. figure 2.[ii]] their vpper face is vnequall as if they were many small glandules [table 7. figure 2.[ii]] (like the glandules of the Kell and mesentery sayth *Vesalius* and with him *Platerus*) and those vnequall (for some are greater & some are lesser) ioyned together. Long they are [Table 7. figure 1.[r] figure 3.[ff]] sinuous or hollow, and beside smal textures in the vessels themselues, they abound with a waterish humor like the thickest whay: In hayle women they are full of this liquor, in those that be sick like bladderts filled with a watery humour, sometimes cleare, sometimes of a yellow or saffron colour and of very euill sent, from whence is often caused the strangulation or suffocation of the matrix, which we call fits of the mother. *Vesalius* telleth two tales of two women in whose testicles he foūd a very noysom and ill sented humor, one of which died in such a fit.

How they differ from mēs in scituation. Figure. *Platerus.*

In the contents.

The suffocation of the matrix.

They differ also in magnitude for they are much lesse in substance, because they are moister and softer, yet *Vesalius* thinks they are harder then in men. Neither is their substance so compact, because they were to ingender a more imperfect seede. In Temperament they are colder, whence womens seed is more moyst, thinne and waterish. It may be, that of this thinnes as it were of water, and of the seede of the man which is thicker as it were of flower a certaine paste should be made in the wombe to bee fermentated or wrought vp into the form of a man; or because *Hippocrates* sayth that man consisteth of water and fire, we may say that the seede of the women is the water, and that of the man the fire, because as the fire it carrieth in a smal body or matter, a great deale of actinity or form; although I am not ignorant that this of *Hippocrates* is & may be otherwise taken, as that both the seeds are the water, and the spirit is the fire; which Nature by the helpe of an aduentitious heate doth extract and segregate from the more excellent part of the seed, especially of the man, lying before hid in the power or possibility of the matter, which is called by Scholers *potentia materiæ*; which spirit assisted by the formatiue faculty of the womb, doth with a discerning iudgement deduce and distinguish into proper acts the power or possibility of the

aab The right vreter at the lowest *a* cut from a part which neare to *b* sticketh yet to the Bladder, because the bottome of the bladder is drawne to the left-side.
c The left vreter inserted into the bladder neare to *r*.
dd The spermaticke veine which goeth to the left testicle marked with *i*.
ee The spermatick veine which goeth to the left testicle marked with *i* also.
f The trunke of the great artery from whence the spermatical arteries do proceed.
gh The spermaticall arteries.
ii The two testicles.
ll A branch which from the spermaticke vessels reacheth vnto the bottom of the wombe.
mm The leading vessell of the seed which *Falopius* calleth the *tuba* or trumpet, because it is crooked and reflected.
n A branch of the spermaticke vessel compassing the leading vessell.
oo A vessell like to a worme which passeth to the wombe, some call it *Cremaster*.
p The bottome of the wombe called *fundus vteri*.
q A part of the right gut.
rs The bottome of the Bladder whereto is inserted the left vreter, and a veine ledde from the necke of the wombe neare vnto *r*.
t The necke of the Bladder.
u The same inserted into the priuity or lap. *x* A part of the necke of the wombe aboue the priuity *yy* Certaine skinnie Caruncles of the priuities in the middest of which is the slit, & on both sides appeare little hillocks.

The Figures belonging to the Dugs or Breasts.

aa The veins of the dugges which come from those, which discending from the top of the shoulder, are offered to the skin. *b* The veines of the dugges deriued from those which through the arme-hole are led into the hand. *c* The body of the dug or Breast. *dd* The kernels and fat betweene them. *e e* The vessels of the dugs discending from the lower part of the necke called *Iugulum*, vnder the Breast bone.

parts mixed together confusedly in the masse of seed. This spirit also moueth & illumineth all the parts & moderateth all the actions of mans life, of which it is also chiefe cause. And therefore it is that we say, that the seed of a man is the actiue principle of the body, that of women but the passiue, or at least far lesse actiue thē the other. But if the seed of both sexes had beene thicke, glewy and compact, they could not haue been so perfectly mingled. Finally, they differ in their coats or couerings, for they haue but one, [tab. 7. fig. 1. ª] because being conteyned in a hidden and safe place they needed no more: that coate *Galen* calleth *dartos*, and it is thinner & softer then that in men, but cleaueth to the testicles very strongly, as if it were one body with them. This coat also receiueth the vessels of seed, and inuesting their substance conteyneth it or holdeth it in. The productions also of the *Peritonæum* doe incompasse only the middle part of the testicles where they receiue the spermatical vessels.

They differ in their coats.

The vse of the Testicles as say *Columbus*, *Archangelus*, *Laurentius* and *Bauhine*, is by their in-bred power to make the seed fruitfull. *Falopius* is not of this mind, *Platerus* halteth betwixt both; but we know assuredly that those women whose testicles are ill disposed are barren and vnfruitfull: for women as well as men do yeeld seed, but cold, though *Aristotle* deny it in his first book *de gener. Animal.* and the 20. chapter; who would haue that humor which is auoyded by the necke of the matrix not to bee a seminarie or seedy humour, but a proper humor of the place, to wit, an excrement of the womb, which also should be found in some, but not in others; as especially browne or swart coloured and manniſh women. But *Hippocrates* in his first Booke *de diæta*, and in his booke *de natura pueri*; and *Galen* in his 14. Booke of the *vse of parts* and the 11. Chapter haue taught, that to perfect generation there is required a concurrence and mixture of the seeds of both sexes; and a place wherin the forme of the parts being onely in power present; the seede might be brought into act, such is the wombe; of which we shall heare by and by.

The vse of a womans testicles.

CHAP. XII. *Of the vaſa deferentia or Leading veſſels.*

Laurentius a Caſtro. Pinæus.

THE veſſell which leadeth the ſeede is on either ſide one [Tab.6.mm. Tab.7. fig.1.*. fig.2.gg. fig.3.gg] which *Laurentius* and *à Caſtro* woulde haue to ariſe from the preparing veſſels, *Pinæus* from the Teſticles. It is ſaide to be ſuſtained by the Ligament of the wombe, as it were with a prop. Neruous it is & white, about the teſticle broad and large, [Tab.6.mm. Tab.7.fig.1,*.fig.2.gg] (ſaith *Galen* in the 9. chapter of his Booke *De diſſectione vteri*,) membranous alſo, and a little complicated or folded like a little ſeminary bladder beeing rugous, ſuch as in men is at

Their ſubſtãce Galen.

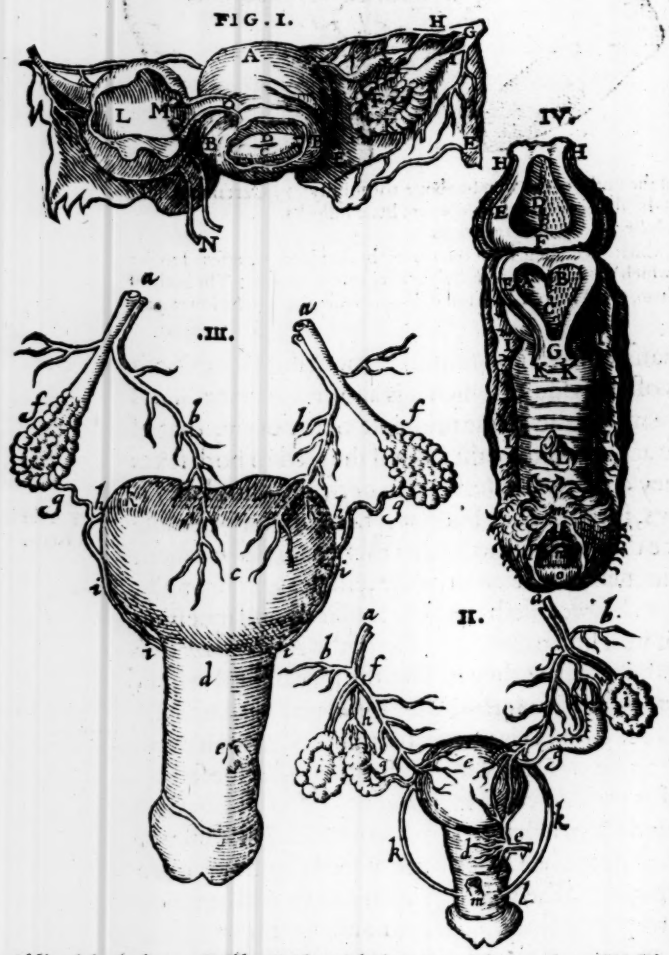
The firſt Figure ſheweth the wombe cut from the body, with the veſſels which grow vnto it, the Teſticles, the Bladder, and the Membranes: the necke of it is turned vpward, that the orifice of the bottome of the wombe may the better be perceiued; the bladder alſo is opened, that his cauity, and the inſertion of the Vreters may better appeare.

The ſecond Figure ſheweth the wombe, with his veſſelles parted from the Membranes and the bladder.

The third Figure ſheweth the womb freed from al the veſſels excepting the ſpermaticall veſſels, where alſo the forme of the Trumpet is omitted.

The fourth Figure ſheweth the wombe cut out of the bodye, and thickneſſe of his coates in a woman with childe, and the cleft of the lap or priuity dilated or laide open.

TABVLA. VII.



A. The bottome of the wombe laide open without any Membrane.
B B. The necke of the wombe turned vpward.
C D. A part of the bottome of the wombe like the nut of the yard, ſwelling into the vpper part of the necke of the wombe, in the middle whereof the orifice appeareth.
E E. A Membrane knitting the wombe to the *Peritonæum*, and holding together the veſſels thereof.
F. The left teſticle.
G. The ſpermaticall Veine and Artery.
H. A part of the ſpermaticall veſſelles reaching vnto the bottome of the wombe.
I. One part of the veſſels comming to the Teſticle.
* A veſſell leading the ſeede vnto the wombe.
K. The coate of the teſticle with the implication of the veſſels.
L. The cauity of the bladder opened.
M. The inſertion of the Vreters into the bladder.
N. The Vreters cut from the Kidneyes.
O. The inſertion of the neck of the bladder into the lap or priuity.

The ſecond Figure.

a a. The ſpermaticall Veine and Artery.
b b. Branches diſtributed to the *Peritonæum* from the ſpermaticall veſſels.
c The bottome of the wombe.
d The necke of the wombe.
e Certaine veſſels running through the inſide of the wombe, and the necke thereof.
ff Veſſels reaching to the bottome of the womb produced from the ſpermaticall veſſell.
g g The Leading veſſel of ſeed called *Tuba* the trumpet.
b b A branch of the ſpermaticall veſſell compaſing the trumpet. *i i.* The Teſticles.
k k The lower Ligaments of the wombe, which ſome call the Cremaſteres or hanging Muſcles of the wombe.
l the lap or priuity into which the cremaſteres do end
m A portion of the necke of the bladder.

The third Figure.

a a. The ſpermaticall veſſels.
b b. A branch from theſe ſpermaticall veſſels to the bottome of the wombe.
c c The bodie or bottome of the wombe.
d The necke of the ſame.
e The necke of the bladder ending into the necke of the wombe. *f f.* The teſticles.
g g The leading veſſels, commonly though not ſo well called the eiaculatory veſſels.
h h The diuiſion of theſe veſſelles, one of them determining into the hornes at double *k k*.
i i The other branch ending in the necke, by which women with childe auoide their ſeede.
k k The hornes of the wombe.

The fourth Figure.

A B. The boſome of the bottome of the wombe, at whoſe ſides are the hornes.
C D. A line like a ſuture or ſeame, a little diſtinguiſhing that boſome.
E E. The ſubſtance of the bottome of the wombe, or the thickneſſe of his inward coate.
F. A protuberation or ſwelling of the wombe in the middle of the boſome. G. The Orifice of the bottome of the wombe. H H. The coate or ſecond couer of the bottome of the wombe, comming from the *Peritonæum*. IIII. A portion of the Membranes which tye the womb. KK. the beginning of the necke of the womb. L The necke of the Bladder inſerted into the necke of the wombe. *m* the *Clitoris* in the toppe of the priuite. *n* The inequality of the priuity where the *Hymen* is placed *o* the hole or paſſage of the priuity in the cleft. *p* The skinny caruncle o. the priuity.

the

the *Proſtatæ*. In the middle it hath a notable hole or paſſage like the mouth of a trumpet, whence *Fallopius* calieth it the Trumpet of the wombe, and ſayeth it is found not onely in the bodies of women, but alſo of all female creatures, by which as by a breathing vent the ſmoky vapors of the womb do exhale into the capacity of the *Abdomen*; & this hole the ſpermaticke veſſels do compaſſe, [Tab. 6.nt. Tab.7.fig.2.hh] and it is curled vp after the maner of a Vine tendrill. For it is more rugous [Tab.7.fig.3.gg] and fuller of windinges then it is in men, and that becauſe of the ſhortneſſe of the way, which is recompenſed by the multitude of turnings, ſeeing it could not paſſe through the production of the *Peritonæum*, becauſe the Teſticles did not hang out.

The trumpet of the womb. *Fallopius.*

How they differ from mens

Theſe Leading veſſels hauing paſſed the Teſticles a little, become by degrees narrower, [Tab.6.mm. Tab.7.fig.1.* fig.2,gg] and are not carried as in men to the necke of the bladder, but to the wombe; and when they come to the ſides of it, [Tab.7.fig.3,kk] which are called the hornes of the wombe (from whence *Fallopius* and *Platerus* thinke theſe leading veſſels do iſſue) they are diuided on either ſide, [Tab.7.fig.3,hh] & one part which is the ſhorter and larger, is implanted into the middle [Tab.7.fig.3,k] of the horne of his owne ſide, or neere vnto it; and powreth into it and into the hollowneſſe of the wombe, ſeed perfectly boiled; but the other part which is narrower but longer [Tab.7.fig.3,ii] is carried along the ſides of the wombe to his necke [Tab.7.fig.3,d] on either ſide, and is inſerted below the innermoſt mouth vnder the necke into the *Proſtatæ*: which are not ſo conſpicuous as they are in men, becauſe the ſeede of a woman is not ſo corpulent or beareth not ſuch a bulke. Theſe keepe the ſeede till the time of coition, and by this way women with child in accompanying with men do looſe ſeede, and not by the inmoſt mouth of the wombe opened. For whereas after conception the mouth of the wombe is exquiſitely cloſed vp, [Tab.7.fig.1. betweene c and p, and fig.4,c] and yet euen then women in coition do looſe ſeede; it is neceſſary the ſame ſhould paſſe ſome other way, becauſe the cauity of the wombe beeing on euery ſide filled, the ſeede that ſhould come from the bottome or ſide of it cannot haue recourſe vnto the orifice, or if it could, yet ſeeing that is ſo ſtraightly ſtopped and muſt not be recluded or opened for feare of abortment, it would follow that the ſeed putrifying the Infant ſhould periſh. For ſeede when it is out of the veſſels, cannot without great danger be reteined, yea it becommeth very poiſon, as *Galen* ſaith in his ſixt Booke *de locis affectis*, and the fift Chapter, and we alſo may plainly ſee in the greeuous fits of widdowes troubled with the Mother: wherefore this paſſage [Tab.7. fig. 3,ii] as *Varolius* rightly admoniſheth muſt be in the necke of the wombe, which in thoſe that haue not conceyued is ſo ſmal, that it cannot be perceiued vnleſſe the Anatomiſt be very diligent and occulate; but in women with childe it is very large and manifeſt. Hence it is, that many women when they are with childe, conceiue greater pleaſure in their husbandes then at other times, and alſo ſome women more then others. But *Fallopius* is of opinion, that theſe Leading veſſelles doe ariſe from the ſides [Tab.7.fig.2.g] or hornes of the womb, and are caried vpward obliquely by the teſticles; but do not ariſe from them, becauſe in ſound & haile women they are diſtant from the teſticles the bredth of a finger, neyther that there appeareth any veſſel which paſſeth from the teſticles to theſe holes or paſſages, but are onely coupled together by a thin membrane produced from the *Peritonæum*, but do not ſo much as touch one another. But if the wombe be euill affected, and that on one ſide, then the Leading veſſell is ioyned to the teſticle on the ill affected ſide, but not on the ſound; but if both ſides of the wombe be affected, then both the leading veſſels are ioyned with both the teſticles.

Their progres

The hornes of the wombe.

Which way a womans ſeed paſſeth after ſhe is conceyued.

Seede out of the Veſſelles groweth poyſonous. *Galen.* *Varolius.*

Why ſome women haue more pleaſure then others after conception. *Fallopius.*

CHAP. XIII. *Of the wombe or Matrixe.*

THE womb ca'd *Vterus*, is by *Ariſtotle* called the Field of Nature, intowhich the ſeed as well of the woman as of the man, is partly powred partly drawne, to which accrueth the womans blood, that the newe off-ſpring of mankinde might be ingendred, nouriſhed, encreaſed, and kept to the due time of birth. For the Naturall and vegetable ſoule which lyeth potentially in the ſeed, diffuſed equally through the whole maſſe, muſt be produced into act; and it is ſo produced by the vertue & heat of the womb that receiueth the ſeed, and the forming faculty which potētially conſiſteth partly in the ſeed of the man, partly in the nature of the wombe, and is called *vis plaſtica*, and ſo of both ſeedes mingled are framed and procreated equally together and at one and the ſame time all the parts of the bodye, vnderſtanding their Spermaticall foundations and ſolid ſubſtance; but as for their ſanguine foundations or proper *Parenchymata*

Lib.1.de gener. Animal. Cap.2.

The forming Faculty.

How all the parts are formed at once.

mata, they are procreated at diuers times, as they sooner or later get nourishment and fire, that is spirit; and so those parts that are nearer to the Liuer are perfected before those that are more remote, and those first into which first the mothers bloud doth flow; that is, first the vmbilicall veine, wherefore that is first absolued in his fleshy substance, from which afterwards the bloud is led and conuayed into other parts.

The names of the wombe.

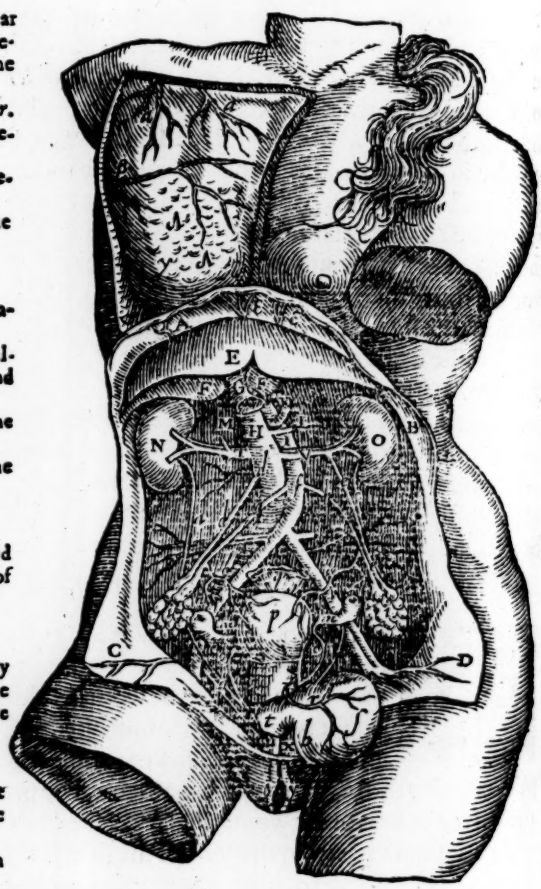
It is called *vterus* properly in women, because it is hollow like a bottle, and as a bottle or bagge of leather is filled and distended with the Infant contained in it; *Hippocrates* calles it γονὴ; but most commonly the Grecians cal it ὑστέρα, because it hath the last place among the entralles or inwards; also μήτρα, *mater*, or the mother, because it is the mother of the Infant, some call it *vulua*, but that is properly in Beastes, as *Pliny* witnesseth in the 37. Chapter of his 11. Booke; it is called *locus* or rather *loci*, the place of a woman.

The scituation & the reasons thereof.

It is placed within the bodie [table 5.[L] table 8.[P] table 10.[L]] because the seede after it is cast into the womb, needed much heat to stirre it vp and to mooue it toward the delineation of the parts. In the lower belly (not in the middle or supreame for that these two are compassed with bones and cannot be dilated according to the increase of the infant, but would haue stifled it by compresion:) because this is easily dilated as the burthen increaseth, and in the lower part of it called the watercourse or *Hypogastrium*, partly because it should be no hinderāce to the nutritiue parts, partly for the more commodious begetting &

Table 8. sheweth the lower Belly, the Guts, being taken away, as also the Stomacke, the mesentery and some membranes, that the vessels seruing for generation may the better be discerned. Also the Breast n Dug of a woman excoriated, is here exhited.

TABVLA. VIII.



ABCD The *Peritonæum* reflected or returned backeward, aboue and below.

yy Certaine skinnie Caruncles of the priuities in the middest of which is the slit, & on both sides appeare little hillocks.

The Figures belonging to the Dugs or Breasts.

αα The veins of the dugges which come from those which discending from the top of the shoulder, are offered to the skin.
β The veines of the dugges deriued from those which through the arme-hole are led into the hand.
γ The body of the dug or Breast.
δδ The kernels and fat betweene them. *ε*. The vessels of the dugs discending from the lower part of the necke called *iugulum*, vnder the Breast bone.

bring-

bringing forth of the fruite. The den or cauitie of the body wherein it is conteined is called *peluis*, that is, the lauor or baſon; ſo that it is compaſſed about as with ſtrong rampires for defence, with the ſhare bones before, the great bone behinde, and the hanch bones on either ſide. I ſpeake of the wombe vnburdened, for then the bottome of it reacheth not higher then the beginning of the great bone, neither toucheth it any thing but the right gut. [Tab.5.x. Tab.8.q.] vppon which it lieth, nor reacheth forward aboue the bladder; [tab. 5.s tab.8.s] for it is placed betweene the bladder and the right gut, that backeward it might haue, as it were, a pillow (ſaith *Galen* in the firſt chapter of his booke *de diſſectione vteri*, and and in the 14. booke *de vſu partium* and the 14. chapter) betweene it and the backebone, that it might not be hurt by his hardneſſe, and before it a ſtrong membrane, to wit, the bladder as a bulwarke to defend it.

A remembrance for prouidmen.

Here we may ſee the glory of the ancient habitation or manſion houſe of mankinde, how that we are bred of a brittle & periſhing ſubſtance betweene the excrements and the vrine, and muſt moulder againe into earth and duſt, wherefore in the ruffe of our pride let vs ſeriouſly conſider of that ſaying of *Plinie*, *Alas, how ſottiſhly frantick is he, that imagines himſelfe out of ſo meane and baſe beginnings, to be borne to pride*; but to returne to our hiſtorie. The wombe is placed in the midſt of the neather belly, that the body might be equally ballanced ſaith *Galen*, and for that cauſe the lauer or baſen is larger in women, from whence alſo they haue larger buttockes then men.

Pliny.

But as the burthen increaſeth, the wombe in the vpper part which is the bottome, being looſe and at libertie groweth vpward to the nauill [Tab.10.l] and leaneth vpon the ſmall guts, yea and fulfilleth all the place of the flankes when they are neere the time of their deliuerance. Neither then doth it ſo directly keepe the middle place of the belly, but leaneth either to the right hand or to the left, according to the diuerſitie of the ſexe of the infant, although this be not perpetuall. Sometimes there falleth ſome part of the kal between the bladder and the wombe, and there cauſeth barrennes by the compreſſion of the mouth of the wombe as *Hippocrates* conceited and expreſſeth in the 46. Aphoriſme of the fifth ſection. It is knit partly by the very ſubſtance of it, partly by foure ligaments, wherof two are aboue, two below; but the bottome [Tab.8.p] before, behinde and aboue it is adioyned to none of the adherent partes, but is looſe free and and at libertie, that it might better bee diſtended in women with child, and in coition when the deſire of conception is, might more freely moue, now vpward then downeward and open it ſelfe to the end of the yard, whence *Plato* in *Timæo* calleth it ξῶον ἐπιθυμητικὸν, that is, a crauing creature (ſo ſaith *Salomon* *The barren wombe neuer ſaith it is enough*,) becauſe in the conception it hath a kinde of Animall motion or luſt to be ſatisfied; neither doth it onely moue it ſelfe in the luſt of conception, but alſo it will in a manner deſcend or ariſe vnto any ſweete ſmell and from any thing that is noyſome: which is the reaſon that many women are ſo eaſily offended with the ſmel of muske or other perfumes taken at the noſe, for that the wombe moueth vpward vnto them; and in the fit of the riſing of the mother, we apply burnt feathers and ſuch like noyſome vapours to the noſe to driue the wombe downeward againe, as alſo ſweete and odoriferous ſuffumigations to draw it downeward to the owne naturall ſeate.

Where it groweth.

A cauſe of barrennes. *Hippocrates.*

The connexion.

The wombe a very creature *Plato.* *Salomon. Prou.* 30. 15.

An obſeruation of the vſe of ſweet and ſtinking ſmels for women.

At the ſides it is tyed to the haunch bones by membranous ligaments [Tab.5.ooqq.tab. 10.lx. Tab.9.fig.4.mm] ariſing as *Galen* ſaith in his 4. Book *de vſu partium*, and cap.14. & in the 4.chap.of his Book *de diſſectione vteri*, frō the Muſcles of the loines; but we rather think (ſaith *Bauhine*) from the *Peritonæum*, and may be compared to Bats wings. [tab.9.fig.1 mm] Theſe Ligaments are wouen ſometimes with fleſhy Fibres (whereupon *Veſalius* and *Archangelus* haue named them Muſcles) by whoſe helpe they being diſtributed into either part of it the wombe is held ſtedfaſt. Theſe Ligaments although they bee ſtrong, yet are they ſome-what looſe or laxe and ſofte, ſo that in no part there are found ſo laxe ligaments, the reaſon is, that they might better bee extended with the wombe, and follow it alſo in the motions without dilaceration; for the wombe when it is filled is large and wide, but afterward is contracted into the quantity of a Peare or a halfe-peny purſe.

Of the conditions of the ties of the wombe.

Theſe Ligaments alſo, as *Hippocrates* and *Plato* in *Timæo* haue written, like to Bridles do hold in the wombe, which yet notwithſtanding rideth as a moored Ship in a Tempeſt betweene her Anchors, eſpecially in barren women, ſometimes vpward to the Liuer and Midriffe, and compreſsing them it bringeth a feare of ſuffocation; ſometimes downward, bearing toward the hips, and cauſeth in them great paine, but eſpecially it troubleth the left ſide, whence it is that we obſerue that thoſe women which beare vnprofitable burthens

The quantity of the wombe Simily.

A good obſeruation for women.

do

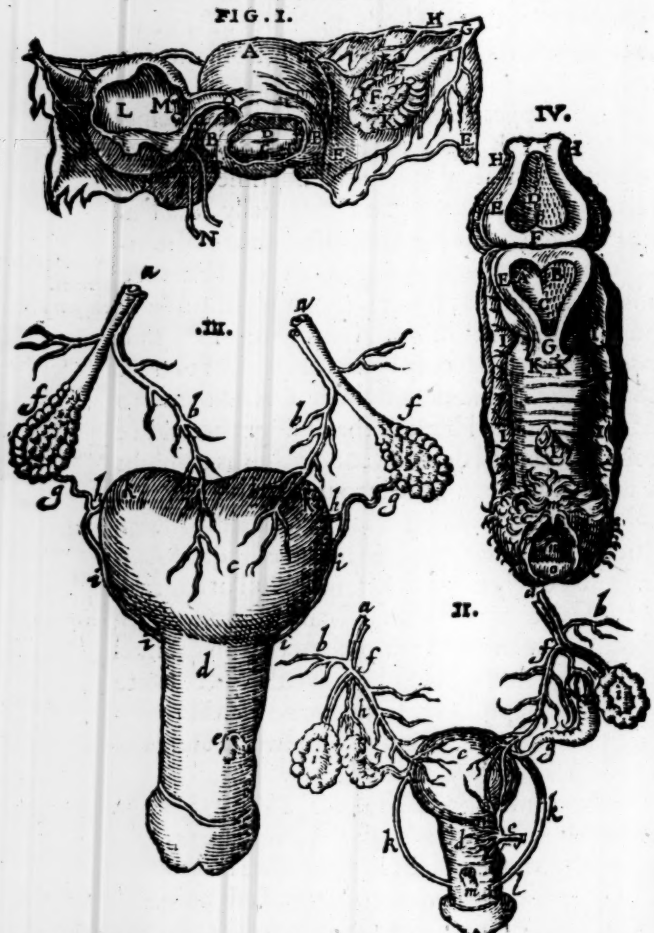
The first Figure sheweth the wombe cut from the body, with the vessels which grow vnto it, the Testicles, the Bladder, and the Membranes: the necke of it is turned vpward, that the orifice of the bottome of the wombe may the better be perceiued; the bladder also is opened, that his cauity, and the insertion of the Vreters may better appeare.

The second Figure sheweth the wombe, with his vesselles parted from the Membranes and the bladder.

The third Figure sheweth the womb freed from all the vessels excepting the spermaticall vessels, where also the forme of the Trumpet is omitted.

The fourth Figure sheweth the wombe cut out of the bodye, and thickneſſe of his coates in a woman with childe, and the cleft of the lap or priuity dilated or laide open.

TABVLA. IX.



A. The bottome of the wombe laide open without any Membrane.
B B. The necke of the wombe turned vpward.
C D. A part of the bottome of the wombe like the nut of the yard, swelling into the vpper part of the necke of the wombe, in the middle whereof the orifice appeareth.
E E. A Membrane knitting the wombe to the *Peritonæum*, and holding together the vessels thereof.
F. The left testicle.
G. The spermaticall Veine and Artery.
H. A part of the spermaticall vesselles reaching vnto the bottome of the wombe.
I. One part of the vessels comming to the Testicle.
* A vessell leading the seede vnto the wombe.
K. The coate of the testicle with the implication of the vessels.
L. The cauity of the bladder opened.
M. The insertion of the Vreters into the bladder.
N. The Vreters cut from the Kidneyes.
O. The insertion of the neck of the bladder into the lap or priuity.

The second Figure.

a a. The spermaticall Veine and Artery.
b b. Branches distributed to the *Peritonæum* from the spermaticall vessels.
c The bottome of the wombe.
d The necke of the wombe.
e Certaine vessels running through the inside of the wombe, and the necke thereof.
ff Vessels reaching to the bottome of the wombe produced from the spermaticall vessell.
g g The Leading vessel of seed called *Tuba* the trumpet.
h h A branch of the spermaticall vessell compassing the trumpet
i i. The Testicles.
k k The lower Ligaments of the wombe, which some call the Cremasteres or hanging Muscles of the wombe.
l the lap or priuity into which the cremasteres do end
m A portion of the necke of the bladder.

The third Figure.

a a. The spermaticall vessels.
b b. A branch from these spermaticall vessels to the bottome of the wombe.
c c The bodie or bottome of the wombe.
d The necke of the same.
e The necke of the bladder ending into the necke of the wombe.
f f. The testicles.
g g The leading vessels, commonly though not so well called the eiaculatory vessels.
h h The diuision of these vesselles, one of them determining into the hornes at double *k k*.
i i The other branch ending in the necke, by which women with childe auoide their seede.
k k The hornes of the wombe.

The fourth Figure.

A B. The bosome of the bottome of the wombe, at whose sides are the hornes.
C D. A line like a suture or seame, a little distinguishing that bosome.
E E. The substance of the bottome of the wombe, or the thickneſſe of his inward coate.
F. A protuberation or swelling of the wombe in the middle of the bosome. G. The Orifice of the bottome of the wombe. H H. The coate or second couer of the bottome of the wombe, comming from the *Peritonæum*. IIII. A portion of the Membranes which tye the womb. KK. the beginning of the necke of the womb. L The necke of the Bladder inserted into the necke of the wombe. *m* the *Clitoris* in the toppe of the priuite. *n* The inequality of the priuity where the *Hymen* is placed *o* the hole or passage of the priuity in the cleft. *p* The skinny caruncle of the priuity.

do especially complaine of greeſe, paine, and gnawings in the left side, sometimes it beareth more downward, as in lustfull passions, and nowe and then compressing the necke of the bladder, it causeth strangulation.

How the womb mooueth.

But we must vnderstand that the wombe is not like a gadding creature that moueth out of one place into another, relinquishing her proper place, but is onely vnequally extended and againe re-called or drawne backe into it selfe from that extension, as when vppon the retention of the menstruall courses, there groweth a plenitude, and so a distension of the veines and ligaments (for these ligaments as we sayde, haue fleshy fibres, and are therefore some-

ſomewhat muſculous, and ſo ſubiect to ſome diſtention) and if it deſcendeth any thing at all it is but a very little; but when it is drawne vpward to the bottome of the ſtomack, that hapneth by reaſon of the conuulſion of the veſſels, which is ſomtimes from repletion, ſomtimes from inantion; not that the wombe is a liuing creature, or hath voluntary motion, or ariſeth it ſelfe aboue the ſtomacke.

So haue we ſeene in a generall, or by and by after a generall convuſion of the whole body, thoſe veſſels ſo conuelled that the wombe hath preſſed vppon the parts next vnto it, thoſe vpon the midriffe, the midriffe vppon the lungs, the lungs vp euen to the throate; ſo that ſome haue thought the partie to bee poſſeſſed of the foule fiend; ſome that would make themſelues wiſer, and ſhould by right haue had more wit, haue ſayd that the mother roſe into the throate. But *Hippocrates* in his Booke *de articulis*, hit the nayle right when hee ſayed; that the wombe of it ſelfe changeth not much his place, but is drawne by other parts. Yet ſometimes what with the waight of the Infant, what with the difficulty and violence of the birth, the ligaments are ſo relaxed that the bottome of the wombe falleth downeward into the lappe: ſometimes alſo the necke is turned and it hangeth forth of the priuities like a yarde betwixt their thighes, that it muſt be taken away by the Chyrurgion, or fall of it ſelfe when the ligaments are putrified, as we ſhall hereafter haply more particularly declare in our Treatiſe of the accidents of the womb in a work of Chyrurgery, which now gloweth and ſparkleth vpon the anuile.

A ſtrange caſe like a poſſeſſion in Mary Glouer of Thames ſtreet.

Hippocrates.

The cutting out of the wombe.

For it is not to be doubted (ſay diuerſe both Greekes and Arabians, beſide ſome experience alſo of our owne times) but that a woman may liue without a wombe, becauſe there is no neceſſity of it for the preſeruation of the particular or indiuiduall nature, but onely for the propagation of the kinde.

The necke of the wombe is tyed to the neighbour parts but not on euery ſide; at the ſides it groweth to certaine membranes, and by their mediation is looſely tyed to the *Peritonæum*; backward it faſtneth to the great or holy-bone, and to the right gut with very thin fibres and a little fat on which it lyeth all along his paſſage, and aboue the lap groweth into one with the fundament to which it is before vnited; ſo that ſometimes when the fundament is vlcerated a little within, the excrements haue been ſeene to fall out at the lappe. Before, it is tyed to the necke of the Bladder. [tab. 8. [c] table 9. fig. 1.° fig. 4. [h]] And becauſe the necke of the womb is broader, part of it is tied to the ſharebones by the helpe of membranes ariſing from the *Peritonæum*; hence it is that in inflamations of the womb there followeth a *Teneſmus*, which is a vaine deſire or dolorous offer to the ſtoole, and the ſtrangurie: and ſo much of the vpper ligaments of the wombe.

The tyes of the neck of the wombe.

A good obſeruation for women.

The lower Ligaments of the wombe [table 8.°° tab. 9. figure 2. [k]] of which *Veſalus* maketh no mention, are likewiſe two, which *Laurentius* cals κρεμαστῆρες; *Columbus*, *proceſſus vteri*; *Varolius*, the hornes of the wombe: but indeede they are certaine neruous productions, round like to earth wormes, reddiſh, and hollow eſpecially in their end, like vnto the *husky-membrane*, which cauity is ſometimes found to be filled with fat. Theſe Ligaments proceede on either hand from the ſides of the womb [table 8. at [p] table 9. at [c]] and in their beginning or originall they touch the leading [table 8. [m]° table 9. figure 2. [g]] veſſelles of the ſeede; thence they riſe vnto the leske, and are carried through the production of the *Peritonæum*, as the ſpermaticke veſſelles of men, and paſſe through the Tendons of the oblique muſcles of the *Abdomen*. This production beeing dilated, when alſo the inward coate whereof it conſiſteth is firſt broken as in hard bargaines of trauell it often hapneth, there falleth to Women as to Men a rupture of which they are cured by Ligature after ſection.

The lower ligaments. *Laurentius.* *Columbus.* *Varolius.*

The rupture in women how cauſed.

To theſe after they are out of the *Abdomen*, are ioyned fleſhy fibres comming from the hanch-bones, which make certaine ſmall muſcles called κρεμαστῆρες, in Latine *ſuſpenſores* that is *hangers vp* of which *Veſalius* maketh no mention. Theſe in women haue no communion with the Teſticles, albeit in men they haue, becauſe they adioyne to the ſpermaticall veſſels.

Theſe Ligaments aboue the ſhare-bone [table 9. figure 2. [l]] do degenerate into a broad and ſinewy ſtendernes (mingled as it were with a membrane which toucheth and inueſteth the fore-part of the ſhare-bone) vppon which the *Clitoris* cleaueth and is tyed; in ſo much that being neruous and therefore of moſt exquiſite ſence, from his attrition luſtfull imaginations are communicated to theſe Ligaments, and from theſe to the veſſelles leading the ſeede: although their vſe alſo is, to hold the wombe ſuſpended leaſt it fall out of the lappe

(like

Table x. sheweth the portrature of a woman great with child whose wombe is bared and the Kel taken away, that the Stomacke, the guttes and the wombe might bee better seene. TABVLA. X.

R R. The vmbilicall arteries.

S. The Nauell.

T. The vmbilicall veyne cutte from the Liuer.

The Vses of the ligaments

(like as the *Cremasteres* in men doe suspend the Testicles) to strengthen and corroborate it, as well because of the great burthens it carries often and long, as of the strong throwes in the birth, and the humours which doe flow thither out of the whole body, which doe not onely moysten the part, but also might very well relaxe it. Finally by how much these Ligaments haue more fleshy fibres wouen into them, by so much do they sayth *Pinæus* more leane to the office of muscles, helping the voluntary attraction of mans seede out of the necke into the cauity of the wombe.

The Figure of the wombe.

The figure of the wombe is round [table 8.[b] tab. 9. figure 1.[a] figure 2.[c]] that it might bee the more capacious, and lesse obnoxious to iniuries; aboue, it is somewhat depressed [table 9. figure 3.] like the bladder, excepting the tops of it which they call the hornes. For in woemen with child, as in the bladder so in the womb, the bottome is long and the necke narrow; but in those that be not with childe the bottome is no broader then the necke. *Soranus* and out of him *Falopius* likneth it to a pressed cupping glasse, both for the forme and also for the manner of attraction; for the seed of man cannot attaine vnto the bottome of the wombe vnlesse it be drawne. Taking it together with the necke it is very well compared by *Archangelus*, *Laurentius*, *Pinæus*, and *Bauhine* to a Peare. [table 9. fig. 3.] For the bottome downward directly from the corners becommeth narrower by degrees euen to the beginning of the necke, which is like a long and round passage, yet so as that the bottome

Like a Peare.

Archang. Laur. Pinæus.

is

is of a figure moſt like vnto roundnes as wee ſee in a good fayre Peare, whoſe bottome is round and bottle faſhion.

The magnitude of it is not in all women alike, but differs according to the age, body, and impregnation or burthen. In Virgins that are growing it is ſmall and leſſe then the Bladder; but in women growne it is greater; ſo in thoſe that vſe not mans helpe, and in old women becauſe they are dryed and withered, it is but little, (that it may the leſſe trouble the neighbour parts) and thicke, not much broader then two fingers; and in length ſcarce euer ſo long as three (I meane the bottome,) ſeldome reaching aboue the ſhare-bone and the bladder. In ful growne women it is greater, (yet thoſe that haue neuer conceiued are much like to virgins) becauſe there is preſent vſe of it; and after a woman hath bred in it, it remaineth during the ſtrength and ability of their age ſomewhat larger then when ſhee was a growne Maide, yet not aboue a handfull. In a woman with child it is increaſed into all dimenſions, for the larger it is ſtretched the thicker it groweth. It hath two ſorts of parts, ſimple, and compound.

Table 11. *the firſt figure ſheweth the wombe of a woman with childe opened in the length, that the after birth cleauing thereto might be ſeene.*

The

The compoſition of the womb e.
The ſimilar parts of it.
Membranes.

The ſimple parts are the Ligaments of which we haue ſpoken; membranes, veines, arteries and nerues, of all which the wombe is compounded. The compound parts are foure, the bottome, the mouth, the necke, and the lap or outward priuitie. The membranes are two, one outward another inward, whoſe nature and property it is to be able to be extended or ſtreatched, and againe contracted and gathered together. The vtter [table 9. figure 4.^{HH} table 5.$^{\infty\infty\,\Omega\Omega}$] which is called the common membrane and is neruous, is the thickeſt of all membranes that come from the *Peritoneum*: wherefore it is ſtrong and growes to the wombe on both ſides and is doubled, inueſting it for more ſafety and ſtrength. The inner [Table 9. Figure 4.^{EE} Table 11. Figure 1.^{ABCD}] or proper is double, but yet ſo ioyned that they can hardly bee diſtinguiſhed but in exulcerations; betweene which as betweene the coates of the ſtomacke there are placed fleſhy fibres; which they that ſay the wombe hath but one coate, doe not call a coate but the very ſubſtance of the wombe, when indeed both theſe and the outward make the ſubſtance of it together membranous, thight, & compact; that when the burthen is encreaſed they may bee dilated, and after the birth may bee contracted again; but by reaſon of this inner or proper membrane it is fleſhy or very thick that it might haue heat to cheriſh the ſeede and the Infant; and beſide it is porous, that it may be extended according to the increaſing of the burthen. Wherefore it exceedeth in thicknes all other coates of the belly, neither doth it alwayes keepe the ſame thicknes ſayth *Galen* in the 8. Chapter of his Book *de diſſectione vteri*: for in youth it is ſmall and alſo the

thinner

thinner, but after the courſes begin it growes in thickneſſe as in magnitude, as alſo it decreaſeth both in magnitude and thickneſſes when Women leaue to conceyue and theyr courſes ſtay. For the beginning and end of their courſes is, when they begin and ceaſe to be fit for conception. So when the time of the courſes is at hande, it growes thick and ſomwhat tumified, as being watered or dewed with the humidity of the bloode which floweth vnto it. Againe, the oftner a woman hath conceiued the thicker it is.

Moreouer, in the time of conception it is thicke and ſofter and growes thicker as the conception encreaſeth, beeing thickeſt of all at the time of the birth. Yet *Galen* ſeemeth to ſay otherwiſe in his Booke *de diſſectione vteri*, and the 8. chapter, and the 14. Booke of the vſe of parts, and the 14. chapter (which opinion of his many follow) albeit it is againſt himſelfe a little before where hee ſayth, that it groweth thicke when the courſes come becauſe of blood; now we know that the greater the infant growes, the more bloode accrueth vnto the wombe.

And indeed by Diſſection we are taught, that about the time of deliuerance and in the laſt

FIG. II.

The firſt Figure ſheweth an Infant of 14. dayes olde, in which all the parts are exactly delineated.

A. The Infant.

B B. The vmbilicall veſſels meeting together.

C C. The diuarication of the vmbilicall Veſſelles, thorough the Chorion.

D D D. The Coate called *Amnios.*

The ſecond figure ſheweth an abortiue Infant, which was auoided the xxv. day after conception, being depriued of blood to nouriſh it, becauſe the vmbilical veſſels were broken. The magnitude of that infant is perfectly deſcribed.

month it becommeth two Fingers bredths thicke, and that not onely in one place but euery where, eſpecially toward the higher part of the bottome or ſoale in which the veſſels of the wombe did meete, and to which the after byrth called the *ſecundinæ* doe adhere; for as we ſaide before after the conception it encreaſeth in all kinds of dimenſions til it be vnburdened. For from the plentifull confluence of blood, becauſe of the many veines and Arteries ſcatterly diſperſed through his coates, his ſubſtance becomes fleſhy, fungous, ſpongy, and diuiſible into many ſhels or huskes like a Bezoar ſtone, or after the manner of muſhrumme, that it might containe the greater quantity of blood and ſpirits or the life and nouriſhment of the Infant, and beſide the heate beeing encreaſed it neceſſarily draweth more vnto it, and ſo it tumifieth and is diſtended, but after the byrth when the confluence ceaſeth, it returneth to his former both magnitude and thickneſſe. For if it neuer gathereth that carnoſity and ſoftneſſe the woman neuer conceyueth. But if it ſometimes do not gather it, then is ſhe for that time fruitleſſe, whence it is that we ſee ſome women which haue conceyued to become fruitleſſe for a ſpace, and after fall to bearing afreſh.

Why women who haue conceiued leaue bearing for a time, & after fall to it againe.

The Fibres of the wombe.

Betweene theſe membranes run Fibres (ſaith *Galen* in his 14. Booke *de vſu partium*, and the 14. chapter) of all ſorts, becauſe it muſt draw and reteine the ſeede and expell the burthen; the fleſhy fibres make the proper *parenchyma* or fleſh of the womb; that ſo the heate may be encreaſed for conception: by which alſo it may be, as by muſcles the voluntary motion of the wombe in drawing the ſeede into his cauity (as a Hart draweth a Snake out of the holes of the earth by drawing in his breath at his Noſethrils) & embracing it afterward is accompliſhed; haply alſo they haue another vſe (ſaieth *Archangelus*) to thruſt out ſome recrements of the wombe, which cannot be cleanſed by the ſole compreſsion of the Muſcles of the *Abdomen*.

Compariſon.

Archangelus.

The ſpermaticall fibres of the wombe.

But in thoſe that are ſomewhat gone with childe, the trebble kinde of ſpermaticall Fibres do appeare more manifeſtly, the right are inwarde which draw the ſeede, they are but few becauſe the ſeede is brought euen to the very mouth of the wombe by the yard. The oblique are in the middeſt and are moſt and moſt ſtrong, that they may retaine that which is conceiued till the due time; the tranſuerſe are outward very ſtrong alſo, becauſe of the force that is neceſſary in the deliuerance.

The Veynes & arteries of the wombe.

The veines and arteries which paſſe through the coates of the wombe are twofold, for two veins & two arteries are led thither from the ſpermatical [Ta. 8.[11]. Ta. 9. fig. 1.[x] fig.[2ff], fig. 3.[bb]] veſſels, ſo many alſo from the Hypogaſtrical, which run vpward from below [tab. 9. fig. 2,[c]. Tab. 11. fig. 1,[FF]] that from all parts of the body as well below it as aboue it, blood might be miniſtred vnto it; for they bring not Aliment onely to the wombe, but alſo to the infant, as alſo they ſerue to emptie the whole bodye in the menſtruall purgation. But the the veines are greater then the arteries.

The veine frō the ſpermaticall.

Galen.

The one of theſe which proceedeth from the ſpermaticall and diſcendeth from aboue, is diſſeminated through his whole bodie eſpecially through his bottome, to bring aliment vnto it, yet the ends of the veſſels which are carried into the left ſide are vnited & become one with the ends of the veſſels which are diſtributed in his right ſide, that ſo the right ſide (for this is *Galens* opinion, in his 14. Booke *de vſu partium*, and the 9. Chapter) may take to it ſelfe ſome ſmall portion of whaey humidity, which may by his acrimony ſtirre vp his action and procure pleaſure; as we ſee the whaey humors that are gathered vnder the skinne if they be heated, they ſtirre vp itching and a kinde of pleaſure withall. By this veine alſo the chiefe part of the menſtruall blood, eſpecially in women but not with childe, dooth flowe foorth.

A cauſe of pleaſure.

The Veine from the Hypogaſtricall.

The other Veine ariſeth from the Hypogaſtricall braunch of the hollowe Veine at the ſides of the great bone about the ſhare; it is the greater and aſcendeth by the ſides of the necke vnto the middeſt of the wombe, where it mingleth it ſelfe with the former. This is diſtributed partly through the bottome of the wombe, partly through the necke of it. But the veſſels that paſſe through the bottome, are alwayes vnited (which ſaith *Fallopius*, Anatomiſts haue much neglected) by ſome branches, and that eyther without the wombe or in his ſubſtance: without the wombe, the boughs of the vpper vein are ioyned with the ſmall branches of the lower at the necke of the womb [Tab. 9. fig. 2,[c], with [h]] where on both ſides there are many veſſelles, and thoſe notable ones finger-fanged or placed like croſſe Fingers, and being vnited doe paſſe into his ſubſtance and end or open into the cauity, which Anaſtomoſes or inoculations of veines are more conſpicuous in women with childe, and thoſe whoſe courſes do flowe or are neere vpon it. But if they be not vnited, then from the

lower

lower veine ſome branches are carried vpward, to be planted in the bottome.

The branches of this Hypogaſtricall veine being entred the ſubſtance of the wombe do mingle themſelues with the vpper braunches proceeding from the ſpermaticall, and the mouths or extreamities of them reach vnto the inner cauity of it, and are called *Cotelydones* and *Acetabula*, to which in the conception the Liuer of the wombe or the after birth doth cleaue, from whence the infant receiueth aliment through the vmbilicall veſſelles, and by which it is tied to the wombe. Through theſe, there arriueth more blood at the wombe then is neceſſary for the nouriſhment thereof all the while the Woman is childing, that when conception ſhall happen to bee, there may bee ſome quantity of the Mothers blood at hand which is one of the principles of generation; as alſo that when the infant is begotten and doth encreaſe, it may not want aliment according to that proportion it ſtandeth in neede of; all which blood after the infant is brought into the world, returneth back to the breaſts and there is turned into milke.

Acetabula and *Cotelydones* what they are

At other times, becauſe it is more plentifull then the womb it ſelfe requireth, therefore it is like a ſuperfluity excluded euery month, and if it bee reteined it will corrupt and induceth many paſsions called *Hyſterica*, which we call fits of the Mother, which yet are oftner procured by ſeed reteined and corrupted then by blood. With this blood alſo other excrements conteined in or amongſt the blood and a whole heape of humors are purged ſomtimes in three dayes ſpace, ſometimes they flow longer, and commonly at the new moone the younger ſort haue them, the elder in the full of the moone; which therefore wee note, becauſe when in Maidens the courſes are ſtopped and they know not well when the time, of their euacuation ſhould be, we ſhould apply our remedies either in the end of the olde

The menſtruall purgation.

An obſeruation for the procuring of the courſes

The ſecond figure ſheweth an abortiue Infant, which was auoided the xxv. day after conception, being depriued of blood to nouriſh it, becauſe the vmbilical veſſels were broken. The magnitude of that infant is perfectly deſcribed.

Moone, or in the beginning of the new.

The other part of the *Hipogastrica* veine.

Finally, the other part of the lower veine is inserted into the necke of the wombe, [Tab. 9. fig. 2, ᶜ] whether if too much blood be brought by the spermaticke vessels whilst the woman is with childe, it is exonerated not by the orifice or mouth of the wombe, but by the Anastomosis or inoculations of the veines into the neck of the same. Wherefore by these veines are some women with childe euacuated which haue plethoricall and ful bodies and so more affluence of blood in the first months after their conception then is required for the nourishment of the Infant, and not by the bottome of the wombe as otherwise in maides and women the menstruall blood vseth to bee purged; otherwise the Infant would be choaked with the aboundance of bloud and the orifice of the wombe must necessarily be opened, which would bring a danger of abortment.

How and by what wayes women with child haue their courses.

Of the arteries of the wombe. Their vse.

That which we haue sayed of the veines wee must say of the arteries which accompany them, whose vse also is in those that be not with childe to encrease the heat of the womb, to bring vnto it spirit and vital bloud, together with vital faculty and heat, and by their motion to ventilate or breath the in-bred heat, to stir the bloud and so to preserue it from putrifaction. But whether in the time of the courses the arteriall blood bee also euacuated, we ingenuously confesse our selues to be ignorāt saith *Bauhine*, sure we are that from these forenamed vessells or that which is called the lap or priuy veine, there are carried certaine small veines and arteries to the lap and the hillocks or Caruncles thereof.

The nerues of the wombe.

The nerues of the wombe though they bee small yet are they very many, implicated or couched one within another like a net, that they may confer exquisite sence vnto it. To the higher part of the bottom of it, they come from the termination of the branches of the sixt coniugation which go vnto the roots of the ribs. To the lower part of the bottom and to the neck, from the marrow of the loyns and the great bone, (whence is that admirable consent between the womb and the head especially the backpart of it) that feeling those things that are troublesome, the expelling faculty might be prouoked, and pleasure also conceiued in coition, (therefore about the lower parts they are more plentifull) as also the motion of the wombe wherein it draweth and imbraceth the seed of the man quickned and strengthned. For there are certaine fleshy fibres in the wombe as wee haue shewed already, which are in stead of small muscles. And thus far of the simple and similar parts of the wombe or matrix, now followeth the compound or dissimilar.

The cause of the consent betweene the wombe & the head
A cause of pleasure.

CHAP. XIIII. *Of the simple or similar parts of the wombe, and particularly of the bottome and the orifice.*

The parts of the wombe.

ALthough from the bottome of the wombe to the very lap or priuities there be but one continuated passage, yet because in it there are many and diuerse parts, therefore it is diuided into the vpper part or the bottom, the mouth or inward orifice of the necke, the necke it selfe and the outward priuity or lap.

The bottome or soale.

The bottom which is properly the wombe & the matrix, *Hippoc.* in his booke *de nat. pueri* calleth κόλπος, *sinus* the bosom. *Galen* so also *lib.* 14 & 15. *de vsu partiū* & the 3. chapters, and somtimes κύστις, that is a cauity or hollownes. This is the chiefe of all the parts of it, because for it al the other parts were made; for in it is the Infant conceiued of the seed, (that we may so say according to our manner of speech, though indeede conception is nothing els but the wombs receiuing and imbracing of the seede) formed and distinguished, nourished & increased, made a liuing soule, & preserued euen to the infusion of that diuine & immortal substāce, & thē it thrusteth it into the sea of the world & the tides of the same.

The hornes.

This bottome then is the vpper [tab. 5.ᴸ tab. 8.ᴾ tab. 9. fig. 1.ᴬ fig 2. & 3.ᶜ sheweth the bottom of the wombe of a woman with child cut open] and broader part of the womb placed aboue the share-bone, that so it might better be dilated as the Infant increaseth; on the out side smooth, equall and lined ouer as it were with a wateriſh moysture and sendeth out on either side aboue a certaine production or rather a corner, which *Herophilus* compareth to the turning of a halfe moone; *Diocles* and with him *Galen* in *lib. 2. de dissectione vteri*, chap. 2. and chap. 8. and *lib* 14. *of the vse of parts* chap. 11. calleth them κεράτα, that is hornes, because the superficies of the wombe is there somewhat more eminent, euen as in the heades of young calues there are certaine buds where the hornes vvill aftervvards grovv forth. Into these the seed of the vvoman is povvred out in those that be not vvith child, for into thē the leading vessels of seed are inserted. [tab. 9. fig. 1.* fig. 2.ᵍᵍ fig. 3.ʰʰ] These you may plainly see if you cut the bottome of the vvombe through the midst; for on the inside at the orifice [tab. 9. fig. 4.ᶜ] you shall perceiue on each side a little corner [tab. 9. fig. 4. at ᴬ & ᴮ] vvhich by degrees [tab. 9. fig. 4.ᴬᴮ] inlargeth it selfe tovvard the bottome.

The

The vſe of theſe hornes is, that the wombe might be made more capacious for the entertayning of the Infant, becauſe vpon theſe two ſtocks as vpon baſes may two veſſelles of Infants bee built or generated. Wherefore becauſe it is the inſtrument of conception it hath a cauity & yet but one, for there are in it no partitions or chambers: notwithſtanding it is vſually diuided into the right and the left boſome; the right in which male childeren are conceiued, the left in which females are conceiued, as *Hippocrates* and *Galen* haue determined: yet is not this diuiſion made by any wall or partition, but onely by a line or ſuture and ſeame [tab. 9. fig. 4. $^{c\ D}$] lightly riſing vp but very obſcurely through the middle part of the ſuperficies, and running forward & backward according to his longitude; which line or ſuture is called by *Ariſtotle* in the 3. Booke of his Hiſtory of Creatures and the firſt Chapter διχοῦν the *mediana* or the middle: and thence it is that the antients doe not call it matrix but *matrites*, or the mothers, as if there were two of them, and ſayed they were anſwerable in number to the breaſtes, for it is a very rare thing that a womans wombe ſhould be diuided into two as beaſts are. This cauity [tab. 9. fig. 4. $^{A\ B}$] is ſmooth and ſo narrow that it will ſcarcely hold a common beane, and when it receiueth the ſeede from both the Parents it is filled with it, for any portion of ſeede that getteth into it filleth it, becauſe it embraceth it ſo narrowly; for in the leaſt portion of ſeede that may be, the whole formatiue faculty is potentially included, out of which mingled and as it were fermentated and houed vp, the Infant is generated; and is encreaſed by blood eftſoons comming to it for nourriſhment, by which alſo the ſubſtance of the wombe groweth into a greater bulke; as a little ſponge if it be filled with water will ariſe to a greater magnitude, which being preſſed out againe the ſponge will become as ſmall as before.

Their vſe.

The cauity of the wombe.

The ſuture or line.

The leaſt quãtity of ſeed filleth the wõbe.

A fit compariſon.

The bottome hath many pores or paſſages which are the mouthes of the *Cotelydones* ſo called, by which the bloud in the time of geſtation reacheth out of the veines of the wombe into his cauity. In women not burdened for the moſt part it is lined within with a viſcous or ſlimy ſubſtance, whitiſh or of colour betweene a pale yellow and a red. The ſubſtance of the bottome of the wombe is harder and more compact then that of the lap, yet ſofter then that of the necke, and in the corners it is rugous.

The weay of the bloud for the nouriſhment of the Infant.

From the lower part of the bottom there runneth a notable portion reſembling the nut of the yarde [table 9. figure 1. $^{c\ D}$] which with his blunt head toucheth not the ſides of the neck, about an inch long, but as ſlender as a little finger that it will ſcarcely admit a Probe or a ſmall penne at the moſt: but it is rough leaſt the ſeede that is drawne ſhould fall back, which commeth to paſſe in thoſe women who haue this part ſlippery becauſe their humors are faulty, and ſo become barren. This part which is betweene the beginning of the bottome and the orifice, *Falopius* thinks was called the necke by *Galen*, *Soranus*, and the antients. It hath a manifeſt paſſage [table 9. fig. 1. betweene ^{c} and ^{D}] which maketh alſo another part.

A ſecret part wanting a name.

Falopius his conceit of this name of it.

This paſſage is the entrance into the bottome of the wombe, wherefore *Hippocrates* in the firſt ſection of his Aphoriſmes, and the 51. Aphoriſme calleth it στόμα τῶν ὑστερέων, *vel* τῶν μητρίων, *or vteri* the mouth of the wombe: *Galen* in his 14. Booke *de vſu partium* and the third Chapter, and in the 7. Chapter of his Booke *de diſſectione vteri*, calleth it the inwarde orifice of the necke, for by this the bottome openeth directly into the necke. This orifice is tranſuerſe or ouerthwart like a Plaice mouth, or moſt like to the paſſage in the nutte of the yarde: ſo that the whole orifice with the tranſuerſe ſlitte, is like the letter, ɵ, ſmal and wonderous narrow, that the ſeede once receiued cannot eaſily fall backe, nor any thing hurtfull get into the cauity of the vvombe. It is direct againſt the bottome, becauſe the mans ſeede might paſſe in a right line through the necke and it to the bottome; and ſo alſo it might be better dravvn by the bottom from a leuel, for if it be diuerted or turned aſide may euils follovv ſayeth *Hippocrates* in his firſt Booke of the diſeaſes of vvomen, for then the vvombe receiueth not the ſeede, but it falleth backe againe out of the neck inſtantly. Then alſo the courſes either come not at all, or with great violence and diſeaſe: it is alvvayes ſhut except only at that time, when in coition the bottome draweth the mans ſeed, and when the ſeed is conceiued or receiued then is it ſo cloſely ſhut vp ſaith *Hippocrates* in the 51. Aphoriſme of the 5. Section, that a Needle or a ſmall Probe can hardly be thruſt into it: and ſo it continues nine moneths; for when women with childe yeelde ſeede it is not out of the bottome but by the necke of the vvombe, as vve haue ſayd before.

The orifice or mouth of the wombe.

The faſhion of it.

The cloſenes of it.

Verie rarely is it opened, and that either for the caſting out of a falſe conception a perfect conception remaining behinde, or in ſuperfœtation where after one conception another

By how many meanes it is opened.

other commeth. So likewiſe, when the wombe not fit to conceiue doth belch out againe the ſeed of both parties, or when as in polutions or affrictions women that haue not conceiued do looſe their owne ſeed; or when as in women vnburdened the courſes or any offenſiue humors are that way purged, as in the Whites, in which caſe oftentimes the whole bodie is purged that way, the wombe at all not beeing affected; or when falſe conceptions alone are caſt out, as the *Mola* or Moone-calfe, and ſuch like; or finally, when the Infant it ſelfe is borne into the world; for when that is perfected, this paſſage is ſo diſtended & openeth ſo wide, that from the bottome of the wombe to the very lap the cauity is equall, that through it the Infant may paſſe; which admirable worke of Nature or Natures Mayſter God himſelfe, we may wonder at, but not vnderſtand ſaith *Galen* in his 15. Booke *De vſu partium*, and the 17. chapter. But becauſe it muſt be opened according to the magnitude of the Infant, and that by degrees, being it is of a thicke and faſt ſubſtance [Tab. 9. fig. 4. at °] and is yet thicker when the birth approacheth, there cleaueth vnto it a certain viſcid and ſlimy body like glew, that by the helpe of it the orifice without feare of dilaceration or diuulſion may bee diſtended and naturally opened. This is round like a crowne, and as often as the paſſage openeth, commeth away in an orbicular forme. The Midwiues call it the Crowne or the Roſe. This Orifice, if it be too much looſened or opened aboue meaſure, as in ouer-moyſt bodies, or in the whites, or by reaſon of too frequent copulation as in Harlots, it bringeth barrenneſſe; ſo doth it alſo if it be too fat, or thicke, or growe callous or hard; ſometimes there growe in it the Scirrhus or the Cancer both incureable diſeaſes, which happen eſpecially when the courſes faile.

Note this.

The admirable worke of God in the birth.

The crowne or roſe of the wombe.

Why Harlots do not conceiue.

CHAP. XV. *Of the necke of the wombe & of the Hymen.*

THE third part of the wombe is the neck called *Ceruix* or *Collum vteri* [tab. 9. fig. 2. and 3, d. Fig. 4. xx, in the firſt figure the necke is turned vpward at ”] into which the yard paſſeth. This *Galen* commonly calleth ἀυχὴν τῆς μητρᾶς, ſometime ῥάχηλον and στόμαχος. *Ariſtotle* μῆτρα, καυλὸς ϗ στόμα τῆς ὑςέρας, the matrixe, the necke, and the gate of the wombe. It is a paſſage within the Cauity of the *Peritonæum*, called the Baſon or Lauer, placed betweene the right gut & the bladder, whiter then the ſuperficies of the bottome. It hath a deepe cauity and wide, (whence *Fallopius* calleth it the boſome of modeſty) but the mouth or entrance of it is much narrower. It reacheth from the inner [Tab. 5. fig. 4. °] orifice of the wombe, to the outward Orifice [Tab. 9. fig. 4. °] or very lap and priuity, and being long that the ſeede of the man may be brought to the orifice of the wombe it receyueth the yard fitly like a ſheath, wherefore the amplitude is anſwerable to that it muſt contain & is not broader then the right gut. It becommeth in the time of coition longer or ſhorter wider or narrower as the yard is; and according to the womans appetite more or leſſe turgid, more open or more contracted & direct; wherefore the length of it cannot be limited no more then the length of the yarde; and though it be continuated with the bottome, yet it hath a diuers ſubſtance from it. For it is Membranous and Neruous, that it may better be enlarged or contracted, neither too hard, nor too ſoft.

The necke of the wombe. 14. *vſu part.* 3. 15 *vſu part.* 3. 14. *vſu part.* 4. *Lib.* 7. *Hiſt.* 1.

The capacitie of it.

The ſubſtance of it is ſomewhat fungous or ſpongie, like that of a mans yarde, for as it was neceſſary that the yard ſhould bee diſtended to fill this, ſo it was neceſſary that this in coition ſhould be ſo contracted and ſtraightned that it might ſtraightly embrace the ſame, which happeneth by reaſon of many ſmall Arteries which fill the paſſage with ſpirits, & ſo it becommeth narrower. Wherefore in women that are full of luſt, or in the time of anie womans appetite it ſtrutteth, and the Caruncles ſwell outward (which in Cowes and Bitches is ſo apparent, that their priuities ſeeme to bee very much enflamed) and the Cauitie growes very ſtraight. In yong wenches it is more delicate and ſoft, and becommeth euerie day harder, ſo that thoſe that haue often conceiued and old women, haue it hard callous & as it were griſtly, by reaſon of the often attrition and the frequent flowing of their courſes. Whereupon *Herophylus* compared it to the weazon or winde-pipe. This when it is not diſtended is rugous, if it be much ſtretched it becommeth ſmooth and ſlippery, vnleſſe it be in that part which endeth in the lap; but in the entrance of the paſſage and in the forepart, there are many round folds for the greater pleaſure of louers which commeth from the attrition of them by the nut of the yard. Theſe folds are in yong women ſmoother and narrower, and the paſſage ſtraighter, that it will ſcarſe admit a finger, which is not from the cloſing of the ſides of his necke, but by reaſon of the mediocrity of his paſſage, yet thorough it

The ſtreightneſſe whence cauſed.

The foulds of it.

do

doe passe not onely the bloud in the monthly euacuations of growne Maydens, but also other corrupt humors in the disease of the whites or womens fluxe, which also we haue seen (being taught by *Aristotle* to obserue it) to bee purged this way in young children of foure or fiue yeare old. A strange obseruation.

The attrition of these folds and their extension in the first society of mayds with men, *Soranus* thought to bee the cause of some maydens payne in deuirgination or losse of their maiden-head as we speake, and because certaine veines passe by them these being broken by the husband the blood issueth sometimes in great aboundance: but the neck (when neither the seed is sent in, nor the Infant is excluded, but at other times) is writhen & oblique; for being loosned and falling into it selfe, it is necessary that it must haue certaine contorsions or wrethings, that the partes within contained may bee defended from outward cold, wherefore then it is shorter and narrower, but in coition it is distended vnto the measure of the yarde; in the birth to the measure of the Infant which are to passe through it: and therefore when the courses flowe, but especially when the time of deliuerance is at hand, the necke becomming right, straight and open, women are most subiect to take colde by it. The cause of paine in deflowring of a mayde. Whē women take most cold.

In the end of this necke, immediatly aboue the necke [table 9. figure 2. [m] figure 3.[e] fig. 4.[l]] of the bladder, they place in Virgins the *Hymen* or *Eugion*, [table 9. figure 4.[n]] which many will haue to bee a slender membrane, neruous, not thicke, placed ouerthwart that it may shut the cauity of the necke of the wombe, yet perforated in the middest like a ring, that in growne mayds it will admit the top of a little finger, that through it the courses may passe, sprinkled also with veines. This they say is broken in the deuirgination, from whence comes the paine and effusion of blood, and after it vanisheth as doth the bridle of the nut of a mans yarde: with this also are the wings or lips of the lap tyed together, because there is no vse of a large entrance before coition. The Hymen.

But let vs set downe with your patience, the true History of the *Hymen*, which *Seuerinus Pinaeus* the French Kings Chyrurgion hath diligently and at large recorded. A discourse of the Hymen out of *Pinaeus*.

In the middle of the trench which is in the great slit or clift lyeth alwayes hid the orifice of the Maidens bosome of modesty, being placed not in the end of the trench, but in the inner end of that production which is annexed to the trench. This production which is peculiar to Virgins, is as long as the little finger is broad in the middest, and is incircled aboue with a round cauity. The figure of it is round, yet determineth into a sharpnes, and in the end hath one notable passage which will admit the top of the little finger.

The substance is partly fleshy partly membranous, being compounded of Caruncles or little peeces of flesh and membranes. The Caruncles are foure, and are like the berries of the Mirtle, in euery corner of the bosome one; the membranes tying them together are also foure, which are not disposed ouerthwart but runne all right downward from the inner end of the sayed bosome, and are placed each in the distances betweene euery Caruncle, with which they are almost equally extended or streatched forth. But these both Caruncles and membranes are in some bodies shorter or longer, thicker or thinner thē in others, as also the orifice at the end of them is in some wider in some narrower, and then especially is at the straightest when the Caruncles and the fleshy membranes are neareſt ioined together, from whence comes either geater or lesse payne in deuirgination or deflowring, which *Terence* calleth *The sharpe coition*. The Caruncles. Whence commeth the pain in deuirgination.

All these particles together make the forme of the cup of a little rose halfe blowne when the bearded leaues are taken away. Or this production with the lappe or priuity may be likened to the great Cloue Gilly-flower when it is moderately blowne. *Galen* in the 2. Chapter of his Booke *de vteri dissectione* likneth this production to the prepuce or fore-skin of a man, because it is somewhat long and perforated in the end; yet is it a little more fleshy and softer then the fore-skin. It is called *Hymen quasi Limen*, as it were the entrance, the piller, or locke, or flower of virginity. For being whole it is the onely sure note of vnsteyned virginity (yet some also haue other quaint deuices to try virginity with; as if a thred measured from the tip of the nose along the fore-heade to the end of the sagitall suture or seame, will also fitly encompasse the womans necke,) for when the yarde entreth into the necke of the wombe, then the fleshy membranes which are among the caruncles, are torn vp euen to their rootes, and the Caruncles are so fretted and streatched, that a man would beleeue they were neuer ioyned; some notable vessels are opened, and in the breaking is payne, which in young wenches is more because of the dryenesse of the part, but the effusi- *Hymen.* An od trick to try a mayd. The true cause of paine in deuirgination.

on

on of blood the leſſe; becauſe of the ſmalneſſe of the veſſels. In elder maids whoſe courſes haue now ſome good time flowed there is leſſe paine, becauſe of the moyſture and laxitie of the Hymen; but the effuſion of blood is greater becauſe the veſſels are grown larger and the blood gotten a fuller courſe vnto them. For all virgins although they be neuer ſo mellow, yet haue their firſt coition painfull, but ſome more ſome leſſe; vnleſſe they then are menſtruous, or haue beene within three or foure dayes; for then they admit the yard with leſſe trouble, becauſe of the relaxation and lubricity of theſe moyſt partes whereupon the Membranes are dilated with little or no paine. And this hath beene the cauſe why ſome men haue vnworthily ſuſpected the vncorrupted chaſtity of their wiues. Wherefore it were fit the mothers or women friends of ſuch Virgins ſhould haue care of their Honor, by giuing warning to their Bride-groomes of their Brides purgations, if at that time they be vpon them; and very often they are when the Brides are growne women and well complexioned, becauſe the ioy and priuate pleaſures of affianced young folkes, as alſo their dancings and frolicke diet with ſuch like, do often by mouing the body accelerate and haſten ſuch purgations, and being come do cauſe them longer to endure.

Why ſome haue no paine in deuirgination.

A good caueate for Mothers concerning their daughters honor.

The torne Membranes of this production in their vtmoſt compaſſe indented, do ſometimes hang downe on either hand in the ſides by the cleft like vnto values (for ſo *Pinæus* calleth them) or leafe-gates, which are much leſſe then the *Nymphæ*, but of the ſame figure & vſe. Theſe are not loſt, before a woman hath borne a childe, but are reſerued being returned vpward to the orifice of the necke of the wombe, nowe made much wider then in the time of virginity: but in thoſe that haue often brought forth large limb'd Infants, or whoſe wombe hath falne downward and ſo the necke of it being inuerted or turned, they are leſned and contracted or drawne vpward toward the necke and ſo perfectly vnited to the caruncles to which they adhere, that they ſeeme to be vtterly periſhed.

The Caruncles.
Their ſeituation.
Their Vſe.

But the foure Caruncles which are like Mirtle berries, whereof one and the foremoſt is placed at the orifice of the bladder, another and the hindmoſt with the two laterall ſcituated not ouer-thwart but length-wiſe; theſe I ſay doe remaine as long as the woman liueth, though ſhe liue verie long. Their vſe, as alſo that of the Membranes when they are reflected vpward, is immediately to ſtop the orifice of the necke of the womb as a fleſhy production doth ſtop the necke of the bladder; they hinder alſo the ingreſſe of cold aire, duſt, or any other ſuch like (in which ſeruice they are aſsiſted alſo by the *Nymphæ*, and the wings of the lap or priuity) and in coition doe aggrate the member of the man; for when they are heated and grow turgid with ſpirits, they ſo conſtringe the yard eſpecially in yong women, as if it were cloſely preſſed in the hand.

The outward Orifice of the necke.

Next to theſe is the rugous or plighted chinke or riſte, which is placed as it were in the trench of the great Cleft, and like a narrow valley leadeth the way by a round cauitie into the inward parts, and maketh the outward orifice of the necke. *Galen* in his 15. Booke *De vſu partium*, and the third chapter, calleth it στόμα τραχήλου, or the outward orifice of the neck of the wombe, by which the yard is receyued to prouoke the parts of the woman to yeelde theyr ſeede, and to infuſe his owne. This orifice ſometimes by a diſeaſe called *Rhagades*, otherwhile by a great cicatrice or ſcar bred after ſom other exulceration, is ſo ſtreightned, that ſuch women can no more admit their husbands; ſometimes through a notable exulceration after a hard trauell it groweth cleane vp, which once we obſerued (ſaith *Bauhine*) in an honorable Matron in whom there appeared not any ſigne of an entrance, but after a whole yeare keeping her owne counſell her courſes being all that while ſtopped, ſhee was tormented with many conuulſiue fittes of the Mother, and ſo periſhed through her owne default.

The diſeaſes of it.

A Story out of *Bauhine*.

Heere is alſo to be obſerued a skinny Ligament in the backe part of the outwarde Orifice of the necke, which in virgins is ſtraighter and is couered by the trench, but in thoſe that haue brought foorth it is much more laxe and looſe; ſo that the looſeneſſe of this Ligament or skinny tye is the onely ſigne that a woman hath borne a childe; for it is ſo alwayes in ſuch and in none but ſuch, vnleſſe in others the wombe do, or haue falne downe; to this ſigne there happeneth ſometimes another, and that is the ruggedneſſe or ſmall plightes of the skinne of the lower bellie, which being ſtrained in trauell remaineth euer after rugous.

The skinny ligament

A pretty obſeruation concerning this Ligament.

CHAP.

CHAP. XVI. *Of the Lap or Priuities.*

THE laſt diſsimilar part of the wombe, *Galen* in his 14. and 15. Bookes *De vſu partium*, the ſixt and the third Chapters, calleth αἰδοῖον γυναικεῖον, in Latine *pudendum muliebre*, that is, the womans modeſty, [Tab.9.fig.2.[l]. fig 4. neere [n o]] of ſome *Vulua*, as it were *vallis* a valley, or *Valua* a Flood-gate, becauſe it is diuided into two parts by a cleft, which like Flood gates or leafe-doores are eaſily opened or ſhut as neede is. We will call it the lappe. It is that part into which the necke of the wombe determineth, and is ſeated outwardly at the forepart of the ſhare bone, and is as it were a skinny addition of the necke, as *Galen* ſpeaketh in his foureteenth Booke *de vſu partium*, and the ſixt Chapter, aunſwering to the prepuce or foreskin of a man. In this there are many parts to be diſcerned without diſſection. Of which ſome are altogether outward, offering themſelues before the wings be diſplayed; others inward, not appearing before the wings be opened and ſeperated on both ſides. Of which we will firſt entreate.

The names of the lap.

The poſition of it.

The parts of it.

There is therefore a large trench, in which are the paſſage of the necke [Table.9.fig.2.[m]. fig.3.[e]. fig.4.[t]] of the bladder with a Caruncle, the *Nymphæ* and the *Clitoris*. For, although the Hymen and his membranes and caruncles with the ſlitte and the orifice of the necke may alſo be ſeene without diſſection, yet becauſe they pertaine not to the lap but to the necke of the wombe, we haue deſcribed them already.

The inner partes of the Lap.

At the end therefore of the necke of the wombe, immedietely vnder the ſhare-bone, lightly aboue the lap it ſelfe, on the fore-part there is an entrance or paſſage which commeth out of the implantation of the necke of the bladder, by which the vrine is let out into the vtmoſt part of the necke of the wombe, or rather into the lap it ſelfe, euen as in a man the vrine floweth out of the paſſage or channell which is appointed for the ſeede. In the compaſſe of this there is a caruncle [Tab.9.fig.4.[p]] or a little fleſhy hillocke by which this paſſage is couered, that after the vrine is let go, the outward aire ſhoulde not get into the bladder through his necke which is ſhort and wide; which caruncle alſo as it regardeth the trench, ſtrengthneth the leafe-gate or locke of virginity.

The paſſage of the vrine.

The caruncle belonging to it.

The *Nymphæ*, ſo called by *Galen*, of others αἰδοιοκόμαλα καὶ αἰδοῖα, becauſe they firſt admit the man, of the Latines *Alæ* the wings, of others skinny caruncles, are two productions on either ſide one in the beginning almoſt ioyned; which ariſe from a welt or gard of the skin of the ſubſtance of a Ligament in the backe part of the orifice of the necke, and lying hid betweene the two lips of the lap and almoſt alwayes touching one another, do aſcend to the end of the commiſſure or meeting of the ſhare-bones. Theſe being ioyned doe make a fleſhy eminence, and couering the *Clitoris* with a fore-skin aſcend with a manifeſt riſing Line to the top of the great cleft: they are longer from their middle outward and do hang ſometimes a little foorth through the great cleft, without the lips of the lap, and that with a blunt angle, being otherwiſe of a triangular figure.

The *Nymphæ*.

Their ſcituation.

They are very like in colour and ſhape to that part of a Cockes combe which hangs vnder his throate. Their ſubſtance is partly fleſhy, partly membranous, ſoft and fungous, & they are inueſted with a thin coate. Somtimes, they grow to ſo great a length on one ſide, more rarely on both; and not ſo ordinarily in maidens as in women, (and then it is called by *Ruffus* κέρκωσις,) what through the affluence of humours, what through attrectation, that for the trouble and ſhame (being in many Countryes a notable argument of petulancie & immodeſty) they neede the Chirurgions helpe to cut them off (although they bleed much and are hardly cicatriſed) eſpecially among the Egyptians, amongeſt whom this accident (as *Galen* ſaith) is very familiar. Wherefore in Maidens before they grow too long they cut them off, and before they marry.

Their ſubſtance.

The Egyptian women laſciuious.

Theſe *Nymphæ*, beſide the great pleaſure women haue by them in coition, doe alſo defend the wombe from outward iniuries, being of that vſe to the orifice of the necke which the foreskin is to the yard; for they do not onely ſhut the cleft as it were with lips, but alſo immediately defend the orifice as well of the bladder as the wombe from colde aire and other hurtfull things. Moreouer, they leade the vrine through a long paſſage as it were betweene two walles, receyuing it from the bottome of the cleft as out of a Tunnell: from whence it is that it ruuneth foorth in a broad ſtreame with a hiſsing noiſe, not wetting the wings of the lap in the paſſage; and from theſe vſes they haue their name of Nymphes, becauſe they ioyne vnto the paſſage of the vrine, and the necke of the wombe; out of which,

Their vſes.

Why they are called *Nymphæ*.

as

as out of fountaines (and the *Nymphes* are ſayed to bee preſedents or dieties of the fountaines) water and humours doe iſſue: and beſide, becauſe in them are the veneriall delicacies, for the Poets ſay that the Nymphes laſciuiouſly ſeeke out the Satyres among the woods and forreſts.

Clitoris in Greeke κλειτορὶς commeth of an obſcœne worde ſignifying contrectation but properly it is called the womans yard. It is a ſmall production in the vpper, forward [table 9. figure 4.[m]] and middle fatty part of the ſhare, in the top of the greater cleft where the *Nymphes* doe meet, and is anſwerable to the member of the man, from which it differs in the length, the common paſſage and the want of one paire of muſcles; but agrees in ſcituation, ſubſtance and compoſition. For it conſiſteth of two neruous bodies (which *Laurentius* cals ligaments) round without, hard and thick; but within ſpongy and porous, that vvhen the ſpirits come into it, it may bee diſtended and grow looſe when they are diſſipated, theſe bodies, as thoſe of the mans yarde, are full of blacke, thicke and ſprightfull blood.

How it diſſereth from a mans.

The ſubſtãce.

Their originall is from both the ſhare-bones where they ioyne with the bone of the hip, and are ſeuered at firſt, but after they are gone a little foreward they are vnited about the coniunction of the ſharebones, and ſo make the body of a yard harde and ſolide, and haue a termination like the nut, to which on either ſide is adioyned a ſmall muſcle.

The originall of it.

The head is properly called *Tentigo* by Iuuenall, which is couered with a fine skin made of the coniunction of the *Nymphæ* as it were with a fore-skinne. It hath an entrance but no through paſſage; there are veſſelles alſo running along the backe of it as in a mans yarde; and although for the moſt part it hath but a ſmall production hidden vnder the *Nymphes* and hard to be felt but with curioſity, yet ſometimes it groweth to ſuch a length that it hangeth without the cleft like a mans member, eſpecially when it is fretted with the touch of the cloaths, and ſo ſtrutteth and groweth to a rigiditie as doth the yarde of a man. And this part it is which thoſe wicked women doe abuſe called *Tribades* (often mentioned by many authours, and in ſome ſtates worthily puniſhed) to their mutuall and vnnaturall luſtes.

Tribades odioſæ feminæ.

Leo Africanus, Cœlius Aurelianus.

The vſe of it.

The vſe of this part is the ſame with the bridle of the yard; for becauſe the Teſticles of the women are far diſtant from the yard of the man, the imagination is carried to the ſpermaticall veſſels by the motion and attrition of this *Clitoris*, together with the lower ligatures of the wombe, whoſe originall toucheth, cleaueth and is tyed to the leading veſſelles of the ſeede, and ſo the profuſion of their ſeede is ſtirred vp for generation, for which buſineſſe it was not neceſſary it ſhould be large: wherefore although by this paſſage their ſeede is not ciaculated, yet by the attrition of it their imagination is wrought to call that out that lyeth deeply hidden in the body, and hence it is called *æſtrum Veneris* & *dulcedo amoris*; for in it with the ligaments inſerted into it is, the eſpeciall ſeate of delight in their veneral imbracements, as *Columbus* imagineth he firſt diſcouered.

The wiſe diſpoſition of nature.

For Nature who wiſheth as *Galen* ſayth in his 14. Booke *de vſu partium* and the ſecond Chapter, that if it might be, her worke might be immortal, and falling from that hope becauſe of the contrariety of the matter, hath giuen to all creatures both the inſtruments of conception, and hath alſo infuſed into them a ſtraunge and violent kinde of delight, that none of the *kindes* of the creatures ſhould periſh but remayne euer after a ſort immortall. And truely it was very neceſſary that there ſhould be a kinde of pleaſant force or violence in the Nature of mankinde to tranſport him out of himſelfe or beſide himſelfe as it were, in the act of generation; to which otherwiſe being maiſter of himſelfe he would hardly haue beene drawne; which extaſie, (for it is called a little *Epilepſie* or falling ſicknes) is cauſed by the touch of the ſeede vpon the neruous and quicke ſenſed parts as it paſſeth by them.

To draw to an end. Thoſe parts which appeare outwardly are the great ſlit, the lips and the groyne or leske: for as ſoon as the lippes are diuided, there appeare three clefts or ſlits; one and the greateſt which is the firſt and vtmoſt, and two leſſer and collaterall betweene the *Nymphes*, the vſe of which is to cloſe vp the parts more ſafely. But that cleft which is called σχίσμα or the great and long fiſſure is made by the lips and bendeth backward to the Fundament from the ſhare-bones downward toward the cleft of the buttocks: for it ought to bee longer then the orifice, leaſt the Infant ſhould bee hindered in the birth, becauſe the skinne is much thicker and not ſo yeelding as are membranes: and the more it tendeth backward the deeper and broader it is, and ſo degenerateth into a trench or valley, repreſenting the figure of a boate, and endeth in the welt of the orifice of the necke. In the mid-

The outward parts of the lip.

σχίσμα the great fiſſure.

dle

dle of this trench is placed the orifice of the necke, and this is the fiſſure that admitteth the yard, and is a part thought too obſcœne to look vpon; which is the reaſon ſayth *Pliny* that the carcaſſes of women doe floate in the water with their faces downeward, contrary to mens which ſwimme vpward; euen Nature it ſelfe yeelding to modeſty; although the cauſe alſo may bee referred to the largenes of a womans belly, as alſo becauſe the water getting into the lap filleth the belly, and for that the waight of her breaſts turneth her body downwards. The reaſons why the carcaſſes of women floate with their faces downeward.

The two lips which *Hippocrates* in his Booke *de locis in homine* calleth κρήμνα follow next, which make the fiſſure of the outward orifice; they are long, ſoft and of a skinny ſubſtance and fleſhy withall, after a ſort glandulous and ſpongy, and vnder them haue a hard fat and are as it were callous. They are couered with a thin skinne, and are in married women more ſmooth and depreſſed. The lips.

The extuberations of theſe winges are called hillocks or mountainets (*Veſalius* calleth theſe extuberations *alæ* or wings, the other *labra* or lippes) and the mount of *Venus*: theſe in mature or ripe women are adorned with haire, the buſh of which is called *pubes* or *peeten*. Theſe hayres are in women more curled then in Virgins, and do reach as a couering vnto the lippes; the lippes were made for ornament and for defence that the womb might be kept from refrigeration. *Mons veneris* the mountain of Venus. *Pubes, peeten,* or the buſh. Their vſe.

But if in the demonſtration of the wombe we will begin at the externall parts, wee muſt proceede by the guide of a vterine probe, and then the partes will thus ariſe. Firſt the region of the ſhare-bones, then the buſh, the hillocks whereon the hayre growes, the two lips, the great outward fiſſure betweene the lippes making the outward orifice, the trench like a boate, the two ſmaller clefts or fiſſures between the Nymphes, the two Nymphes themſelues; the *Tentigo* or head or nutte of the *Clitoris* couered by the Nymphes as by a foreskin and the impaſſable paſſage of it; the two bodies of the *Clitoris* and two muſcles belonging to it; the paſſage of the necke of the bladder with the Caruncle or fleſhy hillocke which couers it; the skinny ligament which wee ſayed was a ſigne whether a woman had beene a mother or no; the rugous fiſſure or cleft making the orifice of the necke; the foure Caruncles and the foure membranes between them making the *Hymen* in virgins, the neck or canale of the wombe, all theſe may be ſeene without inciſion, the reſt muſt be found by inciſion. Another way of demonſtration of the parts and appurtenances of the wombe.

And thus much of the parts of generation belonging to women: now the diſcourſe of Hermophradites or of *Androgunes* that are both man and woman, wee will referre to another place.

CHAP. XVII. *Of the wombe of a Sheepe and a Dogge.*

NOw becauſe in the want of woemens bodies it is an ordinary cuſtome for Anatomiſts to exerciſe themſelues and their auditors in the diſſection of the wombes of other creatures; therefore I will ſhortly exhibite vnto you the wombe of an Ewe and a Bitch, as wel by way of hiſtory as alſo by a Table carued onely for that purpoſe. Why we haue added this chapter.

In an Ewe therefore the necke of the wombe reacheth from the priuity to the top of the Holy-bone, where beginneth the bottom of the wombe ſpreading it ſelfe a litle in the region of the Loynes. This womb is a long body preſſed on either ſide, but toward the end it parteth into two proceſſes looking vpward and bending outvvard very like the hornes of a Ramme. [table 14. figure 2. ᵉ] The outvvard ſuperficies of the bottome, after the manner of membranes is glib and ſmooth; and is tyed to the neighbour parts (euen as the necke is tyed) by membranous ligaments ariſing from the *Peritonæum*, through vvhich there are alſo veſſelles diſſeminated vvhich are ſent vnto the vvombe. The proceſſes of the bottome vvhere they are diuided aſunder on the inſides are alſo ſmooth, and doe grovve to many particles of the belly, but their outſides are continued vvith the bottome of the vvombe it ſelfe by certaine membranes. The womb of an Ewe or a Cow. The figure. Connexion.

The bottome alſo hath tvvo cauities [table 14. figure 2. ᴰ] vvhich meete at his orifice [table 14. fig. 2. ᶜ] that reacheth vnto the necke. The cauities or boſomes are ſomevvhat yellovviſh, and haue in them many riſings or ſvvellings like little knobbes, vvhich after the creature hath conceiued, open themſelues and make dennes or cauities. If they breed one Lambe, then onely one of the cauities is dilated; if tvvo, then in each cauity is one contayned. The membranes of this vvombe are tvvo, one externall [table 14. figure 2. ᶠ ᶠ] from the The bottome. Membranes.

Figure 1.
A. The ſpermaticall Veine and artery.
B. Portions of the ſpermatical veſſels reaching branches to the vpper part of the wombe.
C. The Teſticle and the Leading veſſell.
D D A Membrane tying the womb to the *Peritonæum*.
E. A veine and an artery diſtributed to the necke of the wombe, and the lower part of the bottome.
F. The right ſide of the bottome of the wombe, couered with the outward coat.
G. the left ſide of the bottom of the womb halfe of it freed from the outward coate.
G H. The outward couering at G. the inward H.
I. The leſte leading veſſel ſeparated from the teſticle.
K. The place where is the orifice of the bottome of the wombe.
L. The necke of the womb, the left ſide is vncouered from the outward coate.
M. A part of the necke of the bladder.
N. The skin lett at the priuity.

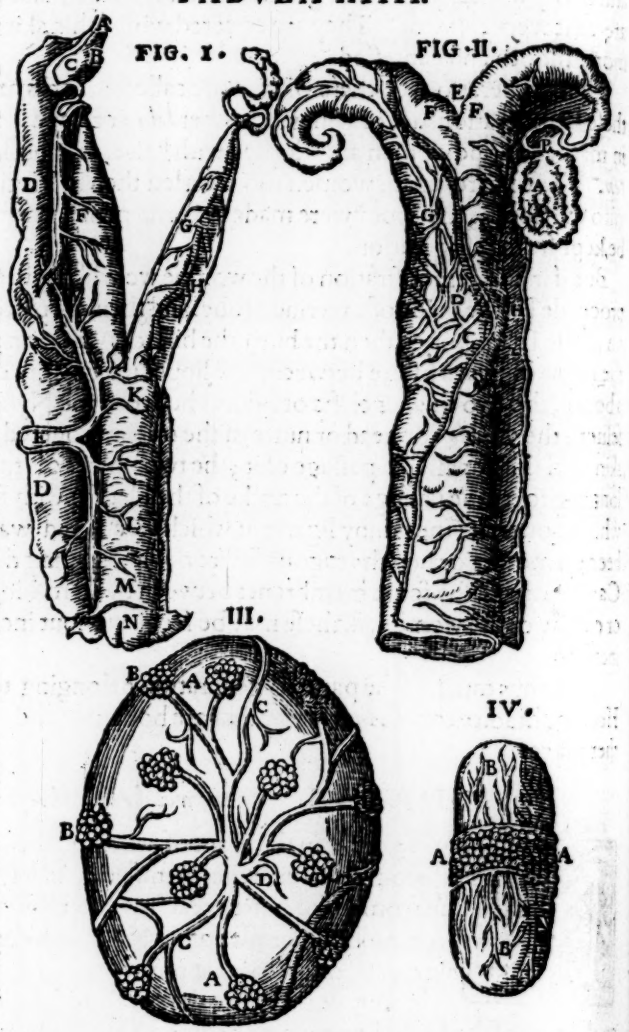
Figure 2.
Figure 2. A. the left teſticle.
B. The veſſell leading the ſeede into the hornes of the wombe.
C. The place of the orifice of the bottome of the wombe.
D. The place where the wombe is diuided into two parts.
E. The two parts of the womb reſembling the hornes of a Ram.
F F, G. the outward coate of the wombe at F, the inner at G.
H. A portion of a Membrane, ioyning the womb to the *Peritonæum*.

Figure 3
Figure 3.
A A The outward couering of the Calfe.
B B. The places where the outward couerings is tied to the wombe, & admitteth the veſſels, where alſo there is a fleſhie ſubſtance, which is likened to the fleſh of the Splene.
C C. The meeting of the veines and arteries through this couering, for the making of the vmbilicall veſſels.
D. The place where thoſe veynes and arteries diſperſed through this couering, are gathred together a litle before they make the vmbilicall veſſels.

Figure 4
The fourth Figure.
A A. A fleſhy ſubſtance growing vppon the outſide of the vtter couering of the Calfe, which compaſſeth the couering ouerthwart, otherwiſe then in men.
B B. That part of the outwarde couering which is not ouer growne with that fleſhy ſubſtance marked with A A. but is branched with veines and arteries.

The firſt figure ſheweth the womb of a dog, becauſe thoſe may more plentifully be gotten for diſſection.
The ſecond figure ſheweth the womb of a Cow (altogether like that of a Sheepe, ſauing that it is bigger, that the hornes might better appeare, becauſe it is fit that yong Anatomiſts ſhould excerciſe themſelues in the diſſection of the wombes of ſheepe.
The third ſheweth the after birth or clenſing of a Cow.
The 4. hath another repreſentation of the clenſing of a Cow.

TABVLA XIIII.



the *Peritonæum*, from which the Ligaments do proceede, and wherein the veſſels are leade vnto the wombe. The other internall [Tab. 14, fig. 2.°] and proper, which compaſſeth the wombe round about.

Veſſels.

Betweene theſe coates are diſperſed an infinite number of Veines and Arteries, ſtrangely implicated or folded together; and theſe implications are heere more manifeſt by much then they are in the wombe of a woman, although the coates of her wombe be rent aſſunder. About theſe veſſels there appeare many round bodies like little knubs, which in women are called *Acetabula*, [Tab. 9. fig. 4. about ª and ᵇ] very ſmall they are, and nothing elſe but the mouth of the veſſels.

Acetabula.

Their Teſticles are ſcituated at the ſides of the wombe [Tab. 14. fig. 2, ^] vnder the tops of the hornes. The veſſels which attaine vnto the Teſticles and the womb are the very ſame with thoſe of a woman both in their originall and their paſſage, excepting thoſe which leade the ſeede into the cauity of the womb, whoſe implantation in theſe creatures is much more manifeſt, ſo that you may eaſily enter a Probe into them. Such alſo and after the ſame maner is the faſhion of the wombes of a Goate and of a Cow.

The Teſticles

But

But the wombe of a Bitch, [Tab. 14. fig. 1] hath a necke [Tab. 14, fig.1,[L]] reaching but to the beginning of the Holy-bone. The bottom is presently diuided into two parts, which by degrees determine in a sharpe end, and do not turne round like the hornes of the womb of an Ewe or Cow, but run out straight. And because these creatures beare many whelps at once in particular parts of their wombe, these parts are distinctly implicated or rowled vp like the guts. The womb of a Bitch.

These two parts of the bottome [Tab.14,fig.1.[F G]] do end in a common orifice, [Table 14,fig.1,[K]] which reacheth vnto the vpper part or seate of the necke. It hath a double coat, one outward from the *Peritonæum*, [Tab.14.fig.1,[DD]] from which it hath his processes: the other inward. The two parts of the bottom

The Testicles [Tab.14.fig.1,[C]] are placed at the tops of the two parts of the bottome. The vessels are like those of an Ewe before described, but they haue no such knobbes in the cauities, as we spake of in the former. The Testicles Vessels.

It is a strange thing which *Gesner* and others doe write, that in a *Paria* a Prouince not farre from the Region of the *Patagons* in the West India, there is a creature found which our Country-men cal a half Fox. For it hath two wombs, one inward in which they generate as other creatures do, the other outward scituated vnder the former, wherin they cherish and defend their Cubbes, and out of which they seldome take them but vvhen they would sucke. Heere we will put an end to our History of the parts of Generation, & come to the Controuersies. A strange creature in the West India.

¶ A Dilucidation or Exposition of the Controuersies of the fourth Booke.

QVESTION I. *Whether the Testicles be principall parts or no.*

ARistotle & the *Peripatetick* Philosophers do admit but one principall or chiefe part in the body of man which is the Heart; but their opinion is long agoe hissed out of the Physitians Schoole. Many do accuse *Galen* of leuity & inconstancy in assigning the number of the principall parts. For sometimes he accounteth the Testicles among the principall parts, sometimes he excludeth them, but it will not be hard for vs to reconcile *Galen* vnto himselfe. The *Peripatetians*. *Galen* accused but redeemed *Lib.de sem. de arte poua. 6 de vsu part. 6.de placit.Ia.*

The Testicles, because they are the chiefe Organes or instruments of procreation & by procreation mankind is preserued, are therefore to be accounted principall parts; and haply so much are they more excellent then the heart, by how much the species or whole kinde is more noble then one *individuum* or particular of the kinde. Surely the power and vertue of the Testicles is very great & incredible, not onely to make the body fruitefull, but also in the alteration of the temperament, the habit, the proper substance of the body, yea & of the maners themselues. In these doth *Galen* place, beside that in the heart, another hearth as it were of the inbred heate, and these are the houshould Goddes which doe blesse and warme the whole bodye. Hence it is, that the Egyptians in their Hieroglyphickes doe paint *Typhon* gelt, signifying thereby his power and soueraignty to be abolished and decayed. The Testicles alter the temper, habit, and maners. Why the Egiptians painted *Typhō* gelt

That they change the temperament it is manifest, because the testicles being taken away or but fretted, contorted, or writhen, yea refrigerated, or hauing suffred convulsion, there presently followeth a change from a hot to a cold temper, and in olde time it was accoun- The temperament.

ted a singular remedy for the leprosie to cut off the Testicles, and to this day we vse to apply Epithymations to them, and finde that they doe wonderfully corroborate and strengthen the whole frame of the body. And it is ordinary for women (and that not vvithout reason) to presume much vppon the death or recouery of children by the firmenesse or loosenesse of these parts; yea *Hippocrates* himselfe sayth in his Prognosticks, *That the Conuultion of the testicles and priuy parts do threaten danger of death.*

Prognostication by the Testicles.

We see also that in gelt men called Eunuches, there is a change of the whole habite and proper substance of the body, for they become fatter and smooth without haires; the flower also of their bloode decayeth and their vessels or veines loose their bredth and capacity, and all vigour of lust and desire of ioylity is extinguished; beside the flesh of such creatures looseth the former tast and smell; for whereas before it breathed out a certaine vnsauoury and rammish sowreneſſe, after they are gelt it becommeth sweete and pleasant to the taste.

The habite.

Concerning the chaunge of their Manners, that is notable of *Auenzoar* the Arabian, where he saith, Eunuchs haue a shrill and piping voice, euill manners, and worse dispositions, neyther shall you lightly finde one of them of a good inclination, or not broken witted. *Claudian* against *Eutropius* inueyeth thus against Eunuchs.

The maners.

Adde quod Eunuchus nulla pietate mouetur,
Nec Generi natisque Cauet.
The Eunuch is deuoide of pietie,
Both to his Parents and his Progenie.

Albeit in the seauenth Booke of the *Institution* of *Cyrus* it is recorded, that this kind of men is quiet, diligent, and especially faithfull: but we may answere that they are quiet because they are dull and blockish; diligent because they are seruile and base-minded; faithfull because they haue so much distrust of themselues. But howsoeuer, whence comes trow we this so sudden alteration of the temper, habit and maners? *Aristotle* thinketh that the heart is stretched by the testicles, and therefore relaxed when they are cut away, and so a common principle affected, because the strength of the Nerues is relaxed or loosened in their originall or beginning. Euen as wee see it commeth to passe in instruments, which haue a more acute or trebble sound when the strings are stretched, and a lower and more remisse when they are loosened; right so it is in Eunuchs, the Testicles being taken away and so the heart affected, the voice and very forme becommeth womanish; for a principle though it be small in quantity, yet it is great in power and efficacy.

Why gelt mẽ are so chãged

Aristotles prety conceits.

Comparison.

Against this opinion of *Aristotle Galen* disputeth in his first Booke *de Semine*, and we in our next exercise shall prosecute it at large; for neither doeth the strength of the heart depend vpon the contention or stretching of the Testicles but vpon his owne proper temper; neither if the heart needed any such tension or stretching, were the testicles pinnes fitting for the same. The Common opinion is, that all the other parts are heated by the repercussion of heate from the Testicles vnto them; but because their substance is soft and rare, & reflection or repercussion is vsually (especially if it be any thing strong) from thight and hollow bodies, I imagine that their smal and slender reflection can be no cause or author of so powerfull a heat as the parts do stand in need of. *Galen* referres this alteration to the natiue and ingenit temper of the testicles themselues; for in the place last before named he sayth, that in them there is another fountaine or furnace rather of heate, euen as there is in the heart. But vnder correction it seemeth to me more reasonable, that the heate of the Testicles is not so much from their natiue and in-bred temper, because they are without blooce & like vnto Glandules, as by reason of the seed conteyned in them; for where that is it heateth the whole body, distendeth yea enrageth it. For *Hippocrates* saith, that seede is of Nature fiery and aery; by the aery part it distendeth the whole frame of Nature, and by the fiery setteth it on worke, or a gog as we say, transporting not the body onely, but the minde also from reason to rage. For as the least part of mortall poyson in a moment changeth the whole body; so is it in seede, whose quality is so actiue and operatiue, that it darteth forth as it were by irradiation his beames through the whole body. And thence it is, that we see gelt creatures are not so stirring as others, whose many motions do stirre vp and so encrease their heate.

Confuted by Galen.

The common opinion.

Galens opinion

Not altogether allowed.

Comparison,

It may be obiected that *Galen* in another placce attributeth onely to the Liuer and the Heart power to change the whole body, not to the Testicles. For thus hee sayeth: *Those that*

Galen redeemed.

that haue hot Liuers haue also all their habit hot, vnlesse there bee some obstacle in the heart: on the other side they that haue hot heartes haue also hot habites, vnlesse the Liuer doe vehemently oppose against it: but of the Testicles not one worde or any mention at all; these men may thus be satisfied.

There is a twofold influence of heate, one immediate, another mediate. The immediate influence of the twofold spirits and bloud and with them of the heate, is from the heart and liuer by the veines and arteries. The mediate is from the Testicles into the whole body indeede, but by the mediation of the Heart and the Liuer and the common vessels. For the Testicles haue no peculiar vessels by which they might deriue their influence into the whole body; but they impart this power and faculty of alteration, to the heart by the arteries, to the Liuer by the veines; from which it is againe reinfused into the particular members. A twofold influence of heat.

It will be obiected that this faculty of alteration proceeding from the Testicles is infused not bodily but onely operatiuely; what neede then hath it of a conduite or pipe either arteriall or venall? But I answere, that faculties doe not vse to bee infused or transfused but by the mediation of spirits, which although they wander and gad vp and downe the body; yet notwithstanding they stand neede of peculiar receptacles to containe them in, such as are the veines, nerues, and arteries. So poyson although in the specificall or essentiall form it opposeth the heart, yet is it carried in a moment of time and matter to the heart through the arteries and spirits wherein the faculties haue their consistence. Obiection. How faculties are infused. Comparison.

Such therefore is the excellency, such the admirable faculty of the Testicles, as well in procreation of seede as we shall declare in our next exercise, as also in the alteration of the temper, habit and manners; and in that respect are they called by *Galen, principall parts*.

But their want not aduersaries who would thrust them out of this ranke of dignity, although their arguments are very weake. Firste they say *Galen* in two places defineth a principall part, in the first by *Necessity*, in the second by *communication of a faculty or some common matter*. But for the Testicles there is no necessity of them, for *Eunuches* liue without them, neither is there any faculty proceeding from them; for the animall faculty proceedeth from the braine, the vitall from the heart, the naturall (to which the faculty of procreation is referred) issueth from the Liuer the chiefe of all naturall partes. Moreouer from the Testicles there is no matter communicated to the whole body, for they haue no spirits proper vnto them, no vesselles which runne through the body by which it may bee conuayed; but these are trifles. Obiections. What a principal part is according to *Galen*.

For we confesse the Testicles are not necessary for conseruation of the life of the *individuum* or singular man, but for propagation of the whole species, or of mankinde they are of absolute necessity. Wherefore they are principall parts in respect of mankinde, not in respect of this or that particular man. For the propagation of mankinde is onely accomplished by procreation: procreation is not without seede, seed is only concocted and perfected by the Testicles, to which the spermaticke vessels doe serue as well for preparation as for conduction and leading of the seede. Answered.

But me thinkes I heare the *Peripatetians* obstreperously deny the Testicles this power of procreation of seede, against whome we will in the next place bend our forces. Obiections of the preparation of seed.

QVEST. II. *Of the vse of the Testicles.*

COncerning the vse of the Testicles there are diuerse opinions, and those farre differing one from another. *Aristotle* denyeth them the vertue of making seed and attributeth it onely to the spermaticall vesselles, because many creatures want Testicles, as Fishes and Serpents, which yet enioy a coition, and doe auoyde perfect seede able to propagate their *species* or kinde. That a Bull or Horse hauing lost their Testicles may yet presently couple with their Females and procreate; and finally because they accomplish or fill vp no part of the passages; that is, haue no society with the spermaticke vessels. He taketh knowledge of other vses of these Testicles which he maketh to be threefold. *Aristotles* opinion. His arguments. 3. *Hist. Anim.* 1. & 1. *de gener. Anim.* 4.

The first, that they establish the motion of the seede, and hanging at the vessels inuerted or writhen with a wonderfull art, doe hold them together and make them more patent and ample, (as we see weauers hang waights at the strings of their warp) and therfore when they are cut off, the spermaticall vessels are contracted and their passages occluded or shut vp so as the seede can haue no passage. His threefold vse of them. Comparison.

The second vse of the Testicles is for the strength of the heart, for by these as by certain waights the heart is streatched, and thence proceedeth the change of the Temperament and whole habit when they are taken away, the bridle being loosed and the strength of the heart so as it were dissolued or resolued.

The third vse I gather out of his Problemes; that by their waight and poyse they should helpe the tension or erection of the yarde. And this is *Aristotles* opinion of the vse of the Testicles, which we will now bring to the touch-stone to see how it will hold.

Confutation of the first vse

For the first vse he may well be confuted by himselfe: the vessels of seede sayeth he are writhen and intorted with wonderfull art, and implicated or foulded vp in many boughts and circumuolutions; the waight therefore of the Testicles should bee so far from dilating their passages, that if they did streatch them they would rather draw them out in length euen vnto the feete. But the truth is, that these vessels are so firmely tyed to the neighbour parts that they admit no streatching or tension at all, or if they should be streatched they would not onely not be dilated, but they would become narrow and straighter; for vesselles when they are streatched out in length cling closer together.

No vse of any sensible cauity for the seed

But what vse is there of any such sensible cauity or amplitude for the excretion or emission of? Is there not seede contayned in the substance of the Testicles and of the *Epididymis* in which there is no sensible or conspicuous cauity? and is not the seede led along by the leading vesselles to the smal bladders and *Prostatæ*, and there kept in readines for effusion without any cauity? The seed it selfe is houen with aboundance of spirits which maketh it to passe *orgasmo*, that is, with a kinde of impetuous violence. If it be obiected that seede is thicker then arteriall blood which yet hath need of a conspicuous canell or pipe to passe in as are the arteries. I answere, that the arteriall bloud is a plentifull streame ordayned to water the whole body with a continuall and aboundant influxion, which could not bee without very patent and open passages; so Nature formed the arterial veine large and ample, that it might be sufficient to nourish the Lungs, a rare body and in continuall motion. But the seede falleth by degrees and insinuateth it selfe rather then floweth into the spermaticke vessels, and is first prepared in their circumuolutions and after is deriued through small pores and hayrie passages into the substance of the Testicles, and is thence driuen into the eiaculatorie vessels which are indeed porous as an Indian Reede, but haue no sensible cauity at all. There is not therefore required any such rectitude and amplitude in the vessels or substances conteyning the seed as *Aristotle* dreamt of, either for the concoction or eiaculation and auoyding thereof.

Obiection.

Solution.

Arguments against *Aristotle*

But let vs presse *Aristotle* a little farther: although the Testicles doe hang in their due place, yet doe those men become lesse apt for generation who haue their Testicles bruised or worne and wasted or refrigerated, so that euen thence it is manifest that their chiefe vse is not to streatch or dilate the vessels: besides many creatures haue their Testicles within tyed to their backs, and yet are as fruitfull as any other; as some Tuppes or Rammes called Riggall Tuppes, and all female creatures who are very prolifique though their Testicles hang not at all. Furthermore if the Testicles were made as waights to keepe the passages open; then in the time of coition or generation and eiaculation of seede the Testicles should descend downeward that the passages might bee made more patent and open: but we finde the quite contrary to be true, that in coition the Testicles are contracted & drawn vpward, not let lower downward. *Aristotles* nice conceited vse therefore is but supposititious and not the true vse of Nature. *Auerrhois* being not able to auoyde the strength of these reasons, departeth from *Aristotles* opinion to whome he was so much addicted, and yeeldeth that the Testicles haue power to procreate seede.

Auerrhois forsaketh *Aristot.*

Confutation of the 2. vse.

The second vse ascribed to the Testicles by *Aristotle*, is for the tension and strengthning of the heart, to which we answere: that they bee of small waight, neither doe they hang at the heart vnlesse it be by arteries, and those not right but oblique, and yet those adhearing and tyed to the neighbour partes so as the Testicles cannot by them streatch or bend the heart: againe if this were a vse truely assigned, then their hearts and vigor should be strongest whose Testicles are more relaxed and hung lower: but women finde these much more impotent, and account them lazie loyned fellowes: adde hereto, that if the heart needed any tension, it might better haue beene tentered, and with shorter stringes to the spine of the back; also the Liuer is very neare and a waighty body, and tyed to the heart by the hollow vein, & therfore certainly stratcheth it more then the smal bodies of the Testicles placed so farre off and so slenderly depending vpon it, and that by strings fastned to the backe

by

by the way: moreouer the veſſels which leade to the Teſticles are diuerſly contorted, and if they weere ſtreatched out woulde reach vnto a mans feete almoſt; againe, all creatures whoſe Teſticles are hidde within ſhould be faynt and crauen-hearted. Finally if this were true, the heart which is a moſt noble part ſhould haue his ſtrength not of himſelfe but by dependencie from elſewhere, which were a great abſurditie in reaſon. Wherfore we think this opinion of *Ariſtoties* to bee but a quaint deuice, worthy of the wit but not of the iudgement of ſo great a Phyloſopher.

As for the laſt vſe aſsigned by *Ariſtotle* which is the erection of the yarde, that may be confuted by that we haue ſayd before to be the true cauſe of erection, and that is partly Natural, to wit, an aboundance of winde and ſpirits filling the hollow Nerues; and partly Animall, from an appetite mouing the muſcles which are appoynted to make this erection: We will therefore bid adue vnto *Ariſtot e* his faigned conceite, and to them alſo who deny vnto the Teſticles the power of procreating ſeede: for whereas they obiect that there are many creatures which haue no Teſticles and yet doe abound with ſeede prolifique or fitte for generation: wee anſwere that ſuch Creatures are imperfect and their generation not perfect but lame. Confutation of the laſt vſe. Obiection. Solution.

To conclude, that a new gelt Horſe or Bull can copulate and ingender ſeemeth hard to be beleeued, becauſe of the extreame payne that muſt neceſſarily follow the violation of parts of ſo exquiſite ſence; but if it do ſo come to paſſe, then is it by that ſeede that is already laboured by the ingenit power of the Teſticles before they were ſeparated and reſerued for preſent vſe in the *Paraſtata* and *Proſtata*; and not by any ſeed concocted after the taking away of the Teſticles. How a new gelt horſe may get a foale.

QVEST. III. *The opinion of Phiſitians concerning the true vſe of the Teſticles.*

THere are ſome not vnlearned Phyſitians, who will not allow to the Teſticles any power of procreating ſeede, but reſerue that onely for the preparing veſſels and the *Epididymis*; becauſe there appeare no paſſages by which the ſeed ſhould paſſe from the bunching implications of the veſſelles into the Teſticles: againe the *Epididymis* and the preparing and leading veſſels may be ſeparated without rending from the Teſticle: adde hereto that the *Epididymis* is often full of white ſeede, which is rarely found in the Teſticle it ſelfe. They therefore ſay that the Teſticles were made to ſucke away the ſerous humour and excrement of the ſeed and to conteyne it, for which reaſon their ſubſtance is glandulous. The opinion of ſome Phyſitians. Their reaſons What vſe they aſſigne to the teſticles

Now *Hippocrates* aſsigneth this vſe to Glandules to receiue the excrements of the parts, and therefore the Braine, the Heart, and the Liuer, haue their ſeuerall Emunctories. But for my owne part I ſee no reaſon why the excrement of the ſeede ſhould rather paſſe into the ſubſtance of the Teſticles then the ſeed it ſelfe, which is ſo houen and barmed as it were with ſpirits: beſides, the body of the Teſticles is rare and ſpongy, & hath many ſmall pipes inſerted into them out of the veſſels; wherefore through theſe ſmall and almoſt inſenſible paſſages, they ſucke the ſeede by an ingenit faculty of their own; for if Aliment be brought vnto them to nouriſh them, and yet there are no conſpicuous veſſels diſſeminated through their ſubſtance, I ſee no reaſon but ſeed alſo may without manifeſt veſſels be conueyed into them. Their bodies are indeed glandulous or reſembling Glandules, but very Glandules they are not, as is ſayed already. The third opinion concerning the vſe of the Teſticles is theirs who think, that they are ordayned for Pillowes to ſafe-gard and ſtrengthen the veſſels. For ſay they where there is any notable partition of veſſelles in the whole body, there Nature hath appoynted glandules as pillowes to ſecure them. So is the *Pancreas* placed vnder the diuiſion of the *vena porta* or Gate veine, many glandules are in the diuarications of the veines of the meſentery. The *Thymus* vnder the *ſubclauian* diuiſion, and vnder the axillary and crurall veines notorious glandules or kernels are to bee found: in like manner the Teſticles are appointed for the ſecurity of the ſpermaticall veſſels. But the truth is that the onely ignorance of Anatomy brought in this old wiues fable. For the kernels or glandules which are placed at the diuiſions of the veſſels, do on euery ſide ſuſtaine, eſtabliſh and ſupport them; but the Teſticles are hung only at the ends of the veſſels. Anſwere to them. Another opinion Which ignorance of Anatomy hath brought forth

Wherefore the opinion of *Hippocrates*, *Galen* and almoſt of all the Phiſitians is much more probable, who doe attribute to the teſticles a power of their own to procreate ſeed, and the prime place in the worke of generation, becauſe they haue a great power for alteration of the habit, the temperament and the manners themſelues. Moreouer thoſe creatures The true opinion of almoſt all Phyſitians

Their reaſons

atures who haue abſtained long from the worke of generation, haue their Teſticles ſwolne and diſtended with ſeede, which vppon the vſe of the Female doe abate againe. Which thing alſo *Ariſtotle* himſelfe hath left teſtimony of where he ſayeth. *That certaine Birds and Beaſtes at what time they vſe to couple, haue their Teſticles very great, but when that ſeaſon is ouer, they become ſo ſmall that it may be doubted whether they haue any Teſticles at all or no*: Againe when the Teſticles are refrigerated or ouer-cooled, then barrennes followeth. And truely if a man liſt to runne ouer all the concoctions in the body of a man, hee ſhall finde that there is onely a preparation in the veſſels, but concoction and perfect elaboration to be in and from the particular ſubſtance of the part.

Diuerſe inſtances.

The Animall ſpirit as we ſhall declare hereafter, is prepared in the wonderfull implications and texture of the arteries, but his forme and proper difference it acquireth in the marrowy ſubſtance or ventricles of the braine. The Milke is prepared in the veines but groweth white in the glandules of the Breaſtes. Blood getteth a kinde of rudiment in the veines of the meſentery, but his redneſſe and the forme of bloud it onely obteyneth in and by the *Parenchyma* or ſubſtance of the Liuer.

The true courſe of the ſeede.

In the ſmall and threddy veynes of the particular partes there is a preparation vnto the third concoction, but aſsimulation is onely made by and in the ſubſtance of the parts. So there is a delineation and preparation of ſeede in the ſpermaticke veſſels, which are diuerſly implicated by a wonderful artifice of nature, that in thoſe implications the ſpirits might be exactly mingled with the bloud, and therefore here an artery entreth into a veine, and a veine into an artery.

The ſeede thus prepared the Teſticles draw for their nouriſhment, to which they giue forme, perfection, and fœcundity, wherewith when they are ſatisfied, the remainder they expell into the leading veſſels: theſe doe exonerate themſelues into many ſmall bladders, and into the *Proſtatæ*, and there it is reſerued and kept in ſtore for the neceſſary vſe of Nature in procreation.

QVEST. IIII. *Of the ſubſtance and coates of the Teſticles.*

That the Teſticles are not glandules.

THE ſubſtance of the Teſticles ſome ſay are Glandules, alleadging *Galen*, who reckoneth them among the Glandules in his third Booke *de Alimentis*: and *Hippocrates* in his Booke of Glandules defineth them to be ſpongy, rare, fatte and friable, but ſuch are the Teſticles, therefore they are Glandules. We anſwere that we muſt diſtinguiſh betweene Glandules and glandulous bodies. The Teſticles are indeede glandulous bodies, ſo are the Kidneyes, ſo is the Braine, yet no man will call it a Glandule, but the body of it is like a Glandule, as wee ſhall ſhew more at large when we ſpeake of the Braine.

The difference between a glandule and a glandulous body.

Of their coats How many coates ſtones haue.

Againe, concerning the coates of the Teſticles, Anatomiſts doe differ one from another, ſome make more, ſome fewer: we reſolue they are foure; two common and two proper; the two common are called *ſcrotum* or the Cod and *darton*: the two proper called *Eleuthroides* the firſt, and ὑμὴν νευρώδης, that is the neruous membrane the latter. *Veſalius* calleth this *Epididymida*; but *Falopius* elegantly confuteth him; for the *Epididymis* is indeede that we call *Paraſtatæ*, and is a body not a membrane, a little Teſticle not a coate of the Teſticle as the word ſignifieth: euen as a Cuticle is a ſmall skinne; the *Epiglotis* a ſmal toung as it were. And *Galen* in the 15. and 16. Chapters of his Booke *de ſemine* calleth the *Epididymis* a particle fixed to the head of the Teſticle, which wee haue ſeene to ſwell notably, the Teſticle it ſelfe not being taynted at all, yea, and many *Epilepticall* fittes to ariſe therefrom.

Varicoſum corpus.

The Teſticles of women haue not this additament, or if they haue it is ſo ſmal that it cannot be perceiued. The reaſon may be becauſe it was not neceſſary that their ſeede ſhould be ſo laboured or thicke as that of mens, but remaineth more moyſt and fluid, as it were to temper the action of the ſeede of man.

QVEST. V. *Of the conſent betweene the Cheſt and the Teſticles.*

The conſent betweene the Cheſt and the teſticles.

THE Conſent betweene the Cheſt and the Teſticles is expreſſed by *Hippocrates* in three ſeuerall places. In the firſt Section of the ſecond Booke *Epid.* he ſayeth, *When the Teſticle ſwelleth after a Cough, it calleth to our remembrances the conſent or ſympathy betweene the Cheſt, the Breaſts, the Seede & the Voice.* Againe, in the firſt Section of the firſt Booke thus; *Many were ouertaken with*

Three places of *Hippocrates* expounded.

dry

dry Coughes, & many of those men long after were troubled with painful inflamations, sometimes in one stone, sometimes in both. Thirdly in the first againe of the second Booke thus: *Long and inueterate Coughes doe cease when the Testicles begin to swell.* Howe this commeth to passe we will now declare: but first it must be resolued what that diuine old man meant by dry Coughes; not that Cough which is without matter; causèd either by a bare distemper as when the winde is at the North, or by the inequality of the rough Artery, or by the simpathy of the sinnewy parts; for how could that breede tumors and Apostemations? But a Cough with a matter, whose cause is either the thinnesse of the matter, which the breath cannot intercept as we cough, but it slideth downe by the sides of the weazon; or else the thicknes of the same which will not follow the constraint of the chest. This matter whither thin or thicke *Hippocrates* vnderstandeth to be euacuated by Apostemations belowe, and especially in the coddes or testicles: but all the difficulty is, which way this crude matter should passe out of the chest vnto the parts of generation.

What *Hipoc.* meaneth by a dry cough.

The wayes by which the humor must pas out of the chest into the testicles.

There are three sorts of vessels which goe to the Testicles; A Nerue, an Artery, and a veine, all which haue through-passages from the chest to the testicles. First of al, a notable and euident branch of the rib sinnew called *Costalis*, runneth by the sides of the ribs into the Testicles. A veine from the *non-parill* or vn-mated veine of the brest runneth thorough the Midriffe, and determineth into the veine of the Kidney, and the spermaticall veines. As for the Artery, albeit none do come to the great trunke from the Lunges (in whose lappes the matter of the cough doth lye) yet it is not vnreasonable to thinke that the offending humour may passe by the venall artery into the left ventricle of the heart, and from thence into the great Artery, and so into his branches; by which way also the matter or *pus* of *pleuritical* and *Peripneumonicall*, or *Empyicall* patients descendeth, and so is diuersly auoyded by vrine, seidge, or Apostemations in the lower parts; and by this passage also it is more then probable, that the matter should fall out of the chest to the testicles.

The way of the Nerue.

The way of the Veine.

The way of the Arteire.

The passage of matter thorough the left Ventricle of the heart.

QVEST. VI. *Of the situation of the Prostatæ.*

COncerning the Glandules called *Prostatæ*, Anatomists doe contend; some thinke they are placed beneath the sphincter Muscle, others aboue, we adhere to the latter. For, beside the credite of dissection, if they were placed below the sphincter then the seede should neuer be spent without the auoyding of vrine also, & again in the running of the reines, the seed could not flow without the water; besides the Vrine would alwayes lye vpon these Glandules and fret them with his acrimony. They are therefore placed aboue the sphincter, and their inflamation or exulceration breeds the venerious gonorrhæa or running of the reines.

That the *Prostate* are aboue the sphincter.

QVEST. VII. *Whether the Erection of the yard be a Naturall or an Animall action.*

EVery action according to *Galen*, is Naturall or Animall; that he calleth Naturall which is not voluntary, so the vitall faculty is Naturall because it is not Arbitrary. The inflation of the virile member is an action, because there is in it Locall and Mathematicall motion, it must therefore needs be a Natural or an Anmiall, or a mixt action.

How manie sorts of actions there are

To prooue it to be meerely Animall this argument is vrged, because all the Animal faculties, Imagination, Motion, and Sense do concurre to the perfection of it. For the first, before the distention of this part, whether wee wake or sleepe wanton and lasciuious imaginations do trouble vs. Now mens Imaginations when they wake are alwayes voluntary and arbitrary with election; and when they sleepe, then are their imaginations like those of bruite beasts, following the species or Idea and representations of the seede as it pricketh & swelleth these parts of generation. For euen as in sleepe Flegme stirreth vp in our imaginations similitudes of raine and waters, Choler of rage and fury like vnto it selfe, Melancholy that enemy of the light and demolisher of the principles of life it selfe, powreth a cloude of darkenesse ouer our minde, and representeth to our imaginations similitudes full of terror and feare; right so the seede contained in the *Prostatæ* swelling with aboundance by his tickling or itching quality communicated to the braine by the continuity of the sinnewes, mooueth or stirreth vp images or shaddowes of venerious delights in the fantasies of men, wherefore this part or member is not erected without the helpe of the imagination.

That erection is meerely Animal.

The effects of the humours in sleepe.

How venerious imaginations in sleep are mooued.

The

The Senſe mooueth the imagination, the imagination commandeth the mooving Faculty, that obeyeth, and ſo it is puffed vp. The mooving Faculty hath the help of four Muſcles, two of which run along the ſides of the member; now wee know that all motions of the Muſcles is Animall, becauſe a Muſcle is defined to be an inſtrument of voluntary motion. This inflation hath pleaſure alſo ioyned vnto it, but pleaſure is not without ſence; wherefore all theſe three Animall faculties concurre in erection, and therefore it is meerly an Animall action.

That it is meerly naturall.

On the contrary that it is a Naturall action may thus bee demonſtrated: all the cauſes of this diſtention, the inſtruments, the efficients and the end are Naturall. The Naturall

The inſtruments.

organs or inſtruments are two ligaments, hollow, fungous and blacke, which though they be called Nerues, yet are not voluntary and ſenſible or feeling ſinewes, they ariſe from the

The efficient.

hanch and ſhare-bones, not from the brayne or marrow of the backe. The efficient cauſe is not our will, becauſe erection is not alwayes at our commaundement either to moue or to appeaſe as we may doe our armes, legges and eyes; but the efficient cauſe is heate, ſpirites and winde, which fill and diſtend theſe hollow bodies, with an infinite number of veſſelles both veines and arteries diſperſed and wouen through them. The finall cauſe is procreation which belongeth to the Naturall not to the Animall faculty.

The finall.

Betwixt theſe two extreames we wil take the middle way and determine, that the action

The middle and true opinion that it is a mixt action.

of erection is neyther meerely Animall nor meere Naturall, but a mixed action. In reſpect of the imagination & the ſence it is Animall, becauſe it is not diſtended vnleſſe ſome luxurious imagination goe before, and the diſtention when it is made is alwayes accompanied with a ſence of pleaſure and delight; but in reſpect of the motion we rather thinke it to be Naturall which yet is ſomewhat holpen by the Animal. For as the appetite which

Compariſon from the appetite.

is ſtirred vp in the vppermoſt mouth of the ſtomacke (becauſe traction breedes diuulſion, diuulſion ſence, ſence Appetite) is called Animall; and yet the motion wherby the greedy ſtomacke ſometimes ſnatcheth vnchewed meate euen out of the mouth is Naturall: ſo the erection of this member becauſe it is with ſence and imagination is ſayed to bee Animall, but the locall motion whereby it is mathematically inlarged is Natural, ariſing from the inbred faculty of the ligaments: ſuch is alſo the motion of the wombe when it draweth ſeed, and of the heart when it draweth into it ſelfe ayre and bloud. Yet it muſt be confeſſed that this naturall motion is holpen by the Animal, becauſe the foure muſcles before mentioned though they be very ſmall, yet they helpe to enlarge the diſtention, and doe alſo for a time keep it ſo diſtended.

Obiection.

If it be obiected that in the running of the Reynes called the venereall *Gonorrhæa*, there

Solution.

is erection without imagination or pleaſure, yea with payne. I anſwere with *Galen* that there is a twofould erection, one according to nature, another vnnaturall; the firſt is from the ingenit faculty of the hollow ligament; the other is ſymptomaticall; the firſt with pleaſure, the other without it yea with payne; in the firſt the yarde is firſt diſtended and after

Compariſons.

filled with a vaporous ſpirite; in the latter it is firſt filled then after diſtended. In a word, there is the ſame difference betweene theſe two diſtentions which is between the two motions of the heart. In the Naturall motion of the heart which is accompliſhed by the vitall faculty, becauſe the heart is dilated it is filled with ayre and bloud, and becauſe it is contracted it is emptyed; but in the deprаued palpitation of the heart the heart is diſtended becauſe it is filled. So ſmiths bellowes becauſe they are dilated are preſently filled with ayre for the auoyding of vacuity, but bottles are diſtended becauſe they are filled with wine or water.

Priapiſmus.

Wherefore the Naturall erection euer followeth imagination and hath pleaſure accompanying it, but the vnnaturall which *Galen* calleth *Priapiſmus*, is altogether without

The cauſes of it.

luſt or appetite. The cauſe of this is a plenitude of thick & craſſe wind, proued becauſe the motion is ſo ſudden and ſo violent; for all violent and ſudden motions are of winde not of humor as *Galen* ſaith; and this wind or vapour is generated either in the hollow nerues and ligaments, or is thither brought by the open paſſages of the arteries. But of what? Surely of craſſe and thicke humours, and that is the reaſon why melancholly men are moſt troubled with this vnnaturall erection; as alſo are Lepers, and therefore the Antients called the

Melancholly men ſubiect to it and why.

Leproſie *ſatyriaſis*. And thus much concerning the parts of generation in men, now it followeth concerning thoſe of women.

QVEST

QVEST. VIII. *How the parts of generation in men and women doe differ.*

Whether the parts of generation in men and women do onely differ in scituation.

CONcerning the parts of generation in women, it is a great and notable question whether they differ onely in scituation from those of men. For the ancients haue thought that a woman might become a man, but not on the contrary side a man become a woman. For they say that the parts of generation in women ly hid, because the strength of their naturall heate is weaker then in men in whom it thrusteth those parts outward. Women haue spermatic all vessels, aswell preparing as Leading vessels and testicles which boile the blood, and a kinde of yard also, which they say is the necke of the wombe if it be inuerted. Finally, the bottome of the wombe distinguished by the middle line, is the very same with the cod or *scrotum*. This *Galen* often vrgeth in diuers of his works as before is saide; so *Ægineta*, *Auicen*, *Rhasis*, and all of the Greeke and Arabian Families, with whom all Anatomists do consent. For confirmation also heereof there are many stories current among ancient and moderne writers of many woemen turned into men: some of which we will not heere thinke much to remember. First therefore we reade that at Rome when *Licinius Crassus*, and *Cassius Longinus* were Consuls, the seruant of one *Cassinus* of a maide became a young man, and was thereupon led aside into the desert Island of the Sooth-sayers. *Mutianus Licinius* reporteth, that at *Argos* in Greece, he saw a maide named *Arescusa*, who after she was married became a man and had a beard and after married another woman by whom she had yssue.

Reasons for it

Authors.

Examples

Cassinus Maid-seruant.

Arescusa.

Pliny also writeth, that he saw in *Affrica P. Cositius* a Citizen of *Tisdetra*, who of a woman the day before became a man the next day. The *Hyæna* also a cruell and subtle Beast, doth euery other yeare change her sexe. Of whom, *Ouid* in the xv. of his Metamorphosis saith:

Cositius.

The *Hyæna*.

Et quæ modo fœmina tergo
Passa marem, nunc esse marem miramur Hyænam.
The same *Hyæna* which we saw admit the male before,
To couer now her female mate, we can but wonder sore.

Pontanus hath the same of *Iphis* in an elegant verse:

Iphis.

Vota puer soluit quæ fœmina vouerat Iphis.
Iphis her vow benempt a Maide,
But turned boy her vow she paide.

Of later times. *Volateran* a Cardinall saith, that in the time of Pope *Alexander* the sixt he saw at Rome a virgin, who on the day of her mariage had suddenly a virile member grown out of her body. We reade also that there was at *Auscis* in *Vasconia*, a man of aboue sixtie yeares of age, grey, strong and hairy, who had beene before a woman till the age of xv. yeares, or till within xv. yeares of threescore, yet at length by accident of a fall, the Ligaments (saith my Author) being broken, her priuities came outward, and she changed her sex; before which change she had neuer had her courses. *Pontanus* witnesseth that a Fishermans wench of *Caieta* of fourteene yeares olde became suddenly a young springall. The same happened to *Emilia* the wife of *Antonie Spensa* a Citizen of *Ebula*, when she had been twelues yeares a married woman.

A story of *Volateran* the Cardinall.

Another in *Auscis*.

A Fishermans wench of *Caieta*.

Emilia.

In the time of *Ferdinand* the first K of *Naples*, *Carlota* and *Franciscа* the daughters of *Ludouike Quarna* of *Salernum*, when they were 15. years old changed their sex. *Amatus Lusitanus* testifieth in his Centuries that hee saw the same at *Conibrica* a famous towne of *Portugall*. There standeth vpon record in the eight section of the sixt Booke of *Hippocrates* his *Epidemia*, an elegant Historie of one *Phaetusa*, who when her husband was banished was so ouergrown with sorrow, that before her time her courses vtterly stopped and her body became manlike & hairy all ouer and she had a beard and her voice grew stronger. The same also he recordeth to haue hapned to *Namisia* the wife of *Gorgippus* in *Thaso*.

Carlota and *Franciscа*.

Amatus Lusitanus his story.

Hippocrates his *Phaetusa*.

Namisia.

Wherefore say they, if a Woman may become a man and her parts of generation which before lay hid within may come foorth and hang as mens do, then do women differ from men onely in the scite or position of their parts of generation.

Notwithstanding all this, against this opinion there are two mighty arguments: one is taken from the ἀυτοψια in dissection, another from reason, which two are the Philosophers Bloud-

Reasons and experience against the former opinion.

Bloud-hounds, by which they tract the cauſes of things.

From the number of the parts. What parts of man a woman wanteth.

For firſt of all (ſaith *Laurentius*) theſe partes in men and women differ in number. The ſmall bladders which firſt *Herophylus* found, and called *varicoſos adſtites*, that is, the *Paraſtatæ* women haue not at all; nor the *Proſtatæ* which are placed at the roote of the yard and necke of the bladder, in which ſeede is treaſured vp for the neceſſary vſes of nature; althogh there be ſome that thinke that women haue them but ſo ſmal that they are inſenſible, which is (ſaith he) to begge the queſtion. Againe, me thinks it is very abſurd to ſay, that the neck of the wombe inuerted is like the member of a man; for the necke of the womb hath but one cauity, and that is long and large like a ſheath to receiue the virile member: but the member or yard of a man conſiſteth of two hollow Nerues, a common paſſage for ſeede and vrine, and foure Muſcles. Neyther is the cauity of a mans yard ſo large and ample as that of the necke of the wombe. Add to this, that the necke of the bladder in women doth not equall in length the necke of the womb, but in men it equalleth the whole length of the member or yard. Howſoeuer therefore the necke of the wombe ſhall be inuerted, yet will it neuer make the virile member: for three hollow bodies cannot be made of one, but the yard conſiſteth of three hollow bodies; two Ligaments ariſing from bones and the σπόγγος as we haue before ſufficiently ſhewed. If any man inſtance in the *Tentigo* of the Ancients, or *Fallopius* his *Clitoris*, bearing the ſhape of a mans yard, as which hath two Ligaments and foure Muſcles, yet ſee how theſe two differ. The *Clitoris* is a ſmall body, not continuated at all with the bladder, but placed in the height of the lap, the *Clitoris* hath no paſſage for the emiſsion of ſeede; but the virile member is long and hath a paſſage in the middeſt by which it powreth ſeede into the necke of the wombe.

From the forme & ſtructure of the parts.

Concerning *Fallopius* his *Clitoris*.

Neither is there (ſaith *Laurentius*) any ſimilitude betweene the bottome of the wombe inuerted, and the *ſcrotum* or cod of a man: For the cod is a rugous and thin skin, the bottome of the wombe is a very thicke and thight membrane, all fleſhy within and vvouen with manifold fibres.

Concerning the Cod and the bottom of the wombe.

Finally, the inſertion of the ſpermaticke veſſels, the different figure of the mans and womans Teſticles, their magnitude, ſubſtance and ſtructure or compoſition doe ſtrongly gainſay this opinion.

The inſertion of the ſpermaticke Veſſels.

But what ſhall we ſay to thoſe ſo many ſtories of women changed into men? Truely, I thinke ſaith he, all of them monſtrous and ſome not credible. But if ſuch a thing ſhal happen, it may well be anſwered that ſuch parties were Hermophradites, that is, had the parts of both ſexes, which becauſe of the weakeneſſe of their heate in their nonage lay hid, but brake out afterward as their heate grew vnto ſtrength. Or we may ſafely ſay, that there are ſome women ſo hot by nature that their *Clitoris* hangeth foorth in the faſhion of a mans member, which becauſe it may be diſtended and againe growe looſe and flaccid, may deceiue ignorant people. Againe Midwiues may oft be deceiued becauſe of the faultie conformation of thoſe parts, for ſometimes the member and teſticles are ſo ſmall, and ſinke ſo deepe into the body that they cannot eaſily be diſcerned.

Anſweres to the obiection of the change of ſexes. The firſt. The ſecond. The third.

Pinæus writeth, that at *Paris* in the yeare, 1577. in the ſtreete of S. *Dennis*, a woman trauelled and brought foorth a ſonne, which becauſe of the weakneſſe of the infant was ſuddenly baptized for a daughter, and was called *Ioanna*. A fewe dayes after, in dreſsing the Infant the Mother perceyued it to be a manchilde and ſo did the ſtanders by and they named it *John*.

A Hiſtorie.

As for the authority of *Hippocrates*. It followeth not that all thoſe women whoſe voyces turne ſtrong or haue beards and grow hairy do preſently alſo change their parts of generation; neither doth *Hippocrates* ſay ſo, but plainly the contrary: for he addeth, *When we had tried all meanes we could not bring downe her courſes, but ſhe periſhed.* Wherefore hir parts of generation remained as thoſe of a Woman, although her bodye grew manniſh and hairie.

Anſwere to the authoritie of *Hippocrates*.

QVESTION IX. *Of the motions of the wombe.*

How the womb is ſaide to moue.

ANother queſtion there is, whether the wombe moue locally and Mathematically, or Phyſically onely: concerning which we wil reſolue thus. There is a threefold motion of the wombe, one altogether naturall, another altogether Symptomicall and Convulſiue; the third mixt, partly Naturall partly Symptomical. The Naturall motion is meerely from the faculty of the ſoule; the Symptomatical meerly from an vnhealthfull cauſe, the third from them both together.

A threefolde motion.

The

The naturall motion is when the wombe draweth ſeed out of the neck into his bottom, for then it runneth downward to meete it, inſomuch that ſometimes it hath beene ſeene euen to fall out; it mooueth alſo naturally when in conception it is contracted and imbraceth the ſeede ſtrictly on euery ſide; as alſo when it excludeth the Infant, the after-birth or any other thing contayned in it beſide Nature. For the accompliſhment of this motion it hath right fibres and very many tranſuerſe or ouerthwart, and this motion comes from the neceſsity of Nature. The natural motion of the wombe.

The ſymptomaticall motion is onely from a cauſe that is morbous or diſeaſefull and that is convulſiue; which motion is manifeſt in the ſuffocation of the matrixe, for then the wombe is moued vpward becauſe it is drawne convulſiuely; and that comes either from repletion or from exhauſtion or emptines, the ligaments either being by drought exſiccated or ſteeped in ouermuch moyſture: ſometimes it commeth from a poyſonous breath, from the ſuppreſsion of the courſes, or the retention and corruption of the womans ſeede falne into it out of the veſſels. The ſymptomaticall motion of the wombe. The ſuffocation or ſtrangulation of the matrixe.

In this convulſiue motion the midriffe is preſſed or borne vp, which is the chiefe inſtrument of free reſpiration or breathing, and the braine is alſo drawn into conſent which is the chiefe ſeate or tribunall of the Animall faculty, which faculty is the efficient cauſe of reſpiration. Hence it is that in ſuch ſuffocations or ſtrangulations there is an interception of reſpiration, for the inſtrumentall cauſe the midriffe is intercepted, the efficient cauſe the Animal faculty alſo, becauſe the braine is drawn into conſent. The finall cauſe alſo is taken away, for the heat of the heart at that time is very ſmall and requireth therefore no other ventilation but by tranſpiration, which is by the pores of the habit of the body. Why ſuch women do not breath. All the cauſes of reſpiration in this ſuffocation are taken away.

But you muſt marke that I cal not this motion a convulſion, but onely a convulſiue motion; for convulſion properly is, an vnbidden motion of thoſe parts which we vſe to moue at our commandement, but the wombe is not mooued by our willes but by it owne will, wherefore convulſions belong not to the wombe but to the muſcles onely which are inſtruments of voluntary motion; but abuſiuely we may call this a convulſion as *Hippocrates* calleth the Hiccocke a convulſion. What parts ſuffer convulſions.

The third motion of the wombe wee ſayed was mixt, proceeding from a morbous or vnhealthy cauſe and partly from the faculty, as in a great exiccation it runneth vpward toward the Liuer which is the fountaine of ſweete moyſture; for all dried partes doe as it were thirſt after this moyſture with a naturall appetite; and this motion is indeede truely mixt, being partly phyſicall or naturall the dry wombe drawing toward the ſeate of moyſture, or drawing the moyſture vnto it ſelfe as *Galen* interpreteth it; and partly mathematicall or locall it mooving as *Hippocrates* ſayeth, with a kinde of impetuous violence to the *præcordia*; although I am not ignorant that *Galen* in this poynt reproueth his maiſter, and taketh this motion to be meerely Phyſicall or naturall; and is called mathematicall by *Hippocrates* but abuſiuely onely. The 3. mixt motion of the wombe.

QVEST. X. *How the Wombe is affected with ſmelles and ſauours.*

FVrthermore it is not only recorded by antient Authors, but approued by daily experience, that the wombe is much affected with ſauours and ſmelles; ſo that ſome haue beene knowne to miſcarry vpon the ſtench of a candle put out as *Ariſtotle* recordeth is his 8. Booke of the Hiſtory of Creatures and the 24. chapter. But how and by what paſſages this apprehenſion of odours is, few haue ſufficiently declared; wherefore we will payne our ſelues a little and our readers alſo, to lay open this difficulty, becauſe it may be of great vſe for the preſeruation of health, and will not be altogether vnpleaſant to them that deſire to know themſelues. How the wõb is affected with ſmels and ſauours.

As therefore Colour is the onely obiect of the ſight, ſo is odour of the ſmelling; and as the ſight hath the eye as his peculiar & proper inſtrument of ſeeing, ſo is the noſe (I mean principally the partes contayned within it, that is the ſpongy bone and the two proceſſes called *mamillares*) the onely inſtrument of ſmelling: it were therefore very abſurde to imagine that the wombe did ſmell ſauours or ſmelles, becauſe it is not the proper inſtrument of ſmelling, howe then? It is affected with ſauours by reaſon of the ſubtile and thinne vapour or ſpirite which ariſeth from any ſtrong ſented thing; euen as our ſpirites are refreſhed and exhilerated with ſweete ſauours, not by apprehending the ſent of them; but by receiuing a thinne ayrie vapour from them whereby the ſpirites are nouriſhed, enlightned and ſtrengthned; right ſo is the wombe affected with the vapors of things which yeelde a ſtrong ſmell be it pleaſant or vnpleaſant and that very ſuddenly, becauſe it Not vnder the forme of ſmels. But by vapourous ſpirits.

is

is a part of exquiſite ſence. But if it bee ſo, it may be demaunded, why then the wombe is pleaſed with ſweet ſmels and diſpleaſed with thoſe that are vnpleaſant; for it ſeemeth hereby to make choyce of ſmelles euen for the very ſauour and ſent? I anſwere that all thinges which yeeld a noyſome ſmell are vnconcocted and of a bad or imperfect mixture, & therfore they affect the ſence with a kinde of inæquality; or elſe the ſpirits or vapours that ariſe from theſe ranke bodies are impure (whence come faintings and ſwoundings ſometimes,) and ſo defile the ſpirits contayned in theſe generatiue parts.

Obiection.

Solution.

Obiection. Why muſke and Ciuit cauſe fits of the mother, and ſtinking things cure it.

Anſwere. It is a ſigne of an ill diſpoſed wombe ro bee offended with ſweet things.

How noyſom ſmels cure the ſuffocation.

One difficulty there yet remayneth: If the wombe delight in ſweete ſauours, why then doth the ſmell of Amber greece, muſke and ſuch like bring ſuffocation of the mother; and that of *aſſa fœtida* and *caſtoreum* & ſuch like extreme ſtinking things cure the ſame diſeaſe? I anſwere, that all women fall not into ſuffocation vpon the ſmelling of ſweet perfumes or the like, but onely thoſe whoſe wombe is eſpecially euilly affected. For ſweet ſmels hauing a quicke ſpirit ariſing from them, doe inſtantly affect the Brayn and the membranes of the ſame, the membranous wombe is preſently drawne into conſent with the Brayne and moued, ſo as thoſe bad vapours which before lay as it were a ſleep in the ill affected womb, are now ſtirred and wrought vp by the arteries or other blinde paſſages vnto the midriffe, the heart and the braine it ſelfe, and ſo comes the ſuffocation we ſpake off. But thoſe things that yeeld a noyſome ſauour, becauſe they are crude and ill mixt, doe ſtoppe the paſſages and pores of the braine, and do not reach vnto the inner membranes to affect them: they cure alſo the *Hyſtericall paroxiſme* or fitte of the mother, becauſe our nature being offended with them as with enimies rowſeth vp it ſelfe againſt them, and together with the ill vapors excludeth alſo out of the wombe the euil humors from whence they ariſe, euen as in acute diſeaſes nature being prouoked by the ill quality of the humors moueth to criticall excretions, or in purgations when ſhe is goaded with the aduerſe quality of the medicine relieueth her ſelfe by euacuation.

Comparisons

Obiection. Anſwere. The paſſages of theſe ſpirits and vapors.

But you will aske by what paſſages are theſe vapours and ſpirites carried. I anſwere, beſide the open paſſages of the arteries by which ſuch ayrie ſpirits doe continually paſſe and repaſſe, in a mans body there are many ſecret and vnknowne waies which thoſe ſubtile bodies may eaſily finde, conſidering that euen craſſe and thicke humours doe ordinarily follow medicines we know not by what paſſages; as when a little *Elaterium* euen a graine or two will purge away three or foure pintes of water or more which lay before in the capacity of the *Abdomen*, drawing it thence into the guttes, and yet we knowe no direct paſſages from the one part to the other; and this hath made men to ſay that as open as the body of glaſſe is to the light although it be very ſolide, ſo open is the whole body as to external aire of which we finde our body oftentimes very ſenſible, ſo to humours, much more to ſpirits and thinne and ſubtile vapours. Experience hereof we haue in the vſe of Tobaceo, for a man ſhall often finde it ſenſibly in his toes and fingers ends preſently vpon the taking.

Dropſy water how purged.

The working of Tobaeco in the fingers ends.

But of this we ſhall take leaue in the next diſcourſe to ſpeake a little more largely ſeeing it not onely concerneth almoſt all women, but may ſerue ſomewhat to ſtay their minds vpon many accidents which euery day befall them

QVEST. XI. *Of the wonderfull conſent betweene the wombe and almoſt all the parts of womens bodis.*

An enumeration of the parts with which the wombe doth ſympathize.

Concerning the wonderfull ſympathy that is betweene the wombe and almoſt all the parts of womens bodies, that place of *Hippocrates* in his Booke *de locis in homine* is moſt remarkable, where he ſayeth, *That the wombs of women are the cauſes of all diſeaſes*: that is to ſay, The wombe being affected there follow manifeſt ſignes of diſtemper in all the parts of the body, as the Brayne, the Heart, the Liuer, the Kidneyes, the Bladder, the Guts, the Share-bones: and in all the faculties, Animall, Vitall, and Natural; but aboue all, the ſympathy betweene the wombe and the breaſtes is moſt notable, yet will we not ſticke a little to inſiſt vpon the former particulars.

The conſent betweene the wombe and the braine.

Betweene the Brayne and the wombe there is very great conſent, as well by the nerues as by the membranes of the marrow of the backe: hence in affects of the mother come the paynes which ſome women often feele in the backe-parts of their heade, their frenzies or franticke fittes, their dumbe ſilence and indeede inabilitie to ſpeake, their ſtrange fearefulneſſe, ſometimes loathing their liues yet fearing beyond meaſure to die; their conuulſions, the calligation or dimneſſe of their ſight, the hiſſing of their eares, and a world of ſuch like

and

and of vnlike accidents.

Betweene the heart and the wombe the conſent is made by the mediation of manie notable Arteries called Spermaticall and Hypogaſtricall, that is, the Arteries of ſeede, & of the inferiour part of the lower belly. Hence come light faintings, deſperate ſwoondings, the ceſſation of breathing and intermiſsion of the pulſe, the vſe of them both being taken away by a venemous breath, which diſſolueth the naturall heate of the heart; and ſuch women liue onely by tranſpiration, that is by ſuch aer as is drawne through the pores of the skin into the Arteries and ſo reacheth vnto the heart; ſo that it is impoſsible almoſt to perceiue whether ſuch women do yet liue or no, and doubtleſſe many are buried in ſuch fits (for they will laſt ſometimes 24. houres or more, and the bodies grow colde and rigid like dead carkaſſes) who would recouer if ſpace were giuen.

Betweene the heart and the wombe.

What it is to liue by tranſpiration.

Many wome buried quick.

In my time there went a woman begging about this Cittie, who had a Coffin carried with her, and oftentimes ſhe fell into thoſe Hyſtericall fits, and would lye ſo long in them, nothing differing from a dead carkaſſe, till the wonted time of her reuiuing. Hence it may be came the Prouerbe, *Thou ſhalt not beleeue a woman* (that ſhe will die) *no not vvhen ſhee is deade.*

A Hiſtorie.

This is a ſore accident, and therefore it ſhall not bee amiſſe to tell you how you may know whether ſuch haue any life left in them or no. A downy feather applyed vnto their mouth will not ſometimes ſerue the turne, for you ſhall not perceiue it to ſhake and yet the woman liues; the onely infallible token of life or death, is if you apply a cleare looking glaſſe cloſe vpon their mouths, for then if they liue the glaſſe will haue a little dew vpon it, if they be dead none at all. But the ſafeſt way is not to be ouer-haſty to burie women, eſpecially ſuch as dye ſuddenly and not vppon euident cauſe, til 2. or 3 dayes bee ouer, for ſome haue beene knowne ſo long after their ſuppoſed deaths to reuiue, and ſome taken agayne out of their Coffins haue beene found to haue beaten themſelues vpon their reuiuing before their ſtifling into the graue, if we will beleeue the reports of ſuch as we haue no great reaſon to miſtruſt. But to returne to our ſimpathy.

How to know whether a woman be aliue or dead.

A miſerable caſe.

Betweene the Liuer and the wombe ſee aboue.

Betweene the Liuer and the wombe the ſimpathy is a little aboue expreſſed, to which we may adde, that as from other parts affected, ſo from the ill affection of the womb, ſometimes come Iaundiſes, Cacexies, that is, ill habits of the bodie, green ſickneſſes, and then which nothing is more ordinary, the Dropſie it ſelfe.

Iandiſes.

Greenſickneſs

Dropſies.

Betweene the kidnies & the wombe.

Betweene the Kidneyes and the wombe the conſent is euident in the torments and pains of the Loines, which women and Maids haue in or about the time of their courſes. Inſo much as ſome haue told me they had as leeſe beare a childe as endure that paine; and my ſelfe haue ſeene ſome to my thinking by their deportment, in as great extremity in the one as in the other. This conſent commeth by the mediation of the ſpermaticke veines, for the left of theſe veſſels ariſeth out of the emulgent or kidny vein on the ſame ſide. The like may be ſaid of the ſimpathie between the womb the bladder and the right gut, for vpon inflamation of the wombe, as *Hippoc.* writeth in his firſt Booke *de Morb. mulier.* commeth the diſeaſe of the right gut, called *Teneſmus*, that is a vaine deſire to empty the belly, and alſo the *Stranguric*, becauſe the inflamation preſſeth both partes; ſo that neither the excrements nor the vrine can be long kept.

Betweene the bladder, the right gut, and the wombe.

This conſent is by reaſon of the vicinity or neighbour-hood of the parts, as alſo by communion. The communion is by the membranes of the *Peritonæum* which tye the wombe to theſe partes, and by their common veſſels, for from the ſame braunch of the Hypogaſtricall Veine come ſmall riuerets to the bladder, the wombe and the right gut. Neyther is the Connexion of the wombe with the ſhare-bene and the Leſk to be ouer paſſed without remembrance, which is made by two exceeding ſtrong Ligaments, for which cauſe in the ſuffocations of the matrix, we apply Cupping-glaſſes to the ſides of the Share-bones & to the Leſke, that by theſe Ligaments as by certaine cords the wombe labouring vpwarde may be retracted and drawne backe.

How this conſent commeth

The Connexion of the womb.

Cupping glaſſes applied.

But aboue all other Conſents is that ſimpathy betweene the womb and the breſts which exceedeth euen admiration it ſelf, and is diuerſly manifeſted by the frequent tranſlation of humours out of the breaſts into the wombe, and out of the wombe into the breſts; by the ſignes of the wombe affected which are taken from the inſpection of the breſts; from the vſuall cures of the diſeaſes of both partes; and finally from the knowledge wee haue by the breſts of the condition of the infant yet contained in the wombe. Beſide the authority of *Hippocrates* in his Booke *de Glandulis*, we haue many examples of the firſt, that is of the tranſlation

The ſimpathy betweene the breſts and the womb.

How it is manifeſted.

ſlation of humors too and againe betweene theſe parts.

Blood out of the Nipples.

Amatus Luſitanus in his ſecond Century the ſecond Cure reporteth, that hee ſaw two women, who vpon the ſuppreſsion of their courſes did auoid bloode out of the Nipples of their breaſts at certaine and ſet times and returnes, imagine ſhortly after the vſuall time of their courſes. And *Hippocrates* it appeareth had ſeene the like, for hee writeth in the 40. Aphoriſme of the fift ſection, that thoſe women who haue blood gathered about their breſts are in danger to grow mad and raging. *Braſſavolus* reporteth, that hee ſaw a woman out of whoſe breſts iſſued blood in ſtead of milke; and this may well be, for we all knowe that Nurſes haue their courſes ſtopped, becauſe the blood returneth from the wombe vnto the breſts, where it is turned into milke vſually; that in this example the blood came out vnturned that was the rarity.

Milk auoided by the womb and by Vrine.

We haue ſeene alſo on the contrary many women in childebed who haue auoided by the womb and the bladder great quantities of milke. This tranſlation of humors therefore is ordinary. Somtimes the blood goeth other wayes, as I haue known

A ſtrãge thing of a Maide of Lincolnſhire

an ancient maide in Lincolnſhire, who euer about the time ſhe ſhould haue her Courſes, for many daies together hath founde in her mouth in the morning when ſhee awaked, the quantity of foure or fiue ounces of blood more or leſſe, and moſt part of it caked as it is in a Saſer after blood letting, and this continued with her for many yeares together, but hir teeth rotted fowly with it, her breath grew noiſome, and ſhe faint at thoſe times, but without any other diſeaſe.

The conditiõ of the wombe known by the breſts. *Hippocrates.*

For the ſecond, that is, that by the inſpection of the breaſts the condition of the wombe may be knowne, we will alledge onely that oracle of *Hippocrates* in the ſixt Booke of his *Epidemia* and the fift ſection. If the Nipples of the breaſt and that which is vſually red about them, grow paled or yellowiſh, then is the wombe diſeaſed.

How to ſtay immoderate Courſes.

For the third, that the cure of the affectes of theſe parts demonſtrate their ſympathie, we may remember that which *Hippocrates* hath deliuered, and is continually put in practiſe as neede requireth, viz: *If you would ſtay the immoderate fluxe of a womans Courſes, then ſet a great Cupping-glaſſe vnder hir breaſt*; for that will draw backe the bloode by an accuſtomed way.

The breaſts ſhew the age, ſex & health of the infant in the womb

Finally, by the inſpection of the breſts, the age, the ſexe, and the health of the Infant yet in the wombe is demonſtrated. *Hippocrates* in his Booke *de Natura pueri. As ſoone as the infant beginneth to moue, the Milke acquainteth the Mother with it, for preſently vpon the motion the breaſts ſwel, and the Nipples ſtrut out.* If therefore the breaſts bewray the time of the infants mouing then doe they alſo declare the age; for a man childe mooueth the thirde month, a maiden childe the fourth. And for the ſexe, *if the right breſt*, ſaith *Hippocrates* in

The Age.

the 38 Aphoriſme of the fift Section, *doe conſume or fall, it fore-tokeneth an abortment of a male childe; if the left of a female ſo if the right breſt ſwel and ſtrut; it is a ſigne that a male childe is conceiued, if the left a female.*

How the breſts foretell the health or ſickneſs of the Infant.

Laſt of all, the inſpection of the breaſts doth foretel the health or ſickneſſe of the infant. For if in a woman with childe the breaſts do ſuddenly fall ſwampe as we ſay, then will ſhee abort or miſcarry, ſo ſaith *Hippocrates* in the 37. Aphoriſme of the fift ſection. All theſe are moſt euident and neceſſary arguments of the conſent and ſympathy between the breſts and the wombe: but becauſe almoſt all ſimple ſympathies are made by the communion of veſſels, we will in a few wordes lay open vnto you how the veſſelles of theſe two partes doe

How the veſſelles of theſe parts do communicate.

communicate one with another, as *Laurentius* conceyueth it.

The common receiued opinion.

Almoſt all Anatomiſtes do agree, that the branches of the aſcending Epigaſtrick veine, do meete in one with the branches of the deſcending Mammarie veine; and that there are in theſe branches many Anaſtomoſes or inoculations. I doe not deny (ſaith *Laurentius*) the coition or coniunction of theſe branches, but ſeeme to my ſelfe to haue found more patent, large, and nigher wayes for this communion. For the Epigaſtricke veine is not diſ-

another more likely.

perſed in his branches through the wombe, but ariſeth more commonly from a branch of the Crurall veine.

The Mamarie Veine.

Likewiſe that veine which they call *Mammaria* or the breſt veine, runneth by the inner part of the breſt-bone to nouriſh the Triangular Muſcle, neither doth it ſend any branches to the breſts vnleſſe they be very ſmall and threddy. I ſuppoſe therfore (ſaith he) that blood, milke and other humours doe flowe backe by the Hypogaſtricke and ſpermaticall Veynes

The Hypogaſtrick and ſpermaticall.

(which are proper veines of the wombe) vnto the trunke of the hollow veine, and out of it into the vein called *Axillaris* or the ſhoulder vein, from which there ariſe two notable cheſt veines called *Thoracica*, which do water the Muſcles of the cheſt, and the Glandules or kernels of the breſt.

On

On the other side, I conceiue that the milk returneth by the *Thoracicall* veines to the *Axillarie*, from it vnto the trunke of the hollow veine; from which it passeth somtimes by the spermaticke branch into the womb, sometimes by the *Hypogastricall* partly into the womb partly into the bladder, from whence come oftentimes those milky waters which wee call *Lactea*, that are made after the woman is deliuered. There is also a nearer way for the milk to passe by the wayes of the vrine through the emulgent veines.

Milky waters made after women labour.

QVEST. XII. *Concerning the Acetabula, the hornes and coates of the wombe.*

COncerning the endings of the vessels in the bottome of the womb, to which the after-birth cleaueth till it be seuered either by the strength of the Infant, or after by the dexterity of the Midwife, they are called *Acetabula* in Latine; in Greeke *Cotyledones*, which are nothing else but the ioyning of the ends of two paire of veines (one comming from the spermaticall another from the *Hypogastricall* braunch) with the mouths of the vmbilicall veine, and so making a sumphysis or connexion between the mother and the Infant.

Cotyledones what they are

The latter Anatomists deny that there are any such conspicuous in women, but only in Sheep and Goates: *Aristotle* sayth in his 3. Booke of the *Historie* and the second of the *Generation of Creatures*, they are onely to be found in horned Beasts: we say. There is a 3. fould acceptation of this word *Acetabula* in *Galens* Booke of the dissection of the wombe. First they signifie visible holes into which the vessels of the wombe doe ende in fashion resembling the bearbe called Venus Nauill which we call in English Penny-grasse or hippewort. These *Acetabula* are neuer found in women but in Sheep and Goates are very conspicuous. Secondly by *Acetabula* we vnderstand the mouthes of the vesselles swelling like Nipples. And lastly, they are the ends of the vessels at the bottom of the wombe ioyning with the vmbilicall or Nauill veines. In this third acception no man will deny but that they are to be found in the wombe of a woman.

In what Creatures they are found.

What *Galen* meaneth by *Acetabula*.

How they are to be found in women.

These mouthes of the vessels sayeth *Hippocrates* in the 45. Aphorisme of the fift Section, if they be ful of mucous or slimy water are the cause of abortment, because it dissolueth the continuity or connexion of the Infant with the mother.

A cause of abortion.

Concerning the horns of the womb which bud out at the sides therof, *Diocles* first of all men made mention of thē. *Galen* & almost all Anatomists following him do confesse them to be in the wombe of a woman; but the truth is, that they are only conspicuous in Sheep, Goates, and Kine. Indeede the sides of a womans wombe doe swell a little and are raysed where the leading vessels doe end, but not sufficiently to expresse the forme of hornes or Nipples.

Of the hornes of the wombe

Lastly, *Galen* seemeth to speake diuersly concerning the coats of the wombe, somtimes affirming it hath but one, as in the third Booke of Naturall faculties: againe in his Booke of the dissection of the wombe he sayeth it hath two; the outward neruous, the inward venal; the outward simple, the inward double; but these places may easily be accorded: for whereas he sayeth it hath but one, he vnderstandeth the proper coate of the wombe which is the thickest of all the coates of the body; but when he sayeth it hath two, he addeth to the proper a common coate comming from the *Peritonæum* or Rim of the Belly.

Of the coates of the wombe

Galen reconciled to himselfe.

QVEST. XIII. *Of the Membrane called Hymen and the markes of virginitie*

IT hath been an old question and so continueth to this day, whether there be any certaine markes or notes of virginity in women and what they are. Almost all Physitians thinke that there is a certain membrane sometimes in the middest of the necke of the wombe, sometimes immediately after the passage of the water, placed ouerthwart which they call *Hymen* This membrane they say is perforated in the middest to giue way to their courses, and is broken or torne in their first accompanying with men; and therefore they call it *Claustrum virginitatis*, *The lock of Virginity*: for which their opinion they bring testimonies out of the holy scriptures. For it was a custome among the Iewes that the Brides should not accompany with their Bridegroomes but vpon a sheete, wherein the bloud should bee kept, which was giuen to the Brides parents as a witnesse of their daughters true virginity. *Falopius* yeeldeth to this opinion, *Columbus* writeth that he hath seene it, *Laurentius* sayeth

What the *Hymen* is thought by some to be

The lock of virginity.

A custome among the Iewes.

Laurentius his opinion.

that he hath cut vp mayden children borne before their time, of three moneths, of 3.4,6. and 7. yeares old, and yet hee could neuer finde it though he searched curiously for it with a Probe; which (sayth he) might haue beene felt to resist the Probe if there had beene any such thing, and therfore he thinketh that it is but a meere fable. Yet notwithstanding thus far he giueth credite to *Columbus* and *Falopius*, that hee thinketh there is sometimes such a membrane found; but if it be stretched ouerthwart in the middle or at the end of the neck of the wombe, then hee thinketh it is not Naturall, but an Organicall disease or of the instrument being faulty in conformation. So oftentimes at the very end or extremity of the lap there groweth sometimes a membrane sometimes a Caruncle or small peece of flesh, which affection or disease *Auicen* calleth *clausuram* or *the incloſure*; the Greeians call it ἐμφυσιν & such women ἄπορους, that is *imperforatas*. Some are so from their infancie, some by mishap, as by an vlcer, inflamation or some other tumor against nature; but hee that will reade more of this disease let him resort to *Aetius*, *Paulus*, *Celsus*, *Albucasis* and *Oribasius* who thinketh that there is at all no such matter. Wee must therefore finde out some other locke of Virginitie. Some thinke the sides of the neeke of the wombe do cleaue together in mayds and in the deuirgination are separated. *Almanzor* writeth that the necke of the womb in virgins is very narrow and rugous, & those foulds or plights are wouen together with many small veines and arteries which are broken in the first coition. *Laurentius* is of opinion that those foure Caruncles described in the history of the womb and placed not ouerthwart but longwise, doe so ioyne together in virgines by the interuening of exceeding thin membranes, that in the first coition both the Caruncles are fretted and the membranes torne, and that thence floweth the blood. This ioyning of the Caruncles *Seuerinus Pineus* a learned Chyrurgion belonging to the French King hath notably described in a Booke which hee wrote of purpose concerning the marks or notes of Virginity, which wee also remembred before in our discourse. And thus much shall suffice to haue spoken concerning the partes of Generation both in men and women, and the Controuersies thereto belonging.

Imperforate mulieres.

The End of the Controuersies of the Fourth Booke.

THE FIFT BOOKE,

Wherein the Hiſtorie of the Infant is accurately deſcribed, as alſo the principles of Generation, the Conception, the Conformation, the Nouriſhment, the Life, *the Motion, and the Birth of the Infant, as neere as may be according to the Opinion of* Hippocrates.

The Præface.

FInding this following diſcourſe of the forming of the Infant in *Laurentius* immediately following his Hiſtory of the parts of Generation, and conſidering that it contained many things not only profitable but pleaſant alſo, I thought good (gentle Reader) to make thee partaker thereof. And the rather I heere to perſwaded my ſelfe, becauſe at the firſt ſight I conceiued that my ſelfe alſo in this *my conception* ſhold find pleaſure. But it hapneth all otherwiſe with me then it is in naturall generation, where the infant is begotten in pleaſure, though brought forth in paine. For this I aſſure thee was begotten with much paine & trauel, and if thy gentle hand help not in the birth, that alſo wil be very irkſome. I know I ſhalbe taxed by ſome for hanging too long in this argument, but I alſo know that all the Authority blame hath, is frō the Authors therof. The ſubiect of our preſent diſcourſe is the hiſtory of the Infant, of the Principles of his generation, his Conception, Conformation, Nouriſhment, Life, Motion and Birth. Verilie a knotty & ſnarled skaine to vnreele; a thicket, wherein he that haſteth with bold raſhneſſe and temerity ſhall offend & ſtumble at euery ſtep; he that is diligent ſhall entangle himſelf, and he that is guided by blinde ignorance ſhall light vpon pits and bogs; ſo that it will bee impoſsible for any man that enters into theſe Liſtes fairely to acquite himſelfe. The further he wadeth in this Riuer, the greater confluence of waters wil ouertake him, the deeper muſt he ſound if he will finde the bottome.

The argument of the Booke following.

We begin with the ſeed which is like the *Chaos*. Vpon which as the ſpirit of God moued whilſt it was without forme; firſt to preſerue it & after to diſtinguiſh it, ſo it is in this maſſe of ſeed; the Formatiue ſpirit broodeth it firſt. After as a Spider in the center of her Lawnie Canopy with admirable skil weaueth her Cipreſſe web, firſt hanging it by ſlender Ties to the rooſe, and after knitting her enter braided yarn into a curious net: ſo the ſpirit firſt faſtneth the ſeed to the wombe with membranes and ligaments, after diſtinguiſheth it into certaine ſpermaticall threds which we call *Stamina corporis*, the warpe of the bodie. To theſe when the ſecond principle which is the Mothers blood accrueth, it filleth vp their voyde diſtances and ſo amaſſeth them into a ſolid body, which euery day is nouriſhed and encreaſed into all dimenſions, furniſhed alſo with motion, ſenſe and finally with a reaſonable ſoule. Then as impatient of ſo cloſe impriſonment, as vnſatisfied with ſo ſlender allowance, it inſtantly ſtriues till this Little world arriues into the great.

The maner of the Infantes production outof the ſeed

After we haue thus perfected the Hiſtory, we deſcend vnto the many and buſie Controuerſies depending thereupon. Theſe concerne the differences of the ſexes, the Nature of the Seed with the maner of his excretion; the qualities of the Mothers blood, the accidents hapning vnto vs there-from, with the cauſes of the monthly euacuation of the ſame; the manner of Conception as well lawful, both ſimple, double & manifold, as illegitimate and Monſtrous; the order and times of Conformation, not onely of the infant it ſelfe, but alſo of the membranes and veſſels to which it is faſtned; the Similitude of the children to their parents; the admirable effects of the Imagination; the cauſes of ſuperfœtation, the maner & matter of the infants Noriſhment; the admirable Vnion and communion of the veſſels of the heart; how he breatheth by Tranſpiration, not by Reſpiration; the works of his Vital & Animall ſpirits; his Scituation or poſition in the womb; and finally, the nature, differences times and cauſes of his Birth, togither with the conſequences thereof. All theſe with many more falling in with our diſputations we heere exhibit for their ſatisfaction whome they may concern, & who are more deſirous to know them, then able of themſelues to attaine thereto.

The Controuerſies conteined in this Booke.

CHAP. I.

What things are necessary toward a perfect Generation.

The propagation of kindes diuerse.

THE propagation of kindes, as it is made in the Elements by Transmutation, and in Mettals by Appositon, so it is in creatures by Generation. But of Generation there are diuers maners. For some creatures engender without coition onely by affrication. Others quite contrary to the ordinarie course of Nature, by a reception of the instrument of the female. Some females also do engender within themselues without the help of the male. There are also some creatures which are engendred onely by putrifaction without either male or female: others are sometimes bred out of putrifaction, other-whiles out of seede. But all these kinds of generation are maimed and imperfect, and therfore the creatures so procreated, are called ἄναιμα, φολιόνλα ἢ ἄναιμα ζῶα vnbloodye and infectile creatures, of which a man of worthy memory among vs, D. *Muffet* hath written a learned and curious discourse, which happely time may communicate vnto the world. The Generation of man and of the perfect creatures is farre more noble, as whereto three things are alwaies required; a diuersity or distinction of sexes, their mutuall embracements and copulations, and a permixtion of a certaine matter yssuing from them both which potentially containeth the *Idea* or forme of the particular parts of the body, and the fatal destiny of the same, & this the Grecians call μοῖραν πεπρωμένην.

Insecta Animalia.

D. Muffet.

Three things required to perfect generation.

The distinction of the Sexes is especially necessary, because Generation is not accomplished but by seeds which must be sowne in a fruitefull ground, that is, shedde into such a place as wherein their dull and sleepy faculties may be raised and rowzed vp, which we call Conception, and afterward that which is thus conceiued, may be cherished, nourished, and so attaine the vtmost perfection of his kinde. But because man was too hotte to performe this office (for his heate consumeth al in him and leaueth no remainder to serue for the nourishment of the infant) it was necessary that a woman should bee created (for wee will insist now onely in mankinde) which might affoord not onely a place wherein to cherish and conceiue the seede, but also matter for the nourishment and augmentation of the same. Both these sexes of male and female do not differ in the kinde as we cal it or species, that is, essentiall form and perfection; but only in some accidents, to wit, in temper and in the structure and scituation of the parts of Generation. For the female sexe as well as the male is a perfection of mankinde: some there bee that call a woman *Animal occasionatum*, or *Accessorium*, barbarous words to expresse a barbarous conceit; as if they should say, A Creature by the way, or made by mischance; yea some haue growne to that impudencie, that they haue denied a woman to haue a soule as man hath. The truth is, that as the soule of a woman is the same diuine nature with a mans, so is her body a necessary being, a first and not a second intention of Nature, her proper and absolute worke not her error or preuarication. The difference is by the Ancients in few words elegantly set downe when they define a man, to be a creature begetting in another, a woman a Creature begetting in her selfe.

1 Distinction of sexes.

A barbarous conceite.

The second thing required to perfect generation, is the mutuall embracements of these two sexes which is called *Coitus* or coition, that is, going together, A principle of Nature whereof nothing but sinne makes vs ashamed. Neither are these embracements sufficient, vnlesse from either sexe there proccede a third thing, by which and out of which a newe man may bee generated. The effusion therefore of seeds (which are indeede the immediate principles of generation) is altogether necessary, otherwise it were not a generation, but a new Creation. These three things therefore must concurre to a perfect generation, a distinction of sexes, their copulation, and an emission of seede from them both.

2. Copulation

3. Emission of seede.

CHAP. II. *Of the Principles of generation, seed & the Mothers blood.*

Two principles of generation.

WHatsoeuer is generated (saith the Philosopher) is begotten out of somwhat and from somvvhat; else vvere it as vve said a nevv Creation no Generation; Wherfore the Ancients haue resolued that tvvo principles must concurre to generation, Seed & the Mothers blood. The seed is the principle *à quo*, that is, the efficient

cient or workman which formeth the Creature, and *ex quo*, that is, the matter whereof the ſpermatical parts are generated. The blood hath onely the Nature of a matter and paſſiue principle, (we therefore vſe the Schoole words becauſe they moſt emphatically expreſſe the thing) for out of this bloud the fleſhy partes are generated and both the ſpermaticall and the fleſhy are nouriſhed. The Nature of both theſe principles is very obſcure, which we will endeuour to make plaine on this manner. The Seed is called in Greek γονὴ, σπέρμα, σπόρος, in Latine *ſemen*; *Genitura*, betweene which *Ariſtotle* puts a nice difference, but *Hippocrates* takes them promiſcuouſly for the ſame. And ſo we wil call it Seed and Geniture, which we define. A body moyſt, hot, frothy and white, conſiſting of the remainders of the laſt and perfect nouriſhment and the ſpirites mingled therewith, laboured and boyled by the vertue of the Teſticles, and ſo made fit for the perfect generation of a liuing Creature. This definition doth fully and ſufficiently expreſſe all the cauſes, the formall, the materiall, the efficient and the finall.

A perfect definitiõ of ſeed.

The humidity, heate, frothineſſe and whitenes do make the forme. The ſeed is moiſt δυνάμει & συνάσει; that is in Power and Conſiſtence: and therfore *Cteſias* Phyſitian to King *Artaxerxis* was deceiued, who thought that the ſeed of an Elephant was ſo dry that it wold become like vnto Amber; but it is neceſſary it ſhold be moyſt, as wel that it might be moulded by the efficient, as alſo becauſe it muſt containe the *Idea* or ſpecificall forme of all the particles. Hot it is, that it might produce thoſe formes, for cold entreth not into generation vnleſſe it be by accident. It is frothy by the permixtion of the ſpirits and by their motion; whence it is that the Poets call Venus ἀφρογένειαν as if ſhee were made of the froth or ſoame of the ſea; and therefore ſeede when it is annoyded ſoone looſeth his magnitude, becauſe the ſpirits which houed it vp do vaniſh; whereas phlegme and other mucous matters keepe their bulke becauſe they haue little ſpirites in them. It is white, becauſe it is boyled in the Teſticles and the ſpermaticall veſſels whoſe inward ſuperficies is white, as alſo becauſe it containeth in it much ayre and ſpirits: and therfore it is but a vaine thing which *Herodotus* reporteth of the ſeed of *Negroes* or Blacke-Moores, that it is black.

The forme cauſe. *Cteſias* his error. How moyſt. Why hot. Why frothy.

The matter of the ſeede is double, the ouerplus of the laſt nouriſhment and ſpirits. That ouerplus is bloud, not altered and whitned in the ſolid parts as the Antients imagined, but red, pure and ſincere, derined to the Teſticles and the preparing veſſels from the trunke of the hollow veine through the ſpermaticall veines. And hence it is that thoſe men who are very immoderate in the vſe of Venus, auoyde ſometimes bloody ſeede, yea nowe and then pure blood. Of this minde alſo is *Soranus* and therefore it is, ſayeth he, that the Antients called thoſe that were of a kindred *Conſanguineos*, *i.* of the ſame bloud, becauſe the ſeed is made of bloud, which phraſe we alſo at this day retayne. The other matter of the ſeede is that which maketh it fruitfull; to wit, thoſe Spirites which wander about the body; theſe potentially conteine the *Idea* or forme of the particular parts (for they are ayrie and moyſt eaſily taking any impreſſion) and paſſe through the ſpermaticall arteries to the mazey veſſels of the *Paraſtatæ* and the Teſticles. There they are exquiſitly mingled with the bloud, and of two is made one body, like as of that admirable complication of the ſpermaticall veine and arterie is made one veſſell.

The material cauſe double bloud. *Soranus*. Why kinſmen are called *conſanguinei*. And ſpirits.

This double matter of the ſeede *Hippocrates* expreſſeth by the names of fire and water, for ſo he ſayth ſometimes, that the ſeed is fire, ſometimes he calleth it water. It is firie by reaſon of the ſpirites which haue in them an impetuous violence or nimble agility, whence alſo it is called γονὴ πύρετος *ſemen turgens*, ſwelling ſeede. In reſpect of the bloud which is the corpulency or bulke thereof, it is called *aqueum* watery. Both theſe *Hippocrates* in his Booke *de diæta* in one ſentence elegantly expreſſeth, where he ſayth, *The Soule creepeth into man being made of a mixture of fire and water*: By the Soule he meaneth the Seed, which therefore in other places he calleth ἔμψυχον that is Animated: by Fire hee meaneth the ſpirits and the in-bred heat which is commonly called *innatum calidum*; by *Water* he meaneth the Alimentary moyſture which is bloud. The fire ſayeth hee moueth all things through and through, the water nouriſheth all things through and through. In reſpect therefore of this double matter the ſeede carrieth the nature of both the principles of generation; of the materiall in reſpect of his craſſament or thicke body out of which as out of their proportionable matter the ſpermatical parts are generated; of the efficient and of the forme in reſpect of the ſpirits wherewith it is fulfilled. I ſayed that the ſeed was called an efficient and formall principle, becauſe the efficient and the forme are two actors in reſpect of their different operations, though indeede and trueth they are but one and the ſame. For the

Hippocrates. How ſeed is firie. How watry. A hard place of *Hippocrates* explained. How ſeed is both an efficient and materiall cauſe.

forme

forme being diffused through the matter, maketh it to be that which it is & no other thing, and it is called εἶδος the species, or ἐντελέχεια the act: but considerit as it affecteth, moueth, disposeth and worketh the matter into a proper and conuenient habitation for it selfe, and then it carrieth the nature of an efficient. The seede in respect of his bodie yssueth onelie from the vessels; but in respect of his spirits which wander vp and downe and through all, it may be sayde to yssue from all the parts of the body. This therefore is the double matter of the seede, blood and spirits.

The efficient cau'e of the seede.

The Efficients and authors of the seede are onely the Testicles, for the power called γεννητικὴ δύναμις, that is, of making seede, we attribute first of all and originally to the testicles. To the spermaticall vessels secondarily *per συμπάθειαν*, that is, by influence and irradiation from the testicles.

The finall cause.

The last part of the definition designeth the finall cause of the seede, to wit, the generation of a liuing creature, and the nourishment of the testicles. And thus it appeareth how this definition of seede is accomplished euery way and complete.

Seede of two sorts.

Furthermore, seede is of two sorts whatsoeuer the *Peripateticks* prattle to the contrary, one of the male, another of the female, because in both sexes there are by Nature ordained Organs or instruments for the preparing, boyling and leading thereof; as also the same causes of pleasure and delight in the spending or euacuation. But yet the seede of the male is the first principle of generation and more actiue or operatiue; the Females the second and lesse operatiue, yet they are both fruitfull and powerfull for procreation, but neyther of them auaileable without the helpe of the other.

Of the Male.

The Female.

Two kinds of seeds in both sexes.

Hippocrates in his first Booke *de Diæta* maketh mention of a double kinde of seed in both sexes, the one strong & hot, the other weaker and colder. The first he calleth *semen masculi* or male seede, the other *semen fœminium*, or female and fœminine seede: out of the diuers mixtion whereof, and as they ouercome one another, hee thinketh that a male or female creature is generated. And thus much for the first principle of Generation, which is Seede.

CHAP. III. *Of the Mothers Blood, the other principle of Generation.*

What partes are made of this blood.

THE other principle of our Generation is the Mothers Blood, to which we ascribe the Faculty of suffering onely, and not of dooing, that is to say, it is onely a principle which is wrought vpon by the seed, but it selfe worketh not in the generation of man.

Menstruall purgations.

Of this blood are the *Parenchymata* of the bowels made, as also the flesh of the Muscles; with this as well the spermaticall as the fleshy parts are nourished, doe encrease and attaine their seuerall perfections. This bloude wee thinke is of the same nature with that which at certaine times euery moneth is purged out by the wombe, in which respect *Hippocrates* first called it καταμήνιον αἷμα, that is, the Menstruous or monthly bloode.

A definition of the courses

The Nature of this blood entangled in a thousand difficulties we will make plaine by this definition. The Menstruous blood is the excrement of the last Aliment of the fleshy parts, which at certaine times and by standing periods is in a moderate quantity purged by the wombe, but originally ordained for the Generation and Nourishment of the New creature. This definition expresseth six heads concerning the menstruall blood: the matter, the Efficient cause, the vniuersall time, the particular time, the quantity, the wayes of euacuation, and the vse which hath the nature of the finall cause.

The matter of the menstruous blood is the ouer plus of the last Aliment. For in the nature of woman there is a superfluity more then she spendeth for many reasons. First, because her heate is but weake, and cannot discusse or euaporate the reliques lefte after the parts are satisfied; secondly because of the softnesse and loosenesse of their flesh; whence it is that a womans body is scarsely perspirable, that is, in respect of men they sweate but little. Thirdly, by reason of their course of life and order of diet. For they eate more moist meates, they vse bathing oftner, they sleepe more, and in a word their life is more sedentary and idle, at least they vse lesse exercise; for these reasons a woman among all creatures is followed with these monthly euacuations.

We call the matter of this bloud an Excrement, not that it cannot bee assimulated or is of a hurtfull or noxious quality like an vnprofitable excrement, but because the quantitie thereof redoundeth after the flesh of the parts is satiated and filled, and is returned into the veines and thence as an excrement vomited out by Nature offended with an vnprofitable bur-

burden, for there is a satietie euen of that which is good. And this is that affluence and refluence *Hippocrates* speaketh off, that tide of the blood sometimes flowing, again ebbing sometimes. For when the veines strut with fulnesse the hot flesh draweth the bloud vnto it, which, when that attraction is satisfied and ceased, ebbeth againe into the veines. This blood therefore is laudable and Alimentary, and as *Hippocrates* writeth in his first Booke *de morbis mulierum*, floweth out red like the bloud of a sacrifice and soon caketh if the women be sound. *Hippocrates* expounded.

The veines being fulfilled with these remaynders of the Aliment, and burdened with the wayght of the blood whose quantity onely is offensiue vnto them, they solicite Nature to excretion. Nature, being alwayes vigilant for her own behoofe, and a true louer and cherisher of her selfe, by the expelling faculty which she hath alwayes at her command driueth out these reliques. For as a man that hath lost one or both his legges, if hee continue that fulnesse of dyet which hee vsed before, is often solicited with a great issue of blood by the siedge, because the liuer sanguifieth as much as it was wont, which yet there wants one part or more to consume it: euen so and after no other manner is this menstruall euacuation accomplished, by Nature not being able to dispose of that plenty which by the Liuer is ministred. The efficient cause of the courses.

But because Nature doth all her businesses in order and therefore prescribeth lawes vnto her selfe, she doth not endeuour this excretion in euery age, at all times, nor euery day, but at set times and by determined periods, which shee of her selfe neither anticipateth nor procrastinateth; that is, doth not either preuent or foreslow vnlesse shee be prouoked and hastned before her time, or else hindered or interrupted at her owne time. These Natural times are either vniuersall or particular. The Vniuersal time, all men do accord, beginneth for the most part in the second seauen yeares, that is at 14. yeares olde, and endeth the seauenth seuen, that is at 49. or 50. Now the reason why this bloud floweth not before the 14. yeare is this, because both the vessels are narrower, and beside the heate ouercome with the aboundance of the humour cannot expell the reliques, which after it hath gotten more strength it is able to maister and driue as it were out of the field. Adde hereto that in the first yeares a great part of the bloud is consumed in the growth of the body; and beside before the woman is fit to conceiue, Nature doth not bestow this matter of the menstruall blood vpon her. The vniuersal time of the courses, and the reasons thereof.

Now at the second seauen yeares the heate begins to gather strength, to burst foorth as the Sunne in his brightnes, and to rule in the Horizon of the body; from which heate doe proceede as necessary consequencies, the largenes of the wayes and vessells, the motions and commotions of the humours, their subtilty or thinnesse, and finally the strength of the expelling faculty. At that time men begin to grow hayrie, to haue lustfull imaginations and to change their voyce; womens Pappes begin to swell and they to thinke vppon husbands. Why the courses flow at 14. yeares old.

After the fiftieth yeare the courses cease, because the heate being nowe become more weake is not able to engender any notable portion of laudable bloud, neither yet if there be any such ouerplus, is able to euacuate or expell the same; you may adde also, that Natures intention and power of procreation beeing determined; it is no more necessary that there should be any nourishment set aside. Why they stay at 50.

Concerning the particular times of this monthly euacuation, *Aristotle* is of opinion that it cannot be precisely set downe, and almost all learned men herein consent with him. Notwithstanding it is reasonable, we say, to think that Nature hath set and determined motions and established lawes, albeit wee are ignorant of them: for who was euer so neare of Natures counsell but that he might in some things erre, in somethings be to seek. These times knowne to her selfe shee keepeth immutable and inviolate, vnlesse either the narrownes of the wayes or the thicknes of the humour doe interrupt her, or else shee bee prouoked by the acrimony of a corroding quality in the bloud, or by some other outward prouocatiō; to poure them forth before her owne stinted and limitted time. Once therefore euery moneth she endeuoreth at least, this menstruall excretion, sometimes in the full of the Moon sometimes in the waine; and in those women which we cal *viragines*, that is, who are more manniſh, for three dayes together, in others that are more soft, idle and delicate, such as *Hippocrates* in his first Booke *de dieta* calleth ὑδαλώδεας, that is, wateriſh women, for a whole seuen-night. And againe, in the first Section of his sixt Booke *Epidem.* *In women that are wateriſh the courses continue longer.* In those women that are of a middle and meanie disposition they continue foure dayes; and these we cal Particular times. The particular times of the courses. *Aristotle.*

The

Hippocrates. The quantity of this monthly euacuation cannot be defined. For as *Hippocrates* obserueth in his Booke *de natura muliebri*, the blood issueth more freely or more sparingly according to the variety of their colour, temperament, age, habite and the time of the yeare. Those women which are fayre and white haue such aboundance of humour, that it issueth diuerse wayes; contrary to those are browne and swart skins which are commonly drier. In moderate and meane tempered women the quantity of the courses is about two *Hemina*, that is 18. ounces which is *Hippocrates* his proportion.

The wayes of the courses. The wayes ordayned for this euacuation are the veines of the womb and the womb it selfe. The veines do run from the *Hipogastrick* and spermatick branches to the bottom & necke of the wombe; by the veines of the necke of the wombe it issueth in those women which are with child, by the other in virgins and such as are not conceiued, but not *per diapedesim*, that is by transudation, but *per anastomosim*, that is by the opening of the orificies of large and patent veines.

Why nature purgeth the bloud throgh the wombe. Now if it be asked why the blood is purged through the womb; I answere, it is done by a wonderfull prouidence of Nature, that the bloud being accustomed to make his iourney this way, it might after conception presently accrew for the nourishment and generation of the Infant.

The finall cause of the menstruous bloud double. Hence we gather the finall cause of the menstruous bloud (which was the last poynt in our definition) to be double, the generation of the *parenchymata* or substances of the bowels and the flesh, as also the nourishment and sustentation of the Infant as well whilest it is in the mothers wombe, as also after it is borne into the world. For howe should the seede conceiued atteine either nourishment or increase vnlesse this bloud should be disposed into these wayes wherein the Infant is conceiued. Afterward when it is born, the same blood returneth by knowne and accustomed waies also into the pappes and there is whitned into milke to suckle it. And this we take to be the nature of the second principle of our generation, the mothers bloud or the monthly courses.

CHAP. IIII. *Of Conception.*

The order of the accesse of the principles THese two principles of Generation, Seede and the Mothers bloud are not at one and the same time auoyded in coition, because the spermaticall and the fleshy parts are not at one and the same time delineated. But if the generation goe rightly on, first both sexes doe affoord fruitfull and pure seedes which are poured out into the wombe as it were into a fertil field. Afterward when the filaments or threds of the solide parts are lined out, then the bloud floweth thereto as wel for the structure of the *parenchymata* or substãces of the bowels, as also for the nourishment of the whole *embryo* or little Infant.

Hippocrates ex pounded. The man therefore and the woman ioyned together in holy wedlocke, and desirous to raise a posteriry for the honour of God and propagation of their family; in their mutual imbracements doe either of them yeeld seede the mans leaping with greater violence. The woman at the same instant doth not onely eiaculate seede into her selfe, but also her womb snatcheth as it were and catcheth the seede of the man, and hideth it in the bottom and bosome thereof.

Conception what it is. These seedes thus cast and drawne into the bottome of the wombe are out of hand exquisitly mingled, otherwise sayeth *Hippocrates* in his Book *de Natura pueri*, they are neither *nourished* nor *animated* together. *And if any man*, sayth he in his first Book *de diæta, do deny that the Soule is mixed with the Soule, let him be held for a dotard.* Now by the Soule hee meaneth the Seed, as we haue sayed before. This mingling of the seedes is the first work or indeuour of Nature in generation. And presently after the seeds are thus mingled, the womb, which is the most noble and almost diuine Nurse, gathereth & contracteth it selfe, and that I may vse the words of the Arabians is so corrugated that ther is no empty or void place left therein. And this it doth as being greedy to conteyne and to cherish, we say to Conceiue the seed. Moreouer, least the geniture thus layd vp should issue forth againe, the mouth or orifice of the wombe is so exquisitly shut and locked vp that it will not admit the poynt of a needle. Then the wombe rowzeth and raiseth vp the sleepy and lurking power of the seeds, and that which was before but potentiall, it bringeth into act. This

An action of the wombe. action of the womb we properly call *Conception*, the Grecians κύησις or κύησις, and it is a Vitification of fruitfull seede to make a creature, depending vpon a proprietie of the body of the wombe.

Hippocrates

Hippocrates in his Booke *de Principijs*, and the fift Aphorisme hath left vnto vs some signes of Conception. Some also doe gather signes of Conception out of all the parts almost of the body. We thinke a woman hath conceiued, if in the confluence of their seedes there runneth a chilnesse or light horror through her whole body; or if she perceiue her womb to contract it selfe; if she receiue the seede of man with delight and it yssue not from her againe; if the inner mouth of the womb be exquisitely and perfectly shut; if she haue a light and wandering paine about her Nauell or *Hypogastrium*, which we call the Water course; if her monthly courses do stop vnusually; if her Paps grow hard, do swell and haue paine in them; if she be not so fit for, or desirous of *Venus* combats; if she suddenly grow mery and as suddenly againe sad beyond her accustomed manner; finally, if shee haue a loathing of her meate, and vse to cast in the morning after her bodye is a little stirred. But vvhether a woman be conceiued with a man or a woman childe it is very hard to iudge. Notwithstanding, we may thus make coniecture out of *Hippocrates* in the 48. Aphorisme of the 5. Section. She that goeth with a manchilde is well coloured, she that goeth with a woman child is swarthy or pale coloured. Againe, in the same place Male children are born in the right side, Females in the left; & in the 38 Aphorisme of the same Section. If she haue conceiued a male the right pap will swell, if a female the left: but all these signes are rather coniecturall then carry any certainty with them.

The signes of Conception.

Of a man and of a Woman-child.

CHAP. V. *Of the Conformation of the Parts.*

THE Generatiue faculty which before lay steeped, drowsie, and as it vvere intercepted in the seede, being now raised vp by the heat and inbred propriety of the wombe breaketh out into acte, as raked Cinders into a luculent flame. Then that noble and diuine builder setteth vpon her worke, & buildeth her selfe a habitation fit for the exercise and performance of all hir functions. But because she could not performe this so great a worke without an organ or Instrument, she vseth the spirit, wherewith the froathy seede swelleth, as hir Painter or drawer to score out and delineate all the particular parts. This spirit walketh through the vvhole body of the seede, and diffuseth it selfe into euery part and portion thereof. This spirite is he which maketh the parts Homogenie, that is, gathereth all the particles of a kinde together, extendeth them, and as a glasse-maker holloweth or boreth them by blowing into the. To this spirit *Aristotle* imputeth the Ordination, the Segregation, the Concretion, the Densation, Rarefaction, and Contraction of the matter of the parts. This *Galen* in his second Booke *de Semine*, calleth the framing Artizan, the begetter or the former of the parts of man. And *Mercurius Trismegistus* saide well, that it was the spirite which viuifieth or quickneth euery forme in the whole world, dispensing and gouerning all things according to the proper worth of each particular.

The spirite is the workman

Aristotle.

Mer. Trismegist

The spirit therefore is the first and immediate instrument of the soule, disporting it selfe in the bulke of the seede, and like a cunning Painter shaddowing out first with a rude Pen-fill the conformation of all parts both Similar and Organicall, the forme and Idea whereof it conteineth in it selfe, afterward it addeth the liuely colours, beautifying and polishing euery one in their due order.

This whole worke of conformation that admirable *Hippocrates*, as *Galen* witnesseth in his first Booke *de Semine*, distinguisheth into foure times. The first time is that, wherein the seeds mingled doe yet retaine their own forme which he calleth γονὴν, for then there is nothing to be seene but the seede coagulated or sammed together, and couered as it wer with a fime. The second time he calleth κύημα, wherein there is a certaine rude adumbration of the parts, and as it were a fleshy *masse*. The third, wherein a man may see the representation of the three principall parts, the Braine, the Heart, and the Liuer, together with the first threds and as it were the warp of all the spermaticall parts, and this constitution of the creature he calleth ἔμβρυον. The fourth and last time wherein there is a perfect separation, discretion and description of all the parts, and then he calleth it παιδίον ἢ κοῦρον, the childe or the Infant. This surely is an excellent distribution, but for those that are rude such as wee intend to informe a great deale too darke and obscure. We will therefore endeuour our selues more manifestly to shew vnto you the whole processe of Nature in the conformation of a man, and in what order all the parts are at first orderly delineated.

The Conformation diuided into four times.

Whilst the spirit, the instrument of the soule, beginneth to work vpon the masse of seed which to see to is vniforme, but indeed full of Heterogeny or different parts; First of all it

seuereth

ſeuereth the parts which are vnlike one another; the thinner more noble and better furniſhed with ſpirits it hideth within; the thicker, colder and clammier which moſt part are ſupplied by the mothers ſeede, it compaſſeth about the former. At theſe cold and viſcid parts of the Seede it beginneth the conformation, for of them it maketh membranes, and ſtreatcheth them out in breadth according to Natures vſe and intent, ſhewing therein her admirable prouidence. For with theſe as it were with defences the more noble part of the ſeede is walled about and ſecured; the inward ſpirites concluded or impriſoned which otherwiſe becauſe of their tenuity would eaſily vaniſh. Adde farther, that if the membranes had not firſt beene made, the tender *Embryo* and the principall partes thereof would haue ſuffered offence from the hardnes of the wombe.

Firſt the membranes.

For euen as God in the great world hath ſeparated the fire from the earth by the interpoſition of water and ayre, ſo in the *Microcoſme* or Little world, the Nature of man imitating the grand Architect hath ſeparated the Infant from the wombe by the interpoſition of theſe membranes. But the Nature of theſe membranes is not all one in Beaſtes and in men. For in Beaſtes, eſpecially ſuch as haue hornes, we haue obſerued three membranes called *Chorion*, *Amnion*, & *Allantoidem*. That we call *Chorion* cleaueth wholly to the womb by the interpoſition of the vmbilicall veines and arteries, and in this membrane are to bee ſeene thoſe *Cotyledones* wouen of a fleſhy and ſpongy ſubſtance. The ſecond membrane called *Amnios* is thinner then the former, this compaſſeth round about the Creature and is thought to bee the receptacle of the ſweate. The third is called *Allantoides*, becauſe it is much like that we call a Haggas pudding, for it doeth not encompaſſe all the Creature but only from the Breaſt-blade to the Hips, and may be compared to a girdle or broad ſwathe, and is fayed to contayne the vrine of the creature whileſt it is in the womb. In a man there are onely two membranes to be found, the firſt and the ſecond called *Chorion* and *Amnios*. The *Chorion* is neruous and ſtrong, & encompaſſeth the Infant roūd whence haply it hath his name, either becauſe it compaſſeth it as a circle or crowne, or becauſe it is *fœtus* χόριον, the conceptacle of the Infant, or becauſe it ſupplyeth nouriſhment vnto it, for ſomuch χορηγεῖ foundeth.

In Beaſtes 3.

In men two. *Chorion.*

This membrane like a ſoft boulſter or pillow ſuſteyneth and ſupporteth all the veines and the vmbilicall arteries; for it was not ſafe that the veſſelles of the Infant iſſuing out of his Nauill ſhould go ſo long a iourney naked without defence. In them are not as in brute beaſtes thoſe *Cotyledones* or knubbes like the Teates of the Breaſt, but onely a fleſhy maſſe made of infinite branches of veines and arteries wonderfully implicated or wouen togither and filled vp with blood which ſupplyeth the place of theſe *Cotyledones*. The later writers call it the cake or Liuer of the wombe, and ſome *orbicularem affuſionem* the round affuſion. Whoſe vſe is as another Liuer to prepare and boyle the bloud for the nouriſhment of the Infant. We do rather call this round and red body like the orbe of the Moone when it is at the full, which cleaueth onely to one part of the wombe and doth not wholly encompaſſe the Infant; πάγκρεας or καλλίπρεας the Sweete-bread of the wombe, and doe aſsigne vnto it that vſe that the Sweete-bread hath in the lower belly, to wit, ſafely to ſupport and as a pillow to beare vp the vmbilicall veſſelles diuerſly ſprinkled through the *Chorion*. But it may be demanded why an Infant hath not thoſe *acetabula* or *Cotyledones* to tye the *Chorion* firmly to the wombe as it is in beaſtes: happely becauſe a woman doth not bring forth ſo many young as beaſtes doe; or becauſe the wombe of a beaſt ſwelleth more outward, and therefore could not beare their burthen vnleſſe it had beene faſtned with ſtronger tyes.

Why in women the *Cotyledones* are not found.

The vſe of the cake.

The other coate which immediatly encompaſſeth the Infant, from the ſoftnes and thinnes thereof is called ἀμνειὸς the Lambs-skinne: others call it the ſhirt, and the Arabians *Albigas*. It is looſe on euery ſide vnleſſe it be at the place of the cake, where it groweth ſo faſt to the *Chorion* that it can hardly be ſeparated; and this coate receiueth the ſweate and the vrine from whence the Infant hath no ſmall help, for it ſwimmeth as it were in theſe waters or is couched in them as it were in a bath: beſide, it maketh the birth more facile and eaſie becauſe it moyſtneth the orifice of the wombe and maketh it more ſlippery.

Amnios.

His vſe.

Theſe coats growing one to another ſeem to make but one couering, which the greeks call δεύτερον καὶ ὕστερον, the Latines *ſecunda* or *ſecundina*, either becauſe it iſſueth laſt out of the womb in the birth, or becauſe it is a ſecond habitation for the Infant, the womb being the firſt, we call it commonly the after-birth.

The after-birth.

The inner or more noble part of the ſeede being ſecured by theſe membranes or coats, more bloudly vndertaketh the forming of the parts. At that time therefore the ſpirite wa-

ketl

keth through the whole body of the ſeede, and becauſe there are two faculties aſsiſtant to the procreating faculty, that is to ſay, the Changing and the Forming: therefore firſt of all the ſeede is altered or changed and diſpoſed, then almoſt in the ſame inſtant the firſt threds of the ſpermaticall partes are together and at once skored or ſhaddowed out with rude lines.

Then are to be ſeene three bubbles or cleare drops ſuch as the raine rayſeth when it falleth into a riuer, which are the rudiments of the three principall parts, & beſide a thouſand ſtrings which are the warp, as it were, of the veſſels and the ſpermaticall parts. So that it is very likely that thoſe oracles of *Hippocrates* in his firſt Booke *de diæta*, and in his Booke *de locis in homine* are moſt true, where he ſayeth, that all the parts are inchoated or begun together, but doe not appeare neither are perfected at once but by degrees. But at what time whether the fift or the ſeauenth day, all theſe begin to be figured, hee only the Creator who maketh the Infant knoweth, and none elſe. Yet if we will relye vpon *Hippocrates* authority or vpon our owne experience, which is very tickle, we may ſay, *That the ſeauenth day the ſeede hath what ſoeuer the body ought to haue*, that is as I interpret it; the ſeuenth day doe appeare the rudements of all the ſpermaticall partes, which alſo your eye may diſcerne if you caſt the maſſe into fayre water and then diligently view it. Theſe foundations of the ſpermaticall parts being thus layed, euery one is after accompliſhed in their owne order, firſt thoſe that are moſt noble and moſt neceſſary, as the three principall partes, the Brayne, the Heart and the Liuer, and the veſſels to them belonging, nerues, arteries and veines. The veines are propagated from the Liuer euen to the *Chorion*, and to the ſame membrane are deriued arteries from the *Iliacall* branches, and doe ioyne with the mouths of the veſſels of the wombe, ſo that theſe vmbilicall veſſelles by which the Infant draweth his breath are the of-ſpring of more inward veſſels contrary to the common opinion of the vulgar Anatomiſts.

The foundations of the parts are layd at once. 3. bladders. *Hippocrates.*

The 7. day the parts are deliniated.

What parts are firſt formed.

The harder and more ſolide parts are figurated together, but not together perfected. For of the bones ſome are ſooner perfected ſome later. The ribbes, the lower iaw, the ſmal bones of the eares, the patell or choler bones, the bone *hyois*, are all bones euen from the firſt originall. The bones of the arme, the legge and the thigh haue their heads imperfect and meerly griſtly; the bones of the vpper iaw, of the hands, of the whole ſpine & the rump are nothing elſe at the firſt but griſtles.

Their order.

The cauſe of the more ſpeedy forming or perfecting of any part is to bee referred to the vſe thereof, that is, to the neceſsity of the finall cauſe; and therefore the ribbes becauſe they make the cauity of the Cheſt are at firſt made bony, leaſt otherwiſe the bowelles ſhould be compreſſed. The lower iaw was very neceſſary inſtantly after the birth of the Infant for his ſucking and other motions. The ſmall bones of the eares that they might reſound the better needed be dry and hard. The patell or coller bones were neceſſarily made ſtrong at the firſt, becauſe they tye the arme and the ſhoulder blade to the trunke of the body; as alſo the bone *hyoids* to eſtabliſh the toung. And thus may we make eſtimation of the other parts; in the delineation whereof the forming quality perpetually laboureth, neuer reſting till it haue made an abſolute ſeparation and deſcription of them all. This is performed in male children the thirtieth day, and in females the 40. or the 42. day. So ſayth *Hippocrates* in his Booke *de Natura pueri*, and *de ſeptimeſtri partu*. *A woman child hath her conformation at the fartheſt the two and fortieth day, and a man child at the fartheſt at the thirtieth.*

The cauſes of this order.

At what time the conformation is accompliſhed.

This is the firſt conformation of the Infant made onely of the body or ſubſtance of the ſeede, which the creature exceedeth not in magnitude. For ſayeth *Ariſtotle* in his ſeuenth Booke of his Hiſtory of Creatures and the third Chapter, if you caſt the *Embryo* into cold water it will not appeare bigger then a great Piſmyre; but I, ſayth *Laurentius*, haue often ſeen an Infant of 40. dayes old, as long as a mans little finger.

There is another conformation of the Infant of the other principle of Generation, that is of bloud, of which the fleſhy parts are framed, as the ſpermatical are of ſeed. This bloud floweth through the vmbilicall veine, which is a branch of the gate veine filling the emptie diſtances betweene the fibres.

The ſecond conformation from the bloud.

But whereas there are three ſorts of fleſh; that which groweth to the bowels they call παρέγχυμα; that which adhereth to the fibres of the muſcles they call abſolutely fleſh; and the third is that which is proper to euery particular part. This threefold fleſh we ſay is not generated together and at once but in order: firſt the *Parenchymata*, next the fleſh of the particular partes, and laſt of all the fleſh of the muſcles. Of the *Parenchymata* the firſt that

3. ſorts of fleſh.

The order of this conformation.

is formed, is that of the Liuer, becauſe the vmbilicall veine firſt powreth out the bloode thereinto; then the *Parenchyma* of the heart, then thoſe of the other bowels. And this is the manner and order of the conformation of the infant, and of all the parts thereof.

CHAP. VI. *Of the Nouriſhment of the Infant, and how it exerciſeth the Naturall Faculties.*

AS in the workes of Art men do proceed from that which is leſſe perfect to that which is more perfect; right ſo is it in the works of Nature. Wherfore the tender *Embryo* liueth firſt the moſt imperfect life, that is, the life of a Plant which we call the Vegitatiue life. Afterward growing vnto further ſtrength, it attaineth the life of an vnreaſonable creature which we call the Senſatiue life, and laſt of all the moſt perfect life of a man when it is endued with a reaſonable ſoule. This *Ariſtotle* teacheth in his firſt Booke *de Generatione Animalium* where he ſaith, *the Infant is not made a liuing Creature and a man together*. But we muſt vnderſtand that this progreſſe in perfection commeth not by reaſon of the forme, becauſe that is ſimple and cannot be diuided, but by reaſon of the matter, that is, of the Organes, which that noble forme and *firſt acte* vſeth for the accompliſhment of ſecond Acts as wee call them, and all the functions.

Three kinds of life.

Ariſtotle.

The firſt life of the creature whereby it liueth from the very beginning of the Conception, is the moſt ſimple; and is maintained without that which wee properly call Nouriſhment. And indeede what neede was there of Nouriſhment or reſtauration where there was no exhauſtion or conſumption of the parts? The *Embryo* at firſt hath ſufficient to cheriſh it ſelfe out of it owne heate, and by it owne inbred ſpirit. But after the parts are diſtinguiſhed and delineated, then preſently it beginneth to be nouriſhed and encreaſed, yet is not this nouriſhment of the ſame kind with that which the infant enioyeth after it is ariued into the worlde. For then it ſucketh Aliment by the mouth, but whilſt it is in the wombe it receiueth it onely by the Nauell, whatſoeuer *Democritus* and *Epicurus* ſay. And that did *Hippocrates* not obſcurely intimate, when he ſaide in his Booke *De Alimento*, ἡ δὲ ἀρχαιοτάτη τροφὴ διὰ τῆς ἐπιγαστρίου ὀμφαλός. that is, *The firſt Nouriſhment is the Nauel through the Abdomen.*

Two kinds of Nouriſhing

One only action in the nouriſhment of the Infant.

After it is borne it ſwalloweth into the ſtomacke meats of all kinds, before (ſaith *Hippocrates* in his Booke *de Natura pueri*) it draweth onely of the pureſt bloode from the Mother, which is transfuſed into the Liuer. The Infant after it is borne maketh manifolde changes and alterations in the Aliment: firſt *Chylification*, then *Sanguification*, laſtly *perfect Aſsimulation* which is the third concoction. When the infant draweth pure bloode, it giueth not thereto any forme or faſhion, but only a perfection and temper like vnto it ſelfe. Wherfore we aſcribe to the infant not Chylification nor Sanguification, but onely the third concoction which is the particular Nouriſhment of the ſingular parts. The manner of this thirde and onely concoction in the infant conteined in the wombe, is thus.

The true way how the Infant is nouriſhed.

The infant being tied by the mediation of veſſels and Membranes to the Mothers womb, draws the pureſt of her blood through the mouths of thoſe veſſels inoculated one into another after a wonderfull manner. This blood thus drawn is powred into the body of the Liuer through the vmbilicall veine, which is a branch of the gate-veine, and reacheth to the Fiſſure of the Liuer, yea you may often in dead bodies followe a probe out of it into the ſmall veins of the Liuer: Here the blood is more and more perfected, afterward the thicker and more crude part is diſtributed through the roots of the Gate-veine into the ſtomacke, the ſpleene and the kidneys, the excrements and reliques wherof by the Splenick & meſenterick branches are abligated into the cauity of the guts, and there are by degrees gathered together, and in their abode are ſo dried that they become thick and blacke. The purer and better concocted part of the bloode is conueyed into the trunke of the hollow veine, from which it is diffuſed through the whole body by the veins, as it were by ſmal riuerets. But becauſe the blood is not without his whey, which ſerueth to weſt it through the ſmal Veines, therefore the whey hauing performed that his office is partly ſpent in ſweate by the habite of the body, partly it is drawne by the Kidneys, and ſo tranſcolated through the Vreters or Vrine veſſels into the bladder. For the conteyning of which ſweate and Vrine, Nature appointed the Membrane called *Amnios*. Yet we muſt not thinke that the Infant piſſeth his vrine into this Membrane by the priuities, but it is conueyed thereinto thorough the *Vrachos*, which is a long and bloodleſſe Canale or pipe lengthened from the bottome of the Bladder vnto the Nauell. Neyther hath it any Muſcle thereto belonging, becauſe in the

The excrements of the Infant where beſtowed.

The vſe of the *Vrachus.*

the Infant no time is vnſeaſonable for the auoyding of theſe excrements; whereas when we auoide our vrine, we haue Muſcles at the roote of the yard, to ſtay or to further that euacuation that it might not be performed but in conuenient time, and at our beſt leiſure as before is ſaide.

CHAP. VII. *How the Infant exerciſeth his vital Faculties.*

THE Infant alſo liueth in the wombe farre otherwiſe then hee liueth after he is borne; for neither is the Cheſt diſtended and contracted, becauſe hee draweth not his breath by his mouth, neither doth hee engender any vitall ſpirits becauſe he draweth them from his Mother: neither laſtly dooth hee neede the motion or worke of the Heart or the Lungs, but the heate of the perticular parts is cheriſhed, preſerued and refreſhed onely by Tranſpiration and the pulſation of the Arteries.

The diſſimilitude of the life of the Infant before & after birth.

This different life hath alſo a different ſtructure, ſubſtance, and vſe of the vitall organes, which becauſe it hath not beene knowne to any of the Anatomiſts of this our age; albeit it was firſt of all diſcouered by *Galen* in his ſixte and fifteenth Bookes of the Vſe of Partes, though obſcurely, we will endeuour to make it as manifeſt and plaine as poſsibly we can.

Galens wonderful Obſertation.

In the *Baſis* of the heart, that is, in the broad end, there appeare foure notable veſſelles, two in the right ventricle, the Hollow veine, and the Arteriall veine, and two in the lefte, the great Artery, and the venall Artery. The vſe of theſe after we are borne is this. The Hollow veine which gapeth with a wide mouth into the heart, powreth the bloode into the right ventricle as it were into a wide Ciſterne, there it is reboyled and attenuated as well for the generation of vitall ſpirits, as alſo for the nouriſhment of the Lungs. A parte therefore of it ſwetheth through the middle wall betwixt the ventricles into the left ventricle: Another part is carried by the arteriall veine into the thin, rare, and ſpongy ſubſtance of the Lungs. The Venall Artery leadeth into the left Ventricle the aer which wee breath in, prepared before in the Lungs where it is mingled with the blood, of which permixtion the vitall ſpirits are generated. This ſpirite the heart driueth into the trunke, and ſo into branches of the great Artery. In the infant before birth all theſe things are otherwiſe, and a farre other vſe is there of all the veſſels.

The Vſe of thoſe Veſſells after birth.

The vſe of the veſſels before the Infant is borne.

For the hollow veine doth not poure this ſtreame of blood into the right ventricle, becauſe neither the Lungs ſtand in need of attenuated blood, being at that time all of the red, thicke, and immooueable, neither is there any generation of vitall ſpirits. The venall artery leadeth not the aer into the left ventricle, becauſe the infant doeth not breath by the mouth, but onely hath vſe of Tranſpiration. The great Artery receiueth no vitall ſpirites from the heart, but by the vmbilicall arteries: and therefore the Arteriall veine dooth not the office of a veine but of an Arterie, for it carrieth onely vitall ſpirits, but no bloode. Againe the venall artery doth the office of a veine, containing onely thick and hie coloured blood for the nouriſhment of the Lungs. But becauſe there was no paſſage from the Hollow veine to the venall Artery, Nature ioyned theſe two veſſels (which doe but touch one another) by a large and round hole through which the bloode hath free paſſage from the Hollow veine, to the venall Artery.

How the Veſſels of the hart are vnited.

To this hole ſhe hath alſo ſet a thin and cleare Membrane like a couer, which ſhoulde giue way to the blood ruſhing out of the Hollow vein, but ſhould prohibit it for returning againe thereinto. As alſo that by means of this Membrane, the hole after birth when there is no more vſe of it, might ſooner bee ſouldered vp, hauing a principle of conſolidation ſo neere and ready at hand. And becauſe the arteriall veine and the great artery were diſtant a little ſpace each from other, ſhe hath ioyned them by a third pipe or Canale of the Nature of an artery running aſlope betweene them, that ſo the vital ſpirite might paſſe freely from the great artery into the arteriall veine.

The wonderfull reſiccatiō of the paſſages after birth

This is that admirable vnion of the veſſels of the heart in the infant vnborn, to wit, of the hollow veine with the venall artery, and of the great Artery with the arteriall veine; but the ſhutting vp and reſiccation of theſe veſſels within a few dayes after the birth, that is indeed beyond all admiration. For that large hole vvhereof vvee ſpake, is ſo cloſed that there remaineth no footſteps or ſigne of it. As for the third arteriall pipe or Canale, vvithin a fevv daies it vvithereth and ſhrinketh together, and at length it grovveth ſo ſmall that no man would beleeue there vvere any ſuch thing.

Hence it may bee concluded that the Infant in the wombe draweth his mothers ſpirites by the vmbilicall arteries, and liueth contented onely with the pulſation of the arteries, not at all needing the help or motion of the heart.

CHAP. VIII. *Of the motion and ſcituation of the Infant in the wombe, which are Animall faculties.*

Why the Infant moueth not the firſt 3. months.

THE Soule being an ἐντελέχεια or act of an Naturall organicall body, doeth not nor cannot performe her functions without a conuenient organ or inſtrument. Wherefore in the firſt monethes the tender Infant by reaſon of the weaknes of the Brayne and ſoftneſſe of the ſinewes is not able to moue his members. But when the bones begin to gather ſtrength, and the nerues, membranes and ligaments, which before were full of a mucous and ſlimy humour begin to dry, then the Infant kicketh and moueth.

When the motion begins. *Hippocrates.*

The firſt beginning of this motion ſayeth *Hippocrates* in his Booke *de Natura pueri*, and *de morbis Mulierum*, is in Male children at the third moneth, in Females at the fourth: ſo that there is a certaine and definite proportion of the conformation and the motion of the Infant, and a double time comming betweene them. Male children therefore becauſe they haue their conformation the thirtieth day doe mooue the ninetieth, now the 90. day maketh vp the third moneth. Females becauſe they haue their conformation the two & fortieth day, they are mooued the hundered and twentyeth, which fulfilleth the fourth moneth.

The Infants motion voluntary.

This motion of the Infant is not Naturall but voluntary, as beeing perfourmed by the helpe of the Muſcles contracting themſelues. The muſcles are contracted becauſe the Soule ſo commaundeth. This commaundement is cartyed by a corporeall Spirite and conuayed thorough the Nerues; which Spirte is daylie generated in the *Sinus* of the Braine or in his ſubſtance of the Vitall, which the Infant receiueth from the vmbilicall Arteries.

The ſcituation of the Infant.

To this mooting faculty wee muſt alſo referre the ſcituation or poſition of the Infant in the wombe. For ſo *Hippocrates* in his *Prognoſtickes* referreth the poſition or manner of lying of the ſickeman, eyther prone that is downeward, or ſupine that is vpward or on either ſide, to the weaknes and ſtrength of the mouing faculty.

The natural ſcituation. *Hippocrates.*

The Naturall ſcituation of the Infant is thus deſcribed by *Hippocrates* in his Booke *de Natura pueri*. *The Infant as he is placed in the wombe hath his hands at his knees, and his head bent downe to his feete.* Wherefore he ſitteth in the wombe crumpled, contracted or bent round, holding his knees with his hands and bending his head betweene them, ſo that each eye is fixed to the thumbe of either hand, and his noſe betwixt his knees.

Figura media what it is.

This Figure though it bee not exquiſitely the meane or middle poſition as wee call it, that is ſo Naturall as that all the partes are in their due poſition; yet it commeth neareſt thereunto, and therefore is neither paynfull nor wearyſome to the Infant; and for the mother very conuenient becauſe thus the Infant taketh vp the leaſt roome, and beſide riſeth

The reaſon of the poſition.

not ſo high that it ſhould preſſe or beare vp the midriffe or the ſtomacke, as we ſee in ſome women vvhen their burthen lyeth high they are ſhort breathed and much more vnvvealdy as vve vſe to ſay.

Moreouer this poſition is moſt fit for the eaſie birth of the Infant, for lying thus vvith his head betvvixt his legges, vvhen he ſeeketh meanes to get out, he is ſooner turned vvith his head dovvnevvard to the orifice of the vvombe, vvhich manner of trauell is of all other the eaſieſt and moſt ſecure, both for the Infant and the mother, as ſhall better appeare in the next Chapter.

CHAP. IX. *The excluſion or birth of the Childe.*

THE tender and ſoft particles of the Infant being now all perfected and eſtabliſhed hee becommeth euery day greater and hotter, and requireth more nouriſhment, and being now not contented onely with tranſpiration, deſireth and ſtriueth after a more free vſe of the ayre.

Now when as the mother is not able to ſupply vnto the Infant either the ayre whereby it liueth in ſufficient quantity through the narrow vmbilical arteries, or other nou-

nourishment by the vmbilicall veines, whereby it might be supported and refrigerated, the Infant then as it were vndertaking of himselfe a beginning of motion, striueth to free himselfe from the prison and dungeon wherein he was restrayned; kicking therefore hee breaketh the membranes wherein he was inwrapped, and arming himselfe with strong violence maketh way for his inlargement with all the strength and contention that he may.

This contention and distention the wombe ill brooking, and besides being ouerburthened with the waight of the Infant now growne, striueth to lay downe her loade; and with all her strength by that expulsiue faculty wherewith she is especially furnished she rowzeth vppe her selfe, and with violence thrusteth her guest out of possession of his true inheritance. The causes of a womās deliuerance.

Thus the ioynt strife and as it were consent betwixt the Infant and the wombe bringeth to light a new man, not vppon his feete, nor side-long, but as diuine *Hippocrates* hath foreshewed ἐπικάρδιον, that is head-long; so be his out-gate be naturall. The reason is, because the vpper parts which hang vpon the nauel string as at the beame of the ballance, do ouerway the neather. In what manner the Infant is borne.

Furthermore, this strife and contention of the Infant and the wombe is assisted by the voluntary endeuor of the woman in trauell, which is by drawing in her breath and by that meanes bearing down the midriffe: adde hereto the skilfull hand of the head-woman or Midwife as we cal them, for she setteth the woman in a due posture or position of parts, receiueth the Infant gently which falleth from betwixt her knees, directeth it if it offer it selfe amisse; and finally draweth away as easily as is possible the after-birth which stayeth behinde.

Here *Galen* in his 15. Booke *de vsu partium*, breakes out into an admiration of the immortall God; for the mouth or orifice of the womb, which in the whole time that the burthen was carried, was so exquisitly closed vp, nowe enlargeth it selfe to that extent that the body of the Infant passeth through it. *Galens* admiration at the prouidence of God.

This birth hath no certaine or limitted time in man as in other creatures, but hapneth vncertainly at any time of the yeare: the reason is, because other creatures haue set times of copulation, but man because the propagation of his kinde was most necessary, is not tyed to any time or season, but left to the liberty of his appetite and guidance of his discretion. Adde hereto, that other creatures in their coitions are glutted and more then satisfied: man (I know not how) hath his appetite encreased euen in the fruition of that which hee affecteth. Other creatures vse alwayes one and the same manner of diet, which may be a brydle and restraynt: Man wandreth wantonly through infinite varieties of viands and delicates whereby he is goaded and prouoked to intemperate lust. I forbeare to speake of the power of those fancies, lustful imaginations and passions wherby euery houre as by so many furies he is racked and tormented: all which we know are of great anaile to alter the body of man. The time of trauel vncertaine.

The times of the birth of man are the 7.8.9.10. and eleuenth monethes. The seauenth moneth is the first time, because before it an Infant cannot be borne aliue into the world, neither indeede is such an exclusion properly called a birth, but an abortment. The eleauenth moneth is the last time and vtmost limit, which whosoeuer exceedeth, is deceiued in the time of her conception, and the Cat we say hath eaten her marke. The middle months are the nine and the tenth. The time of mans birth.

By a moneth we meane with *Hippocrates* that which they call *mensis solaris*, that is to say thirty dayes. Nor that birth which we cal *Septimestris*, or *Nonimestris*, or *Decimestris*, each fulfill seauen or nine or ten whole and compleate monethes: for wee knowe that there is a great latitude of the seuenth and tenth moneth, so that the Infant that is born in the beginning or middle or end of the seuenth month is truely called *partus septimestris*. The beginning of the seuenth moneth *Hippocrates* designed in his Booke *de septimestri partu*, where he sayeth that those Infants which wee call *septimestres* are brought into the world within an hundred and fourescore dayes and a peece of a day. The end of the seuenth month hee limitteth in his Booke *de principiis*, where he sayth that the *Septimestris partus* is circumscribed within thirty weekes, that is two hundred and ten dayes; for 7. times 30. amounteth to that number. *Hippocrates.* *Septimestris partus* what it is.

The Infants called *Octimestres*, that is, such as are borne the eight moneth do neuer liue, vnlesse happely in Egypt, because the heauen and the soyle are there most gentle and benigne. The birth at nine moneths is most legitmate and to Nature most familiar. In the

tenth month trauell is not so vncouth, in the eleuenth most rare.

But why the seuenth month and the ninth should bring forth liuing Infants not the eight, the *Pythagorians* do refer to the power and efficacy of Numbers, the *Geometricians* to the duplicated proportion of the conformation and the motion, and the triplicated proportion of the motion to the birth. The *Astrologians* refer it to the diuerse and different Aspects of the Planets and Stars. But these are mere toyes.

Why the Infant borne the 7. month suruiueth.

The Physitians vpon better grounds haue found out certaine and established rules of Nature and her ordinary Circuites and Returnes, which vnlesse she be interrupted or prouoked, she neuer either hasteneth or foresloweth. Wherefore seeing the infant in the seuenth month becommeth perfect, not wanting any accomplishment of his parts, if at that time he haue strength sufficient, he breaketh the Membranes and worketh out his passage, liuing and suruiuing because he is perfect, especially if it be a male childe.

The Physitians reasons.

But in the eight month if he be borne, albeit he haue the perfection of his parts, yet he suruiueth not, because he is not able to endure two instantly succeeding afflictions (as we call them) or contentions; for the seuenth month being now perfected he laboureth sore and striueth for his enlargement. If therefore being weakened by that strife he againe returne to labor before he be refreshed, it is impossible he should hold out or suruiue so great expence of strength and spirits but must needs sink and faile.

Why the viii. month the infant liueth not.

Furthermore, at the eight moneth the Infant doth not liue, because he commeth after the day of birth which should haue beene in the seuenth month, and before the day which is to be the ninth.

Whereupon we gather, that some euill accident hath betided him, which eyther hath hindred his birth the seuenth month, or preuented his stay till the ninth. But because these things are somewhat obscure, we referre you for further satisfaction to the Controuersies next ensuing, wherein we will labour to assoile not onely this difficulty, but also all others which may arise concerning the difference and temper of the Sexes, the Nature and Effusion of the seede, the quality and causes of Excretion of the Mothers bloode, the Lawfulnesse and Errors of Conception, the manner and time of Conformation, the Growth and encrease of the Infant, and how it exerciseth the Naturall, Vitall and Animall Functions; and finally, concerning the Nature, Differences, Times, and Causes of the Birth.

The subiect of the Controuersies following.

¶ A Dilucidation or Exposition of the Controuersies concerning the Historie of the Infant.

QVEST. I. *Of the Difference of the Sexes.*

The necessity of the distinction of the sexes.

Aristotle in his Bookes of the History and Generation of creatures, doth often inculcate that the difference of Sexes is most necessary vnto perfect Generation, which is also sufficiently proued by the Finall cause the most noble of al the rest, mouing the other causes it selfe remaining immoueable. For as in the seede of a Plant, the power of the whol tree is potentially included and contained, which notwithstanding neuer breaketh into acte, vnlesse that acte be stirred vp by the heate of the earth; Right so, the seeds of the Parents conteyning in them the Idea or forme of the singular parts of the bodie, are neuer actuated, neuer exhibite their power and efficacie, vnlesse they be sown and as it were buried in the fruitfull Fielde or Garden of Nature, the womb of the woman.

It was therefore necessary that there should be a double creature, one which shoulde beget in another, and another that should generate in it selfe: the first we call a Male, the second a Fœmale.

The Male is originally the hotter, and therefore the first principle of the work, and besides affoordeth the greatest part of the formatiue power or faculty. What the Male is.

The Female is the colder, and affoordeth the place wherein the seede is conceiued, and the matter whereby the Conception is nourished and sustained, which matter is the crude and raw remainders of her owne aliment. What the Female is.

The place is the wombe, which by a naturall disposition looseneth the bondes wherein the spirit of the seede is fettered, and withall helpeth to adde vigour and efficacie therunto. For if the seede should be powred into any other part of the body it would not be Conceyued but putrified; not preserued, but corrupted.

The matter whereby the seede is nourished is the Mothers bloode. The Excrement of the last aliment of the fleshy parts.

This difference of the Sexes do not make the essentiall distinctions of the creature: the reasons are: First (because as *Aristotle* saith in his second Booke *de Generatione Animalium* and the 4. chap. and in his 4. Booke *de Historia Animalium* and the 17. chapt.) in all creatures there is not this distinction or diuersity of Sexes. Secondly, because essentiall differences do make a distinction of kinds: now we know that the Male and the Female as both of one kinde, and onely differ in certaine accidents. But what these accidentall differences are is not agreed vpon as yet. The diffrence of Sexes is not essentiall.

The *Peripatetiks* thinke that Nature euer intendeth the generation of a Male, and that the Female is procreated by accident out of a weaker seede which is not able to attaine the perfection of the male. Wherefore *Aristotle* thinketh, that the Woman or female is nothing else but an error or aberration of Nature, which he calleth παράβασιν by a Metaphor taken from Trauellers which misse of their way and yet at length attain their iournies end; yea he proceedeth further and saith, that the female is a bye worke or preuarication, yea the first monster in Nature. *Aristot.* Errot.

Galen in his 6. and 7. chapters of his 14. Booke *de vsu partium*, following *Aristotle* something too neere, writeth, that the formatiue power which is in the seede of man being but one, doth alwayes entend the generation of one, that is, the Male; but if she erre from hir scope and cannot generate a male, then bringeth she foorth the female which is the first and most simple imperfection of a male, which therefore he calleth a creature lame, occasionall and accessary, as if she were not of the mayne, but made by the bye. *Galens* Error.

Now heerein he putteth the difference betwixt her and the Male, that in males the parts of generation are without the body, in Females they lye within because of the weakenesse of the heate, which is not able to thrust them foorth. And therefore he saith, that the neck of the wombe is nothing else but the virile member turned inward, and the bottome of the wombe nothing but the *scrotum* or cod inuerted.

But this opinion of *Galen* and *Aristotle* we cannot approue. For we thinke that Nature aswell intendeth the generation of a female as of a male: and therefore it is vnworthily said that she is an Error or Monster in Nature. For the perfection of all naturall things is to be esteemed and measured by the end: now it was necessary that woman should be so formed or else Nature must haue missed of her scope, because shee intended a perfect generation, which without a woman cannot be accomplished. Disproued.

Those things which *Galen* vrgeth concerning the similitude, or parts of generation differing onely in scite and position, many men do esteeme very absurd. Sure we are that they sauour little of the truth of Anatomy, as we haue already prooued in the Booke going before: wherein we haue shewed how little likenesse there is betwixt the necke of the womb and the yard, the bottome of it and the cod. Neither is the structure, figure, or magnitude of the testicles one and their same, nor the distribution and insertion of the spermatick vessels alike, wherefore we must not thinke that the female is an imperfect male differing onely in the position of the genitals. No similitude betwixt their Genitals.

Neither yet must we thinke that the Sexes do differ in essentiall forme and perfection, but in the structure and temperament of the parts of generation.

The woman hath a wombe ordained by Nature as a Field or seed-plot to receyue, conceiue and cherish the seed; the temper of her whole body is colder then that of a man, because she was to suggest and minister matter for the Nourishment of the Infant. And this How the Sexes are distinguished.

way

way *Aristotle* in the second Chapter of his first Booke *de Generatione Animalium* seemeth to incline, where he sayeth that the Male and the Female doe differ as well in respect as in sence: In respect, because the manner of their generation is diuerse; for the Female generateth in her selfe, the Male not in himselfe but in the Female: In sence, because the partes appeare other, and otherwise in the Sexes. The partes of the Female are the wombe and the rest which by a general name are called *matrices*; the parts of a man are the virile member and the Testicles. And so much shall be sufficient to haue beene added concerning the difference of the Sexes. But because there is more difference of the Tempers in men and women, we will insist somewhat more vpon that point.

QVEST. II. *Of the Temperament of women, whether they are colder or hotter then men.*

COncerning the Temperament of men and women there is a notable controuersie, which if I may take vppon mee to censure or arbitrate, I will briefly acquaint you with what I haue gathered concerning this matter, out of the fountaines of the Grecians, and Cisternes of the Arabians.

There are some which thinke that women are hotter then men: others on the contrary, that men exceede women in heate by many degrees: Neither of these opinions want patrons to defend them, nor reasons to sustaine and support them.

That women are hotter then men. *Hippocrates.*

If the *Edicts* of *Hippocrates* our *Dictator* doe stand for a law, as truely they deserue well to doe, then shall mens part goe to the wall; for in his first Booke *de morbis mulierum*, hee playnly auoucheth that women are hotter then men, his words are these. *I say that the flesh of a woman is more rare then that of a man.* Nowe rarity with the Phylosophers is the worke of heat, to wit, his secundary quality; as it is the property of cold to condense or thicken: so it is the property of heate to rarifie or make thin. Againe in the same place hee sayeth that the body of a woman draweth more suddenly and more aboundantly the moysture out of the belly, then the body of a man.

Now wee know that sudden and aboundant traction is not accomplished without the help of notable heate, and therefore it is that *Hippocrates* in his 6. Section of his 6. Booke *Epidemion* calleth *carnes attractrices*, because they are very hot. Finally, let vs see what *Hippocrates* inferreth vpon this rarity of the flesh and strong attraction of moysture. *The woman hath hotter bloud, and therefore is hotter then a man*; what cold hee say more playnely? what more determinately?

Reasons for this opinion.

Of the same opinion was *Permenides* as *Aristotle* reporteth in the second chapter of his second Booke *de partibus Animalium*. But let vs see how this opinion of *Hippocrates* may be established by reason.

The first.

The Temper of the whole body is to be esteemed according to the Temper of the principall parts, especially of the heart and the Liuer; and this we haue from *Galen* in his Booke *de Temperamentis*, and *de Arte parua*, where he sayeth: *Those whose heart is hot, are also of a hot habite of body*, vnlesse there bee some obstacle in the Liuer; and those that haue hot Liuers haue also hot habits vnlesse there be some repugnancie in the Heart. But if both these bowels doe conspire in the same Temper, then of necessity must the Temper of the whole body be like vnto them; but the Heart and the Liuer of women are hotter then of men; and therefore their whole bodies are also of a hotter temper then mens.

A womans heart hotter then a mans.

That the heart of a woman is hotter then the heart of a man may thus be demonstated, the Temper of the particular parts is especially known by the strength of their action; now the actions and faculties of the heart are two, *vitall* as say the Physitians, and θυμοειδὴς or *Irascibilis*, that is, the passion of anger as say the Platonists. Both these are more operatiue & liuely in a woman then in a man. The vitall faculty shyneth most euidently in the pulse.

Now the pulses of women are more quicke and frequent, of men more rare and slow as *Galen* teacheth in the 9. Chapter of his Booke of pulses *ad Tyrones*, and in the second chapter of his third Book *de causis pulsuum*. That also *Auerroes* affirmeth in the fourth *Colliget*: and the 19. Chapter. But the frequency and swiftnesse of the pulse bewrayeth the strength of the heate; for as it is the property of colde to make the partes sluggish and dull in their motion; so heate moueth them continually, and giueth them no rest at all.

Women sooner angry then men.

The other faculty also of the heart which we called *Irascibilis* or the passion of Anger, we many of vs know by woefull experience to bee quicker and more vigorous in woemen then in men, for they are easily heated and vpon very sleight causes; but Anger with *Galen*

in

in his Booke *de Arte parua* is a ſigne of a hot heart. Hence it is that females are more bold and cruell then males. For Hunters affirm, that of Tygers, Beares and Lyons, the females are farre fiercer then the males.

The Liuer of a woman hotter then of a man.

That the Liuer of a woman is hotter then a man may bee prooued by the ſame demonſtration: The Naturall Faculty which hath his reſidence in the Liuer, and is diuided into the enereſing, nouriſhing and procreating vertues, is ſtronger in a woman then in a man. For we ſee that wenches grow faſter then boyes, become ſooner ripe, and yeeld ſeede the ſooner, which is the worke of the generatiue Faculty; they are alſo more wanton and laſciuious, as hauing the Teſticles hid within their bodies, by which they are heated. For *Galen* ſaith, that the Teſticles after the heart, are as it were another hearth of Naturall heate.

The procreating Faculties.

The Nouriſhing Faculty, which is a certaine ſigne of the heat of the Liuer, is more perfect in a woman then in a man; for their liuer engendreth more blood, now ſo much blood as we haue, ſo much heate haue we alſo. Neither is this blood of theirs of any hurtfull or ill quality, but onely offenſiue in quantity. Beſide the habit of women is more fat, plumpe and delicate to ſee to and to feele, and altogether without haires.

The Nouriſhing Faculties.

Finally, in women all the Animall Faculties are moſt perfect, their ſenſes moſt ſharpe, their Muſcles more nimble and deliuer to mooue their ioynts, their memories more happy, their inuention more ſubtile, their words, which expreſſe the conceit of the mind, more plentifull and abundant, and therefore *Virgil* expreſsing the communication of the Gods, makes *Iupiter* begin, and *Venus* to anſwere, but addeth:

The Animall Faculties.

Aenei. 10.

Iupiter hæc paucis, at non Venus aurea contrà
Pauca refert.
Thus in few words did *Iupiter* his royall ſentence end,
But *Venus* faire in many more did thus her cauſe commend.

If therefore all the Faculties, Vitall, Naturall and Animall, are in women more perfect then in men, who will deny but they are alſo hotter then men? Neither will we paſſe ouer in ſilence that which *Macrobius* hath obſerued in the 7 Booke of his *Saturnalia*, *What time the bodies of men were burnt, to euery ten men they put the body of a woman, to make them the ſooner take fire.*

Macrobius. Saturnal.

Theſe things are indeede probable, and couered ouer with a veile of trueth, which notwithſtanding if we weigh in the ballance of Philoſophie and of Phyſicke, they will appeare to be as light as vanity it ſelfe; we will therefore maintaine the other opinion, that men are generally hotter then women. And this we will confirme by ſtrong and ſubſtantial reaſons, as alſo by the authority of the beſt and moſt authenticke Authors.

That men are hotter then women.

There are very many things which will euince this truth, but theſe among the reſt. The Principles of Generation; the Place in which, and out of which the Infant is generated; the Conformation; the Motion; the time of Birth; the Purgation after Birth; the Structure and Habit of all the parts; the manner of Diet and courſe of life: And finally, the Finall cauſe. All which we will briefly run through.

The places from which the arguments are fetched.

If we conſider the Principles of Generation, Men are generated of hotter ſeede then women. This hath *Hippocrates* elegantly declared in his firſt Booke *de diæta*. For acknowledging a double or twofold kinde of ſeede in both Sexes, a Male ſeede and a Female, he concludeth that of the male ſeede, that is the hotter and more vigorous, a man is generated; out of the weaker a Woman. Moreouer, men are generated in a hotter place, *Hippocrates* in the 48. Aphoriſme of the fift ſection, ſaith, Male infants are borne on the right ſide, females on the left. Now we know that the right ſide is hotter then the left by reaſon of the Liuer. For the heart is indifferent and in the very middeſt, eſpecially the Baſis thereof which is the hotteſt part.

The principles of Generatiõ.

The place of Conception.

Neither are Males generated onely in the right ſide, but alſo out of the right ſide. For ſo ſaith *Hippocrates* in his Bookes *Epidemion*; when a man begins to grow luſtfull, if his right Teſticle ſwell, he will beget a manchilde, if his left a woman. And thence alſo it is that he calleth the right Teſticle *Maſculũ* the male, and the left *Fœminium* the Female, becauſe the ſeede of the one is very hot and exquiſitly boyled and made of the pureſt blood, that of the other colder & thinner, hauing much whey in it becauſe of the originall of the left ſpermaticall veine out of the emulgent. This the Countreymen know full well, and therfore when they would haue Cow-calues, they tye the right Teſticle of the Bull, that the ſeed may only yſſue from the left; which they learned or might haue done from *Hippocrates* in his book

The place out of which the Infant is conceyued.

De

De Superfœtatione, where he ſayeth, *When you would engender a Female, tye the right Teſticle of the Male, when a Male tye the left.*

The conformation.

If wee reſpect the τύπωσις or conformation of both the Sexes, the Male is ſooner perfected and articulated in the wombe; for he is accompliſhed the thirtieth, the Female not before the 40. day, as wee haue before noted out of *Hippocrates* in his firſt Booke *de diæta*, *de natura pueri* and *Epidemion*: but conformation is the woorke of heate. So likewiſe the Male is moued ſooner that is the third moneth, the Female later that is the fourth beſide the motions of the Male are more frequent and more violent, all which are manifeſt ſignes of an aboundant heate. Adde hereto that the Male borne the ſeuenth moneth commonly ſurviueth, the Female ſeldome or neuer.

The *Lochia.*

That alſo which is auoyded after the Infant is borne into the world called *Lochia* doeth teſtifie the heate of a Male childe: for the woman which is diliuered of a Female is longer in her purgations, of a Male ſhorter, becauſe the Male being hotter ſpendeth more of the bloud gathered together in the wombe. This *Hippocrates* teacheth in playne tearmes in his Booke *de morbis mulierum*: *After the birth of a mayde* (ſayeth hee) *the longeſt purgation laſteth 42. dayes, but after the birth of a knaue childe* (ſo our Fathers called a Male) *the purgation laſteth at the longeſt but 30 dayes.*

The habit and ſtructure.

If we conſider the habite and ſtructure of the parts of both Sexes, you ſhall finde in men more ſignes of heate then in women. The habit of a woman is fatter, looſer and ſofter; but fat is not generated but by a weake heate, woemen are ſmooth without hayre. The fleſh of men is more ſolide, their veſſelles larger, their voyce baſer: now it is heate which amplifieth and enlargeth, as cold ſtraightneth and contracteth.

A woman ſayth *Hippocrates* in the 43. Aphoriſme of the ſeaueuth Section, is not *Ambi-dextra*, that is, cannot vſe both hands as well as one, becauſe ſhe wanteth heat to ſtrengthen both ſides alike.

The diet.

In diet alſo, that is, in the cuſtome and vſage of their liues in meat and drink and ſuch like, men appeare to be hotter then women.

Hippocrates in his firſt Booke *de diæta*. *Men doe liue a more laborious life, and eat more ſolide meates then women, that they may gather heate and become dryer, woemens foode is more moyſte*; and beſide, they liue an idle and ſedentarie life, pricking for the moſt part vppon a clout.

The finall cauſe.

Finally, to all theſe we may ad the neceſsity of the Finall cauſe which is in Natural things the chiefe of all cauſes: It behoued therefore that man ſhould be hotter, becauſe his body was made to endure labour and trauell, as alſo that his minde ſhould bee ſtout and inuincible to vndergoe dangers, the onely hearing whereof will driue a woman as wee ſay out of her little wits. The woman was ordayned to receiue and conceiue the ſeede of the man, to beare and nouriſh the Infant, to gouerne and moderate the houſe at home, to delight and refreſh her husband foreſwunke with labour and well-nigh exhauſted and ſpent with care and trauell; and therefore her body is ſoft, ſmooth and delicate, made eſpecially for pleaſure, ſo that whoſoeuer vſeth them for other doth almoſt abuſe them.

Concluſion.

Wherfore we conclude, that if you reſpect the principles of Generation, the place, conformation, motion, birth, purgations after birth, the habit of the whole body, the ſtructure of the parts, the manner and order of life, and the finall cauſe of Creation, you ſhall finde that in all theſe reſpects a man is hotter then a woman.

Authorities to proue men hotter.

If our aduerſaries will not yeelde to all theſe demonſtratiue arguments, let them at leaſt giue credance to the whole Family of the Grecians both Philoſophers end Phyſitians.

Hippocrates.

This *Hippocrates* before the birth or incarnation as we may ſay of Philoſophy, with a diuine ſpirit declareth, not darkely and obſcurely but in playne tearmes in his firſt Booke *de diæta*, after this manner: *Generally and vniuerſally men are hotter and dryer then women* (for we inſiſt vpon mankind) *and women moyſter and colder then men.*

Ariſtotle.

That Genius and interpreter of Nature, *Ariſtotle* in his Booke of the *length and ſhortnes of life*, ſayth, *that men liue longer then women becauſe they are hotter.* In his third Booke *de partibus Animalium*, men are ſtronger and more couragious. In the firſt and eight Chapters of the firſt Booke of his Politicks, men in all actions are more excellent then women; ſurely becauſe of their heate from whence commeth the ſtrength of the faculties. And in the 29. Probleme of the 4. Section, he enquireth why men in winter are more apt for Venus and women in ſummer, hee anſwereth, becauſe men who are hotter and dryer are in Summer ſpent as it were and broken; and women in winter becauſe they are cold and moyſt & haue little ſtore of heat,

haue

haue their humors as it were frozen or curdled, not fluxible and mouing.

Galen in a thousand places establisheth this truth, but especially in the sixt chap. of his 14. Booke *de vsu partium*, where hee saith that women are more imperfect then men, because they are colder. For indeed of all qualities heate is the most operatiue. Conclusion.

Hence therefore we conceiue that it is manifest to all men that list to vnderstande the truth, that men are vniuersally hotter then women, and that those that maintaine the contrary are Apostataes for the ancient and authenticke Philosophy. But because wee may seeme not fully to satisfie men by our reasons and authorities, vnlesse we answere the arguments brought and vrged on the contrary part, we wil a little paine our selues and the Reader to answere them in order.

To begin therefore with the authority of *Hippocrates*, because it is a kind of wickednesse not to subscribe vnto this Father of Physicke, we will thus interpret the force of his words. Answer to the authorities.

Whereas therefore he saith, that a woman hath a rarer kinde of flesh then a man, we answere, that he vseth the word Rare abusiuely or at large for that which is laxe and soft, not for that which is porous. For if we so vnderstand it, the body of a man is more rare, that is more porous and open, and therefore they sweate more freely and more easily. And that this is *Hippocrates* meaning we appeale vnto himselfe in his Booke of Glandules, where hee saith; *It is therefore manifest, that the Chest and Paps, and the whole body of a woman is laxe & soft.* And a litle aboue, *A mans body is ful; & like a cloath, thicke and thight both to see to & to feele to, but a woman is rare, and laxe, and moyst, both to see to and to feele to.* Nowe laxity argueth a defect of heate which is not able to boyle and dissolue the superfluous moisture; on the contrary, solidity and fastnesse of the flesh ariseth from the perfect assimulation of well boiled and resolued Aliments. Wherefore seeing the flesh of men is faster then that of the woman, it followeth necessarily that they are also hotter. *Hippocrates* pounded.

And whereas *Hippocrates* saith, that women draw more aliment then men. Hee also abuseth the word *Traction* for that which is to *receiue* and *conteyne*. For the bodye of a woman being looser and as it were spongye, receyueth and conteyneth a greater quantity of blood. And that this is *Hippocrates* meaning, I gather from the Context of the place cited. For he illustrateth his opinion by an elegant similitude. If (saith he) you lay out all night vpon the ground the like waight of wooll, and of a well wouen cloath; you shal find in the morning the wooll to waigh heauier then the cloth, because it hath sucked vp more moysture: so it is reasonable that the lax and loose flesh of women doth receiue & retaine a greater quantity of blood then the fast flesh of a man. An excellent Similitude.

And whereas in the same place he saith, that the bloode of a Woman is hotter then the blood of a man, and therefore a woman is of a hotter temper then a man; that we thinke is crept into *Hippocrates* text, being added by some nouice scribe. And thus that great Learned man *Ludouicus Duretus* vnderstandeth *Hippocrates* and conceyueth of this corrupted place; as also *Christopherus a Veiga* in his Commentaries vpon *Hippocrates* Prognostiques. Wherefore we cannot admit of *Cordæus* his interpretation, who thinketh that the bloode suppressed, because transpiration is hindred, attaineth an outward and Aguish heat, and so becommeth hotter then the blood of men. For then wee must needes accuse *Hippocrates* of folly, (which were a kinde of blasphemy) because he compareth a sick woman with a sound and haile man. But if you compare the blood of both sexes diseased, the heat of a man wil certainly be more intense then that of a woman, because it is ioyned with siccity. Now siccity (saith *Auerrhoes*) is the File of heate: And thus we suppose that wee haue satisfied the authorities out of *Hippocrates*. Now let vs waigh the arguments with as much diligence as we may. A place of *Hippocrates* corrupted. *Duretus. Vega.* *Cordæus* interpretation of the corrupted place reiected *Auerrhoes.*

Womens pulses are more frequent and swift therefore they are hotter; for the swiftnesse or frequency of the pulse commeth from heate. We answere, that their pulses are more quicke and frequent, not because of the aboundance of heate, but because of the straightnesse of their organes. For the Arteries beeing small and narrowe, and oppressed with aboundance of crude and colde humours, could not bee so extended and dilated as in men; wherefore the necessity of life maketh recompence in the quicknes and frequency of the pulse; Nature prouiding for her selfe one way, when she cannot another. But the pulses of men are strong & great by reason of the strength of the faculty, because a great Artery may be extended into all dimensions. Answer to the former Arguments. Why Women haue quicke Pulses.

That which is obiected concerning the two faculties of the heart, the *Irascible* and the courage we thus dissolue: In *Hippocrates* and *Galen* ἐξυθυμία and θυμὸς, that is *Iracundia* and

Ira

Ira, Anger and Wrath are two distinct things. Anger is a disease of a weake mind which cannot moderate it selfe but is easily inflamed, such are women, childeren, and weake and cowardly men, and this we tearme fretfulnesse or pettishnes: but Wrath which is *Ira permanens* belongs to stout heartes, and therefore *Homer* calleth *Achilles* Anger: μῆνιν.

Homer.

Iliad. a. Μῆνιν ἄειδε θεὰ Πηληϊάδεω Ἀχιλῆος. *&c.*
O Goddesse sing the fixed rage of Peleus wrathfull Sonne.

Galen. And *Galen* in his second Commentarie vppon the first Booke *Epidemion* opposeth ἐυθύμους *Iracundos*, angry men, θυμώδεσι to wrathfull men; becausse these latter are of a manly courage and contemners of base things, the former are faint harted or white Liuered as we vse to tearme them. And the Temper of these two sorts is very different; for those that are angry, pettish, fretfull or wantle, chuse you which you will call them, are cold; but those that are wrathfull are hot. If therefore women are Nockthrown or easily mooued of the hindges, that they haue from their cold Temper, and from the impotencie and weaknes of their mind, becausse they are not able to lay a law vpon themselues.

Galen interpreted by Hip. And whereas *Galen* in his Booke *de arte parua* maketh ἐξυθυμίαν to be a signe of a hot hart, he abuseth the word. For *Hippocrates* in the fourth Section of the sixt Booke *Epidem.* maketh it a signe of a cold habit in expresse words, where he sayeth, *Those that haue hot bellies haue but cold flesh, such are thinne and veynie, and* ἐξυθυμώτεροι, that is, *angry or fretfull.* Women therefore are peuish creatures most-what, but nothing stout or strong hearted though their stomacks be good. *Hippocrates* in his Booke *de morbis virginum* hath this saying ἀνδρειοτέρη φύσις ἡ γυναικείη, *The Nature of a woman is to be of an abiect minde.*

Why females are fierce. And whereas they contend, that among rauenous Creatures the Females are most fierce, we say that the loue they beare to their yong addeth spirits and courage vnto them, and therefore that is rather to be accounted woodnes then fortitude. There are some creatures which becausse of their giddy madnesse make a shew of generosity, as the Female Elephant: some also there are in whome the feare of a worse condition begetteth boldnes, such are Panthers. In a Dogge partly his trustinesse to his maister partly his enuy maketh him fierce. Wee say therefore that Females are more churlish and fierce, but not stouter or stronger hearted. That which is obiected concerning the strength of their naturall faculties is of all the rest the most friuoulous and veine.

Why women grow faster & be ripe sooner then men. They say that women grow faster and doe sooner generate, and therefore they are hotter; but we say, that these are demonstratiue signes of a cold temperament. For therefore they grow faster and ingender sooner, becausse their end is nearer, for that the principles of their life are weaker. For as a short disease which we call *acute*, doth suddenly run through his foure times; the beginning, the encrease, the height, and the declination so that one time ouertaketh another; so women being of a shorter life then men, becausse they are colder, they sooner grow women and so also sooner grow old then men. And hereto subscribeth *Aristotle* in the sixt Chapter of his 4. Booke *de generatione Animalium* where he saith, *That all things that are lesse and weake as well in the works of Art as of Nature, doe sooner attayne vnto their end.*

Why females are lasciuious That Females are more wanton and petulant then Males, wee thinke happeth becausse of the impotencie of their minds; for the imaginations of lustfull women are like the imaginations of bruite beastes which haue no repugnancie or contradiction of reason to restraine them. So bruitish and beastly men are more lasciuious, not becausse they are hotter then other men, but becausse they are bruitish. Beastes do couple not to ingender but to satisfie the sting of lust, wise men couple that they might not couple.

That womens Testicles are hidden within their bodies is also an argument of the couldnes of their Temper, becausse they want heate to thrust them forth. Yet for all this we doe not say that women do generate more then men, for they want the matter and the spirite. Indeede they haue more bloud as wee sayed euen now, and that is by reason of their colde Temperament which cannot discusse the reliques of the Aliment; adde heereto that the blood of women is colder and rawer then the bloud of men. We conclude therefore that vniuersally men are hotter then women, Males then Females, as well in regard of the Naturall Temper, as that which is acquired by diet and the course of life.

But now I had need heere to Apologise for my selfe for speaking so much of womens weaknes, but they must attribute something to the heat of disputation, most to the current and streame of our Authours, least of all to mee who will bee as ready in another place to flou-

flouriſh forth their commendations as I am here to huddle ouer their ntaurall imperfections.

QVEST. III. *What Seede is.*

HAuing thus diſcourſed of the diſſerence of the Sexes the firſt thing neceſſary to Generation, it followeth that we intreat of the Seede which is the immediate matter of the ſame. To this common place we may wel giue the ſame Epithite which *Homer* was wont to giue to thoſe places which were ſcituated vnder mountaines, which hee calleth πολυπίδακας, that is, hauing many ſprings of liuing water. For I doubt not but the Reader ſhall find it ful of pleaſure and contentment, ful of variety and of pleaſant philoſophicall flowers, eſpecially if I can acquit my ſelfe wel in gathering them, and if they looſe not their verdure and ſauour now tranſplanted into a ſtrange ſoyle. That I may therefore take euery thing in order, it will not be amiſſe firſt to informe you what the worde it ſelfe in the originall ſignifies.

The names of ſeed.

τοινῦ σπέρμα, *ſemen* and *genitura*, Seede and Geniture, among Phyſitians are taken for one and the ſame. *Hippocrates* intituled his Booke of Seed περὶ γονῆς. And *Galen* his περὶ σπέρματος. And *Hippocrates* in many places of the ſame Booke calleth it alſo σπέρμα, as where hee ſayeth καὶ ἔστιν ἐν τῷ ἀνδρὶ τὸ θηλυ σπέρμα καὶ τὸ ἄρσεν, καὶ ἐν τῇ γυναικὶ ὁμοίως: *There is as in a man ſo in a woman Male and Female Seed.* And *Gal.* in his Comentary vpon the 62. Aphoriſme of the firſt Section σπέρμα ὀνομάζομεν καὶ γονὴν καὶ γονόν, *We call Seede Geniture.* *Hippocrates* alſo for the ſame vſeth θορὸς in his ſecond Booke *de Morbis.* But *Galen* in his Commentarie in 1. *Prognoſt.* diſtinguiſheth betweene θορὸς and σπέρμα, where he ſaith that θορὸς ſignifieth rather *the excretion of Seed.* *Ariſtotle* in the 18. Chapter of his firſt Book *de Generatione Animalium*, putteth a difference betweene *Geniture* and *Seede*, as if *Geniture* were *ens imperfectum*, an imperfect thing, and onely one principle of Generation, but *Seede* perfect, compounded of both principles. For our part we will take them promiſcuouſly, although the name of ſeed be more frequent and in more ordinary vſe.

Hippocrates. *Galen.*

What θορὸς is.

Ariſtot.

The Nature of Seede no man that I know hath yet eſſentially defined; *Hippocrates* in his Booke *de Genitura* calleth it, *The beſt and ſtrongeſt part of that humour which is contayned in the whole body.* *Pythagoras*, The froth of the beſt and moſt laudable blood. *Plato*, The defluxion of the ſpinall marrow. *Alcmæon*, A ſmall portion of the Braine. *Zeno Criticus* The ſpirit of a man which he looſeth with moyſture, and the ſlough of the Soule. *Epicurus* A fragment of the Soule and the Body. Some of the Antients haue defined it to be, *A hot ſpirit in a moyſture able to moue it ſelfe and to generate the ſame out of which it iſſueth.* *Ariſtotle* ſayeth it is *an Excrement of the laſt Aliment of the ſolide parts*; ſometimes he calleth it *a profitable Excrement.* *Fernelius* deſcribeth it on this manner: *It is that out of which originally are made all thinges which are according to Nature, not as out of a matter, but as out of an Efficient Principle.* But it ſeemeth to vs that none of all theſe do ſufficiently expreſſe the nature of Seede. The fiue firſt are moſt imperfect, and therefore we will not contend with them.

Hippocrates. *Plato.* *Alcmæon.* *Zeno Criticus.* *Epicurus.*

A deſinition of the antients.

Ariſtotle. *Fernelius.*

Ariſtotles deſcription defineth onely the matter, which is the remaynder of the laſt Aliment; but the forme and the efficient cauſe it toucheth not; neither indeede doeth it expreſſe the whole matter of Seede, becauſe as we ſhall ſhew anone there is a double matter of Seede, bloud and ſpirits. So that to ſay that Seede is an excrement of the laſt Aliment, is all one as if he ſhould haue ſayed Seede is Blood. *Fernelius* definition contayneth neyther the forme nor the matter of Seede, but attributeth to it onely an operatiue or efficient dower, whereas it is alſo a materiall principle: wherefore we haue here exhibited another definition perfect we hope and abſolute in all his members and parts which is this.

All diſalowed.

A perfect deſinition of ſeede.

Seede is a moyſt ſpumous or frothy and white body, made of the permiſtion of the ſurpluſage of the laſt Aliment and of the influent or errant ſpirits boyled and laboured onely by the vertue of the Teſticles, and that for the perfect Generation of a Creature. We already in this Book a little before examined the ſingular particles of this definition, which we ſhall not therefore need to run ouer againe; here we will onely proſecute a little more curiouſly the matter of Seede.

We therefore ſay that there is a double matter of Seede, the Excrement of the laſt Aliment, and Spirits. That this firſt matter is an excrement, *Ariſtotle* prooueth by an elegant induction, on this manner. VVhatſoeuer is contayned in the body eyther is a part of the body, or an Aliment, or a colliquation, or an excrement: Seede is not a part of the body,

The matter of ſeede double.

It is no part. nor an Aliment, nor a Colliquation, and therefore an Excrement. It is not a part, becauſe whilſt it remaineth in vs there is nothing made of it, neither hath the body any vſe eſpecially of the matter of it. Add heereto, that if it were a part ſo often as it is loſt the creatures ſhould become maimed.

No Aliment. No Colliquation. It is not an Aliment for then it ſhould not be auoyded, much leſſe is it a Colliquation. For a Colliquation is a thing beſide Nature, ſeede is truly naturall yea the quinteſſence of the Nature of man. Thoſe things that are fat are moſt ſubiect to Colliquation or melting, but we know that fat men haue leaſt quantity of ſeede. Moreouer Colliquation may bee made of any moiſture in any part of the body, but the ſeede hath his owne determinate & limited ſeate wherein it is contained. Colliquation is alwayes hurtfull, but the auoyding of ſeed is ſometimes very profitable.

But an excrement. It remaineth therefore that ſeede muſt needs be an excrement. But what manner of excrement is it? In all creatures that bring foorth their young aliue there is a double excrement. The one naturall and profitable, the other vnprofitable. The firſt is profitable either to noriſh ſome part, or to procreate, conceiue and breed vp the young, as *Galen* teacheth in his Commentary vpon the 39. Aphoriſme of the fift Section; the other cannot bee aſsimulated becauſe it is of a diſsimilar ſubſtance. The firſt is called an excrement onely by reaſon of the abounding quantitie thereof. The ſecond is noxious and hurtfull euen in qualitie alſo.

Excrements double.

What is a profitable excrement. The Chylus which is made in the ſtomacke is acceptable euen to the ſtomacke which is pained about the concocting thereof, but at length it is thruſt downe into the gut as an ouer-plus or ſuperfluity; ſo that which was an excrement to the ſtomacke becommeth to the Liuer an Aliment. The Liuer being ſatisfied and glutted with blood, driues that which remaineth as a ſurpluſage into the great veines, ſo the excrement that is, the ſuperfluity of the Liuer, becommeth a conuenable aliment for the particular parts.

How euerie part miniſtereth to another out of his owne aboundance. The parts both fleſhy and ſolid when they are ſatisfied with blood, do leaue that which remaineth in the veines; theſe reliques are by little and little drawne by the Teſticles and at length are conuerted into the nature of ſeede. And for this cauſe the ſeede is called an excrement of the laſt concoction, becauſe it is generated out of the remainders of the laſt Aliment. That remainder is blood, not changed or whitened by the ſolid partes, for the ſeede hath his whiteneſſe onely from the ſpermaticall veſſels and the Teſticles; but redde and pure blood deriued from the trunke of the Hollow veine into the ſpermaticall veines. An argument heereof is, becauſe children and decrepit old men do not yeeld ſeed, for that in theſe there is no ouerplus left; and ſuch wantons as doe too immoderately ſatisfye their inordinate concupiſcence do often yeeld bloudy ſeed, becauſe it is not altered hy the ſpermaticke veſſels and the teſticles.

How ſeed becomes white.

The ſecond matter of the ſeede. There is another matter of the ſeede far more noble which maketh it prolificall or fruitfull, and that is ſpirits brought vnto it by the ſpermaticall arteries; which being fierie & aery ſubſtances wandering and courſing about the whole bodye doe containe in themſelues the Idea or forme of the particular parts. Neither do theſe ſpirits only cõteine the forme of the ſexes, but alſo τὴν πεπρωμένην μοῖραν, the fatall neceſsity of life and death; ſo that from whence we haue the acte of life, from thence alſo we haue the neceſsity of diſſolution.

In regard of theſe ſpirits the ſeede is called an efficient and a formall prineiple. For the ſpirit is the immediate and proportionable inſtrument of Nature, wherby the noble Architect, that is the ſoule, extendeth the Membranes, produceth and lengtheneth the paſſages, and by a kinde of puffing ſufflation perforateth them.

The double Nature of ſeed. This therefore is the double matter of ſeede, blood and ſpirits. Hence it is that among the Philoſophers the ſeede is eſteemed to haue a double Nature; one aery, ſpumous or frothy, another wateriſh and diffluent. For in that the ſeed is aery it is neuer congealed or frozen, and in that it is wateriſh, it is no ſooner out of his owne veſſels but it melteth the ſpirits being vaniſhed which did vnite his parts.

How ſeede & water differ. *Ariſtotle.* Now, whereas there are ſome which affirme that ſeed is onely wateriſh, becauſe the colour is like water, as alſo the conſiſtence when it hath bin but a little time out of the veſſels; we will againſt them oppoſe *Ariſtotle* who diſputeth this very point in the ſecond chapter of his ſecond Booke *de generatione Animalium*, where he ſaith, that the natures of water and ſeede are very different, for water by heate becommeth not thicke as ſeede doth. All wateriſh things by colde are congealed, ſeede is made more fluid. And in the 51 Problem of the firſt Section he ſaith, that ſeede is like to Flegme and water, not in Nature but onely in colour.

lour. But we proceede.

How the double matter is mingled.

This double matter is mingled in these Labyrinths in which the vein openeth into the artery, and the artery into the veine by a wonderfull inoculation, so that of two there becommeth one vessel; an Embleme of the holy mixtion of seedes in Mattimony. For as of two vessels a veine and an artery there is made one vessell, so of a double matter blood and spirits there is made one seede, and of two seeds the Males and the Females one infant, and of two parents the husband and the wife one body. But we returne.

An Embleme of Matrimony

How this mixture becommeth seede.

The blood and the spirits being thus mingled do attaine in the preparing vessels a rudiment of seede, not so much by the inbred power or faculty of the vessels themselues, as by an irradiation or beaming influence they haue from the Testicles. Finally, in the *Epididymis* and the Testicles the seed is boyled by their proper and ingenit vertue whose substance is rare, spongy and friable; and from these it is deriued into the eiaculatory vessels as an ouer plus and peculiar excrement of the Testicles. From whence it is manifest, that fruitfull & prolificall seede yssueth onely out of the Testicles not from the whole body, as we shal further prooue in our next exercise.

QVEST. IIII. *Whether seede fall from all the parts of the body.*

The olde and receiued opinion.

ME thinkes now I see a faire and large fielde before me, wherein I may expatiate and disport my selfe a little, not restraining my discourse within those narrow cancels wherein I haue formerly confined it. It was a common receyued opinion in old time, that the seede did flow from all parts of the body. This *Hippocrates* auoucheth in his Booke *de genitura, de morbo sacro* or of the Epilepsie, & *de aere aquis & locis*, for ther he saith *That seed yssueth from al moysture which is contained in the body.* And in another place, *Seede falleth from all the parts, sound seed from sound parts, and sicke or diseased from diseased parts.* Hence it is, that lame men beget lame children, bald men bald children, and Spleniticke men children afflicted with the Spleene.

Hippocrates.

Confirmd by foure reasons

This opinion is confirmed by foure reasons. First, because in the acte of Generation or Copulation the whole bodie is delighted and as it were stupified with an extasie of pleasure, or if you wil, suffereth a pleasant Convulsion. Whence it was that coition is called *parua Epilepsia*, a light Fit of the Falling sicknesse, as we saide euen now.

The second reason is, because the Childe beareth the Carracter of the Fathers imperfections: Balde men, balde children; Lame men, lame children and so likewise in all the Cense of Hereditary diseases.

Thirdly, because those that are immoderate in the vse of *Venus* doe waste and consume all the parts of their bodies. Finally, because children do resemble their parents in all parts of their bodies.

An elegant history.

There is an elegant History of a Boy in *Calcedo*, who bare in his right arme from his birth certaine markes which were seared before in his Fathers right arme also.

Aristotle. *Fernelius.*

But this opinion is gainsayed and disprooued by *Aristotle* in the 17. and 18. chapters of his first Booke *de generatione Animalium*, & that with weighty arguments which we list not heere transcribe. *Fernelius* also in the seauenth Booke of his *Physiologia* and the second Chapter addeth other reasons to which we referre the studious Reader. It shall suffice vs in this place to answere the former arguments.

The former arguments answered.

The argument drawne from the vniuersall pleasure and tickling delight of the whole body is of no force; for euen in itching the whole bodie is tickled, though onely one part itcheth. Morcouer, if the pleasure were therefore conceiued because the seed floweth from the whol body, it shold not be perceiued in all the body at once but by degrees, first in one part then in another as the seede fell from this or that part. For we cannot imagine that in one moment of time the seed is deriued from al the parts into the Testicles, and so into the eiaculatory vessels. We therefore acknowledge another cause of that pleasure whereby the whole body is delighted in Coition, to wit; the high heate, froathinesse and aboundant spirites of the Seede; for that Seede so qualified as it tickleth the partes of Generation which are of exquisite sense vvith his suddaine motion, it draweth the vvhole bodye into a sympathy and consent with them. For as if a Membrane be affected any way with paine, all the Membranes of the body conceyue a sense of dolour therewith: so when a Membrane is tickled the vvhole body receyueth a sense of delight and is likewise mooued therewith.

Why all the body is tickled in coition.

That lame men beget lame childeren, or maymed maymed is not perpetually true, for we see oftentimes that lame men beget perfect childeren, and hee that wanteth a ioynt begetteth a childe with all his ioynts.

That in immoderate coition the whole body is resolued and consumed, happeneth because the remaynders of the Aliment and the Spirits are in such men exhausted, whereof when the partes are defrauded then they must of necessity waste and consume. And therefore *Auicen* sayeth, that the great expence of Seede wasteth the bodye fortie times so much as the expence or the losse of bloud, if the losse of them both bee proportionable.

Finally, that which they obtrude concerning the likenesse of Childeren to their Parents belongeth to a higher contemplation, and shall bee disputed at large by and by in a more conuenient place; yet thus much in the meane time wee say for answere, that the similitude they speake off proceedeth not so much from the crasse and thicke matter of the Seede, as from the formatiue faculty seated in the particular partes, and communicated to the Testicles, and at length to the Seede by the influent Spirites which are neare of kinne vnto those which haue their perpetuall residence in the parts of the body.

Wee therefore doe protest against that old errour as a beggerly rudiment receiued from hand to hand among the Auntients, that the Seede falleth from all the partes of the body.

Another opinion of those that deriue the seed from the brayne.

Some there are who deriue the greatest part of the Seed from the Brayn and the Spinall marrow. This opinion of theirs I will illustrate by authorities, examples and reasons. The authoritie is that of *Hippocrates* in his Book *de Genitura*, where he sayeth, that the Seede is diffused out of the Brayne into the Loynes and the marrow of the backe, from thence into the Kidneyes, from the Kidneyes it attayneth through the middest of the Testicles to the priuy partes. In his Booke *de Natura ossium*, hee wryteth that the Iugular veynes proceede from both sides of the heade into the Testicles, and thither conuay the Seede, wherefore from the Brayne to the Testicles *Hippocrates* sheweth a double way, the spinall marrow, and the veines behinde the eares.

Authorities to proue it.

Plato in his *Timæus* defineth Seede to be *A defluxion of the spinall marrow. Alcmæon. A small portion of the Brayne*; whence it is that the common people think that the braines and marrow of the bones do engender much seed.

Histories.

For the confirmation of this opinion, there are elegant Histories in *Hippocrates* Book *de aëre aquis et locis*. The first is of such men as were called μακροκέφαλοι, the other of the Scithians.

Macrocephali what they are

There were in tymes past among the inhabitants of *Europe* certayne men called *macrocephals* who were had in great esteeme, whose heades were long, and such were accounted noble and generous spirites. And therefore the Nurses were wont to presse the tender heads of Infants and to lengthen them with swathes, till at length those that by custom and constraint had long heads, begat children with long heads naturally and by conformation without any constraint at all.

The Scythians cut the veines behind the eares.

The Scithians hauing no skill at all in Horse-manshippe, and riding without stirrups, grew all of them almost to be troubled with the hipgowt or sciatica, which disease that they might cure, they caused the veines behind their eares to be opened, which being cut a sunder they after proued barren, and some thought this came to passe because the cicatrice or scarre closed vp the way of the seede descending from the Brayne. To which conceit a Lawyer it may be alluding, wrote that Theeues should haue their eares cutte off least they should beget young Theeues. They conclude therfore that the greatest part of the fruitfull and best concocted seede falleth from the Brayn and the spinall marrow. This also may be confirmed by some sleight reasons.

Reasons to confirme this opinion. *Hippocrates.*

In coition the Brayne is most chiefly affected; then the spinall marrow and the veines; and oftetimes as *Hippocrates* obserueth in his Books *Epidemion*, and *Lib. de internis affectibus*, vppon the immoderate vse of Venus there followeth *Tabes dorsalis* a consumption of the marrow of the backe.

A story out of *Albertus mag.*

Albertus Magnus maketh mention of a petulant & lasciuious Stage-player, whose head when he was dead was opened, and there was found but a little part of his Brayne left, the rest forsooth was consumed vpon harlots. Adde hereto, that vpon immoderate vse of women followeth baldnesse; now baldnes we know commeth from the want of a hot and fatty moysture, which kinde of moysture is spent in coition. And *Aristotle* saith that no man

growes

growes bald before he haue knowne the vse of Venus. This was often cast in *Cæsars* teeth when he triumphed ouer the *Galles*. *Citizens keepe vp your wiues, for wee bring home a bald Leacher*. And these are the authorities, histories and reasons whereby some are perswaded to thinke that the seed floweth from the head vnto the testicles: concerning this matter we will be bold to speake freely. *Cæsars* disgrace

I confesse that *Hippocrates* had a most happy and diuine wit, which as sayeth *Macrobius*, *would neuer deceiue any man, nor could it selfe be deceiued*. Yet herein hee hath neede to be excused, and no maruell; for in his age the Art of dissection was but rude, scarcely knowne to any man, and therefore it is that many of his sayings concerning Anatomy wee cannot either vnderstand or giue consent vnto. Sure we are that there are no manifest or conspicuous passages as yet found from the Brayn and Spinall marrow to the Testicles, vnlesse haply some small nerues which carry onely spirites but are not capable of seede: neyther yet doe we finde any braunches deriued to the Testicles from the externall iugular veines, vnlesse as all the veines of the body are continued one with another: wee therefore cannot conceiue how thick and well laboured seed should passe into the Testicles from those veins which run behind the eares. *Hippocrates* commendations. His age rude in Anatomicall dissections.

The Story of the Scythians which they obiect, who grewe barren vppon the cutting of the veines behinde their eares is of no force; for they vnderstand not aright the cause of that barrennesse. Some think that the Cicatrice or scar which grewe vppon the wound did shutte vppe the wayes of the seede. *Auicen* thinketh that it came to passe because the descent of the Animall spirit was intercepted; others think that the arteries were cut, and so the passage of the vitall spirit hindered: but these are fond assertions and sauour little of any knowledge in Anatomy; for these veines and arteries which appeare behinde the eares are externall vessels. There are farre larger vesselles internal, which runne into the Brayne through the holes of the skull, by which as by riuerets the brayne is watered and by which rather then by these outward which touch not the brayn at all, the seede should fall from the head. But let vs grant that the seede falleth through these outward veines; shall we thinke that a scarre will hinder the passage, or interclude the wayes of the seede and the spirites? by no meanes. For if thicke bloud floweth and returneth through these vesselles notwithstanding those hinderances, why should not the seed passe also which is full fraught with spirits and will passe through insensible pores. VVee must therefore enquire further for the cause of this sterility or barrennesse and not impute it to the interception of the wayes. I finde in *Hippocrates* three causes of this their sterility; their much riding, their sciatica payne, and the too great effusion of bloud vpon the cutting of those veines. Continuall riding weakneth the strength of the loynes, the kidneis and the spermatick parts: now the Scithians did vse to ride perpetually and without stirrups. How the Scythiãs become barren. 3. Causes of their barrennes out of *Hippocrates*.

That much riding may bee a cause of barrennesse, *Hippocrates* sheweth in the place before quoted, where hee sayeth. *Amongest the Scythians the richest and most noble weere most of all others thus affected, the poorer sorte least of all; for the noble spirites because they vsed to ride much incurred these mischiefes, whereas the poorer sorte went on foot*. From their frequent riding proceeded also their hip-gouts, which is the second cause of sterility. For nothing so much infirmeth and weakneth the body, and to weaknes addeth the corruption of the humors, as payne. Much riding may cause barrennes. So may paine

This payne that they might mittigate they cut the veines behinde their eares, out of which issued great aboundance of bloud. And hence came the third cause of their sterilitie, for by the losse of much blood which is the very treasure of Nature, theyr Braynes weere ouer cooled.

Nowe the Brayne is a principall part, into consent wherewith the Heart and the Liuer were eftsoones drawne: and hence came it to passe that their Seede was waterish, barren and vnfruitfull. For the principall partes are all of them knitte and tyed together in so great and in so strayght bandes of conspiration, that but one of them fayling, or faltering both the other are sodainly deaded or be-numbed & all their vigor and strength quite abated. And large effusion of bloud.

That their Braynes were refrigerated by the immoderate effusion of bloud, *Hippocrates* playnely declareth in these wordes. *When the disease beginnes to take hould of them they cut both the veines which are behinde their eares. And presently after abundance of bloode issuing foorth they fall asleepe for meere weakenesse*; by which it appeareth that the cause *Hippocrates*.

of their barrenneſſe was not the cloſing vp of the paſſages, but their inordinate riding, the paine of the Sciatica and the refrigeration of the braine by the immoderate effuſion or expence of blood and ſo conſequently of ſpirits.

The obiectiō of the *Macrocephali* anſwered.

That which they obiect concerning the *Macrocephali*, doth indeede proue that the formatiue Faculty yſſueth from the braine vnto the Teſticles, but it dooth not prooue that white and perfect ſeede deſcendeth thither from thence.

why the brain is moſt affected in coition

And whereas in coition the braine and the ſpinall marrow are eſpecially affected, that commeth to paſſe, ſay we, becauſe their ſoft ſubſtance is ſooneſt exhauſted, and doth leſſe reſiſt the traction of the Teſticles. Add heereto, that the braine is the laſt part wherein the traction of the Teſticles doth reſt and determine.

Empedocles opinion.

Galen in the third Chapter of his ſecond Booke *de Semine* writeth, that *Empedocles* doth not thinke that the ſeed fell from the whol body, but half of it from one parent, halfe from the other: the more excellent parts from the Father, and the more ignoble from the Mother. But it were time ill ſpent to inſiſt vpon the anſwering of ſuch idle conceits.

The opinion of others

Some haue been of opinion, that white ſeede falleth from all the ſolid parts, paſſing from them into the ſmaller veines, out of the ſmaller into the greater, and in them rideth in the humors as a cloud or ſedement in the vrine, and ſo is drawn away by the ingenite traction of the Teſticles.

Confuted by *Ariſtotles*

Theſe men *Ariſtotle* elegantly confuteth in the places before cited, & *Galen* in his Bookes *de Semine*.

Auicens opinion.

Auicen the Prince of the Arabians contendeth, that the matter of the ſeede falleth vnto the Teſticles from the three principall parts of the body, the Braine, the Heart and the Liuer, and him haue many of the new writers followed. Neither were the Poets ignorant of this kind of Philoſophy, but leaſt it ſhould grow common or be profaned by the rude vulgar wits, they cloaked it vnder obſcure and blacke veiles and ſhaddowes of fables, as they would do a holy thing. For they thought it a great wickedneſſe and not to bee expiated, if the ſecrets of Philoſophy were bewrayed to the common people. Wherefore they feigne that when *Venus* and *Mars* were in bed together, they were deprehended or taken in the manner, as we ſay, by *Mercury*, *Neptune* and *Apollo*. *Apollo* with his rayes as with a quickning Nectar illuſtrateth them. Now by *Apollo* they meane the heart, whoſe affinitie with the ſunne is ſo great, that they call the Sunne the heart of the world, and the heart the ſunne of the body. *Neptune* the God of the Sea and the ruler of al moiſture reſembles the Liuer which is the fountain of beneficall moiſture. Vnder the name of Mercury that witty and wily God they deſigned the braine. Theſe three principles therefore reſpect *Mars* coupling with *Venus*, that is, haue the ruling power in procreation.

The poets Philoſophy concerning this matter.

An Elegant Mythologie.

Thus haue you heard the diuerſe and different opinions of the ancients and late writers concerning this matter, it remaineth now that wee reſolue vppon ſomething our ſelues, which we will do on this manner.

What wee reſolue of.

The ſeed is a moyſt, ſpumous and white body, compounded of a permixtion of blood and ſpirits, laboured and boyled by the Teſticles, and falling onely from them in the time of generation, or from the adiacent parts. Neither do we aſcribe that faculty which they cal σπερματοποιητικὴν, *the Faculty of making ſeede* to any other part ſaue onely to the teſticles and their veſſels. But whereas there is a double matter of the ſeede, blood and ſpirits; we think that the blood is red and not at all altred by the ſolid parts, and falleth only from the veins. As for the ſpirits which are aery, thin and ſwift Natures, wandering through the whole body being neere of kin vnto the ingenite ſpirits of the particular parts, we thinke they fall into the Teſticles out of the whole body, and bring with them the Idea or forme of the parts and their formatiue faculty. And in this ſenſe haply it may be ſaide, that the ſeede falleth from all the parts of the body, but in no other.

Obiection. Anſwere.

But ſome man may ſay, If the ſeede yſſue onely from the Teſticles, how may it bee that two ſo ſmall bodies as the Teſticles are, ſhould be able to boile ſo great a quanty of ſeede? I anſwere, that heerein appeareth the wonderfull wiſedome and prouidence of the GOD of Nature, who hath made all officiall parts, not onely to draw fit and conuenient Aliment for their owne vſe, but ſo much and ſo great a quantity as may ſuffice the other intentions of Nature alſo. So the Liuer draweth more blood out of the Veins of the Menſetery then is ſufficient for his owne nouriſhment, ſo the heart generateth abondance of ſpirits; not onely for his owne vſe, but to ſuſtaine the life of all the parts. The Teſticles therefore beeing common and officiall members, and the firſt and immediate organs of generation, do draw more blood then may ſuffice for their own ſuſtentation, which ouerplus being there arri-

The wonderfull prouidēce of God.

arriued, is by them continually concocted and boyled into ſeede.

QVEST.V. *Whether women do yeelde ſeede.*

CONcerning the ſeede of women, there is a hot contention betweene the *Peripatetians* and the Phyſitians. *Galen* in his Bookes *de Semine*, and in the 14. book *de vſu partium*, elegantly diſcuſſeth the whole queſtion, wherefore that which he there hath at large and in many words exemplified, wee in this place will contract and draw into a briefe ſumme. There ſhall be therefore three heads of this Diſputation. First of all we will propound the reaſons of the *Peripatetiks*. Secondly, we will giue you a view of the opinion of the Phyſitians; and laſtly wee will anſwere all Obiections that are brought againſt the truth.

Three heades of this Controuerſie.

Ariſtotle in his Bookes *de Generatione Animalium* contendeth, that women neither looſe any ſeede in the acte of generation, neither yet indeede haue any ſeede at all, and that for theſe reaſons.

The arguments of the *Peripatetiks* that women haue no ſeede.

Firſt, becauſe it is abſurd to thinke that in women there ſhould be a double ſecretion at once of blood and ſeede. Secondly, becauſe women in their voice, in their haire & in the habit of their body, are moſt like vnto Boyes, but boyes breede no ſeed. Thirdlie, becauſe women do ſometimes conceiue without pleaſure yea againſt their wils. For *Auerrhoes* telleth a Story of a woman who being in a Bath together with ſome men, receyued ſeed that fell from them and floted in the water and thereupon conceiued. Fourthly, becauſe a woman is an vnperfect male, and hath no actiue power but onely a paſſiue in generation. Finally, becauſe if women ſhould looſe ſeed they might engender without the helpe of the male, becauſe they haue in themſelues the other principle of generation, to wit, the Menſtruall blood.

On the contrary, the Phyſitians bring ſtronger arguments to prooue that women yeeld ſeede. This firſt of all men *Hippocrates* auoucheth in his Bookes *de Genitura* and *de diæta*, where he doth not onely acknowledge that women haue ſeede, but addeth moreouer, that in either ſexe there is a twofold kinde of ſeede, one ſtronger, another weaker. *Ariſtotle* alſo himſelfe in his tenth booke *de Hiſtoria Animalium* is conſtrained to confeſſe that to generation there is neceſſarily required a concourſe of the ſeeds of both ſexes.

The opinion of the Phyſitians. *Hippocrates.* *Ariſtotle.*

Galen in this buſineſſe hath ſo excellently acquitted himſelfe, that he hath preuented all men after him for gaining any credit by the maintenance of this truth. Notwithſtanding, we will endeauour by demonſtratiue arguments to make it ſo manifeſt, as for euer all mens mouths ſhall be ſtopped.

Galen.

Firſt therefore it is agreed vppon by all men, as well Phyſitians as Philoſophers, that Nature endeuoureth nothing raſhly or in vaine. If therefore there bee all Organes for generating, boyling, and deriuing or leading ſeede to the parts of generation in Women as in men, it muſt needs follow that they alſo doe generate, boyle and leade downe ſeede. Now for the preparation of ſeede they haue foure veſſels, two veines and two Arteries, for the boyling and perfecting ſeede they haue teſticles, for the leading it down they haue eiaculatory veſſels. And this is agreed vpon by all Anatomiſts.

The reaſons on the Phyſitians ſide.

I know well that the *Peripatetiks* will Obiect, that in thoſe veſſelles there is conteyned a kinde of wateriſh moyſture and ſerous but nothing ſufficiently boyled, and that the Teſticles of women haue as much vſe as the paps in men. But how miſerably they are deceiued, good reader be thou iudge. If thoſe preparing veſſels do containe nothing but a whaey and ſerous moiſture, crude and vndigeſted, why are they contorted with ſo many Girations and Convolutions? why ſo wreathed and plighted one with another? Nature no where in all the body hath made any web or complication of veſſels but onely for a newe coction and elaboration. Add heereto, that if theſe veſſels do onely yeelde a wateriſh and ſerous humor, why doth the ſpermaticall veine inſinuate it ſelfe into the ſpermaticall artery, ſo that of two veſſels they become but one, as it is in men? Is it not rather therefore, that the double matter of the ſeede ſhould be exquiſitely mingled, and one body made of the permixtion of blood and ſpirits? As for the proportion betweene womens Teſticles & mens breaſts, we ſay it is not equall. For the Pappes in men ſerue onely for ornament, to ſtrengthen the cheſt and defend the noble parts therein contained. The Teſticles of women vnleſſe they make ſeede, are altogether vnprofitable. The Pappes of men haue no Glandules, neyther do they generate milke; the Teſticles of women are perfect Glandules, and

Obiection. Anſwere.

That there is not the ſame reaſon or proportion in the paps of men, and the Teſticles of women.

An argument from the eiaculatory vessels.

and their substance is mouable and hollow or cauernous as they are in men. Moreouer, why are the eiaculatory vessels which are inserted into the sides of the wombe, which they commonly call the hornes, more intorted in women then in men, but only that the shortnes of the way might be recompenced by the variety of the complications? What neede was there of so great curiosity in this admirable work of Nature, if it had been only for the Generation or eiaculation of a crude and wateriſh humour.

Another demonstration.

This demonstration we take to be strong enough and indeed not to be gayn-sayed; yet giue mee leaue to strengthen it yet more with another. There is nothing more certayne then that woemen in their accompanying with men doe looſe somewhat from whence comes their pleasure and delight. That therefore which is auoyded is either bloud, or a thinne and serous humour, or perfect and laboured seed. No man in his right wits will say it is bloud; for when the courses flow there is no pleasure, no delight followes thereuppon, yea most commonly dire and terrible racking paynes. That it is not a serous or vnconcocted humour is conuinced by the wonderfull structure of the preparing and by the complications of the eiaculatorie vessels. VVherefore it remayneth that it must bee something well concocted and laboured in these complications which they looſe. And that is Seed, which is prooued by the white colour, the thickneſſe and the spirites wherewith it is houed and turgid.

If you dissect the organs of women which haue long refrayned the vse of men, you shall finde their vesselles and Testicles full of seede. Adde hereto that those who of a long time haue intermitted the vse of the mariage bed, or otherwise are wanton women doe in their sleepes auoyde great quantity of seede. And are not women often troubled with the *gonorrhæa* or running of the reynes and that disease which we cal *priapismus*? Yea sometimes when their genitalles are full of seede they grow into woodneſſe and rage of lust, and euen to bee starke mad indeede; but after that seede is auoyded they come againe vnto themselues.

Another opinion of some *Peripateticks*.

Continuall experience tels that those Females which are castrated or gelt, will neuer admitte the vse of the Male, but the goads of lust are in them vtterly extinguished. The strength and validitie of these arguments haue driuen many of the *Peripateticks* to confesse that women also doe auoyde seede, but least they should depart from the opinion of their Maister *Aristotle*, they say that that seede is vnfruitefull, hauing in it no actiue or operatiue faculty or power. So that all the actiue power of generation they attribute to men, comparing the man to the Artificer and the woman to the wood which hee squareth and heweth and worketh into a shape or forme. The man they say yeeldeth the Soule and the forme, the woman onely the matter.

Auerrhoes. *Albertus Magnus.*

The principall of this sect are *Auerrhoes* and *Albertus Magnus*: for say they, whereas in euery Nature there must be a Patient correspondent and answerable to the agent, it is most likely that the passiue power is giuen to women which might answere to the actiue power in men. And truely to receiue the seede, to conceiue it, to beare the burthen and to nourish the Infant; are all arguments of a passiue faculty.

Womens seed is operatiue.

With this deuice they think they haue eluded and escaped the darts of the Physitians, when yet alas they wallow still in the same myre. For, to auoyde white, spumous, thicke and well concocted seede is all one as to auoyde actiue and operatiue seede. For will the spirites which are brought by the spermaticall arteries and are exquisitely mixed with the bloude in these mazy complications, play them idlie in the conformation? Or shoulde we not rather beleeue that the spermaticall partes are of them generated as of their proper matter? The seed therefore of vvomen is actiue as that of men, but yet it is vveaker, because it is lesse hot and hath in it fevver spirits.

A strong reason of *Galens*.

I vvill giue you a taste of one or tvvo of *Galens* arguments vvhich shall manifest the fœcundity and fruitfulnes of vvomens seede.

How children become like their parents.

That the childe is sometimes like the father sometimes like the mother no man vvill deny. This similitude is either from the seede or from the menstruall bloud; not onely from the menstruall bloud, because then children should alvvaies be like their mothers neuer like their fathers; neither onely from the seede of the father, for then children should alvvayes bee like the father and neuer like the mother: the similitude therefore proceedeth from a common cause issuing from them both, vvhich common cause is seede. The *Peripateticks* vvill answvere that sometimes the children are neither like father nor mother, but like their grandfathers or great grandfathers, vvho neither actiuely nor passiuely did contribute any

thing

thing to their generation. But I cannot see what they can answere to that argument of hereditary diseases.

The woman that is troubled with the Gowt bringeth foorth a son subiect to the gowt, if she be subiect to the Falling sickneſſe she will bring foorth an Epilepticall infant, or being troubled with the Stone a childe disposed to that disease; these diseases I hope they wil not say come by reason of the fault of the blood. For who euer was so mad to say, that the Menstruall blood contained in it the Idea or forme of the particular parts? The impurity of the blood wil indeede make the childe weake and sickly; but to make a calculous impression in the Kidneyes, or a gowty impresion in the ioyntes is onely proper to the seede, which conteyneth in it the fatall necessity of life and death.

Againe, all formation and specification (for you must giue vs leaue to vse our Schooletearmes in these matters of Art) that is, all power to set the seale or figure or difference vpon any thing, proceedeth from the seede alone. For the matter as it is a bare matter cannot chaunge the species or forme of any thing, but the species followeth rather the Dam then the Sire. For if an Ewe be couered by a Goate, she will not bring foorth a Kid but a Lamb with a hard and rugged wooll; if a Tup couple with a she-Goat, she will bring forth not a Lambe but a Kid with a soft wooll, as *Athenaus* auoucheth. There proceedeth therefore from the Dam a formatiue Faculty, now all formatiue facultie as we said is from seed, none at all from the blood. A third. Note this. *Athenaus.*

But there is a place in *Galen* which seemeth to be against vs. For in the first chap. of his 14. Booke *de vſu partium* he denieth to the seede of the woman the power of procreation. A woman (saith he) because she is colder then a man, hath in her *Parastata* a thin and vnconcocted humor, which conferreth nothing to the procreation of the infant, and therefore when it hath done his office it is cast foorth; but another humour, that is the seed of the man, is drawne into the wombe. Wee must thus vnderstand *Galen*, that in women, beside their seede, there is another wateriſh moysture which delighteth, tickleth and washeth their genitals; and that indeede conferreth nothing to generation, for so he saith a little after. But in the time of coition that humor suddenly and together with the seede yssueth, and therefore mooueth the sense; at other times it yssueth also by little and litle and sometimes without any sense at all. We conclude therefore, that women do yeeld seede which hath in it some operatiue or actiue faculty. A hard place in *Galen.* Expounded.

The vse of this seede according to *Galen* in the eleuenth chapter of his fourteenth booke *de vſu partium* is manifold. First for generation, for by it as by a workman concurring together with the seed of a man, the parts are figurated; and of it as of their matter the membranes are generated wherewith the infant is compassed. The second vse is to be an Aliment for the hotter seede of the man. For euery hot thing is norisshed by that which is moderately cold, that is, lesse hot as saith *Hippocrates* in his Booke *De Alimento*. The thirde vse is to irrigate or moysten the sides of the wombe, for all the parts of the womb could not be lined or moistened by the seede of the man. The last vse *Galen* addeth, which is to open the necke of the matrix. The vſes of a womans seed. *Hippocrates.*

Argenterius derideth these vses of the seede, because nothing is nourished that doth not liue, but the seede liueth not. Againe, the seede of the woman is not eiaculated into the sides of the wombe, because a womans wombe hath no hornes. But he is indeed himselfe ridiculous, endeuouring to correct *Magnificat* as we say, when hee cannot sing *Te Deum*. Neither shall you finde any man more forward to carpe at others, then those who themselues lye most open to scorne and disgrace, as that petulant Author doth in most passages of his workes. But for your sakes who may haply learne something by it, we will do him the honesty to answer his cauils. *Argenterius* the Cauiller. Answered.

We say therefore, that the seed is potentially Animated, & when it is cast into the womb that power by the heate of the womb is broght into an act, and therefore presently it worketh the workes of the soule; for it formeth and figurateth the parts. If then it be animated it liueth, but that life is the life of a plant. Beside, when *Galen* saith that the seed of a man is nourished by the seede of a woman, we must not be so grosse as to vnderstand him as if he meant a perfect nourishment which is made by assimulation; but because the seede of the man was hotter then the seede of the woman, it is tempered and made more dilute or fluxible by the cold and thin seede of the woman. After the same manner we say, that the spirits are nourished by the aer, and so we must vnderstand *Hippocrates* where he saith, *That euery hot thing is nourished by that which is moderately cold.* *Galen* expounded By *Hippocrates.*

That

That the ſeede is not eiaculated into the ſides of the wombe becauſe the womb hath no hornes, ſauoureth of Craſſe and palpable ignorance of the inſertion of the eiaculatory veſſels into the ſides of the bottome of the wombe, and ſo we let it paſſe.

Anſwer to the *Peripatetiks* arguments.

It remaineth now that we make aunſwere to the arguments of the *Peripatetickes*. First therefore

1 That double ſecretion or profuſion of blood and ſeede we do not thinke is made together and at once but at diuers times; that is, of ſeed in the coition and conception, of blood immediately after the firſt diſcretion or ſeparation of the ſpermaticall parts.

2 There is not the ſame reaſon of young boyes and of women. For in Boyes there is no remainder of lawdable blood of which ſeede ſhould bee made, becauſe one part of the blood is conſumed in their nouriſhment and the reſt in their growth, but in women there is abundance of ſuperfluous blood.

3 Thoſe women who do conceiue without pleaſure haue ill affected wombes.

4 *Auerrhoes* his Hiſtory we take to be a right old wiues tale and no credit to be giuen thereto.

5 That a woman is not an imperfect male, but a perfection of mankinde wee haue abundantly prooued before.

6 The laſt argument of *Ariſtotle* which carrieth moſt ſhew of truth, we may thus anſwere. Although a woman haue in her ſelfe the efficient and materiall cauſes of generation; yet cannot ſhe generate in her ſelfe without the helpe of the man; I ſpeake of a lawfull generation, becauſe her ſeede is but weake and too cold. We ſee that Henns wil lay Egges without the Cocke, which we cal Addle egges becauſe they will neuer proue Chickins, yea neither Cockes egges which ſometimes they lay will proue any thing. Wherfore the concourſe or confluence of the ſeedes of both ſexes, is of abſolute neceſsity in generation.

Valeſius his opinion.

Valeſius anſwereth this Obiection thus; that if a woman be of a cold conſtitution her ſeede is too weake to endeauour of it ſelfe the conformation of the parts. If the woman be hotter, then is her ſeede fruitfull enough and of ſufficient power, but then there is in ſuch women want of the remainder of Aliment by which the ſeede conceiued and formed in the wombe might be nouriſhed. Wherefore a hot woman without a man may generate but cannot nouriſh and perfect that which ſhe hath conceiued. But if theſe things were ſo as *Valeſius* woulde haue them, then hot and manniſh maydens without the embracements of men ſhould ſuffer many abortments. And ſometimes it hath bin obſerued that the geniture yſſuing from a woman the ſeuenth day after conception hath bin dearticulated, ſo that in it hath appeared the rudiments of the three principall parts and the threds of al the ſpermaticall parts very conſpicuous: For theſe are the workes of ſeede onely and not of blood, becauſe the blood conferreth nothing to the conformation and diſcretion of the parts, neither yet floweth vnto the Conception till the deſcription of the ſpermaticall parts bee begun. And thus much of the ſeede of women wherein I haue beene ſomewhat more large, becauſe the Aduerſaries are in this point very violent and will hardly be gainſaide, whatſoeuer euidence of reaſon is brought againſt them. Now we proceed to the manner of the emiſsion of ſeed.

Diſprooued.

QVEST. VI. *Of the Excretion of the Seede, by what power or Faculty it is accompliſhed.*

Whether the excretion of ſeede be Naturall or Animall.

Oncerning the excretion or auoyding of ſeede, there remaines two things to be handled, two doubts to be cleared. First, by what power or Faculty this excretion is made, by the Naturall or by the Animall. Secondly, why there is ſo great pleaſure in the emiſsion of ſeede. Both theſe doubts it ſhall not be hard to aſſoil, yet becauſe we would giue the Reader full ſatisfaction, we wil inſiſt ſomwhat the more particulary vpon them.

That it is naturall. Reaſon 1.

That the excretion of ſeede is altogether Naturall may thus bee demonſtrated. Becauſe euery excrement is driuen foorth by the power of Nature, and ſeede is an excrement. So the menſtrual blood which is a profitable excrement of the laſt Aliment of the fleſhy parts is purged onely by the force of Nature at certaine times and determinate courſes; whereupon we cal them *Courſes*. So the Chylus which is the excrement of the ſtomack, although it be profitable is thruſt downe into the guts by the ingenite faculty of the ſame ſtomacke onely. So the excretion of the excrements of the belly and of the bladder is meerely Naturall. Moreouer for the excretion of ſeed, Nature hath ordained no Muſcles at all, for there

appeare

appeare none in the ſpermaticall veſſelles nor in the Teſticles nor in the *Proſtate* Glandules.

Happely you will ſay there are the muſcles called *Cremeſteres* which compreſſe the Leading veſſels, by which compreſsion the ſeede is ſtrayned forth; but we do not acknowledge that vſe of the *Cremaſter* muſcles, becauſe in the veſſelles of ſeed which are in women there are no ſuch muſcles found, who notwithſtanding auoyde ſeede as well as men as hath bin proued. Hereto may be added the authority of *Hippocrates*, at leaſt of *Polybius* in his book *de genitura*, who referreth the cauſe of excretion to the ſpumy or frothy nature of the ſeed, which thence being turgid and not able to containe it ſelfe in his place, maketh way for his owne euacuation.

Obiection. Anſwere. Hippocrates authority.

On the contrary that the excretion of ſeede is Animal theſe arguments may perſwade: Firſt, becauſe neither whileſt we wake, nor in our ſleepe there is any ſuch excretion vnleſſe the force of the imagination goe before it. Secondly, becauſe in the auoyding of ſeed the legges and the armes are contracted and the whole body ſuffereth a kinde of convulſion; whereupon as wee haue already ſayed, *Democritus* calleth coition a light *Epilepſie* or falling ſicknes. Thirdly, becauſe that excretion is made ſometime ſlower ſometimes ſooner according to our arbitrary will and diſcretion. Finally, becauſe it is alwayes ioyned with pleaſure, now pleaſure is an affect of the ſenſatiue faculty which is meerly Animall.

That it is animall. Reaſon. 1.

We are of the ſame opinion concerning the eiaculation of Seede that wee were of concerning the erection of the yarde, to witte, that it is a mixt action of a Naturall and an Animall. It is Animall becauſe it hath imagination going before and pleaſure alwayes accompanying it. It is Naturall, becauſe it is made when Nature is prouoked either by an itching or tickling quality, or oppreſſed with a burden of aboundance and that without the help of muſcles.

What we conclude of. It is a mixt action.

But it muſt be remembred that we here ſpeake of that profuſion of ſeede which is Naturall, not of that which is ſymptomaticall, which they call the *Gonorrhœa* or running of the reynes; which neither hath any imagination going before nor pleaſure accompanying it, neither yet is driuen out by the ſtrength of Nature, but falleth away by reaſon of the acrimony of the ſeede, the weaknes of the veſſelles, their convulſion and the inflamation of the neighbour parts: finally, which bringeth vpon the Patient an extenuation and conſumption of the whole body. Witnes that Satyre in *Thaſo* whoſe name was *Grypalopex*, of whom *Hippocrates* maketh mention in the 7. Section of the 6. Booke *Epidemion*, who at the age of 25. yeares poured out his ſeed in great aboundance night and day, and in the 30. yeare was vtterly conſumed and ſo dyed.

The cauſes of the running of the reynes.

A ſtory of a Satyre.

QVEST. VII. *Whence commeth the pleaſure in the eiaculation of Seede.*

THE wonderfull prouidence of Nature hath giuen to all Creatures certayne goades and prouocations of luſt, and an impotent deſire of copulation for the preſeruation of the ſeuerall kindes of Creatures, becauſe the *Indiuiduum* or particular is of it ſelfe and by an inbred neceſsity diſſoluble and mortall. And indeede this ſting of pleaſure was very neceſſary, without which man eſpecially the one ſexe in ſcorne and deteſtation of ſo bruitiſh and baſe a worke, the other for feare of payne and trouble, would haue abhorred this woorke of Nature. The Finall cauſe therefore of this pleaſure which is conceiued in the whole action of copulation, but eſpecially in the emiſsion of the Seed, is onely the conſeruation or preſeruation of mankinde.

The finall cauſe of pleaſure in coitiō.

The Efficient cauſes of this pleaſure we acknowledge to bee many and diuerſe; to omit the reſt, we will make mention onely of three which are the eſpeciall and moſt immediate. The firſt is the tickling of the turgid and itching ſeed: now the ſeed is turgid, that is, houen or frothy by reaſon of the impetuous motion of the ſpirites; for ſeede without ſpirites ſuch as is auoyded in the *Gonorrhœa* breedeth no pleaſure at all; after the ſame manner thoſe that abuſe the vſe of woemen by frequent copulation haue leſſe pleaſure then other men becauſe they haue fewer ſpirits.

3. Efficient cauſes.

Yet is not this cauſe of it ſelfe ſufficient to procure pleaſure ſuch eſpecially as is conceiued, but another cauſe is required which is the celerity or ſwiftneſſe of the motion and of the excretion. For as paine is neuer cauſed vnleſſe there bee a ſudden and ſwift alteration, ſo when the ſeed iſſueth by little and little or weepingly, there is no pleaſure at all. Finally, to theſe two is added the exquiſite ſence of the partes of generation and their narrownes,

rowneſſe. For ſo the parts being tickled, and the veſſelles which were diſtended returning into their naturall ſcituation and conſtitution, there is ſtirred vp a wonderfull delight and pleaſure. But that theſe things may be made more euident we will handle heere two problemes. The firſt, why the ſpirits as they paſſe through the other parts, Veines, Arteries, Sinnewes, Membranes theſe laſt eſpecially being of exquiſit ſenſe, together with the blood and the humors, do not induce the ſame pleaſure which they doe in the ſpermaticall Organs. Haply it is, becauſe this kinde of ſenſation by the wonderful prouidence of Nature is beſtowed onely vpon the genitals for the conſeruation of the ſpecies or kinde, like as ſhe hath giuen onely to the mouth of the ſtomacke the ſenſe of diuulſion and appetite. Or we may ſay, that in the other veſſelles there is not ſo ſudden and headſtrong an effuſion of humors and ſpirits together.

2. Problemes
The firſt.

Solution.

The ſecond Probleme.

The Solution

The other Probleme is, why men and woemen that are aſleepe haue great pleaſure in their Nocturnall polutions, ſeeing that in ſleepe the ſenſatiue faculties are all at reſt: for the Philoſopher calleth ſleepe ἀρχὴν τῆς πρώτης αἰσθήσεως, *the reſt of the firſt ſenſator*. Wee anſwere firſt, that the imagination in ſleepe is ſtronger then when wee are awake, as appeareth in thoſe that walke and talke in their ſleep. Againe, in ſleep the ſenſes are not ſo drowned in ſenceleſneſſe but that they are rowzed vp by a violent obiect, and therefore ſuch awake if they be violently ſtirred: and for the moſt part ſuch nightly pollutions doe awaken thoſe who are troubled with them. If you prick a ſleeping man with a Needle euen before he awake he gathereth vp his body; and if you continue he will awake though hee ſleepe neuer ſo ſoundly. Now the excretion of ſeede in a dreame is indeede a very ſtrong obiect to the ſpermaticall parts. Theſe therefore are the cauſes of pleaſure in the excretion or auoyding of ſeede. But whether the pleaſure of the man or of the woman be the greater, it would be a vaine and fruitleſſe diſquiſition to enquire. Indeede the woman conceiueth pleaſure more waies, that is in the auoyding of her owne ſeede and alſo in the attraction of the mans: for which cauſe the *Tyreſian* Prieſt who had experience of both ſexes preferred the woman in this kinde: but the pleaſure of the man is more intenſe, partly becauſe his ſeede is more hot and ſpirituous, & partly alſo becauſe it yſſueth with greater violence and with a kinde of Almaine leape or ſubſultation.

Whether me or woemen haue greater pleaſure.

The anſwere.

And thus much concerning the firſt principle of generation, that is, the ſeed of both ſexes. Now we come to the ſecond principle, which is the Mothers blood.

QVEST. VIII. *Whether the Menſtruall Blood haue any noxious or hurtfull qualitie therein.*

COncerning the Nature of the Menſtruall blood, there hath been and yet is ſo hard hold and ſo many opinions euen among Phyſitians themſelues, that it were a ſhame to make mention of all their differences, much more to inſiſt vpon them. But becauſe we would pretermit nothing that were worthy of your knowledge, wee will inſiſt vppon the chiefe heads of the Controuerſie. The firſt of which ſhall bee concerning the matter of the Courſes.

Of the matter of the courſes

All men do agree that this blood is an excrement, for like a ſuperfluity it is euery month driuen foorth of the wombe; but becauſe there are two kinds of excrements, the one Naturall and profitable, the other altogether vnprofitable and vnnaturall, wee muſt enquire of which kinde this menſtruall blood is.

That it is ill qualitied.

Hippocrates authority.

Ariſtotle

Galen.

That it is an vnprofitable excrement and of a noxious or hurtfull quality, may bee proued by the authority of famous learned men, as alſo by ſtrong reaſons. *Hippocrates* in his firſt Booke *De morbis mulierum*, expreſſeth the malignant quality thereof in theſe words, *It fretteth the earth like Vineger, and gnaweth the body of the woman whereſoeuer it lighteth and vlcerateth the parts of generation.* *Ariſtotle* in the 19. Chapter of his fourth Booke *De Natura Animalium* writeth, that that kind of blood is diſeaſed and viriated. *Galen* in the eight Chapter of his Booke *de Atra bile* ſaith, that euery moneth a ſuperfluous portion of blood vnprofitable not onely in quantity but alſo in quality is auoided. *Moſes* that great Law-giuer as we read in holy Scripture, made an Edict that no Menſtruous woman ſhould come into the Sanctuary, *Let her touch no holy thing, nor enter into the Sanctuary whilſt the dayes of her purgation be fulfilled.* By the Lawes of the *Zabri*, thoſe women that had their courſes were interdicted the company and ſociety of men, and the places where ſhe did ſtand were cleanſed by fire. *Heſiodus* forbiddeth that any man ſhould frequent thoſe bathes where

Moyſes.

The lawes of the Zabri.

Men-

menstruous women haue bathed themselues. *Pliny* also in the 28. Chapter of his 7. booke & *Columella* doe think that this bloud is not only vicious but poysonous. For by the touch thereof the young vines do wither, the buds of herbes are burnt vp, yea glasses are infected with a kinde of *tabes*. If a Dogge licke of it he will run mad; and wanton women are wont to bewitch their Louers with this bloud; whence *Ouid* calleth it *Lunare virus*, the Moone poyson; wherefore it is not onely superfluous in quantity but in the whole quality a noysom excrement. This poysonous quality thereof women haue dayly and lamentable experience of in their owne bodies, for if it bee suppressed it is a wonder to see what horrible and how many *symptomes* doe arise there-from.

Pliny. *Columella.* Reason and experience.

If (sayeth *Hippocrates* in his first Booke *de morbis mulierum*) it bee stabled without the wombe, it ingendereth Inflamations, Cancers, Saint Anthonies fires, and *Scirrhous*, that is, hard and indolent tumors. If it returne vnto the vpper partes it breedeth many diseases which follow the Nature of the part affected and the offending humour. In the Liuer it breedeth the *Cacexia*, the Iaundise, the Dropsie. In the Spleene obstructions and *Scirrhous* tumors: in the Stomacke, depraued Appetite and strange longings: in the Heart palpitations and Syncopes or sounding; in the Lungs Vlcers and Consumptions: in the Brayn the falling sicknes and mad melancholly, and many other such like.

What diseases come therefrom.

Amongst the new writers *Fernelius* the best learned Physitian of them all, in the 7. book of his Phisiologie, proueth that this bloud is not Alimentarie nor of the same Nature with that by which the Infant is nourished in the mothers wombe, but thinketh it noxious and hurtfull both in the quantity and quality.

Fernelius opinion.

On the contrary we thinke, and perswade our selues wee shall also conuince others, that this bloud which is monthly euacuated by the wombe, is all one with that bloud whereof the *Parenchymata* or flesh of our bowels are made, and wherewith the Infant in the wombe is nourished, and that it is in his owne nature laudable and pure bloud and no way offensiue to the woman but onely in the quantity thereof. And this we hope wee shall euict both by authority of the Antients and by inuicible and demonstratiue arguments.

The contrary opinion that it is naturall.

First of all *Hippocrates* fauoureth this opinion as also doth *Galen*. *Hippocrates* in his first Booke *de morbis mulierũ* hath this saying. *The bloud falleth from a woman like the bloud of a stickt Sacrifice, which soone cloddeth or caketh together because it is sound and healthfull.* And this also he repeateth in his Booke *de Natura pueri*: now the conditions of laudable bloud are, to be red and quickly to cake. *Galen* in his third Booke *de causis symptomatum*, writeth that this bloud is not vnnaturall, but offendeth onely in quantity. And this may also be demonstrated by good and true reasons: this bloud in a sound woman (for if shee bee sickly the whole masse of bloud is corrupted) the bloud I say that is auoyded euery month by the wombe, is made of the same causes by and of which the other bloud is made with which the flesh is satisfied and nourished. For the matter is the same, the same heat of the Liuer, the same vesselles conteyning it, why then should there bee any difference in their qualities?

Hippocrates. *Galen.* Reasons to proue it naturall.

Moreouer, if (as the Philosopher often vrgeth) the Finall cause be the most noble, and preuayleth in the workes of Nature ouer all the rest, why should this superfluous bloud redound in the colde Nature of women, vnlesse that it might become an Aliment vnto the conceiued and formed Infant? why doeth shee purge it rather by the wombe then by the nose, as it is often auoided in men? vnlesse it be to accustome her selfe to this way, that after the conception it may exhibit it selfe for the nourishment of the Infant.

First. The second.

This is the finall cause of the menstruous bloud acknowledged by *Hippocrates*, *Aristotle*, *Galen*, and all the whole schoole of Physitians. *Aristotle* sayeth that such is the Nature of a woman, that their bloud perpetually falleth to the wombe and the principall parts, & therfore if they be haile and sound of body and haue their courses in good order, they are neuer troubled with varices or swollen veines, neuer with the *Hæmerrhoids* nor with bleeding at the nose as men are.

Now if these courses doe affect the way into the wombe for no other cause but onely for the nourishment of the Infant, then no man will deny but that it is benigne and laudable bloud. For *Hippocrates* in his Booke *de Natura pueri* and in the first booke *de morbis mulierum* sayeth, that the Infant is nourished with pure and sweete bloud; in the first place he sayth, that the Infant draweth out of the bloud that which is the sweetest; in the second, that the woman with childe is pale all ouer, because her pure bloud is consumed in the nourishment and increase of the Infant.

Third.

Moreouer, that the bloud which Nature purgeth by the wombe of a ſound woman is pure and Elementary, this is a manifeſt argument becauſe of it returning to the paps milke is generated, and therefore Nurſes haue not their courſes as long as they giue ſucke; nowe that milke is made of the pureſt blood, *Hippocrates* witneſſeth in his Booke *de Natura pueri.*

Why Nurſes haue not their courſes neither yet conceiue.

Ariſtotle in the firſt Chapter of his fourth Book *de Generatione Animalium*, ſayth that the nature of the Milke and of the menſtruous bloud is one and the ſame, and thence it is that thoſe that giue ſucke haue not their courſes, neither yet do conceiue with childe, and if they do happen to conceiue, then their milk faileth.

Add hereto that if the impurity of the courſes were ſo great as ſome would haue it, then it would follow that when women are with childe and their courſes faile vppon that cauſe, they ſhould be worſe diſpoſed, then if they ſhould faile vppon other cauſes, becauſe the Infant drawing away the purer part of the bloud, that other which is venomous or of a malignant quality would rage ſo much the more hauing loſt the bridle whereby it is reſtrayned: moreouer thoſe *ſymptomes* would be more violent in the laſt moneths then in the firſt after conception; all which is contradicted by common experience.

Concluſion.

Wherefore the menſtruall bloud is onely aboundant in women, and hath no other fault at all, if they be ſound and hayle; and is of the ſame Colour, Nature and Temperament with the reſt of the bloud conteyned in the trunke of the hollow veine, and wherewith the fleſh is nouriſhed. Yet is it called an excrement but that καταχρεστικῶς abuſiuely; becauſe the fleſh being therewith filled and ſatisfied doth returne that which remayneth back into the veines and voyde it out; ſo the Stomacke beeing ſatisfied with the Chylus thruſteth it into the Guttes.

Auicens queſtion.

But *Auicen* maketh a queſtion whether this menſtruall bloud be an excrement of the ſecond or of the third concoction; we ſay it is of both but in a diuerſe reſpect.

Anſwered.

It is an excrement of the ſecond concoction, becauſe the whole maſſe of bloud hath his firſt Generation in the Liuer the ſeate of the ſecond concoction, and from the Liuer is powred as an ouerplus or redundancie into the trunk of the hollowveine. It is an excrement of the third concoction, becauſe it is as we ſayd vomited away by the fleſh when it is ſatisfied after the third concoction.

Anſwere to the former arguments.

Thoſe arguments which before were alleadged againſt this truth are but veine and light. For as we grant that all thoſe miſchiefes and inconueniences before named doe happen in a diſeaſed woman, ſo we deny that there is any ſuch in a ſound, haile and well diſpoſed womans body. And if at any time the ſuppreſsion of the courſes in a ſound body doeth bring forth any of thoſe fore-mentioned *ſymptomes*, that commeth to paſſe becauſe of the ſtay & abode of it, or elſe becauſe euill humors doe fall together with the blood vnto the wombe which is a common ſinke as it were of the body, by the permixtion of which humours the blood acquireth a malignant quality.

The diſcommodities of the courſes proue their purity.

Thoſe incommodities of the menſtruous blood before remembred, are great arguments of the purity thereof: for thoſe thinges which are moſt pure are ſooneſt vitiated, and being once taynted are moſt offenſiue; ſo the *ſymptomes* of ſuppreſſed ſeede are more grieuous then thoſe that come from the ſuppreſsion of the courſes, becauſe the ſeede is the purer and fuller of ſpirits.

Hence it is that the carkaſſe of a man caſteth a worſe ſtench or ſauour then the carkaſſe of any other creature, becauſe a mans body is of all other the moſt temperate. And *Hippocrates* in his Booke *de morbis* ſayth, that by how much the Aliment is better and more pure, by ſo much is their corruption worſe and more offenſiue. And thus much of the Nature and quality of the menſtruous blood.

QVEST. IX. *Whether the menſtruous bloud be the cauſe of thoſe Meazels and ſmall Pocks which are wont once in a mans life to trouble him.*

The queſtion

IT belongeth not to this place to diſpute of the Nature, differences and all the cauſes of the ſmall pockes, as alſo whether the *varioli*, *morbilli*, *exanthemata*, and *ecthymata* be of one and the ſame Nature or no; wee will onely touch that which pertayneth to our preſent purpoſe.

It is a very obſcure queſtion which hath a great while exerciſed the wits of many men, *Whether the ſmall Pocks and Meazels which are wont once in a mans life to happen vnto him, doe come by reaſon of the impurity of the menſtruall bloud.* I will not heere enlarge my ſelfe to reckon vp vnto you all the opinions of all men which haue written

written of this question, but onely tell you what we thinke and that as shortly and perspicuously as the Nature of the cause will giue leaue. It is a sure thing, that among ten thousand men and women there can bee scarce one found who once in their life are not afflicted with this disease. *Auenzoar* writeth that it is almost a miracle if any man escape them. It is therefore a common disease because it taketh hold of all men. All men haue once the smal pox.

Now it is *Hippocrates* resolution in his Booke *de Natura hominis*, that common diseases haue also common causes. *When many men at the same time labour of the same disease, wee determine that the cause of that disease is common.* But what cause may this be that is so common to all men? Not the ayre, for we doe not all breath the same ayre; one man liueth in an impure ayre, another in a pure; one inhabiteth in the North another in the South; wherfore it must be some Principle which is this common cause. This Principle the Arabians first of all men acknowledged to be the Menstrual blood (as *Auicen*, *Auenzoar*, *Halyabas* and *Auerrhoes*) wherof the *Parenchymata* of the bowels are gathered and the particular particles of the Infant are nourished. The opinion of the Arabians that they come of the impurity of the courses.

For though this blood bee pure and laudable, yet by the permixtion of the humours which fall from all the partes of the body vnto the wombe as it were into the common poomp or sinke it becommeth impure; whence it is that as well the spermaticall as the fleshie partes beeing defyled with that corruption, are of necessitie once in a mannes lyfe cleansed and depurated, no otherwise then VVine in the caske woorketh and cleanseth it selfe.

The trueth of this opinion that it may appeare more cleare, we wil see what may be obiected to it, and discusse the same as carefully as wee can, that no scruple may bee lefte behinde.

The Infant is nourished with pure blood. Ἄκρατον sayeth *Hippocrates* in his Booke *de Natura pueri*, διὰ τὸ ἁπαλὸς τὸ παιδίον εἶναι, It draweth out of the bloud that which is the sweeteſt: and therefore there cannot any euill quality settle vppon the solide or fleshy partes. Reasons to the contrary. First. Answered.

Answere out of the sixt Chapter of *Galens* first Booke *de causis Symptomatum*: That the Infant whilest it is young and small in the first monethes, draweth the purest part of blood; but when it becommeth larger then it draweth the pure and impure together promiscuously: or we say, that the blood that the Infant draweth out of the veynes wherewith it is nourished is of it owne Nature pure, but is defyled by the humours which are wont to be purged by the wombe. For *Aristotle* sayeth in his tenth Booke *de Historia Animalium*, that the wombe is a seruile member, ordained to expell those things of which the body behoueth to be purged.

Againe they obiect, if the small poxe grow vpon the impurity of the menstrual blood, why is not that ebullition or boyling of the bloud instantly in the first monethes when the Infant is tender and weake, and there is the greatest disposition of the causes mooving thereunto; but after many yeares yea sometimes not before olde age? why dod not acute Agues or other diseases which happen in the life time cleanse the body of that corruption? Second.

Wee answere out of *Hippocrates*, that one age differeth from another and one Nature from another. A poyson wil sometimes lurke in the body more yeares then one, which in the end will bewray it selfe and either oppresse Nature or bee ouercome by it and auoided. So the virulency and poyson of the French disease and of the Leprosie will lie hid for some yeares, and the poyson of a mad dog a great while before it shew it selfe. Answered.

Their third reason is That some men are troubled with the smal pox oftner then once yea many times, and therfore they proceed other-whence then from the infection of the menstruall blood. But this is a childish argument; for the disease doth therefore returne because haply the expulsiue faculty is weak and thereupon there remaine some reliques of the matter of the disease: so sayth *Hippocrates* in the 12. Aphorisme of the 2. Section. *The remaynders or reliques of diseases are wont to be the causes of relapses.* Third. Answered.

Their fourth reason is, the menstruall blood is turned into the substance of the parts by nutrition; now the parts do not suffer any ebullition but the humors onely, it is therefore absurd to imagine that the pox should be generated of their heat or working; to whom we answere thus. The solid parts do not indeed worke or suffer ebullition, but they doe infect the humors with that quality which they acquire from the impurity of the menstruall bloud, which humors boiling and being offensiue to nature, are thrust out into the skin; insomuch as the parts themselues are purged by that working which is in the blood. Fourth. Answered.

So musty vessels (saith *Auenzoar*) do infect the wine conteined in them, but if the wine do worke in a musty vessell, then it becommeth sweete euer after.

Fift. Answered

The fifte reason is, if the poxe do arise out of the impurity of the Menstruall bloode, why then are not women ouer taken with the pox when their courses are stopped? We answer, that the blood so suppressed is onely in the veins, and is not sprinkled through the substance of the parts, and therefore doth not ferue that malignant quality in the solid parts.

Sixt. Answered.

Their sixt reason: Why are not brute beasts which are full of blood and haue those monethly euacuations the matter you say of the poxe, and a working heate beside? why haue not such beasts the pox also? Haply, because they vse a drier kinde of nourishment and beside lead their whol life in labor and exercise, whence it is that the reliques of their impure blood are spent and euaporated. But a man in his tender infancy sucke a boon dainly, and after he is wayned neuer ceaseth eating, and beside the first seuen yeares of his age liue slouthfully in great idlenesse.

Seauenth.

Finally, seeing the fault of the Mothers blood hath continued euer since the beginning of the world, so that this disease should haue beene the most antiquest of all others, howe commeth it to passe that neither *Hippocrates* nor *Galen*, nor any of the *Grecians* did euer make any mention thereof; insomuch that it seemeth to be a new disease knowne onelie to the Moores? It is not likely therefore that it proceedeth from the impurity of the Mothers blood.

Answered.

But we say that it is very likely that the disease was of old time, but because men were more continent and liued in better order then now they do, it was not so ordinary in the former times as now it is. *Hippoc.* in his Books *Epidemion* doth often make mention of red, round, & small Pustules which he calleth *Exanthemata*; and *Ætius* in his 14. Book saith, that children had certaine Pustules or whelkes which brake out all ouer their bodies. I do not therefore thinke that this disease was altogether vnknowne to the Grecians, but haply not so accurately described, because in those dayes by reason of their good diet, the symptoms or accidents of the disease were not so dangerous. So euen at this day we haue knowne many full of the poxe without either Ague or vomiting, or any notable disease at all; and children oftentimes haue them and know not of it till they be gone.

Fernelius his opinion confuted.

They which referre the cause of the poxe to the malignant disposition of the aer, are in my opinion far wide, for then we must needs acknowledge that the aer is alwaies infected, because we see Children haue them at all times and seasons and euery yeare. Neyther then would the disease haunt children onely, but olde folke also as the plague doth; neither would it happen onely once in a mans life, but as often as the aer is so affected; as it dooth in the plague and other Epidemiall and pestilent diseases which come from the aer.

Mercurialis his opinion.

Mercurialis that learned man in an elegant Booke hee set out concerning the diseases of children resolueth many and those very obscure problemes of the nature & causes of these small pox; but endeauouring to establish a new and vnheard of cause of them, he seemeth to be mistaken.

His opinion is, that the pox is a new disease vnknowne altogether to the Grecians, and that it sprung first of all from the ill disposition of the heauens and the aer, and raged almost vpon all men; who afterward being themselues tainted, conferred the succession of the disease vpon their posterities. For as a gowty Father begetteth a gowty child, and a leprous father a leprous childe, an Epilepticall father an Epilepticall childe, why also should not a father infected with this poisonous disease communicate the same disposition to his child? These things may seeme to some very probable, but if we looke more narrowly into them, they will scarse hold water as we say.

The first Reason.

For to knit vp all in few words, Hereditary diseases are not communicated from the Father or Mother to the childe, but by seede. These seeds containe in them potentially the Idea, Formes and Proprieties of all the partes. So the seede of an arthriticall or calculous Father hath in it the disposition of the gowt or the stone; wherfore that disposition of the pox must remaine in the solid parts of the parent. But in those who haue had the poxe and are perfectly recouerd of them, there remaineth no corruption nor any such disposition as being wholly euacuated by critical excretion and eruption of the pustles; otherwise out of doubt the disease would againe returne. How therefore shall they communicate vnto their children that poysonous disposition which now they themselues haue not in their solid parts.

What diseases are hereditary.

Neither are all diseases hereditary, but those onely which are *in being* in a mans body, and therefore putrid Agues and such other diseases as happen by accident, are not com-

communicated to the children. Now at that time when this disease first began to rage, it must needs be granted that it was as we say in Schooles *Morbus Fiens*, that is, a disease not subsisting but breeding, hauing his hearth or seate in the corruption of the humours, and therefore it could not be communicated to the children. Add hereto, that if these things were so, it would follow, that as we are all once in our liues troubled with the pox, so wee should once in our liues be troubled with the plague. For the time hath beene when the plague raged so fierce that few men escaped it. As is the poxe so is the plague a common disease contracted from the fault and impurity of the aer, why then should not our parents leaue vs also that vnwelcome inheritance as well as they do the pox ?

Morbus Fiens.

The second.

We conclude therefore with the *Arabians*, that the cause of the poxe is the impurity of the Mothers blood wherewith the infant is nourished, which impurity it acquireth as well by his stay in the body beyond the limited time, as also from the permixtion of the humors which fall into the womb as vnto the sinke of the body.

The conclusion with the Arabians.

QVEST. X. *Of the causes of the periodicall euacuation of the Menstrua.*

ALl men know that the Menstruall blood is purged through the wombe by certaine standing and limited circuites and Courses, but the causes of this returne is a very hard thing to finde out. Many do wonder why seeing all other excrements are euacuated euery day, this blood which is the excrement of the last Aliment should be auoided but once in a month.

Why it is not purged euerie day.

The thicke excrements of the first concoction as they are daily generated, so they are dayly auoided. The Choller is euery day thrust out of the Liuer into the bladder of the gall, and thence into the *Duodenum*; the vrine is daily transcolated from the Kidneyes vnto the bladder of vrine. So likewise the excrements of the third concoction, *i*, those of the habit of the body are spent by sweating, breathing & insensible transpiration, by the haire and the soile of the skin. Those of the braine by the palate, by the nosethrils, the eares and the eyes; those of the chest by coughing ; why therefore is not the Menstruall blood euery day euacuated, seeing it hath a continuall generation?

This I thinke is to be attributed onely to the singular prouidence of Nature, and to the Final cause the most excellent of all the rest. For if the blood were euery day purged away by the wombe, then could women neuer conceiue with childe, neyther yet any man haue due and comfortable vse of a woman. First conception would be hindred, because the seed powred out into the cauity of the wombe, would either fall backe or be extinguished; the coates of the wombe being irrigated, moistned and as it were inebriated or made drunke by the daily affluence of the blood. So saith *Hippocrates* in the 62 Aphorisme of the first section, *Those women that haue moyst wombes do not conceiue, because their geniture is extinguished.* Beside, what pleasure or contentment could any man finde in a wife so lothsomly defiled, and that perpetually. It was not therefore fit for the accomplishment of the intention of Nature, that a womans blood should issue euery day, but onely at certaine and definite times and circuites, to wit, once euery moneth.

The true reason.

But why this excretion should be made euery moneth not oftner nor more seldome, is a great question and I assure you very full of difficulty. *Aristotle* in the 2. and 4. *de generatione Animalium*, referreth the reason of this periodicall or certaine euacuation to the motion of the Moone, and saith; that when the Moone is in the wane womens courses do especiall flow, because at that time the aer is colder and moister, from whence comes the encrease and aboundance of that colde and crude humour; but *Aristotle* is by some heerein reprehended, because in the full of the Moone all things are most moiste, as appeareth by Shel-fishes, Oysters, and such like. The *Peripatetikes* answere, that there is a double humiditie, one viuificall or liuely, the other excrementitious. The first is encreased in the full of the Moone, because then there is more light; the second is encreased in the wane, because then the aer is colder; now Menstruall blood is generated by a weake heate.

Why it is purged euery moneth.

Aristo opinion

The *Arabians* thinke there are diuers times of this purgation, according to the diuersitie of womens ages. Young women (say they) are purged in the new Moone, and olde women in the old moone, whence commeth that common verse.

The Arabians opinion.

Luna vetus vetulas, iuuenes noua Luna repurgat.

Young women in the New Moone purge, Old women in the wane.

Some there are, who referre the cause of this circuite and monthly euacuation to the pro-

priety of the moneth, as if the month had a peculiar power to purge the courses, as the day hath to purge the ordinary excrements. And for this we may alleadge a notable testimony of *Hippocrates* in his Booke *de septimestri partu*, where he sayeth, *In the moneths the same things are done by certaine and right reason which are done in dayes: for euery moneth hayle women haue their courses as if the moneth had a peculiar power and efficacy in their bodies.* Wee must needs acknowledge that the Moone hath great power ouer inferior bodies, but that the sole cause of the Criticall daies and of this menstruall euacuation should be referred to the motion of the Moone I could neuer yet perswade my selfe.

A strãge place in *Hippocrates.*

That many things are dispensed by numbers and by moneths I doe not deny; but to attribute any operatiue power to quantity and to number as it is number, I thinke is vnworthy of a Philosopher. It is more wisedome to referre the cause of this periodicall euacuation to the determinate motions and established lawes of Nature to vs vnknowne, which yet she neuer breaketh or abrogateth, but keepes immutable and inuiolable vnlesse she be either prouoked or hindred: for when she is prouoked she antiuerteth or hastneth the excretion auoyding the bloud before her owne time. So whereas the seuenth dayes are only truely criticall, yet Nature indeuoureth vacuations sometimes in the dayes betweene, yea & accomplisheth them, becaus of some prouocation comming from without, that is, beside her owne lawfull contention. Againe, being hindered either by the narrownesse of the passages, or by the thicknes of the humours, she oftentimes procrastinateth and delayeth their accustomed euacuation.

What wee resolue vpon.

How Nature is prouoked.

How hindred.

Hence it is that in some women the courses flow twice in a moneth, in some scarce before euery fortieth day. But why the blood should flow from the wombe rather once euery moneth then twice, or why the seauenth dayes should rather bee criticall then the sixth ἀνθρωπίνην ὑπερβαίνουσι σύνεσιν, *is aboue the capacity of humane wit.*

Hippocrates verily promiseth in the end of his Booke *de principiis, to make manifest the necessity of Nature why she dispenseth all things in the seauenth dayes*: but I thinke he was diswaded by the difficulty of the buisinesse, and therefore no where performeth that promise. Wherefore seeing he that best could durst not aduenture vpon it, we will also ingenuously confesse our ignorance and ranke these secrets among those mysteries of Nature which she reserueth onely to her selfe, to teach vs not onely in this but in other things, to obserue her administrations the better and to suspect our owne weaknes. For wee see that in the most abiect and base things of the world there are some secrets of Nature whereof either we are not at all capable or not yet sufficiently instructed.

Hippocrates promise.

Not kept.

All secrets of nature not to be knowne.

And thus much concerning that other principle of Generation, the mothers blood. now it followeth that we come vnto the Conception, wherein also we shal finde some difficulties worthy the discussing.

QVEST. XI. *Whether it is necessary to Conception that the Seed of both Sexes should issue together, and that with pleasure, and be presently mingled.*

Auerrhoes opinion of the eiaculation.

WEe haue already proued that both the Seedes as well the fathers as the mothers are required in a perfect Generation; but whether they ought both at once to be euacuated is not yet so euident. *Auerrhoes* contendeth that the eiaculation of the Seed into the cauity of the wombe is not alwayes necessaray, and that a woman may Conceiue without the embracements of a man. And to this purpose he telleth a Tale of a woman who conceiued the seede of a man floating in the water of a bath, so strong sayeth hee was the attractiue faculty of the wombe in drawing of seede. But it is great wonder that a Philosopher would be so credulous to beleeue the excuse of a light-skirts, who to saue her honesty deuised this excuse by looking vpon her apron strings: for sayth he a neighbour of mine told me this tale of her selfe. The woman I cannot but commend for her wit, though not for her honesty: but *Auerrhoes* had forgot what his maister *Aristotle* taught him in his second Booke *de Generatione Animalium*. Seede sayeth he is altogether aerie, frothy, and if it be exposed to the ayre it presently melteth, groweth watersh and becommeth vnfruitful. In the sixt Chapter also of his first Booke *de Generatione Animalium*, he writeth that those creatures which haue long yards or virile members are therefore vnfruitfull, because in the length of the way the seede is refrigerated. If therfore it may be refrigerated in his first and natural conceptacle, much more being exposed to the ayre or lost in the water.

How finely he was gulled by a light skirts.

Auerrhoes disproued.

First reason.

Second reason.

Those which are called ὑποσπαδίαιοι whose common passage of seede and vrine is turned

ned aside, by reason that the yarde is too hard reined with the bridle, cannot generate, not because they haue not fruitfull seede, but because hanging a little in the contortion of the yard, it cannot immediately be conueyed into the wombe whilst it reteineth his heat and spirits, as saith *Galen* in the 3. chapter of his 15. Booke *de vsu partium.*

Doth not *Hippocrates* in his first Booke *de Morbis mulierum* affirme that to be a cause of sterility and barrennesse in women when the womb is peruerted or distorted, because then the seede cannot directly passe without delay vnto the inner orifice of the same? It is therefore necessary O *Auerrhoes* that there be a direct and impetuous or forcible eiaculation of the seede of the man into the wombe of the woman. Furthermore, because in brure beasts which couer one the other, the eiaculation of the seede into the wombe is more direct, it commeth to passe that at once couering for the most part they holde as we vse to say, which is not so betwixt reasonable creatures. Againe, beastes are quiet in that action, being so taught by Nature, for motion often preuenteth conception. Third reason. Why Beastes conceiue at the first.

Now, if at the same time both sexes yeelde their seede, then is the conception sooner, and also more perfect, because the wombe at that time being as it were enraged, dooth more greedily draw and more narrowly embrace the seede which is cast vnto it. This *Hippocrates* acknowledgeth in his first Booke *de morbis Mulierum* in these words; *If that which proceedeth from the man, doth together and in a right line concurre and meete with that which is auoyded by the woman, then doth the woman sooner conceiue*, he saith ὁμόῤῥοθῐ, by a Metaphor taken from Water-men, who together do rise vpon their Rowers, together dip them in the water, and together driue their stroke. And whereas he saith that they *sooner conceiue*, it is an argument that it is not of absolute necessity vnto generation, that both sexes shoulde at one and the same time yeeld their seeds; but that there may be conception though it bee slower, if one come a little before or after another; but if the distance of time bee too great between them then the conception succeedeth not, because the spirits of the first seede are exhausted and dissipated. It is not necessary that the eiaculation of both seeds should be at once.

The same thing hath *Aristotle* in his tenth Booke *De Historia Animalium*, vppon which *Scaliger* hath written an excellent Commentary, as that mirror of Learning did all things excellently: There are (saith he) that think, there can be no conception vnlesse the seedes of both sexes do at the same time meete one with another; these are deceiued, because the better habited body sooner yeeldeth, wherefore that seed being the stronger, is not corrupted but reteineth his spirits, and being drawne by the wombe, is reteined for the future permixtion, so that to conception simply this concurrence of seeds at one and the same time is not absolutely, but to a sooner conception it is necessary. Proued by *Aristotles* authority.

It is also demanded, whether conception may bee without pleasure. On the mans part there is no question, but on the womans; for you shall heare many say that they haue no sense or inkling of pleasure at all. *Dinus* is of this minde that conception is not alwaies with pleasure on the womans part; but *Dina* were a better iudge of this controuersy: let vs hear his reason, because sometimes (saith he) the seede is immediately eiaculated into the bottome of the wombe which is of a duller sense, neuer touching the orifice whose sense is more exquisite. A pretty shift I promise you, but the good man was in an error. For pleasure is not therefore conceiued because the seede toucheth the orifice of the wombe, but because it runneth through the spermaticall vesselles of the woman which are of exquisite sense, otherwise women with childe who eiaculate their seede not into the inward orifice, but into the middle of the necke of the wombe, should haue no pleasure in such eiaculations; but it is manifest that they haue greater pleasure after they bee with child then before, because their seed passeth a longer course, as we shall say more at large in our Discourse of Superfœtation. Whither conception may be without pleasure *Dinus* opinion Confuted.

Hippocrates in his Booke *de Principijs* assoileth this question. For after hee hath giuen vs some signes of conception he saith, that these do not happen to all women, but vnto those onely whose bodyes are pure and cleane; but where the body is grosse, full of mucous and impure humors, there are no such signes. That is to say, an impure, mucous and moyste woman may conceyue without pleasure, or any sence of titillation at all. The question assoyled by *Hippocrates.*

Finally, some doubt whether the permixtion of the seeds bee requisite to conception, because it is absurd to thinke that species or kinds are mixed: againe, if they be mixed then should essenties be intended and remitted, which in Philosophy is a grosse absurdity, because euery essence is impartible. Likewise of two beings by themselues, one being by it selfe cannot be made. But we answere, that the Seeds being not actually animated, they Whether the seede of both sexes be mingled. Obiections. Answered.

do

Aristotle. doe not of themselues make the *species* of the Creature. If it bee granted also according to *Aristotle*, that they are imperfect essences or beings, it is necessary that they should bee mixed, otherwise they cannot bee nourished or animated together as *Hippocrates* sayeth in his Booke *de Natura pueri*. And in his first Booke *de diæta*, he blameth them that doubt whether of two fires a third may arise. *If any man sayth he deny that a Soule is mingled with a Soule*, that is, one seede with another, *let him be held for an Idiot in Physicke*. And in the very beginning of his Booke *de Natura pueri*. *If the geniture proceeding from both the parents be retayned in the wombe of the woman they are presently mixed into one*. And thus much of the effusion of the seedes of both Sexes, the pleasure thereuppon conceiued, and the permixtion of the seeds themselues.

QVEST. XII. *Whether the wombe haue any operatiue or actiue power in the conformation of the Creature.*

A double agent. IT wil not be hard to vntie this knot. According to the Philosophers rule there is a double agent, one Principall another Helpfull or assistant onely. A principall agent no man will say the wombe is, because then a woman could conceiue alone without the helpe of the man, and besides Females onely, Males neuer should be formed. The wombe therfore worketh as *Causa sine qua non*, a cause not so much of the being, as without which it could not be; because it awaketh and stirreth vp the sleepy and hidden vertue of the seede. The Physitians make three kindes of Efficient causes. Principall, Helping, or that without which a thing cannot be done.

3. kinds of Efficent causes among Physitians.

So in Purgations the principall cause is the propriety of the medicine, the Helping cause is the hot Temper; the cause *sine qua non* is our naturall heate, without which the power of the medicine being drowsie would neuer be brought into act. So in the conformation of the Infant, the principal cause is the Seed, I meane the spirits of the seed, by which as by workemen the Soule which is the noble and chiefe Architect frameth a mansion fit for the performance of her different functions. The Helping cause is a laudable Temper of the seedes and of the wombe. The *Causa sine qua non* is the wombe. For because the seeds are not actually Animated but only potentially, they need another principle whereby their power may be brought into act: the wombe therefore worketh diuerse wayes. First of all it draweth the Seede of the man through the necke, no otherwise then a Hart draweth a Snake by his nosethrilles out of the earth. For the seede is not powred into the cauity of the wombe as some of the Auntients thought but into the necke thereof. The bottome therefore of the wombe meeteth with the Seede halfe way, and with his inward mouth as with a hand it snatcheth it vnto it selfe and layeth it vp safely in her bosome. And euen as, sayeth *Galen* in his first Booke *de semine*, a hungery stomack runneth with his bottom euen vnto the throate to snatch the meate out of the mouth before it be halfe chewed; so the wombe which is the very seat of Concupiscence, being desirous and longing after the seed, moueth it selfe wholly euen to the priuities, and this is the first action of the womb, to wit, the traction of the Seede of the man.

How many wayes the wombe worketh.

Firſt by traction.

2. By mixtion. The second action of the wombe is the permixtion of the seedes; now they be mixed either by themselues or by another; not of themselues because they are not alwayes auoided at the same time, as we haue in the question before going proued out of *Hippocrates* & *Aristotle*; neither yet are they eiaculated into the same place, for the mans seede is cast into the neck of the wombe, the womans into the sides of the bottome which we call the horns of the wombe: the wombe therefore maketh this permixtion of the seedes which the Barbarians call *Aggregation*.

3. By retention. The third action of the wombe is the Retention of the seedes, in which the woman feeleth a manifest motion of the wombe: for it gathereth, crumpleth and corrugateth it selfe, and so exquisitly shutteth his orifice that it will not admit the poynt of a Probe.

4. By conception. The last action of the wombe is the suscitation or raising vp of the seedes which wee commonly call Conception. Now the faculty of the seed is rayſed or rowled, not so much by the heate of the wombe as by his in-bred propriety, for if the seede should be cast into any other part of the body though it were hotter then the vvombe, it would not be conceyued but putrified.

After Conception the action of the vvombe ceaseth; the vvhole processe of the vvorke of Nature, in fourming, nourishing and increasing is left vnto the Infant: this one thing the vvombe performeth, it conteyneth, preserueth and cherisheth the Infant, because the

place

the place is the preseruer of that which is placed therein.

QVEST. XIII. *Of vitious or faulty Conceptions, and especially of the Mola.*

THat Conception is made by the in-bred propriety of the Wombe, this among the rest manifestly prooueth, that into what part of the body soeuer, sauing into this, the seede is powred, this power or efficacy is neuer stirred vp, neither commeth into acte; so that conception is as properly the action of the wombe, as Chylification is the action of the stomacke. But that conception may be perfect, the seede which is yeelded and reteined must be pure and fruitfull. By pure I vnderstand with *Hippocrates*, that which is not sickly or diseased, neither yet mingled with blood. For blood is not requisite to generation till after the description of the germaticall parts is begun; otherwise the seede being choaked by the aboundance of the blood, neither at all attempteth his worke, neither can it bring to perfection that it could haue well begun. Againe, if the seedes be vnfruitfull, what hope can there be of a harueste. What is required to perfect conception.

To perfect conception there is further required an εὐκρασία or lawdable temperi of the wombe, for those whose wombes are either hot or colde, or moyst or dry aboue measure do not conceiue as saith *Hippocrates*. If therefore any of these things be wanting, wee cannot hope for a lawfull conception, but either there will bee none at all, or a depraued and vitious, such as is of the Moone-calfe or *Mola*. For Nature rather endeauoureth an imperfect and depraued Conception then none at all, because she is greedy of propagation and diligent to maintaine the perpetuity of the kindes of things: wherefore rather then she will do nothing, she will endeuour any thing how imperfect soeuer. So when Nature maketh wormes in the stomacke and guts, she doth better then if she should generate nothing at al, because of a thing immooueable she maketh a thing mooueable by it selfe and of it selfe, & of a putrid and rotten humour an animated creature. Nature endeuoureth a depraued conception rather then none & why.

The nature and causes of this faulty conception which they call the *Mola* or Moon-calfe we will endeauour to finde out. The *Mola* the Grecians call μύλην χοιρίδα, some think that the name came from a Bakers Mill, because it is like thereto both in hardnesse & in roundnesse. Among the Persians the word *Moli* signifieth a deformed thing. *Affranius* the Poet calleth it *Molucrum*, *Aristotle* often μόλυβον, because it is like a parboyled thing. We call it a *Moone-Calfe*. *Galen* in the 7. Chapter of his 14 Booke *de vsu partium*, defineth a *Mola* to be σάρκα ἄτονον καὶ διαπλασον, that is, an *Idle and imperfect flesh*. But this definition doeth not expresse the whole Nature of the *Mola*. For there may bee a rude flesh generated without motion, which is not a *Mola*. There are euery where Caruncles generated, which no man will call Moles. We thinke that this rather is a perfect definition of a *Mola*. *The Mola or moone calfe is an idle flesh without forme and hard, engendred onely in the wombe of a woman, and that of weake seede, which seede vndertaking the Conformation, but beeing oppressed or stifled with aboundance of blood, it cannot atteine his owne end, and therefore in steade of a creature generateth a lumpe of flesh.* The names of the *Mola*. *Affranius*. *Galens* definition. A perfect definition of the *Mola*.

The particular parts of this definition we will discourse of and discusse in order. The *Mola as a flesh*, because his substance is fleshy and red like clodded blood. *It is Idle*, that is, without any Animall motion; for it is not at al moued vnlesse it be after the motion of the wombe. It is *rude without forme*, not that it wanteth his owne forme, for it hath as saith the Philosopher his owne being, but it hath neyther εἶδος nor μορφήν, that is, neither the species nor the forme of a creature. *It is engendred onely in the wombe of a woman*, because as writeth *Aristotle*, onely a woman hath aboundance of menstruall purgatoins, for that her diet is moist, and her course of life sluggish and idle in respect of other creatures. That which is obiected of the Beare which alwayes bringeth foorth her young rude and vnformed, and perfecteth them by licking, either we say it is a Fable, or else that their young doe appeare deformed or vnformed but are not so indeede, but because they lurk all winter in the caues of the earth, they are couered with a slimy and Flegmaticke moysture which the Dam licking of makes their proportion appeare. Flesh. Idle. Rude. Onely in a woman.

The rest of the parts of our definition, doe fully declare the manner of the generation, and the causes of the *Mola*. I know there are diuers opinions of the Ancients concerning their generation. *Plutark* saith that a *Mola* may be generated without the cõpany of a man, whom many follow, who thinke it may be generated onely of the seed of the woman, when to it a great quantity of her bloode accrueth. But this opinion is disprooued by *Galen* in *Plutark* of the *Mola*. Disprooued.

the

the 7. Chapter of his 14. Booke *de vſu partium*, where hee ſaith that among all creatures which walke continually vpon the earth, none doe euer conceiue without the ſeede of the Male; no not a faulty or vitious conception; becauſe all beginning of conformation proceedeth from the ſeede of the Male as that which is the firſt principle of Generation. Add hereto that if a *Mole* could be conceiued onely of the ſeede of the woman; then thoſe Virgines which doe ſuffer nightly polutions might conceiue the ſame which neuer yet was hard off.

Mercurialis his opinion.

Reſelled.

The Coagmentation therefore of the Mole is neuer made without copulation. Some thinke that the Mole is generated as other fleſh, onely by the affluence of aboundance of bloud which is gathered or caked together by the heate of the wombe. But becauſe the blood hath no actiue or operatiue power but onely paſsiue, I doe not ſee how a Moale can be made onely of bloud, when as we ſee it is tyed with ligaments to the wombe and inueſted with membranes, which ligaments and membranes are the rudiments of a conformation inchoated or begunne. Neither are wee to giue credite to them that affirme that it is generated onely of crude and corrupted ſeede, or when the ſeede of the woman ouercommeth the Seede of the Male. The true manner of their Generation *Hippocrates* ſetteth downe in his firſt Booke *de morbis mulierum*, which, becauſe we eſteem it as an Oracle, I will here tranſcribe. *Concerning the Conception of the Mola this is the very trueth: when a great aboundance of bloud cloyeth a little ill diſpoſed ſeede there cannot bee a lawfull conception, yet the belly ſwelleth as if the woman were with Child.* What could be ſayed more ſuccinctly, what to better purpoſe?

Hippocrates opinion.

Explayned.

Two things he requireth to the Generation of the *Mola*: Firſt that there be the Seede of the man; but that in little quantity and vitious or faulty. Secondly that great quantity of blood ſhould flow vnto it. That little and vitiated ſeede vndertaketh the worke of conformation and beginneth to forme the membranes; for almoſt all Moone-calues are couered with filmes and membranes.

The maner of the generation of the *mola*

But when as the ſeede thus little and weake endeuoureth to perfect his woorke hee hath begun, then is the diſcretion or ſeparation of the parts hindered and interrupted by the affluence of too much blood, & the Conception becommeth illegitimate, becauſe the blood beareth greater ſway then the ſeede; ſo that in ſteade of a liuing Creature which was the firſt intention of Nature, there is generated an vnformed & rude maſſe of fleſh hauing indeede the principles of Life, but thoſe ſo weake that they are preſently ſuffocated and extinguiſhed. For whereas it dayly groweth and encreaſeth that commeth not by true nutrition but by appoſition onely.

Some thinke that this fleſh is not altogether without life, but ἡμίζωον as if they ſhould ſay it had halfe a Soule. It is therefore *Hippocrates* reſolution that the *mola* can neuer bee generated without the ſeede of the man, and that the beginning of the coagmentation or gathering of the ſame is alwayes from that ſame ſeed. The very ſame thing *Actuarius* confirmeth by this definition. *The Mola* ſayeth he, *is a fleſhy tumor which hath his beginning and his firmeneſſe or faſtneſſe from prolificall Seede.* And thus much ſhall haue been ſufficient to haue ſayd of the Nature and cauſe of the *Mola*.

Actuarius definition.

The ſignes to diſtinguiſh a *Mola* from an Infant out of *Hippocrates*.

Now let vs acquaint you by what notes and ſignes it may be diſtinguiſhed from a true Conception. *Hippocrates* in his firſt Booke *de morbis mulierum*, and in his Booke *de Sterilibus* conceiueth that the ſignes of the *Mola* are fetcht from theſe foure. The tumor or ſwelling of the belly, the motion, milke and the time of the geſtation. For the firſt, the belly

The tumor of the belly.

ſooner ſwelles vpon the conception of a *Mola* then of an Infant; beſide, it is ſtiffer ſtretched and carried with more difficulty. For the motion; if after the third and fourth moneth the woman feele no motion the Conception is faulty; for ſayeth *Hippocrates* Male Infants do moue the third moneth and Females the fourth.

The motion.

But the *Mola* is altogether immoueable vnleſſe it be accidentally moued together with the wombe: and if a woman in that caſe feele ſometimes a trembling and panting motion, wee ſay it is not ſo much cauſed by the *Mola* it ſelfe, as from the wombe which ſtriueth to ſhake off ſo vnprofitable a burthen. Beſide, the motion of the *Mola* and the Infant is altogether vnlike: for the Infant of it owne accord turneth himſelfe and mooueth euery way, the *Mola* like a bowle, or vnwealdy bulke is rowled to the right ſide or to the left as the wombe doeth incline to either hand. A *Mole* preſſed with the hand giueth way inſtantly but preſently returneth thither againe: the Infant as it yeeldeth not preſently, ſo after it hath giuen way it returneth not into the ſame place and poſition againe.

The

The third signe of the Mole *Hippocrates* taketh from the Nature of the Milke. *This is the greatest and most certaine argument of the Mola, if there appeare no Milke in the Pappes*. But if the Conceptions be legittimate there is milke. For this we haue a Golden saying in the Booke *de Natura pueri*, *As soone as the Infant beginneth to moone, euen then the Milk bewrayeth it to the mother*. But if a *Mola* be conceyued there is no Milke generated. Amongest all the rest, there is indeede no signe so infallible as that which is fetched from the time of the Gestation. For, if the Tumor of the belly continue after the eleauenth month which is the vtmost limit of Gestation, and yet there appeare no signes of a dropsie, wee may bee bold to say, it is not an infant but a *Mola* that is conceiued. And *Hippocrates* saith, *That a woman may beare a Mola two yea three yeares*.

3. signifi from the Milke. *Hippocrates.*

Aristotle also in the 7. chapter of his fourth Booke *De generatione Animalium* saith, that a Mola may endure in a womans body foure yeares, yea the whole course of her life, so that she may grow old with it, yea and dye with it of another disease; and in the tenth Booke *De Historia Animalium* he rendreth the reason; because (saith hee) being no creature it vrgeth not the wombe neither mooueth therein as doth the childe, who by kicking seeketh a way out for himselfe. Moreouer, the *Mola* breatheth not, neither needeth any aer at all, and therefore seeketh not passage for it.

A Mola may lye long in the womb & why.

The late Writers add, that the woman which hath conceiued a Mola becommeth pale, looseth all her colour, yea and pineth away in her whole body. And thus much of the *Mola* his nature, and the signes whereby it may bee distinguished from a Lawfull Conception.

QVEST. XIIII. *Of Monsters and Hermophradites.*

TO depraued and illegittimate Conceptions must Monsters be referred, concerning which, it shall not be out of our way to giue you some briefe Notice. Monsters *Aristotle* calleth Excursions and Digresions of Nature, taking his Metaphor from Trauellers, who wander out of their way yet go stil on their intended iourney. For when Nature cannot accomplish and bring to perfection that shee intendeth, least she should be idle, which is a thing incompetent to her disposition, she doth what she can. And in the second Booke of his Physickes, he defineth a Monster to be a fault, or error, or præuarication of Nature working for some ende of which she is frustrated because of some principle corrupted.

The definitiō of a Monster.

Monsters happen many wayes, and there are of them innumerable differences. We will onely handle the chiefe in this place, because haply in another work we may be in this kind more particular. Monsters happen either when the sexe is vitiated, or when the Conformation is vnlawfull. In the sex, when they are of an vncertaine sex, so that you may doubt whether it be a male or a female or both, as Hermophradites. Bi-sexed Hermophradites they call *Androgynas*, διφυεῖς, ἀνδροθήλυας ἀρσενοθήλυας. In males that commeth to passe three manner of wayes. When in the *Perinæum* or *Interfæminium*, that is, the place betweene the cod and the fundament, there appeareth a small womans priuity; again, when the same happeneth in the cod but without any auoyding of excrement by it; and thirdly, when in the same place the vrine issueth. In females there is but one manner, when a yard or virile member beareth out in the bottome of the share-bone aboue the top of the genitall in the place of the *Clitoris*. Some add in men, when there appeareth a small priuity of a woman aboue the roote of the yard. In women, when a yard appeareth at the Leske, or in the *Perinæum*.

The differences.

Monsters in sexe.

How manie kinds of Hermophradites.

In conformation Monsters are more ordinary. To Conformation we referre Figure, Magnitude, Scituation and Number. In Figure Monsters happen: if a man haue a prone or declining Figure like a bruite beast, if he haue the face of a Dogge, of a VVolfe, a Fox, a Toad, or such like. In Magnitude Exceeding or Deficient: if there be an vnequal proportion of the parts as a great heade, or againe so little that it agreeth not with the rest of the parts. In Scituation, as if the eyes be in the middle of the forehead, the Nosethrilles in the sides, the eares in the nowle, or such like. In Number Exceeding, as when it is diuided into two bodies, two heads, foure armes, or such like; or Deficient, if it haue but one eye, no eares, and the like.

Monsters in conformation

In Figure.

Magnitude.

Scituation.

Number.

Concerning the causes of Monsters, diuers men are of diuers mindes. The Diuine referres it to the iudgement of God, the Astrologers to the Starres: *Alcabitius* saieth, there are certaine degrees in which if the Moone be when a child is conceiued, the birth becommeth

The Causes of Monsters.

commeth monstrous. We list not to exclude the iust vengeance of Almighty God, which no doubt hath a great stroake in these things; but to speake as a Physitian or Naturall Philosopher, it must be granted that all these aberrations of Nature are to be referred vnto the Materiall and Efficient causes of generation. The Matter is the seede, the Efficient or Agent is either Primary or Secondary. The Primary or principle cause is double. The formatiue Faculty and the Imagination. The Secondary is the instrument, to wit, the Place and certaine qualities as heate. The matter is in fault three wayes. For it is either Deficient or Aboundant, or is diuersly mixed. If there be want of Spermaticall matter, then the Monster is deficient either in Magnitude or in Number. If there be ouer plus of Seede, they become double-headed, with foure armes, &c. If there be a confused permixtion of the seede, then are Monsters generated of diuers kindes: as vpon Sodomy and vnnaturall copulations of men and beasts horrible Monsters haue beene brought into the worlde; so *Aristotle* saith, that in Egypt and Affrica, where Beasts of diuers kindes meete at the waters of *Nilus*, or in the Desert-places and mis-match themselues, there are often manie Monsters generated. And thus come monsters arising from the Matter. From the Agent or Efficient monsters may happen diuers wayes. The Primary Agent as we saide, was eyther the Formatiue Faculty or the Imagination. The power of the Imagination wee shall shew a little after in a fitter place, heere it shall bee sufficient to shew out of the learning of the Arabians, that a strong Imagination is able to produce formes euen as say they the superiour Intelligences in the Heauens do produce the formes of Mettalles, Plants, and creatures.

The true causes.

Monsters frō the matter.

Why so many Monsters in Egypt & Affrica.

The differēce of Monsters from the Efficient.

We reade that in the precinct of *Pisa*, a woman brought foorth a female childe full of haire like the haire of a Camell, because (saith the Author) she was wont to kneele before the picture of *Iohn Baptist*, cloathed in Camels haire. The Secondary Agent is the Heate or the place of Conception. Heate hauing a fiery mobility or quicke motion, formeth sundry shapes of bodies and worketh the matter into diuers fashions. The peruersion also, the euill Conformation of the place, that is, of the wombe, may be the cause of a depraued figure. And thus I make an end of this common place at this time, wherein my purpose was onely to touch the heads of things, reseruing my selfe to heereafter for the particular prosecution. Hitherto we haue intreated of the difficulties which might arise concerning the Conception, now it followeth concerning the Conformation.

A Historie.

QVEST. XV. *Whether all the parts are formed together.*

The difficulty of the questiō.

THis question is so hard and ful of obscurity, that *Galen* saith it is only known to God & Nature. For what is more Diuine then the first Conformation of a man? What more admirable? What more secret? This the kinglie Prophet inspired from aboue acknowledgeth, *I wil confesse before thee O Lorde, because I am wonderfull made, thy eyes saw mee before I was shaped, &c.* Seeing therefore the resolution of this question is aboue the reach of humane capacity, which God wot is circumscribed within very narrow limits; if to make some ouerture thereof I shall take a little more liberty to my selfe, I desire all those that desire with mee heerein to be informed, not to impute it to my wandering wit but to the greatnesse of the subiect. Because therefore as by the Collision of stones fire is beaten out, so by the ventilation or skirmish of aduersary opinions the truth comes best to be knowne, we will first with your patience see what the Ancients haue conceyued of this matter.

Alcmeons opinion.

Alcmaon thought, that the braine was first of all formed because it is the seate of reason and the habitation of the soule, as also for that in infants the heade is greater in his proportion then any other of the parts. It may be he had reade in *Hippocrates* his *Epidemia*, that the magnitude of the bones and of all the parts is to be esteemed according vnto the magnitude of the head, as if all the rest were formed by the heade, and had dependancie therefrom.

Pelops.

Galen in the second Chapter of his sixte Booke *de Placitis Hippocratis & Platonis* remembreth that *Pelops* taught publickly that all the vessels had their originall from the braine; the same also was the opinion of that *Persian* Philosopher whom *Auicen* calleth *Theseus Persæus*; others *Syamor Cabronensis*.

Theseus or Syamor.

But because the braine is onely the author of sense and motion, and the principal Faculties which the Infant hath no neede of in his first Conformation; I see no reason why the braine should be formed before the other spermaticall parts.

Dewe-

Democratus as *Aristotle* sayeth in the first Chapter of his second Booke *de Generatione Animalium*, did think that the outward parts were first formed, & afterward the inward parts, as Artificers are wont first rudely to frame the modell of Creatures in wood or stone before they cut out the more curious lines. *Orpheus* thought that a creature was formed as a net is knit, that is in order; *Empedocles* that the Liuer was first formed; the *Stoycks* all the parts together. *Aristotle* in his second Booke *de Generatione Animalium* sayeth that the heart is first of all formed, and by and from it all the partes are produced, which as a childe enfranchised by the father, taketh vpon him to rule and dispence the whole body. This sayth hee is the first and onely principle, the first liuer, the first mouer, the first that maketh blood, because it dyeth last of all, now that that dyeth last liueth also first. That the heart dyeth last, beside that wee are taught it by dayly experience, *Galen* also confesseth as much in the first Chapter of his sixt Booke *de locis affectis*, Death neuer followeth, sayth he, vnlesse the heart be first affected with an immoderate distemper. It is therefore necessary that the Father or Lord of the family which is the Heart, should bee created before the Cater or Steward which is the Liuer. This opinion of *Aristotles*, *Auicen* the prince of the Arabian Family seemeth to follow, which also hee establisheth by some reasons; because the creature cannot be nourished vnlesse he liue and participate of the influence of heat, now the heart is the plentifull fountaine of naturall heat.

Democratus.

Orpheus.
Empedocles.
Aristotles opinion.

The heart dyeth last, after *Gal.* & *Arist.*

Auicens opinion.

Againe, in the first dayes after Conception the Formatiue faculty needeth no nourishment, because there is no notable resolution or expence in the parts; but of heate and vitall spirits there is alwayes neede, therefore it was necessary that the heart should bee formed before the Liuer.

But this opinion of *Aristotles* is long since cast out of the schooles of Physitians. For that it is not the onely nor the first principle we haue already prooued sufficiently in the second question of the Controuersies of the first Booke. Nowe that it is not first generated may be demonstrated both by Reason and Sence, which two are the most vnpartiall Iudges of all Controuersies. By Sence because there alwayes appeare together and at once three bubbles, which are the rudiments of the three principal parts, neither did any man euer obserue one of those bubbles only.

Aristotles opinion confuted.

By sence.

By reason, because in the first dayes after Conception the *Embryo* needeth not the help of the heart. For liuing the life only of a plant, it needeth neither pulsation or spiration nor the influence of heat, because it cherisheth himselfe with his owne heat and with his owne inbred spirit. And wheras *Arstotle* would conclude it to be the first that liueth, because it is the last that dyeth. We say that followeth not: for those things that are first in Generation are not alwayes the last in dissolution.

By reason.

So in the Generation of any thing that is mixed, the matter goeth before the forme, and yet the abolition of the forme is the corruption of the thing mixed. By this reason also in Snakes and Serpents the tayle should be that which liueth first, because when all the other parts are starke dead and immouable, yet the tayle liueth and moueth. We think indeed that the heart is last of all depriued of life, because when the Infant is perfected and absolued the vitall heate floweth onely from the heart as from a most plentifull fountaine, but that it first liueth we vtterly deny; because to liue is either to be Norished or to be Animated. The heart is neither first nourished nor first animated. All nourishment is by blood, blood is not but by the veines, all the veines are from the Liuer; and the Vmbilicall veine which is the first Nurse of the *Embryo* powreth the blood into the *Parenchyma* of the Liuer before that of the heart. Neither is the heart first animated because the seed when it breaketh into act. *i.* when it beginneth the conformation is wholly & actually animated. Therfore all the parts thereof doe actually liue onely by the participation of heate in the moysture. Wee bid therefore adue to *Aristotle*, *Chysippus*, the *Stoyckes* and whosoeuer else doe thinke that the heart is the first liuer and the first maker of bloud.

That the hart doth not first liue.

What it is to liue.

Galen seemeth to differ from himselfe in the order of the conformation of the parts, for sometimes he sayeth that the Heart and the Liuer are formed together, somtimes that the Liuer is first formed, sometimes that the vmbilicall veine hath the preheminence, yet herein he is alway of one minde, that he thinketh the partes are generated in succession, not at once and together. And this he illustrateth by examples of those things that are wrought by Art. For a house is not built all at once, but first the foundations are layde, then the walles are reared, and finally the roofe is layd on: so sayeth he it is in the Infant, one part is formed before another, to wit, that first which is most necessary for the *Embryo*. And that

Galen in this is diuers.

The parts are generated successiuely.

he thinketh is the Liuer, becauſe the Infant liueth at firſt the life of a plant needing onely nutrition as doth a plant; now the Liuer is the ſhop or ſtorehouſe of Aliment. As therefore a plant hath no need of a heart, ſo neither the Infant in the beginning.

Moreouer that the Liuer is firſt generated may be proued by his magnitude and the facility of his generation, for it is made onely of congealed bloud; adde hereto that the vmbilicall veine atteyneth to the Liuer before it commeth to the Heart. That all theſe things are true *Galen* teacheth in the third Chapter of his Booke *de formatione fœtus*, becauſe in Infants the natural faculties as being the firſt of all other are the ſtrongeſt, thoſe that riſe from the Heart much weaker, thoſe weakeſt of all which come from the Brayne. Furthermore all Generation proceedeth from that which is more imperfect to that which is more perfect: wherefore firſt is the liuer generated, then the Heart and laſt of all the Brayne. This is the opinion of *Galen* and almoſt of all Phyſitians both old and new concerning the conformation of the parts.

Galen.

We for our owne part doe not vſe to ſweare vnto the opinion of any man, but as wee eſteeme much and haue in great reuerence the patrons and founders of our Art, as becommeth vs well; ſo if at any time they ſtray from the rule of right reaſon, wee ſhall not make ſcruple to diſſent from them. VVhatſoeuer therefore *Galen* may think, we cannot be perſwaded that the Liuer is firſt formed, becauſe before the delineation of all the parts of the Infant hee needeth not the helpe of the Liuer; for it was not behoofefull that the blood ſhould flow till after the diſcretion and diſcription of the ſpermaticall parts, otherwiſe the ſeede would be cloyed and clogged with blood and inſtead of a lawfull Conception a *Mola* would be formed.

Galens opinion not to be approued.

The reaſons.

As for that nouriſhment and encreaſe which *Galen* feygneth ſhould bee made by the blood, we are ſo farre from thinking it neceſſary to the firſt conformation, that we rather thinke with *Hippocrates* and *Ariſtotle* that it would haue beene a great hinderance thereto, ſo that we may retort *Galens* weapon which he vſeth againſt *Ariſtotle* vppon himſelfe. The Infant ſayth *Galen* needeth not the helpe of the heart, therefore the heart is not formed before the Liuer. VVe ſay, the Infant needed not the helpe of the Liuer becauſe it is not nouriſhed till after the delineation of the ſpermaticall partes is abſolued, wherefore the Liuer ought not to be formed before the Heart and the Brayne.

Obiection, Solution.

You will obiect for *Galen* that life is limited and defined by nutrition, if therefore the *Embryo* doe liue it needeth to bee nouriſhed. I anſwer, that in creatures that are perfect nothing liueth that is not nouriſhed, but imperfect creatures and ſuch as are without bloud may liue a time without nouriſhment, ſo ſome creatures liue al winter in holes and a plant all winter is not nouriſhed, but viuifieth and quickneth it ſelfe. The tender *Embryo* therfore which is without blood liueth the firſt dayes and yet is not nouriſhed, becauſe there is no neceſsity of nouriſhment ſeeing there is no exhauſtion of the parts.

What we thinke.

It remayneth now that we make manifeſt vnto you our own conceit of the order of Conformation, which we will doe as briefly and perſpicuouſly as poſsibly wee can: but becauſe we would haue euen the moſt ignorant conceiue vs the better we wil vſe firſt theſe diſtinctions.

Of the partes ſome are proper to the Infant it ſelfe of which it hath vſe in the whole courſe of his life; others are ſeruiceable vnto it onely ſo long as it abideth in the mothers wombe, of which kinde are thoſe skinny couerings and ſmall membranes compaſsing the Infant about. Againe we muſt obſerue thus much, that ſome partes are ſpermaticall engendered of the craſſament of the ſeed, others fleſhy whoſe originall is immediately from the bloud. And of theſe fleſhy parts there are three kinds as there are three kinds of fleſh. For it is either the fleſh of the bowelles which wee call *Parenchyma* or the fleſh of the muſcles, which *Hippocrates* properly and abſolutely tearmeth σαρξ, that is *Fleſh*, or the peculiar fleſh of euery part which hath not any proper name.

Differences of the parts of the Infant.

The membranes firſt generated.

Theſe things being thus, we conceiue. That the membranes called *Amnion* and *Chorion* are firſt of all formed, becauſe the inward and moſt noble part of the ſeede was to bee defenced and walled about with theſe curtaynes, as we ſhall ſhew more diſtinctly in our next exerciſe.

All the parts formed together.

Theſe coates being formed, we thinke that the rudiments or *Stamina* and threds of all the ſpermaticall parts are formed together at once, becauſe the matter is the ſame, alike altered and diſpoſed by the heate, the workeman the ſame to wit the ſpirit diffuſed through the whole maſſe of the ſeed, the Finall cauſe the ſame, that is, the vſe of euery ſingular part.

For

For, seeing that in the first delineation the Infant needeth not eyther the nourishment of the Liuer, or the influence or pulsation of the heart, or the sense of the braine, but cherisheth it selfe with his owne in-bred heate; why should wee thinke that one of the parts is formed before another? If Nature when she vndertaketh the concoction of quitture or *Pus* which we call Matter, dooth bring the whol to an equalitie together, and insinuate it selfe equally and alike into all the parts thereof, why shall shee not in this first delineation of the Spermaticall parts (the Idea of all which the Formatiue Faculty conteyneth in it selfe) beginne and accomplish the description of all of them together? Neyther is this our opinion but the Conclusion of *Hippocrates* in his first Booke *De Diæta* and in his Booke *de Locis in homine*. *Hippocrates* opinion.

In his Booke *De Diæta*, *The partes are all delineated together, all together encreased, not one or more, before or after another or the rest, but those that are greater by Nature doe appeare before those that are lesse.*

In his Booke *De Locis in homine* straight after the beginning hee breaketh out into these wordes, *It seemeth vnto mee, that there is nothing first in the bodye, but all thinges are the beginning and all things the end, all parts first and all last.* What could he say more plainely? What more breefely? Or what indeede could bee eyther spoken or immagined more Diuine? The Fleshie parts are the last made, and their order

The Spermaticall parts therefore which we call solid or first parts, are shadowed or lined out at once and together, but afterwards they are perfected euery one in their order; First those that are more noble and necessarie, and those last which are most ignoble and lesse necessary. After the delineation of the spermaticall partes are formed the Fleshie, and first of all the *Parenchymata* of the bowelles, nexte the proper flesh of the particular parts, and finally the emptie spaces of the Muscles are filled vp.

Among the *Parenchymata* we thinke that of the Liuer is first gathered together, beecause the Vmbilicall Veyne dooth first powre the blood thereinto, which beeing concreted or caked maketh the substaunce or flesh of the Liuer; and this happely *Galen* meant, where he saith that the Liuer is first generated; so that in this sense if he spake hee may wel be excused. How *Galen* may be excused.

QVEST. XVI.

Whether the Membranes which encompasse the Infant bee first formed, and whether they bee made by the Forming Faculties, and of the Seede of the Woman.

(***)

3 Questions. The first.

That the membranes are first formed.

Experience.

Oncerning the Originall of the Membranes which compasse the Infant three thinges are to bee enquired after. First, whether the Formatiue Facultie doe at these beginne the Conformation, that is, whether these bee first of all formed. Wee thinke that they are, being taught both by Reason and Experience. For Experience, wee will auouch *Hippocrates*, *Aristotle*, *Galen*, and our owne.

The *Geniture* sayeth *Hippocrates*, *After it is mixed and reteyned, what day or houre soeuer it bee auoyded, dooth alwayes appeare couered with a Filme or cruſt.* The same vvriteth *Aristotle* in his Bookes *De Generatione Animalium.* And *Galen* in his first Booke *de Semine.* I haue often seene the Geniture conceyued onely couered with Membranes.

Who euer saw a conception, although it were vitious and illegitimate which was not couered with a Filme as it were with a Garment? The Mola albeit it be verie rude & without forme, yet is it cloathed with a Membrane (a manifest argument that the Formatiue Facultie in all Conceptions beginneth her woorke with the delineation of the Membranes) where shee is hindered that shee can proceede no farther.

To Experience wee may add Reason. The Membranes were necessarily first to bee made, that the Seede heerein being encompassed might the better manifest his operations, as also that the inwarde Spirits thereof might bee kept from Dissipation and vanishing away, and that the tender *Embryo* might not hurt his soft sides against the hardnes of the wombe.

The second Question is more obscure and the more knurrie knotte a great deale to riue, which is, whether these Coueringes bee made by the Formatiue Facultie? Some thinke that they are generated onelie by the heate of the VVombe, and for their opinion dooth vrge *Hippocrates* Authoritie and his Reasons. For, in his Booke *De Natura Pueri* he VVriteth, that the Geniture beeing heated and puffed is compassed with a Filme, euen as Breade when it is baked is compassed with a Cruſt. Now the cruſt of breade or such like is rayſed in the superficies of the Masse onely by the heate of the fire.

The second question, Whether the Membranes are made by the formatiue Faculty.

Authoritie.

Reasons against it.

His reason is on this manner. The seede conteyneth in it selfe the Idea or Forme onely of those partes, from whence it floweth; but in neyther of the Parents are there any such Membranes, how then shall the Seede haue any power at all to make or forme them?

Our resolutiō

But wee thinke that the three Membranes are generated by the Forming Facultie of the Seede, and not by the onely heate of the wombe, because there is no such great heate in the wombe which in so short a time can burne or puffe the Superficies of the Seedes into such Membranes. For if the VVombe shoulde atteine vnto that degree of heate, surely there would bee no conception. So saith *Hippocrates* in his Aphorismes, *Those women who haue hot wombes do not conceiue*, because when the wombe is too hot, the seede is baked and torrified.

The authority expounded

As for the aboue alledged authority of *Hippocrates*, it maketh nothing against vs; for he doth but illustrate an obscure thing by a similitude or comparison: as if he should say, euen as the bread is compassed with a Cruſt, so is the infant compassed with Membranes; but that

that the maner of the generation of theſe two is alike, that he doth no where affirm: & whereas they ſay that the ſeed containeth only the *Idea* or forme of thoſe parts from which it iſſueth, and that there are no ſuch Membranes actually either in the Father or in the Mother; I anſwer that ſuch & ſo diuine are the powers of the forming Faculty, that they can diffuſe or transfuſe themſelues out of one ſeede into another. If therefore the markes which were in the body of the Grandfather do often appeare in the Grandchilde, yea in his poſterity after many degrees of affinity or conſanguinity; why ſhall not the forming Facultie of the fathers ſeede make an impreſsion in the infant of that power which the Father himſelf had when he was ſeede? Add heereto the neceſsity of the Finall cauſe. It was behouefull that the Infant ſhould be inueſted with Membranes, and therefore the noble and abſolute Architect hath made them. The reaſon anſwered.

The third queſtion which we haue heere to diſcuſſe is, whether theſe Membranes bee generated of the mans ſeede, or of the womans. It is the olde receiued opinion, that they are generated onely of the Mothers ſeede, becauſe that is the colder and leſſe fruitefull, wherefore Nature hideth more inward the noble and eſpeciall parts of the ſeed; the more ignoble and baſe ſhe diſpoſeth on the outſide as a defence to the reſt; now the ſeede of the woman is more ignoble. Moreouer the quantity of the mans ſeede is but little and not ſufficient for the forming of the outward and inward partes both, and therefore it prayeth aide of the ſeede of the woman. The thirde queſtion. Whether the Membranes are generated of the Mans ſeed or of the womans.

We thinke that for the moſt part the Membranes are made of the ſeede of the woman, but that they are made only thereof, that we deny. For if the ſeede of the man be ſufficient for the Generation of all the parts of the Infant, why ſhould it not alſo be ſufficient to generate the Chorion? Againe, if the ſeede of the woman doe onely generate theſe Membranes, how commeth that to paſſe which *Hippocrates* auoucheth in his firſt Booke *de Diæta*; that when the womans ſeede getteth the victory ouer the mans, there are procreated three kinds of Females. Dooth not the womans ſeede ſometimes ouercome in the permixtion of the ſeeds of the ſexes? Therefore when the womans ſeede is ſtronger then the mans, why ſhould we attribute the generation of the Membranes vnto the ſtronger ſeede, and of the whole body of the Infant to the weaker. The reſolution.

We conclude therefore that the Membranes may bee generated of either ſeede of the male or Female but of the Female more ordinarily, and againe that of the Mothers Seede not onely theſe Membranes but alſo the Spermaticall partes of the infant may be formed. *Arantius* his idle opinion.

Arantius in the Booke he ſet out of the Infant ſaith, that the two Membranes the *Amnion* and the *Chorion* are not generated before all the reſt of the parts, but that they are propagations of the inner coats; the *Amnion* of the fleſhy Membrane, and the *Chorion* of the *Peritonæum*; but this is againſt all experience and reaſon, as we haue ſufficiently ſhewed in the beginning of this exerciſe.

QVEST. XVII. *Of the Number of the vmbilicall veſſelles.*

IN the Hiſtory of the Vmbilicall veſſelles, there are two thinges obſcure, to wit; the Number of the veſſelles, and their Originall. Concerning their Number the Anatomiſts are at variance, ſome ſay there are onely three, others foure, ſome fiue. They which acknowledge three, make onely one veine and two Arteries. They which woulde haue foure, adde to theſe three the *Vrachos*, thoſe who would haue fiue, number two Veines, as many Arteries and the *Vrachos*. Of the number of theſe veſſels diuers opinions.

We reſolue, that as well in men as in beaſts there are foure alwayes, & only foure to be found. The firſt is the veine which is the Nurſe of the *Embryo*, which alone and by it ſelfe arriueth at the Nauell from the Fiſſure of the Liuer. This veine, when it hath paſſed the Nauell is clouen into two and maketh two diſtinct channels, and theſe againe are diuided and ſubdiuided, whoſe branches being ſupported by the membrane called *Chorion*, do conioyne themſelues with the veynes of the wombe; in Sheepe and Swine by certaine rounde and Nauel-like Excreſences which they call *Cotyledones* or *Acetabula*, in Women by that Our reſolutiõ. A deſcription of the vmbilicall veine.

bulke of fleſh which the late Anatomiſts call the cake or Liuer of the wombe, but I know not for what reaſon: for I doe not beleeue ſayth *Laurentius* that the blood is prepared and boyled in that fleſh, but I acknowledge the ſame vſe of it which the Auntients aſsigned to the glandulous body called *Pancreas*, to wit, ſafely to ſuſtain and like a pillow to vnder prop the innumerable propagations of veſſels which are diſtributed through the *Chorion*. The veine therefore from the nauell to the Liuer is but ſimple and ſingle, which after it is paſſed the nauell is clouen in twaine and appeareth double. And thus are the different places in *Galen* to bee reconciled, where hee writeth ſometimes that this veine is ſingle ſometimes that it is double.

Galen reconciled to him ſelfe.

The Vmbilicall arteries are two, one on either ſide, proceeding not from the heart but from the Iliack branches of the great Arterie deſcending. The fourth veſſell remayneth, and vpon this hindge is the whole controuerſie turned; the Antients called it *vrachus*, becauſe by it the Infant powreth his vrine into the membrane. Almoſt all the late Anatomiſts deny this to be in a man and ſay it is onely found in beaſtes. Yet I ſayeth *Laurentius*, haue alwayes obſerued it euen in men alſo: for that a neruous production is ledde in men from the bottome of the bladder to the nauell as well as in beaſtes, I thinke no Anatomiſt will deny. I aske therefore what vſe is there in man of this production? not onely that it may ſerue for a ligament (for the bladder is tyed and doeth adhere to the neighbour partes very ſtrongly by the interpoſition of many fibres ariſing from the *Peritonæum*) but to leade away the vrine as it doth in bruite beaſtes? And in this my opinion ſayeth the ſame *Laurentius*, I am confirmed by the Hiſtory of a wench whoſe vrine being a long time ſuppreſſed, did at laſt iſſue out at her nauell.

The vmbilicall arteries. The *vrachus*

Proued in men.

A hiſtory out of *Cabrolius*.

This *Bartholemew Cabrolius* a moſt expert Chyrurgion, and the ordinary diſſecter to the Colledge of Phyſitians at *Monpelier* in Fraunce, hath often made mention off. *Fernelius* alſo in the 13. Chapter of the ſixt Booke of his *Pathologia* telleth the like ſtory. One there was ſayeth he about 30. yeares of age in whome the necke of the bladder was obſtructed, and whoſe vrine iſſued plentifully for many moneths together at the nauell as it had beene preſſed out, and that without any tumor, collection of water in the *Abdomen*, or any offence at all in his health: when many hereat wondered much, and I hard that when he was borne his nauill was ill tyed and euer after ſome little quantity of water iſſued that way; I conceiued that the *Vrachos* was not dryed, and that his vrine did now as it did when he was in his mothers wombe returne from the bladder to the nauill.

An elegant hiſtory out of *Fernelius*.

How the 4. veſſels are tyed together.

There are therefore foure vmbilicall veſſelles, one veine, two arteries, and the *Vrachus*; all which about the nauell doe meete and are included in a long neruous and writhen canale like a gut, which they call the rope, the tye, or the gutling. The reaſon why they are ſo encompaſſed is, that they might not part one from another, and ſo be either broken being ſeuered, or intangled if they had ſcope to intangle themſelues. Theſe foure veſſelles when the Infant is borne, as now becomming of no vſe, do degenerate into a Ligament.

A rare obſeruation about the vmbilical veine.

Yet it hath bin obſerued that in ſome after they are grown to good age, the vmbilicall vein hath beene changed into a looſe and open veine, as *Volchier Coiter* obſerued at Noriberge in a mayden of 34. yeares old.

QVESTT. XVIII. *Of the originall of the Vmbilicall veſſels.*

Galen expounded.

THE Controuerſie is no leſſe concerning the originall of the vmbilcall veſſels then it is concerning their number. Some think they haue their originall frō the veſſelles of the wombe, becauſe they are continuated with them, and are torne from the Infant ſooner then from the wombe. And this ſame *Galen* ſeemeth to approue in his Booke *de diſſectione vteri*. The end of that veſſell that is propagated through the wombe giueth beginning to that veſſel which is in the *Chorion*: ſo that you may ſee that theſe two are one. For they are ſo vnited by their mouths that the veine draweth blood from the veine, and the artery ſpirit from the artery. The ſame writeth *Ariſtotle* in the 8. Chapter of his 7. Booke *de Hiſtoria Animalium*: The nauell, ſayth he, is as it were the cup of an Acorn about the veines, whoſe originall is from the wombe, in thoſe creatures which haue *acetabula* from thoſe *acetabula*, in thoſe that haue them not from the veine it ſelfe. But I thinke *Galen* in this place tooke more liberty to ſpeake after the common opinion of the multitude not as himſelfe thought. For that hee might declare the continuity of the veſſelles, hee ſayth, that the end of one veſſell is the beginning of another. A beginning I ſay not Phyſicall or Originall, but Mathematicall, that is, quantitatiue

Ariſtotle.

Gal. excuſed.

titatiue, as the Barbarians speake. Some there are who thinke, that the vmbilicall veines and arteries are first of all generated, and that all the rootes of the Veines and Arteries yssue from them, becauſe the Veines proceede from the Liuer and the Arteries from the hart; now the vmbilicall veine is generated before the Liuer; for his *Parenchyma* is not gathered without blood, and blood is not deriued but through Canales; and therefore it was neceſſary that the vmbilicall veine ſhould be formed before the Liuer. The opinion of ſome Anatomiſts.

This opinion is indeed very probable, and ſo ſometimes ſeemed it to me (ſaith *Laurentius*) to be, but when I tooke a more ſerious conſideration of the matter I found it to bee otherwiſe. For how ſhould ſo many and ſo notable roots of veines as are diſperſed through the whole *Parenchyma* of the Liuer, ariſe from ſo ſmall a branch as this vmbilicall veyne is? Againe, thoſe parts that ariſe one from another muſt of neceſſity bee continuated the one with the other. Now there is no continuity betweene the vmbilicall veine and the hollow veine, vnleſſe it be by the inoculations of the rootes of the gate veine. What is more abſurd then to thinke, firſt that the *Parenchyma* of the Liuer is made of the vmbilicall veine, & afterward that from that *Parenchyma* the rootes of all the veines ſhould ariſe? Are not the ſpermaticall parts delineated before the fleſhy? On the other ſide, who will ſay that all the Arteries are propagated from the vmbilicall arteries, ſeeing they reach not directly to the heart but to the *Iliack* branches? VVould we commend that builder who would ſet vp his wals before he lay his foundations? I know what wil be ſaid, that theſe veſſels are the roots by which the infant is nouriſhed after the maner of a plant, now the roots are firſt formed. But they muſt know, that the infant is not nouriſhed before his ſpermaticall parts be delineated, becauſe before that time there is no neceſsity of Nutrition. That the vmbilicall veine is not firſt formed.

We reſolue therefore that theſe veſſels are begun together with the reſt of the ſpermaticall parts, and that the vmbilicall vein is a branch of the gate-veine to which it is continued; that the two vmbilicall Arteries are ſcions or ſhoots of the Iliack branches of the deſcending trunke of the great Artery; Finally, that the *Vrachos* ariſeth from the bottome of the bladder and aſcendeth vnto the Nauill. Yet we thinke that the vmbilicall Veine and Arteries are perfected before the reſt of the veſſels, becauſe there was more neede of them for the coagmentation or gathering of the fleſh, eſpecially of the bowels. What wee reſolue of.

QVEST. XIX. *Of the times of the Conformation of a man and of a woman-childe.*

WHich is the firſt and which is the laſt day of the Conformation of the Infant, God alone knoweth who made them; and if we haue any thing to ſay of this matter, we haue it out of *Hippocrates* Fountaines. His opinion is in his book *de Natura pueri* and *De Principijs*; That the ſeaueneth day the rudiments of all the ſpermaticall parts do appeare, but the perfect dearticulation and deſcription of the Female is in 42. daies, and of the Male in 30. at the longeſt. But this vvee thinke is to be vnderſtood onely of the firſt Conformation; for we do not beleeue that the fleſh of the Muſcles is in that ſpace perfected and accompliſhed, but the 3 or the 4. moneth rather, at what time the infant beginneth to moue: ſo that we make a double Conformation, one of the ſeede another of the blood; the firſt goeth before, which therefore *Hippocrates* in his booke *de Septimeſtri partu*, and *De Natura pueri* calleth πρώτην πῆξιν, the firſt coagulation or coagmentation; the ſecond doth onely fill vp the diſtances of the firſt, that is, the ſpaces betweene the threds and fibres. The time of Conformatiõ. A double conformation.

Strabo the *Peripatetike*, and *Diocles Carystius* diſpenſe the fabricke of the infant by ſeauens and ſeuens, alluding to that maieſty of the Septinary number which *Plato* conceiueth it to carry in it. Others thinke that 45 dayes is the vtmoſt limit of Conformation. For ſixe dayes they aſcribe *ſpumificationi*, to the frothing of it; foure *Lineationi* to the delineation, eight to the Repletion of the lines, fourteene *Carnificationi* to the generation of fleſh: finally thirteene *Afformationi* to the accompliſhment. The leaſt time of this proceſſe of Nature is thirty dayes, ſixe for Spumification, two for Delineation, foure for Repletion or filling of the Lines, nine for Carnification, and as many for Afformation. *Strabo* & *Diocles*.

Others thus in Verſe.

Sex ſunt in lacte dies, ter ſunt in ſanguine terni,
Bis ſeni Carnem, ter ſeni Membra figurant.

Sixe dayes it is in Milke, in blood three thrice accounted,
Twelue figurate the fleſh, Members ſixe thrice amounted.

Hippo-

Hippocrates. Why the male is ſooner formed in the wombe.

Hippocrates much more diuinely and diſtinctly. Males are formed at the vttermoſt the 30. day, and Females the fortieth or the 42. Now the reaſon why a man childe is ſooner formed in the wombe then a woman, and yet a woman out of the womb ſooner commeth to perfection then a man, is indeed worth the ſearch. This *Hippocrates* hath left vs in the ſecond Section of his ſixt Booke *Epidemion. Mas concreuit coaluitque citius, vbi motus eſt conquieſcit & tardius augeſcit longioreque tempore. A Male gathereth ſooner and is ſooner articulated; after hee moueth hee ſtinteth his motion and groweth more ſlowly and in a longer time*; the ſame alſo he hath in the third Section of the third Booke *Epidemion.* That which moueth ſooner and is ſooner articulated is longer increaſing in his growth The demonſtration of the trueth of this is to be fetched alſo from *Hippocrates*: the Man-child is ſooner formed in the wombe becauſe he is hotter, for conformation is the worke of heate: and in the firſt Booke *de Diæta*, Males are generated of hotter ſeede, Females of colder. And in his Booke *de Natura pueri* in expreſſe words. *This is the reaſon why a Female is formed and articulated later then a Male, becauſe the ſeede of the one is moyſter and weaker then the ſeede of the other.* Adde hereto the nature and condition of the place, for Males for the moſt part are generated in the right ſide Females in the left, as appeareth in the 48. Aphoriſme of the firſt Section; now the right ſide is hotter then the left.

Why the female is ſooner perfected out of the wombe. *Ariſtotles* reaſon.

But why the Female out of the womb is ſooner perfected, we muſt ſeek for a demonſtration out of *Ariſtotle* in his Book *de ortu ad interitu.* The times of perfection and imperfection ought to be proportionably anſwerable one to another; corruption is an imperfection, but accretion and generation are accounted kinds of perfection; whatſoeuer ſooner periſheth attayneth alſo ſooner his perfection. So an acute and ſhort diſeaſe runneth ſuddenly through all his foure times, and commeth ſooner to his height or pitch then a chronicall or long diſeaſe. Now for the moſt part and generally women die ſooner then men, as being of a ſhorter life becauſe the principles of their life are weaker, and therefore they alſo doe ſooner attayne the perfection of their life. To this wee may adde the ſoftneſſe of their bodies which makes them more apt for extenſion.

A double reaſon aſsigned by *Hippocrates.*

Hippocrates who was ignorant of nothing, in his Booke *de ſeptimeſtri partu*, expreſſeth this briefly and plainly in theſe words. *After Females are ſeparated from their mothers* (that is, are borne) *they cotten ſooner then men, grow ſooner wiſe and ſooner old; as well becauſe of the weaknes of their bodies as by reaſon of the maner of their life.* He therefore acknowledgeth a double cauſe; the firſt is weaknes, ſo that that which in the wombe was the cauſe of their ſlower conformation and motion, the ſame is the cauſe out of the wombe of their more ſudden & accelerated perfection. For a Female is a thing more imperfect then a Male and hath her end nearer then he, and therefore needeth not ſo long a worke of Nature. The other cauſe is the manner of their diet and courſe of life; for their life is idlie led in want of exerciſe.

Celſus.

Now ſlothfulnes ſayeth *Celſus* dulleth the body, labour ſtrengthneth it; the firſt maturateth or haſteneth old age, the ſecond prolongeth youth. Nether ſayeth *Hippocrates* in his Book *de victus ratione in morbis acutis*, can a man enioy perfect health vnleſſe he labour his body and take paynes, and in the fourth Section of the ſixt Booke *Epidemion.* The beſt way to maintaine health, is to eate vnder ſatietie and to be free and diligent at labour.

Hippocrates.

QVEST. XX. *Whence it commeth that children are like their Parents.*

A threefold forme.

A threefold ſimilitude.

AS among Philoſophers there is a three-fold forme of euery creature; the firſt *Specificall*; the ſecond of the ſexe; and the third of the *Indiuiduum* or particular by which it is that & no other thing: So among Phiſitians there is a threefold ſimilitude. The firſt *in ſpecie*, *i.* in the kinde; the ſecond the ſexe, the third in the faſhion or feature or indiuiduall figure.

What is the ſimilitude of the ſpecies.

The ſimilitude of the kinde they call that, when a creature of the ſame kinde is procreated, as a man of a man, a dog of a dogge: for euery thing worketh not vpon euery thing, neither doth euery thing ſuffer by euery thing; but euery agent worketh vpon his determinate patient; and therefore of the ſeede and bloud of a man onely a man is made. In this ſpecificall ſimilitude there is much attributed to the materiall cauſe, and that is the reaſon why the of-ſpring is vniuerſally liker to the Female then to the Male, for the Female affordeth more matter to the generation then the Male, ſo of a ſhee Goat and a Ramme is generated a Kid not a Lambe, of a Sheep and a hee Goat a Lambe not a Kid.

What is the ſimilitude of the ſexe and whence.

The ſimilitude of the ſex (that is why a Male or Female is generated) hath for cauſe the

Temper

Temper of the ſeede, his mixture and victory. For if the ſeede of both Parents be very hot Males are generated, if very cold Females. If in the permixtion of the ſeedes the male ſeed haue the vpper hand a Male is procreated, if the Female ſeede a Female. This firſt of all *Hippocrates* taught in his firſt Booke *de diæta*, where he acknowledgeth in either ſexe a double ſeede, the one maſculine hotter and ſtronger, the other feminine that is colder, out of the diuers permixtion of which, both Males and Females are generated.

He therefore thus diſtinguiſheth a threefold Generation of Males and Females. If both the Parents yeeld a maſculine ſeede they breede Male children of a noble and generous diſpoſition, λαμπρὸν τὰς ψυχὰς, καὶ τὸ σῶμα ἰσχυρόν, Nobly minded and ſtrong of body. If from the man there iſſue maſculine ſeede from the woman feminine and the maſculine preuaile a Male will be generated, but leſſe generous and ſtrong then the former. If from the woman there iſſue maſculine ſeed from the man feminine and the maſculine ouercome a Male wil be generated, but womaniſh, ſoft, baſe and effeminate. The very like may bee ſayed of the Generation of Females: For if from both the Parents doe iſſue feminine ſeede a Female will be procreated moſt weake and womaniſh. VVhich *Hippocrates* in the firſt Section of his ſixt Booke *Epidemion* calleth ὑδατώδεας, *aqueſcentes*, ſoft, wateriſh and looſe bodies. If from the woman proceede a feminine ſeede and from the man a maſculine and yet the feminine ouercome, women are begotten bold and moderate.

A threefold generation of Males out of Hippocrates.

If from the man proceede feminine ſeede and from the woman maſculine, and the womans ſeede preuaile, women are begotten, τολμηροτεράς καὶ ἀνδρείας, that is fierce and manniſh. The Temper therefore of the ſeede and the victory in the permixtion are the cauſes of the ſimilitude of the ſex, that is of Males and Females; which cauſes are alſo not a little aſsiſted by the Temper of the wombe and the condition of the place, for as I haue often ſaid Male children are borne in the right ſide, Females in the left.

A threefold generation of Females.

The third ſimilitude remayneth which conſiſteth altogether in the figure forme and accidents of the *indiuiduum*. This *Galen* in his ſecond Booke *de ſemine*, will haue to conſiſt in the differences of the partes and in the conformation of the members. By this, one is white another blacke, one hawke noſed another flat or ſaddle noſed. In this ſimilitude of the *Indiuiduum* conſiſteth all the difficulty of this queſtion, which we will mince as ſmall as we can that it may be diſgeſted without labour, from hence taking our beginning.

The ſimilitude of the indiuiduum.

The Infant ſometimes is altogether like the mother, ſometimes altogether like the Father, other ſomtimes like them both, that is in ſome parts reſembling the mother in others the father. Oftentimes he reſembleth neither the father nor the mother, but the grandfather or the great grandfather; ſometimes he will be like an vnknowne friend, as for example an Æthiopian or ſuch like who neuer had hand in his generation. Of all theſe ſimilitudes we haue many examples in authours of approued credit.

The people called *Cammatæ* haue common wiues, and euery man chuſeth his childeren or refuſeth them as they are more or leſſe like vnto himſelfe. Among the *Chinians* the children are like their fathers in their noſe, their eyes, their forehead and their beard. There haue beene in certaine ſtockes and Tribes ſignes which they called *ſigna gentilitia*, that is, Stocke-markes, as to the *Spartanes* and *Thebanes* a Launce, ſome had a Starre, *Thyeſtes* a Crabbe, which were imprinted in their bodies from their birth; and theſe ſometimes were extinguiſhed in their children and grand children, but after a long time appeared againe in their poſteritie.

Diuers examples of this ſimilitude.

Deleucus and his poſterity had in their thighes the faſhion and repreſentation of an Anchor. *Iulia* the daughter of *Auguſtus Cæſar*, although ſhe playd falſe and had many copeſmates, yet all her childeren were like her husband: Being asked what Art ſhe had for that conuayance, ſhe anſwered wittily and in ſome ſort honeſtly in reſpect of others of her profeſsion; *That ſhe neuer took in her paſſenger till her ſhip were fraughted.* I paſſe by what might be ſayd of the *Lentuli* and the *Macrocephali*: It will concerne vs more to ſpend our time in the ſearch after the cauſes of theſe things.

The cauſe of this ſimilitude or likeneſſe of the forme and feature is very obſcure and full of controuerſie. *Empedocles* the *Pythagorean* referreth the cauſe of this likeneſſe only to the Imagination, whoſe force is ſo great that as it oftentimes changeth the body of the Imaginer: ſo alſo it transferreth his efficacy into the ſeed conceiued. The Arabians attributed ſo much to Imagination that they thought the Soule might ſo farre bee eleuated by imagination, that it ſhould not only worke vpon it own body, but alſo vpon an others: and that Soules ſo eleuated and enobled were able to change the Elements, to heale diſeaſes,

The firſt opinion of them that refer this likenes to the imagination.

The Arabians opinion.

ſes, to weaken whom they liſted, to worke myracles, and finally to exerciſe a kind of command ouer all kinds of matter. *Ariſtotle* in the 12 Probleme of his tenth Section, acknowledgeth this power of the Imagination in the Conception and Infant conceiued. For he aſketh the queſtion why the off-ſpring of men are ſo vnlike one to another: and maketh aunſwere, becauſe in man the ſwiftneſſe of the cogitation and the variety of their wits did imprint many and diuers markes and ſeuerall impreſsions.

Ariſtotles

Galen in his Booke *de Theriaca ad Piſonem. I counſelled* (ſaith hee) *an Æthyopian that hee might beget a white and beautifull childe, to ſet at his beds feete a faire picture, vppon which his wife might wiſtly looke in the time of her conception. He obeyed my counſell and obtained his deſire.* And that was the reaſon why *Heſiodus* forbad women to haue company with their husbands when they returned from a Funerall, but when they came from bankets and diſport. For the illuſtration of this we haue a ſtory of a Sabine wife, of whome Sir *Thomas More* wrote an elegant verſe. And S. *Hierom* in his queſtions vpon Geneſis maketh mention of a woman who was ſuſpected for an Adultreſſe becauſe ſhe brought foorth a childe no way like her husband, but cleared her honeſty becauſe ſhee ſhewed a picture in her chamber like the childe ſhe brought forth. Thus *Iacob* in the 30. of *Geneſis* cunningly made the greateſt part of the flocke of a ſpotted fleece, by laying before the Ewes ſpotted rodds. *Pliny* in the 7. Booke of his Naturall Hiſtory remembreth many examples to this purpoſe, and *Fernelius* in the 7. Booke of his *Phyſiologia* conceiueth, that the Imagination onelie is the cauſe of this ſimilitude of the feature, by which alone hee thinketh the Facultie which formeth the figure is led and gouerned,

Aduiſtotle out of Galen.

S. *Ierom.*

Iacob.

Fernelius.

But me thinkes it is very harde to make the Imagination the onely cauſe of this Similitude. For, neither the Imagination nor any other faculty which hath knowledge ioyned thereto is able to work vnleſſe it haue his obiect preſent by which it may be mooued. Now we know that a childe often reſembleth one whom the mother neuer knew. Adde heereto, that in the coition all the Animall faculties are almoſt intercepted, ſo as the forming faculty can ſcarſe receiue or conceiue thoſe Imaginations.

That it is not the imagination alone.

Againe, if the Imagination alone were the cauſe of the ſimilitude then no infant ſhould be deformed, neither ſhould they be troubled with hereditary diſeaſes; for no mother wiſheth or imagineth euill to her owne children. The Aſtrologians referre the cauſe of the ſimilitude to the Starres. For (ſay they) as often as the Sunne is in the Center of the Horoſcope and the Conception is in the day time, ſo often are ſonnes begotten like their Fathers. And Daughters like their Mothers when the Moone is with the center of the Horoſcope if the conception be by night, or when *Venus* is with the Center of the Horoſcope if the conception be by day. But theſe are meere vanities.

The Aſtrologians.

There are others who referre the cauſe of this likeneſſe onely to the motion of the ſeed and to the formatiue Faculty. And this is *Ariſtotles* opinion in his 4. Booke *De generatione Animalium*, and *Galen* in his 2. Booke *de Semine*.

Their opinio that referre it to the motion of the ſeede.

Ariſtotles Philoſophy concerning this point is indeede very witty & excellent, but withall very obſcure. For he ſaith, that there are in the ſeede many Motions, ſome are Actuall, ſome Potentiall. The Actuall motions are either Vniuerſall or Particular: Vniuerſall, which generate a creature or a man; Particular, which generate males, & thoſe ſuch, that is, of ſuch a Forme, Magnitude of members, Lineaments & Habit. Thoſe motions which are Potentially in the ſeede do proceede from the Grandfather, great Grandfather and the Mother. If one of theſe motions, to wit, that which is neareſt and moſt Particular bee intercepted, then is tranſition made into the next motion, and if that be Deficient, tranſition is made into the Contrary; and at length into the Vniuerſal. Theſe diſtinctions of Motions which I doubt not ſeeme vnto you confuſed and entangled we will make more manifeſt by an example.

Ariſtotles ſubtile Philoſophy.

Made plaine by an inſtance

In the ſeede of *Socrates*, there is a power to beget a male childe like vnto himſelfe. The ſeede therefore is mooued toward the forme of *Socrates*. This Motion, if it bee hindred eyther by the ſeede of his wife which happely is ſtronger then his, or by the coldneſſe of the wombe, or by any other cauſe; then is that firſt motion of the father diſſolued & loſt which was actually in *Socrates*, and tranſition is made into the motion of the Grandfather or great Grandfather which was not in the ſeed of *Socrates* Actually but Potentially, & ſo the child becommeth like *Socrates* Father or his Grandfather; if this ſecond motion be interrupted then is tranſition made into a Contrary motion, that is, into the motion of the ſeed of the Mother, which *Ariſtotle* calleth Contrary, becauſe Nature at the firſt hand and of her ſelf

euer

euer intendeth the Generation of a Male. Whereforei,n the ſteade of a Male ſhall then a Female be procreated like vnto the mother or the grandmother or great grandmother, whoſe *effigies* or repreſentation the ſeede of the woman potentially contayneth. This third motion if it be intercepted, finally there is tranſition into an vniuerſall motion, and a man ſhall be borne indeed, but like neither father nor mother. Galens opinion.

Galen in his ſecond Booke *de ſemine* doeth not acknowledge theſe ſo diuers motions of the ſeede, but referreth the cauſes of the ſimilitude to the temper of the ſeed, and the diuers permixtions thereof, as alſo to the ſtrength of the formatiue faculty. That learned man *Eraſtus* referreth the cauſe of this indiuidual ſimilitude onely to the formatiue faculty, quite excluding the power of the Imaginatiõ, becauſe he perceiued that blind creatures brought forth young like vnto their ſires. The formatiue faculty ſayth he hath no need of a pattern: for as in the ſeede of Lettuce that faculty being therein, generateth and formeth a Lettuce without a patterne; ſo in the ſeede of a man, the formatiue faculty accompliſheth his work without any pattern or imagination at all. But what will *Eraſtus* ſay to that white woman who attentiuely fixing her eyes vpon the picture of an Æthiopian brought foorth a blacke childe? what to her that brought forth a hayrie child by looking often vpon the picture of S. Iohn Baptiſt cloathed in Cammels haire? Eraſtus opinion. What our reſolution is

VVee, that through the waues of this turbulent ſea of opinions wee may ariue in a ſafe harbour, will acknowledge a double cauſe of this diuers ſimilitude, which is in the feature forme and accidents of the *Indiuiduum* or particular creature. The one ordinarie which alwayes worketh vnleſſe it be interrupted, and this is the formatiue faculty ingenite with the ſeede: the other extraordinary which doth not alwaies concurre to generation, but commeth from without & is more noble then the former, becauſe it hath power ouer it now and then and ſetteth a new ſeale vppon the tender and ſoft nature of the childe, and this we call Imagination or Cogitation.

That firſt forming faculty becauſe it conteyneth in it ſelfe the *Idea* of all the particular parts if it worke freely and at liberty and be not interrupted by any thing in the whole time of the conformation as it hapneth in other creatures and in plants, it euer more ſetteth that ſtamp vpon the Infant which is in the ſeed it ſelfe, and ſo the children become alwaies like vnto their Parents; wholly to the father if the fathers ſeede doe alwayes and totally ouercome, and altogether to the mother if the mothers ſeede haue the victory: In ſome parts to the father, in others to the mother if any part of the ſeed of either be ouercome by the other. For though the ſeede appeare to the view *homogenie* yet hath it ſome partes more thicke others thinner. What the formatiue faculty can do.

Sometimes the children repreſente the grandfather or great grandfather, becauſe there lurkes yet in the fathers ſeed ſome faculty deriued from them. For *Ariſtotles* opinion is that the *ſpecies* or forme of the parents may be extended to the 4. generation: & euen as a Loadſtone ſhooteth forth his force and efficacie through the needles hanging one at the end of another to the fourth or beyond; ſo that formatiue faculty is tranſmitted from one ſeed to another. So *Helis* who accompanied with an Æthiopian did not bring foorth a blacke daughter, but yet that daughter of hers brought forth a blacke ſonne. And *Niceus* the Poet of Conſtantinople though begotten of white Parents, did degenerate into the colour of his grandfather who was an Æthiopian. How children become like their progenitors. Hiſtories.

If therefore the formatiue faculty work at liberty it will alwayes generate children like the Parents; but if in the beginning of the conformation the formatiue faculty be hindred by another which is more powerfull and diuine then it ſelfe, ſuch as is the Imagination, then will the impreſsion follow not the weaker but the ſtronger, and ſo the Infant will become vnlike the Parents. For the Imagination commandeth the forming faculty, becauſe the formatiue faculty is but a production of the procreating power which is Naturall; but the Imagination is a Principall faculty: now what Imagination can doe as well in the conformation as after it we haue touched already, to which we will adde theſe things to make vp the queſtion with. What the Imagination can do in this ſimilitude.

Oftentimes the Imagination of that thing is imprinted in the tender Infant which the mother with childe doth ardently deſire, which is onely to bee imputed to the ſtrength of the fancy. For the reall *ſpecies* of a Figge or a Mulbery is not tranſported to the wombe, but onely the ſpirituall forme or abſtracted notion, which is ſooner faſtned vppon the Infant then vpon the wombe, becauſe an impreſsion is ſooner made in ſoft waxe then in hard yron. Why and how the impreſsion is made vpon the infant.

Fur-

Anſwere out of *Auicen.*

Furthermore, the manner of this impreſſion *Auicen* hath expreſſed in his firſt Booke *De Animalibus*, where he ſaith, That a ſtrong Imagination doth inſtantly mooue aery ſpirites which are mooueable of their owne Nature, and in theſe it ſetteth the ſtampe of the thing deſired; the ſpirits being mingled with the blood which is the immediate Aliment of the Infant, do imprint in it the ſame figure they receyued from the Imagination. But howe the ſpirits ſhould ſo ſuddenly receiue and apprehend the *ſpectra* or Images repreſented by the imagination, belongeth to a higher contemplation. Our opinion is, that as the forming faculty in the heauens of thoſe creatures whoſe generation is equiuocall, is imprinted in the aer; after the ſame maner the formes of the Imagination are inſculped or engraued in the aery ſpirites. As therefore the aer is full of formes (as wee ſhall ſhew more at large when we come to the Nature of the ſight) ſo our ſpirits which are aery doe eaſily admit all ſpecies or formes of things. So the ſeede by reaſon of the ſpirits which wander and gad vp and downe through all the parts of the body dooth containe in it ſelfe, as wee haue ſhewed already, the Idea and images of all the particular parts.

How the ſpirits receyue the impreſſiõ of the imagination.

QVEST. XXI. *How Twinnes, or more Infants are generated.*

Why man engendreth not ſo many yong as bruit beaſts

THe Immortall God of his Diuine prouidence hath giuen almoſt to all brute creatures a power to bring foorth many young at once leaſt their kindes ſhould be extinguiſhed, for that of themſelues they are but ſhort liued & beſide ſerue man for food & raiment, yea prey alſo one vpon another. Man the moſt temperate and of longeſt continuance, by the preſcript of Nature breedeth but one infant at once, or at the moſt but two; becauſe there is but one boſom in the wombe of a woman; but two parts thereof the right and the left diſtinguiſhed only by a line, not diſſeuered by any partition; and onely two dugges appointed to nouriſh two infants which we call Twinnes. And if at any time a Woman bring foorth three or more that ſeemeth to the Philoſophers to be παρὰ φύσιν, vnnaturall.

Hiſtories of manifolde infants at a birth

Wee haue many Elegant Hiſtories of ſuch manifolde burthens. In Egypt where *Nylus* that fruitfull Riuer runnes, women bring ſometimes ſix at a birth. *Ariſtotle* in his ſeuenth Booke *De Hiſtoria animalium* affirmeth that one Woman at foure birthes brought into the world twenty al perfect. *Tragus* reporteth, that in Egypt it hath been known that a woman hath borne ſeauen infants at once. *Albertus* telleth a tale of a woman in *Germany* who hauing two and twenty infants formed in hir wombe ſuffered abortment, and of another who had at once 150. all of them being as bigge as a mans little finger.

Margaret Counteſſe of *Holland*, is ſaide to haue brought foorth at one burthen 364 liuing infants, who were all chriſtned but dyed preſently after, the Males were named *Iohn*, and the Females *Elizabeth*: there remaineth to this day a ſtately Marble Sepulchre of hirs in a Monaſtery in *Holland*. Ther are alſo many other Hiſtories of ſuch like burthens as theſe which I willingly pretermit, being more willing to ſpend my time in ſearching out the cauſes of them.

The cauſe of Twinnes.

Many of the Ancients referre the cauſe of Twinnes and manifolde burthens to the variety of the boſomes of the wombe, for they make ſeauen boſomes in the wombe of a Woman, which they call κόλπους or Cels; three in the right ſide of the VVombe appointed for male children, and three in the left appointed for females, the ſeuenth in the midſt wherin Hermophradytes are engendred, but theſe are idle conceites, next a Kinne to Olde wiues tales. For in a womans wombe there is but one boſom, as there is but one cauity in the ſtomacke which yet may be diuided into the right ſide and the left. Theſe ſides are diſeuered by no partition, whatſoeuer *Auicenna Haliabbas* & many other Anatomiſts do auouch, as they are in ſheepe, but onely diſtinguiſhed by a line, which *Ariſtotle* calleth δύκαν, that is, A middle Line, which word he tooke out of *Hippocrates* in his *Coacæ Prænotiones*. Moreouer that the variety of Celles cannot be the cauſe of the multiplicity of the burthen that among other things may bee an argument, becauſe ſometime twenty young ones or more may at once bee conceiued, but no man I thinke will ſay there are ſo many boſomes in the womb; neither yet in other creatures are there ſo many boſomes as there are yong, as appeareth in Fiſhes who haue an infinit number of ſpawn yet no partition or diſtinction between them. *Eraſiſtratus* referreth the cauſe of Twins to a repetition of conception. *Empedocles* vnto the plenty of ſeede, *Ptolomy* to the diuerſe poſitions of the Starres.

Is not the variety of Cels.

But one boſome in a womans wombe

The true cauſe *Hippocrates* acknowledgeth in his firſt Booke *de Diæta*, to be the Diuiſion of the ſeede. *So it was neceſſaric that the Seede be diuided equaly into both ſides of the wombe.*

For

For otherwise in coition all the seede is not at once ejaculated but by fittes or turnes; so that the vnderminer and then doth the seed always issue at once, but it boyleth and is ejaculated at diuers times. A part therefore of the seed falleth into one side of the womb, and another part into another, and so Twinnes are conceiued.

Asclepiades referreth the cause of Twinnes to the excellency of the seede, which if it be strong is able to make many Infants. *Auicen* addeth as another cause the motion of the womb, which draweth into it selfe the seede of a man, and disposeth it diuersly, so drawing the part of the seede in his side, and that side of the womb be stood whence comes a multiplicity of Conceptions. And these are all the causes of Twinnes or many Infants. But that their Conception and Conformation may the better be manifest, we are to discusse three questions. The first whether at the same coition a Male and a Female may be procreated. Secondly, whether Twinnes are included within the same membranes, and conioyned in diuerse places. Lastly, why Twinnes are commonly so like one another, and all these we will resolue out of *Hippocrates*. For the first, wee say that at once two Males, two Females, a Male and a Female may be conceiued at one and the same coition. The manner is thus expressed by *Hippocrates* in his first Booke *de diæta*, and in his Booke *de Natura pueri*: If from both Parents masculine seed doe issue then are two Males generated, if feminine seede two Females, if both masculine and feminine, then of the masculine is a Male conceiued, and a Female of the feminine.

Asclepiades opinion.

Auicens opinion.

Whether in one coition a male and a female may bee conceiued.

Moreouer Twinnes that are both Males or both Females do for the most part suruiue, but if they proeoue a male and a female, the female doeth scarce suruiue or at least is very weake, because it is not formed and perfected at the same time when is the Male is formed and perfected. This *Aristotle* expresseth very plainly in the sixt Chapter of his fourth booke *de Generatione Animalium*. If the Twins be a male and a female they rarely suruiue, because this duplication in men is vnnatural, for that the male & the female are not distinguished in the same time, vnlesse the males conformation be foreslowed, or the females ouerhastned.

The second question *Hippocrates* answereth in his Booke *de superfœtatione*: The woman saith he, that is with childe with Twinnes, trauelleth of them both in one day, and if they be both of one sex they are conteyned in one after birth. Wherefore the Twinnes of the same sexe are wrapped in the same membranes, yet each of them haue their particular vmbilicall vesselles: but if they bee of diuers sexes they haue their diuers coates. Againe, if they be both of one sex, they are carried in the same side of the wombe, two boyes in the right side, and two wenches in the left, but if they bee of different sexes, the male shall bee concluded in the right side of the wombe, and the female in the left.

The third question was why Twinnes are so very like one another. *Hippocrates* in his first Booke *de diæta* acknowledgeth a threefolde cause of this similitude. First of all sayeth he the places wherein they receiue their augmentation are equall, whether they be conceiued in the right or in the left side of the wombe, because by a wonderfull prouidence of nature, the right are equall to the left, that so the whole body might be ἰσόρροπον, that is, equally ballanced. Againe, because they are conceiued together, lastly because they vse the same Aliments, for they sucke the same bloud and enioy the same vitall spirites which they draw from their mother by the vmbilicall arteries. And thus much of Twinnes, now wee proceed to *Superfœtation*.

The true cause of likenesse.

QVEST. XXII. *How Superfœtation is made, why onely a woman when she hath conceiued desireth the company of the Male, and by what wayes she then ejaculateth Seed.*

THere are so many difficulties concerning the nature and manner of superfœtation that many men haue imagined there can be no such thing, but we must not giue eare vnto them. For *Hippocrates* wrote a booke *De superfœtatione*, & there is a notable example of *superfœtation* in his first booke *Epidem.* in a woman of *Larissa*, who the fortieth day after her deliuerance of a legittimate childe auoyded another preposterously conceiued. Famous also is that birth of *Alcmœna*, when she brought forth *Hercules* and *Iphiclus* his brother after him. *Aristotle* in the fifth chapter of his fourth Booke *De generatione Animalium* saith, that some creatures admit *superfœtation*, others do not admit it; and of these that do, some are able to nourish both burthens, some are not able sometimes, at other times they are able. And in his Booke *De historia Animalium*, he alledgeth some examples of *superfœtation*. A certaine adultresse, saith

Diuers examples of superfœtation.

saith he, brought forth one infant like her husband, another like the adulterer: another being with child with twins had a third by *Superfœtation*. Another brought forth one the seuenth moneth which died, and in the ninth was deliuered of two others which did suruiue. *Galen* makes mention of *superfœtation* but seldome. *Rhazis* 22. *Continent*, *Alexandrinus* and *Auicen* are all of opinion, that those women are subiect to *superfœtation* who whilest they are with childe haue their courses. *Plinie* in the eleuenth chapter of his 7. Booke writeth, that *Proconnesia* a seruant accompanied the same day with her maister & his man, and conceiued by them both, and bare either of them a sonne like to the father. That another was deliuered of a childe at fiue moneths and went out her iust time with a second; that another was deliuered of a child at seuen moneths and went out her whole time with two twins beside. *Dodonæus* in his obseruations telleth stories to the same purpose. Wee conclude therefore that there may be *superfœtation*. Now this *superfœtation* is nothing else but a second conception, when a woman already with child accompanying with a man conceiueth againe, as if it were a new conception aboue another before conceiued. This *superfœtation* or iterated conception is not common to all creatures, as *Aristotle* teacheth in his fourth Booke *De generatione Animalium*, to women it happeneth oftener then to others creatures, vnlesse it be Hares and Swine; notwithstanding whensoeuer it happeneth, it is beside the ordinary course of nature. Now the reason why *superfœtation* happeneth most in women, is because women, and they almost only, after their conception do desire the company of their husbands. Other creatures when they are pagled as we say, do neuer or very seldome admit the Male, but what may be reason hereof? *Dinus* in his Comentaries vppon *Hippocrates* booke *de natura pueri* saith, that other creatures after they haue conceiued, doe not desire the company of the Male, because all that which should bee the matter of new seede is consumed in the nourishment of their young, and therefore they are not goaded with their wonted lust. But a woman, because she hath in her aboundance of moysture, hath also her vessels full of seede, from whence comes the motion and sense of the obscoene parts. But this reason I cannot approue. For although the infant do consume almost all the reliques or surplusage of the blood, yet doth it not defraude the parts of the mothers body of their conuenient nourishment; neither taketh from the Testicles their proper faculty of drawing and altering the blood. So women at sixtie years old haue no surplusage of blood and therefore their courses faile; yet they continue to procreate seede euen to their extreme age, which also in coition they auoyde, which though at that age it be not fit for generation, yet is it sufficient to prouoke pleasure.

What superfœtation is.

Why superfœtation belongeth most to women. *Dinus.*

Disproued.

VVe acknowledge other causes of this disposition of women and those naturall. For the Morall causes of which *Lactantius* writeth in his book *de vero cultu* we leaue to diuines. The first is, the scituation and conformation of the wombe: for in other creatures when they are great with yong the wombe is nearer the outward parts, and therefore more in danger to be violated by the Male whose genitals are of a great length, and for the most part of a harder substance. But a womans womb is scituated further inward and beyond the mans reach and therefore she beareth him the more easilier. Again, to beasts the vse of *Venus* is onely giuen for the preseruation of their kinde; if therefore they conceiue the finall cause being satisfied their desire of coition is also appeased; but man vseth these pleasures not onely to propagate his kind, but also to sweeten and mittigate the tedious and irksome labors and cares of his life. *Poppea* the daughter of *Agrippa* being asked this question why beasts did not copulate after they had conceiued, her answer was, *because they were beastes*; and truely the answere beside the quickneese of it was not amisse; for it is a prerogatiue which Nature hath giuen to man aboue other creatures: but to returne to our question. It appeareth therefore that the reason why *superfœtation* is more ordinary in women then in all other creatures is, because when shee hath conceiued yet shee may desire the society of the Male. Now let vs enquire how this *superfœtation* may be.

The true causes thereof. First.

Second.

Poppea her acute answere.

How superfœtation is.

Most certaine it is that the wombe is so greedy of seede, that after Conception it is so contracted that there is no void space left in it, and the inward orifice so close shut that nothing can passe into it or issue out of it. This *Galen* teacheth vs in many places, and *Hippocrates* in the 51. Aphorisme of the 5. Section. *Those that are with child haue the mouth of their wombes closed.* How therefore can it be that the seede of the Male can ariue into the bosome of the wombe to make a second Conception? There haue beene some of the Antients who dreamt that by a wonderfull prouidence of Nature, the womb at certaine times did open it selfe to auoyde those things which might otherwise offend it; at which times if

Hippocrates. The opinion of some.

a woman with child should accompany with a man, the wombe might entertaine his seed, and so breede a Superfœtation. But I take these to be but idle and addle imaginations. For if through the whole course of those nine months the wombe should at certaine times open it self to expell that that is superuacuous: why then are the *Lochia* (*i*, those purgations which issue after trauel) reteined all the time in the womb? Or can the womb at the same time that it auoideth that wherewith it is offended, receiue also the seede whereby it is pleased and conceiue the same? Rather the seed would so be extinguished. Confuted.

Among the late writers there are some who thinke that the wombe is neuer so exquisitly shut, but that it may admit seede; which their opinion they establish by these Reasons. When women are with child they often auoide their Courses pallid, Flegmatick or black, which out of question lay lurking in the cauity of the VVombe, and therefore the Orifice thereof is not so perfectly shut. Another opinion of the new writers. Reason. 1.

Againe, a woman with childe in coition looseth seede, which she perceyueth to yssue from her by her lap, which way it could not yssue vnlesse it came thorough the necke from the cauity of the wombe, because a woman eiaculateth her seede by the sides into the bottome of her wombe. The orifice therefore of the wombe is alwayes open and so hapneth superfœtation the more easily. With these arguments they think they haue won the cause, whereas for want of skill in Anatomy they cast a mist ouer *Hippocrates* Sunshine. For that I may answer their first argument. It is manifest by this maner of reasoning that they are ignorant, that there are two veines which disperse their branches through the wombe, some of which are carried to the inward cauity thereof by which the infant is nourished, others run to the outward part of the wombe euen vnto the necke and the lap it selfe. Disproued. The first reason satisfied.

By these all the time of their ingrauidation or in which they go with childe, the bloode yssueth and the superfluities of the body are purged without interruption, although the inward orifice of the wombe be neuer so closely shut. Their latter reason would vrge more but that we finde two passages whereby the womans seede is auoyded. The first passage determineth in the hornes or sides of the wombe by which the seede is eiaculated into the bosome of the wombe when a woman is not with childe, for it is the shorter and the opener way. The other passage was vnknown to the Ancients and to many also of the later Anatomists, but easie to be obserued in Dissection if it be diligently sort for. It ioyneth vvith the former but is longer, and runneth along the sides of the wombe and the necke and endeth in the lap. By this passage we beleeue that women with childe do auoide their seede, and therefore do conceyue greater pleasure in their husbands companies, because the Seede runneth a longer course through the vessels and beside through the Membranous neck of the wombe, both which are of exquisite sense. The second reason answered. Two passages of seede.

The manner of Superfœtation *Hippocrates* first of all opened in his Booke *de Superfœtatione*, where hee saith; *Superfœtation hapneth to those women, the mouth of whose wombe after their first Conception is not close shut.* For if at that time a woman do againe accompanie with her husband, she will easily receyue his seede and lay it vp in the bosom of the womb, from whence commeth a second Conception. Now this must be vnderstood of the third or fourth day after the first conception, for the wombe cannot abide open all the time of Conformation. The manner of superfœtation out of *Hippocrates*.

But a Question may be asked whither Superfœtation may happen after the first, second, or third month of the first conception, as many men do write and alledge manie examples therefore? We answere, we thinke it may so happen but very rarely. For the wombe may be so enraged, that it may open againe and receiue new seede, and yet the former conception not be violated if the woman be sound and the infant strong, as well because it is firmly tied to the wombe by the mouths of the vessells, as also because as yet it seeketh not to bee enlarged. Whether superfœtation may be after two or three moneths. Answere.

This we, sayth *Laurentius*, haue sometimes obserued in Twinnes. I saw (sayth he) a Noble Woman conceyued of two Twinnes, who first was deliuered the first day of the ninth Month of a dead child, and the seauenth day after of another aliue. Histories.

The like Historie there is in *Hippocrates* seauenth Booke of his *Epidemia*, vvhose wordes are these: *Terpida a Woman of Doriscus* (a Citie of Thracia) *vvhen shee had gone vvith Twinnes fiue Monethes, by some mischaunce suffered Abortment, the one yssued foorth presentlie compassed with a Membrane, the other shee vvent vvith about fortie dayes after*. The inwarde Orifice of the VVombe may therefore bee opened, and yet the Terpida.

the infant remayneth behinde. Wee haue alſo for this the authority of *Hippocrates* in the the 38 Aphoriſme of the fift Section, where he ſaith, *A Woman with childe with Twinnes, if either pappe fall and grow looſe, ſhe wil abort of one of her children, if it be the right breaſt of a Male, if it be the left breſt of a Female.* The Infant therefore may be reteined in the Wombe although the Orifice of the wombe open euen to an abortment. And although the ſecond conception happen the third or the fourth month, yet is it not neceſſary that the firſt ſhold miſcarry; & yet the ſecond conceptions do ſeldom thriue and ſuruiue, eſpecially if they be long after the firſt, becauſe the former infant beeing great draweth away moſt part of the blood, whence it commeth to paſſe that the younger Brother is defrauded of his nouriſhment, and ſo periſheth and is moſt what auoyded before his due time. And ſo much of Superfœtation. Now it is time that we proceede vnto the Controuerſies concerning the noriſhment & augmentation of the Infant.

Hippocrates authority.

Second Conceptions rarely thriue

QVEST. XXIII. *Whether the Infant drawe his Nouriſhment at his mouth.*

OVr whole diſputation concerning the Nouriſhment of the Infant we will abſolue in three queſtions. In the firſt we wil diſpute by what wayes he draweth his Aliment. In the ſecond, what kinde of Nouriſhment he draweth. In the third, how that Nouriſhment is changed and whether it paſſe all three concoctions.

Which way the Infant drawes Nouriſhment.

For the firſt. *Alcmaon* thought that the Infant drewe his nouriſhment by his whole bodo, becauſe it is rare and ſpongy; and as a Sponge ſucketh vp water on euery ſide, ſo thoght he the infant ſucketh blood not onely from his Mothers veines, but alſo from the ſubſtance of her wombe. *Democritus* and *Epicurus* thought, as *Plutarke* reporteth in his fift Booke *de placitis Philoſophorum*, that the Infant in the wombe drew his nouriſhment at his mouth, which thing alſo *Hippocrates* ſeemeth to confeſſe in his Booke *de Principijs*, *The Childe in the womb gathering his lips togither, ſucketh out of his Mothers wombe and draweth both Aliment and ſpirit to his heart when the Mother breatheth.*

Alcmæons opinion.

Democritus & Epicurus.

Hippocrates corrupted.

This opinion hee confirmeth with a double reaſon. Firſt, becauſe children when they are borne haue excrements in their guttes. Secondly, becauſe as ſoone as they are borne they ſucke Milke with their mouths, becauſe they were accuſtomed to ſucke in the womb. *Hippocrates* verily was ſo diuine a writer, that in all that he ſayth we are bound to reuerence him and giue good heede vnto him. And therefore heerein wee are either to excuſe him, becauſe in thoſe times the skill of Anatomy was but in the infancy; or elſe wee may thinke that this, as many other things, was foiſted into his workes. For, in his Golden Booke *De Nutritione* he maketh knowne vnto vs the wayes of this noriſhment of the infant in this oracle. *The firſt Aliment is through the Abdomen by the Nauel.* As if he ſhould ſay; the firſt Aliment is drawne by the Nauell, becauſe it is ſcituated in the middeſt of the *Abdomen*. For how ſhould he draw it by his mouth ſeeing there are no veſſels deriued thither? Neyther hath the infant any coniunction with the womb of the Mother vnleſſe it be by the mouths of their veſſels meeting together, all which veſſels do determine into the Nauell. Moreouer in his Booke *de Natura pueri* he writeth in plaine wordes, that the infant draweth both his nouriſhment and his ſpirit or breath by the Nauell. *In the middle of the fleſh is the Nauel ſeparated, by which the infant breatheth and getteth his encreaſe.* And in his Book *de Octimeſtri partu. The Nauel by which the way is for the aer and the Aliment to ſuſtaine the infant, and the onely ingreſſe by which he cleaueth to his Mother. And by this way is the infant made partaker of thoſe things that enter into the body.* And againe in his Booke *de Natura pueri. The Midwife as ſoone as the Infant is borne tyeth his Nauel, as beeing no more neceſſary to nouriſh him by; and withall ſhe openeth his Mouth to ſhew him another way by which hee ſhould receyue his nouriſhment.*

Hippo. excuſed

His own opinion in manie places.

Seeing therfore *Hippocrates* in all theſe places teacheth vs that the Infant draweth his Nouriſhment and aer alſo by the Nauell not by his mouth; wee conclude that the place aboue vrged is ſurreptitious. For the reaſons which he is made in that place to giue are not beſeeming the learning of ſo great a man, neither anſwerable as you ſee to his opinion in other Tractates which are legittimate and paſt exception, as which indeede none but the diuine wit of *Hippocrates* could endite. Neyther therefore doth the infant ſucke Milke after he is borne becauſe he was accuſtomed to ſucke in the wombe, but becauſe hee is ſo taught by vntaught Nature; the ſame hath *Hippo.* in the ſixt Booke of his *Epidemia*, *Nature not taught doth*

Why the Infant ſucketh aſſoone as he is borne.

doth yet that rightly whith shee hath not learned; and in his Booke περὶ τροφῆς *de Nutritione*, *Nature is taught of none.* The Infant therefore instantly sucketh, not from custome but by Nature or by wil, which is by instinct: for after he is grown old he wil suck again if he think it fit so to do, because, as that most subtile *Scaliger* sayeth in his 239. Exercise, There is but one faculty which serueth the Soule for the behoofe of the body, which also hath therewithall adioyned a notion of his owne conseruation. *Scaliger.*

As for those excrements which the Infant auoydeth as soone as it is borne, they are not excrements of the first concoction or of Chylification, and therefore cannot properly bee called *faeces* and *stercora*; but recrements of the more impure and thicker blood, which are conuayed by the Spleenicke and mesentericall branches from the spleen to the Guttes, and there by long stay and heate doe grow drye and exiccated. VVherefore wee conclude that the Infant draweth not his nourishment by his mouth but by the Nauell. What it is the Infant auoydeth downward.

QVEST. XXIIII. *Whether the Infant be nourished onely with bloud, and whether he accomplish onely one Concoction.*

COncerning the Nature and kinde of Aliment wherewith the tender *Embryo* is nourished so long as hee is contayned within the mothers wombe, there is no light Controuersie. *Hippocrates* thought that he was nourished with the purest part of his mothers blood. To this purpose there is an elegant place in his first Booke *de morbis mulierum*. *A woman with child* (saith he) *is all ouer of a greenish pallid colour, because her pure bloud is day y drawne from her, and descendeth to the nourishment of the Infant.* *Galen* in his first Booke *de causis symptomatum* and the 7. Chapter faith that the small and tender Infant drawes in the first moneths the purest of the blood, but when he is growne greater, he draweth the pure and impure together. That the Infant is nourished with pure bloud.

Hippocrates in his Booke *de Natura pueri*, wrote many things but very obscurely, concerning the Aliment of the Infant: for he acknowledgeth a double Aliment, Bloud & Milke. In the first moneths he thinkes the Infant is nourished with pure bloud: but *when he beginneth to moue, that then a part of the bloud returneth to the Pappes, and is there turned into Milk, and from thence commeth againe to the wombe by the communion of the veines for the nourishment of the Infant*; as if the bloud were circularly conuayed from, and to the wombe againe as *Chymists* vse to do in their destillations. But I see not either why, or how the Infat should be nourished with Milke, seeing al his Aliment is carried first by the veines vnto the Liuer: Vnlesse we shall say that the Infant growne great is nourished with Milk, that is with bloud contayned in the veines of the Pappes, which commeth neare to the Nature of Milk. For when the bloud is exhausted or drawn out of the first veines, he draweth bloud from other veines, especially from such as are more common and ample or large. Now the society of the veines of the wombe and the Paps is admirable. Here some man may aske how the Infant can draw pure bloud seeing it hath much whey mingled therewith, which is prooued by the collection of the vrine? I answere that the naturall whey doeth not take away the puritie of the blood, yea if it wanted his whey it were not pure but altogether faulty: and *Hippocrates* alwayes disalloweth of that bloud which is ἀχρηστον that is, sincere and vnmixt. Whether the Infant in the wombe be nourished with milke. *Hippocrates* expounded. Obiection. Solution.

The third thing to be enquired off remaineth, that is, how the Aliment of the Infant is changed and altered, whether it passe through the three concoctions, or but two, or onely one? Some Imagine that the blood is conueyed by the vmbilicall veine to the branches of the gate veine, from these vnto the stomacke where it is conuerted into a substance like vnto Creame, and thence by the branches of the mesentery transported to the Liuer, and by it turned into blood, and so is made by Chylification and Sanguification in the Infant. For blood if it be taken at the mouth and swallowed into the stomacke, putteth of his forme of blood, and acquireth a new forme of Creame. For my selfe if I may speake as I thinke, I conceiue that there is but one concoction in the Infant; for what neede is there of Chylification or of a new Sanguification, seeing he draweth the purest of his mothers blood? I confesse that it is perfected and further boyled as well in the greater as in the lesser vessels, that so there may be the greater similitude betweene the Infant and his nourishment; but that it should acquire a new forme, that will not sinke into my minde; for the blond remaineth bloud and hath the same power of nourishing it had before, onely it differeth in perfection and in some accidents. How many concoctions are in the Infant.

As for Chylification that was not neceſſary in the Infant, becauſe the excrement of Chylification which is thicke and fœculent or euill ſauoured would with the waight and burthen be troubleſome to him, ſeeing hee hath no membranes allotted for the receiuing or contayning them. Heereto you may alſo adde the noyſome ſmell of the excrements, which doubtleſſe would be offenſiue both to the Infant and to his mother. VVe conclude therfore that in the Infant there is no other but onely the third concoction.

That there is onely the third concoction.

QVEST. XXV. *Of the Communion of the foure Veſſels of the Heart in the Infant.*

The firſt Exerciſe, wherein the trueth of Galens demonſtration is illuſtrated.

THat wonderfull Communion of the veſſelles of the Heart which is found in the Infant, to wit, of the hollow Vein with the venall Artery, and of the great Artery with the arteriall Veine, *Galen* firſt of all men hath ſo excellently deſcribed in his ſixt and fifteenth Bookes of the vſe of Partes, that there is nothing in that whole worke more playnly, more clearely, nor more diuinely handled: but in the vſe of theſe Anaſtamoſes hee hath not ſo ſufficiently explayned himſelfe. For in the 15. Booke hee thinketh that both thoſe inoculations were framed onely for the Lungs ſake; but in the 6. Book he writeth that they are ſome helpe vnto the Heart for the performance of the offices of the vitall faculty. VVherefore becauſe in diuers places he ſpeaketh of diuers vſes of thē, although both places may well ſtand togither, yet thence haue all thoſe taken occaſion to carp at him who either from a ſpirit of contradiction, or from an ambitious deſire to gayne-ſay great men, or from a kinde of wantonneſſe of witte doe forſake the authenticke learning of the Antients and ſeeke for a new kinde of Philoſophy in the greene, raw and vnripe fruits of the later writers.

Galen firſt deſcribed this communion.

But varieth in the vſes therof.

It is not good indeed to pin a mans knowledge vpon any particular mans ſleeue, neyther doe I thinke it the part of a true Philoſopher to ſweare that another man hath ſayed, were it *Hippocrates* himſelfe: but yet wherein the Antients haue gone before vs in ſtrength of demonſtration and euidence of trueth, there to ſtart aſide after the nouel and vndigeſted inuentions of greene wits, I hould it may be a ſigne of a ripe wit, but not of ſound and eſtabliſhed wiſedome or iudgement. VVherefore I will endeuour in this place to ſhew you *Galens* curious, elegant and acurate demonſtration of the Communion of theſe veſſelles; afterward we will enquire alſo what other men haue ſaid of it.

How far we are to ſticke to the antients.

Galen therefore in his fifteenth Booke *de vſu partium* and the ſixt Chapter, asketh the queſtion, why the Lungs in the Infant are redde and not whitiſh as they are after a man is borne. He anſwereth, becauſe they are nouriſhed with thicke and red bloud brought vnto them by veſſels hauing but a ſingle coat, that is by Veines. But there are no paſſages from the hollow Veine into the Lungs; and therefore it was of neceſsity that that hollowe Vein ſhould haue a paſſage bored into the venal Artery. This therefore is the firſt and primary vſe of this hole or perforation.

Galens elegāt demonſtration of this communion.

The vſe of the other coniunction which is betweene the great Arterie and the arteriall Veine by a canale or pipe running betweene them, he thinketh ought to be referred to the maintenance of the life of the Lungs. For all life is from the vitall ſpirite and the arteriall blood, this is deriued by the riuerets of the arterie, which becauſe they no way pertayne or reach vnto the Lungs, it was of neceſsity that the great artery ſhould be vnited to the arteriall Veine. This is *Galens* demonſtration which haply wil ſeem to many obſcure, but I will make it brighter then the mid-day Sun.

Illuſtrated.

The Lungs in the Infant are red, much like the fleſh or *Parenchyma* of the Liuer, and thicker beſide then they are after a man is borne; red they are, becauſe they are both generated and nouriſhed by red blood: thicker becauſe they are neither attenuated by inſpirated ayre, nor yet moued perpetually as they are after the birth. For we do not think that the Cheſt of the Infant is moued in the wombe; if the Cheſt be not mooued then it is not likely that the Lungs are diſtended or contracted, becauſe the Lungs are not mooued by any proper or in-bred faculty of their own, nor by the pulſatiue faculty of the Heart, nor by the Brain; but onely they follow the motion of the Cheſt to auoyde vacuity, as wee ſhall hereafter more clearely proue when we come in the next Booke vnto the Hiſtory of the Cheſt. But when the Infant is borne the Lungs become ſuddenly more rare and ſpongy, and whiter by

by much becauſe they are attenuated by perpetuall motion and by the permixtion of ayre breathed into them.

Wherefore the ſubſtance of the Lungs is not the ſame in the Infant when he lieth darkling in the corners of the wombe and when he enioyeth the vſe of the worlds light. If the ſubſtance bee not the ſame, neither is it proportionable that the Aliment ſhould bee the ſame. The Lungs being rare and ſpongy ſtand in neede of thinne blood laboured in the hotte and boyling right ventricle of the Heart, and therefore *Galen* thought that that right ventricle was onely made for the vſe of the Lungs. And as *Ariſtotle* firſt obſerued thoſe Creatures which haue no Lungs do alſo want the right ventricle of the Heart.

Now the thick, red and immoueable Lungs of the *Embryo* do not need blood attenuated, but are contented with that which is thicke and like themſelues. This craſſe and red blood is onely conueyed in the branches of the Hollow Veine. But how ſhould it attayne out of theſe branches of the Hollow veine vnto the Lunges, ſeeing there are no braunches from that Hollow veine diſperſed into the Lungs? for the Lungs haue onely three veſſels. The Venall Artery, the Arteriall Veine, and the Rough Artery. Heere therefore Nature with wonderful prouidence and Art, perforated the venal Artery which adioyned vpon the hollow Veine, therein to inoculate the veine, that ſo the bloode might haue a free paſſage for the nouriſhment and encreaſing of ſo fleſhy a bowell as the Lungs are; ſo that in the infant the venall Artery performeth onely the office of a veine, and may abſolutely then bee called a veine as well for his vſe as for his ſtructure. This therefore is the true vſe of that open hole, this the neceſsity of that famous inoculation.

Auicens opinion of the vſe of this Communion.

Auicen the Prince of the *Arabians* hath confirmed this demonſtration of *Galen*. *The Lungs* (ſaith he) *are red in the tender infant, becauſe he draweth no aer into them, for they grow not white but onely by the permixtion of breathed aer. They are therefore nouriſhed vvith redde blood, and to that end is the hole made out of one veſſel into another, which is preſently ſtopped after the Infant is borne.*

Second vſe of it.

Neither yet is this inoculation made onely for the Nouriſhment of the Lungs, but alſo for the firſt generation of their *Parenchyma* or ſubſtance. For it is out of doubt that the fleſh of all the bowels is made of the blood congealed or clodded together. This blood is onely brought by veines, but there were no paſſages from the hollow veine to the Lunges, and therefore there was bored an open and patent hole out of the Hollowe veine into the Venall Artery.

A third.

I will add a third vſe of this Communion, that that venal Arterie might bee formed out of the hollow veine. For a thin and venall veſſell could not ariſe out of the thicke & craſſe left ventricle of the heart: now it was neceſſary both that this veſſell ſhould bee fixed into the left ventricle of the heart and alſo be thin, that when wee draw in our breath it might ſuddenly receiue the aer, and when we exſpire it might expell fumid and ſootie vapors. It was neceſſary therfore, that the hollow vein ſhould be vnited with the venall artery; ſo that the venall artery may ſeeme to be a production of the hollow veine; and his firſt originall is not from the heart as is commonly imagined, but from the Liuer by the continuation of the Hollow veine.

The vſe of the the other cõmunion by the Canale.

The vſe of the other Communion which is betweene the great Artery and the arteriall Veine by the interpoſition of a Canale or pi :, I thus manifeſt. The Lungs do liue in the *Embryo*, therefore they ſtood in neede of vitall ſpirits and arteriall bloode for their conſeruation. This vitall ſpirits and blood are onely conteined in the branches of the great Artery; from this great artery into the Lungs there was at all no paſſage. Nature therefore leaſt the Lungs ſhould be defrauded of that quickning *Nectar*, made an arterial pipe perforated from the great artery into the arteriall veine, by which a part of the arteriall blood & vitall ſpirits might be conueyed vnto the ſubſtance of the Lungs.

Another vſe of it.

I acknowledge alſo another vſe of this ſecond communion; that this arterial veine might take his originall from the *Aorta* or great artery. For the veine of the right ſide of the heart ſtood in neede to be Arteriall, that is, to haue a thicke coate like that of the Arteries. Now the fountaine of the Arteries was in the left ventricle. Wherefore Nature propagated the great Artery, and made out of it an Arteriall production or pipe which reacheth into the right ventricle, there to forme the arteriall veine; ſo that hence it is euident that the arteriall veine is a production of the great Artery, and the venall Artery a production of the hollow veine. So it is therefore with the veſſels of the Lungs in an infant yet contained in the wombe, that the venall artery performeth the office of a veine, the arteriall veine of an Ar-

The vſe of the veſſels of the Lungs in the Infant.

tery,

tery, but the Rough Artery is altogether Idle. And this is the true demonstration of these two Vnions or Communions of the vessels of the heart in the Infant yet vnborne.

THE SECOND EXERCISE.

Wherein the new demonstration of the vse of these Communions divulged by Simon Petreus *a Physitian of* Paris *is confuted.*

BVT that the truth of this demonstration of *Galen* may bee more apparent, let vs a little examine some opinions of the late Writers concerning the vse of the Inoculations. *Petreus* is of opinion, that they were ordayned rather for the vse of the heart and the whole body, then for the Nourishment and life of the Lungs. And this is the summe of his demonstration, and these for the most part his owne words.

Petreus opinio

The first intent of Nature is to make all things perfect, but the absolute perfection of her worke she doth not alwayes attaine by reason of the crosse or auerse disposition of the subiect matter, which *Aristotle* calleth the Hypotheticall or materiall necessitie? But what Necessity constrained Nature to produce these inoculations of the vessels? Surely the Necessity was very great, which if a man be ignorant of, he shal neuer vnderstand their history. The Vse and the Action is the end of Nature when she worketh & the scope or aime of the Physitian who searcheth into the workes of Nature, which scope if he neglect all Anatomy will be vncertaine, and all his inspection of the partes will but double their obscurity.

Aristotle often admonisheth, that the Organs are made for the Vse, not the vse applyed to the Instruments; whence it is that *Galen* first propoundeth the Vse and thereto recalleth the composition & Conformation of euery part: I will therefore first shew the vse and necessity of these inoculations of the vessels of the heart.

The ymbilicall Arteries do transmit from the Mother to the Infant Arteriall and Vitall blood, for they are inserted into his Iliacall Arteries. From these the blood ascendeth into the trunke of the great Artery, yea euen to his gate in the Basis of the heart, where it is constrained to make stay, because Nature hath set at that gate of the great Artery three Values whereby the passage is bolted from without inward, albeit from within outward any thing may passe. For this inconueniency and obstacle Nature deuised a present remedy. For considering that the blood laboured in the left side of the Mothers heart, and further prepared in the length of his way from the mother vnto the infant, was fit for the nourishment of his Lungs; she prouided that it should bee powred into the Arteriall Veine which is destined for the nourishment of the Lungs. And for that purpose she prepared in the infant a passage common to the great Artery and the arteriall Veine which is conspicuous aboue the *Basis* of his heart which we call *Anastomosis*. For the other *Anastomosis* I thus demonstrate the vse thereof.

Wee before determined that the arteriall bloode which the infant receyueth from his Mother by the vmbilical Arteries, is spent in the nourishment of the Lungs. Now it wil be worth our labour to learne how vitall bloode sufficient to bee diffused thoroughout the whol body is in the infant generated; for ther is no aer led by the Venal arterie into the left ventricle of the hart wherof the spirits should be made, because the infant breatheth not in the womb, neither getteth any thing into the hart by the great Artery, for the values which open outward and shut inward will admit nothing to enter. The lefte ventricle therefore of the heart had beene vnprofitable thorough want of matter and the discommodity of the place, vnlesse Nature had learned of her selfe to frame wayes for her owne behoofe more easie and expedite, which is the other *Anastomosis*, wherein shee hath wrought a worke beyond all admiration.

This *Anastomosis* is out of the Hollow veine into the venall artery, by which the bloode which is too much for the nourishment of the Lungs, is commodiously transported into the left ventricle of the heart, where it is laboured, confected and receyueth an impression of the vitall Faculty, and so turneth aside into the great artery which is neere neighbour and toucheth it, that by it it might be distributed into the whole body.

This demonstration I take to be most true, that the worke of this *Anastomosis* which is a very miracle in Nature might rather be referred to the vse of the whole body, then vnto an vnprofitable commodity onely of the Lungs. Neyther doe I see by what reason it may

bee

be sayd that the Lungs of the Infant which doe not moue at all whilest it is in the wombe, should yet then require and dispend a greater quantity of Aliment and Bloud then they doe after the childe is borne, when for the generall behoofe of the body they are perpetually moued. For if those inoculations had beene made onely for the Lungs, they being greedy would haue drawne all the bloud by those patent passages which in growne men they drawe onely out of the Areriall Veine. Furthermore this absurditie would follow, that the vitall faculty of the Heart in the Infant must bee idle all the time of his gestation.

This is *Petreus* his demonstation, wherein that I may speak in one word, he establisheth two things: the first that the Arteriall Canale or pipe was made for this purpose to poure out into the Lungs alone the arteriall and vitall bloud which the Infant draweth by the vmbilicall Arteries; so that he vnderstandeth that the vmbilicall Arteries weere not made for the vse of the whole body but onely of the Lungs. The summe of *Petreus* opinion.

The second thing he would establish is, that the Lungs are not nourished by the bloud brought thorough the hole of the hollowe Veyne into the venall Arterie, but that all that blood is transmitted into the leste ventricle of the Heart for the Generation of the vitall spirits.

Which two things how absurde they are and dissonant for true and right reason, I will endeuour to shew both by reason and sence, which are the two most certaine Iudges of all things. *Petreus* impugned.

In his vse of that Communion which is by an arteriall Canale or pipe from the great Artery into the arteriall Veine; I find some things contradictorie, and very many false and absurd.

For sometimes he willes, that both the inoculations were made for the vse of the whole body, not for the commodity onely of the Lungs; afterward as if hee had forgotten himselfe, he writeth in his whole discourse that that Canale which is frō the great artery to the arteriall Veine serueth onely for the Lungs: VVhereas to make good his demonstration, he should haue sayed that the inoculation which is from the hollow Veine to the venal arterie is to be referred to the vse of the whole body; but that which is from the great artery into the arteriall Veine, onely to the nourishment of the Lungs. There is therefore in the first place a manifest contradiction; I forbeare to say howe improperly hee calleth the arteriall pipe an *Anastomosis*: becaule I am taught by *Aristotle* not to take too much care of words or to stand too much vpon them. A contradiction in his demonstration.

Galen indeed sayth that there are many *Anastomoses* or inoculations of veines & arteries, and that an *Anastomosis* is nothing else but an opening of the mouth of one veine or vessell into another, and those medicaments are called *Anastomotica* which haue a faculty to open. VVee also may vnderstand by *Anastomosis* the confluence of humours made when the vesselles doe open one into another. *Aristotle* in his Booke *de mundo* (if that Booke were *Aristotles*) vseth the word in another sence, when he calleth the ocean ἀναστομώμενον, which *Budeus* interpreteth in *fauces se comprimentem*: but to call a Pipe, a Tunnell, a Vessell an *Anastomosis*, is a monster in Grammer, in Philosophy and in Physicke. Now *Petreus* words are these. *And for that purpose Nature prepared in the Infant a passage common to the great Artery and the arteriall Veine, which is conspicuous aboue the basis of his Heart which wee call Anastomosis.* Let any man now iudge, yea let himselfe see how farre this nouell speculation of his hath transported him: but this is but to play with him, let vs now set vppon him with keener weapons. He writeth that the arteriall bloud which the Infant draweth by the vmbilicall arteries, is wholly consumed in the nourishment of the Lungs, and that those notable arteries were onely made for their vse: then which what could he haue sayd or faigned more absurd? He vseth the word *Anastomosis* very improperly.

Let him turne ouer all the writings of the *Grecians* the *Arabians* and the *Latines*, and hee shall see that they all accord in this, that the vmbilical Arteries were made for the vse of the whole body not of the Lungs alone. By these Arteries the whole *Embryo* doeth transpire and draweth the mothers spirits, not the Lungs alone. The vse therefore of the Arteries is common to the whole body of the infant. And this *Hippocrates* teacheth in his Bookes *de Natura pueri*, and *de Octimestri partu*, in these words, *In the middle of the flesh is the Nauell separated, by which the whole Infant doth transpire and attaineth his encrease.* Do not the artery in their Diastole or dilation draw aer and expel the sooty vapors in their Systole or contraction? There are made manie inoculations from the arteries into the veynes, therefore He thinketh amisse that the vmbilicall arteries serue only for the Lungs.

the

the aer is transported out of the arteries into the veines, not out of the veynes into the arteries.

Galen in his fourth and sixt Booke *de Locis affectis*, in his Booke *De vsu pulsum*, in his Commentarie vpon the sixt sect. *lib. Epidem.* teacheth vs that transpiration is through the arteries not through the veines; and in his first Booke *de semine*, he sayeth. *The hole or passage of the membranes about the Nauel is alwayes open for the transmission of bloud and spirits, for bloud floweth out of the Veines, but out of the Arteries spirits with a little thin and hot bloud.* VVhat could he say more playnely, what more perspicuously? This also auoucheth *Auicen* the Prince of the *Arabians*, and finally it is the vniform consent of the Schoole of the *Grecians* and *Arabians*: and with vs this common consent of so great learned men shall euer stand for a law. But *Petræus* one man, of his owne head taxeth and challengeth all antiquity of error. VVell, wee will therefore no more contend with him with authorities, but by waight of argument.

Spiration double. Transpiratiõ and respiration.

It is an axiome in *Aristotle*, that all liuing creatures doe breath. For as a flame pent vp in a straight roome and not ventilated or breathed with aer groweth dimme and at length is extinguished, so our naturall heate is also extinguished vnlesse it be ventilated and wasted with aer as it were with a fanne. This spiration which the Grecians call πνοὴ or πνοὴ is double; the one insensible called διαπνοὴ, or *Transpiration*, which is made by the arteries and other blinde breathing holes of the body; the other may be seene with the eyes, and is made by conspicuous passages, as the mouth & the nosethrils which *Galen* calleth ἀναπνοὴ *Respiration*.

The infant doth not respire.

That the Infant in the wombe doth not *Respire* it is most manifest, because he neither ought nor can, as wee shall proue in our next question. It is necessary therefore that he must haue *Transpiration*, which is not by the vmbilicall veine, nor by the *vrachus*, & therefore by the two vmbilicall arteries; for there are no more but these foure vesselles in the Nauell. VVherefore this vse of the vmbilicall arteries is common to the whole Infant not proper onely to his Lungs.

That all the arterial blood is not spent in the nourishment of the lungs.

Now that in the arteries not only aer as *Erasistratus* thought, but also a vitall spirit and arteriall bloud is conteined, we are taught by ἀυτοψία or *inspection*. The arteriall bloud then which the Infant draweth by the vmbilicall arteries is it not prepared for the life of the whole *Embryo* and the conseruation of the naturall heate? Doth the redde and thick *Parenchyma* of the Lungs, not at all as yet moued, stand in need of so great a quantity of thinne and arteriall bloud? If one veine which they call the *Nurse of the Embryo*, sufficeth for the nourishment of the whole Infant, why should not one small artery haue been sufficient for the nourishing and cherishing of the Lungs, which are a little part of the Infant? But Nature made two vmbilicall arteries and those notable ones, which are branched through the *Chorion* with infinite surcles.

Moreouer, if all that bloud that the Infant draweth by the vmbilicall arteries were consumed in the nourishing of the Lungs, then these absurdities would follow. First, that the Lungs are not nourished with bloud like vnto their substance, nor with pure bloud. For the vmbilicall arteries doe returne the bloud into the Iliacke branches, and from them into the trunk of the *Aorta* or great arterie; wherefore the arteriall bloud of the mother shall bee mingled with the arteriall bloud of the Infant, which hee sayth is generated in the left ventricle of the Heart, and thence diffused into the pipes of the great artery: and so it will come to passe that one of them shall offend another; for in the same vessel there shall be at one & the same time perpetually two contrary motions: one of the bloud ascending from the Iliacke braunches to the Lungs; and another of the arteriall bloud descending from the left ventricle of the Heart to the same Iliacke branches: which thing albeit we confesse, it sometimes hapneth in Critical euacuations and notable indeuours of Nature: so, that it should be perpetuall we cannot be perswaded. Let vs then wipe away this myst from our eyes, and let vs beleeue that the two vmbilicall arteries were made for the vse not of the Lungs alone, but also for the whole body. Now let vs come vnto the vse of the other Inoculation.

His vse of the other inoculation impugned.

Petræus conceit is, that the hollow Veine is perforated into the venall Artery, that the bloud might be powred into the left ventricle of the Heart for the generation of vitall spirits, neither doth he acknowledge any other vse thereof. But wee with *Galen* thinke that it was formed for the generation and nourishment of the Lungs. For if there be a new generation of vitall spirits in the left ventricle of the Heart, made of the bloud which is conuayed in the hollow Veine as *Petreus* would haue it; then what neede was there of that hole

hole or perforation? Doth not the hollow Veine gape into the heart with a wide mouth to poure abundance of blood into his right ventricle? Why is not the blood there boiled & attenuated, and after sweateth through the partition into the left ventricle; and there receiue the stampe or impression of the vital spirit; The blood so attenuated in the right ventricle would be purer and more defaecated, then if it should be transfused out of the hollow Veine into the left ventricle by that *Anastomosis*; there would haue therefore been no necessity of vitall spirits, but for the nourishment of the Lunges there is absolute necessity thereof.

Againe, it is an axiome in Physicke and Philosophy which *Galen* often beateth vpon, that there is neuer made any perfect elaboration vnlesse a preparation go before. So the Animall spirits are prepared in the webs of the braine; the seed is delineated in the writhen complications of the seede vessels; the blood attaineth a rudiment in the veines of the Mesentery; and the preparation to the third concoction is made in the small veins of each particle. But if according to *Petreus* Hypothesis, the blood should be transfused from the hollow Veine into the venal Artery which toucheth it, and from that into the left ventricle of the heart, where I pray you shall that blood be prepared or attenuated? If that newe conceite of the Generation of vital spirits in the infant were to be admitted at all, it were more probable to say, that the blood were powred out of the hollow Veine into the right Ventricle and there prepared, because the Membranes do not hinder the ingate heereof, and beside the partition is bored with so many passages to conuey it into the lefte. For it is the opinion of all learned men, that the right ventricle was ordained for the preparation of the vitall spirit. 2. Reason.

Moreouer, it is most certaine that there is a double matter of the vitall spirite, Aer and Blood; Now *Petreus* doth not thinke that aer is carried into the heart, for the infant in the wombe doth not respire, how then shall that vitall spirit be generated and preserued? Out of doubt it will decay and bee extinguished beeing defrauded of conuenient Aliment; *Hippocrates* in his Booke *de Natura pueri* saith, *Euery thing that is hot is nourished with that which is moderately colde*. Indeed Transpiration is sufficient to preserue a little heat; but for the perpetuall generation of vitall spirits in bloody Creatures there is required great abundance of aer, which onely can be supplied by Respiration. But let vs pursue these Detractors a little farther. 3. Reason.

If we shall admit this new and onely vse of the hole or inoculation, that is, that all the blood should be conueyed from the Hollow Veine through the venall Artery into the lefte ventricle of the heart, with what blood shal then the Lungs be nourished? Open the waies? shew me the veine of the Lungs? For now al the venall Arterie is taken vp, forsooth, to lead blood vnto the heart, and the Arteriall Veine only leadeth vitall spirits and arteriall blood which it receyueth from the Great Artery by the Canale or arteriall pipe. Shall the Lungs be without aliment? He wil answere, that it is nourished with arteriall blood which commeth from the Mother, and that for that purpose the two vmbilicall arteries were ordained. But hath he forgotten that all parts want two sorts of blood, one Venall, another Arteriall? The venall blood by true assimulation turneth into the substance of the part. The arteriall is appointed to conserue, refresh and cherish the naturall heate of the particular parts which is but fugitiue. 4. Reason.

I will not deny but some part of the Mothers arteriall blood is conueyed into the Lungs by the arteriall pipe to preserue their life and to defende their naturall heate, but that the Lungs are therewith nourished, I altogether deny. For the Lungs of the *Embryo* are thicker, faster and heauier then they are after the birth, and therefore must be nourished with thicker blood, for it is a constant truth, that we are norished with that which is like vnto vs; euen euery particular part is nourished with that which is most like vnto it.

This Law and Constitution of Nature, *Petreus* by this new demonstration doth quite abrogate and annihilate, because he appointeth thinner blood for the Lunges of the infant which are red, heauy, sad and thicke, then for the Motherswhich he must confesse are whiter and thinner. For the Mothers Lungs are nourished with blood attenuated in the right ventricle of the heart, and deriued vnto them by the arteriall Veine: hee stiffely maintaines that the Lungs of the *Embryo* are nourished with no other then arteriall bloode laboured and heated in the left ventricle of the Mothers heart and brought vnto them by the vmbilicall arteries, forsooth, to make recompence for their want of motion. Heere also we haue a manifest contradiction. He confesseth that the Lunges are thinner after birth, thicker in the He abrogates the Lawes of Nature. Another contradiction in *Petreus* demonstration.

the *Embryo*, and yet he saith that the lungs are nourished with thicker blood, the Liuer with pure arteriall blood full of spirits.

Galen expounded.

And whereas he buildeth vpon *Galens* foundation, that the Lungs are made of the feces of the blood, and therefore do require for their nourishment thin and arteriall blood: He seeth not that this place is to be vnderstood of the Lungs after the birth, and in the Infant the Lungs are not fleshy nor whitish, but red, heavy and thicke, yet such a while after the birth doe the Lungs remaine heavy and red, whence it commeth to passe that many infants shortly after their birth are strangled, because the Lungs cannot play themselues, vnless when the childe lyeth vpon his back, or by some compression of his Chest, and therefore it is best to lay Children with their heades somewhat elevated or rayed vp, that the Lungs, which are heavy may more easily follow the contraction and dilatation of the Chest.

How children are often strangled. How to remedy it.

These Children which dye so suffocated if they bee opened will bee found to haue their Lungs full of thicke bloud, and very red. But let vs heare *Galen* accurately describing the Lungs of a tender Infant in the sixt Chapter of the 15. Booke *de vsu partium*, in which place he of set purpose expresseth the History of the Infant: *Why are the Lungs of an Infant red and not whitish as after birth? Because they are nourished with bloud brought vnto them by vessels which haue but a single coate. And then he addeth: When the creature beginneth to respire the Lungs are moued perpetually: whence it is that the bloud being diuided by the double motion of the breath is made thinner then before and as it were frothy, and so the flesh of the Lungs which before was redde, heavy and thicke, becommeth white, light and rare or spongy.* How pregnant and plaine a place this is who seeth not? The flesh of the Lungs of the Infant is red, heavy and fast, and afterward becommeth thinner and frothy: wherefore the Lungs of the *Embryo* stood neede of red and thicke bloud, which kinde is onely conueyed by the rilles of the hollow veine, not through the thicke pipes of the great Artery. But there are no passages from the hollow veine to the Lungs, and therefore Nature made that admirable *Anastomosis* for the nourishment of the Lungs.

A pregnant place in *Galen* against *Petreus*.

And thus *Petreus* ought to haue played the Philosopher, and not to haue abused that which *Galen* intendeth concerning the nourishment of the Lungs after birth, to the nourishment of the Lungs of the *Embryo* in the mothers womb. But if he will not yeeld to these reasons which are cleare demonstrations, then wee cite him to the tribunall of trueth to αὐτοψίαν, that is, to ocular inspection. Cut the Lungs of the *Embryo* and you shall see all the branches of the venall Arterie full of red and thicke bloud. From whence, good *Petreus*, is that bloud, is it not from that hole of the hollow veine?

Arguments from *Autopsia*.

We conclude therefore that that admirable *Anastomosis* or inoculation was framed by Nature, not for the elaboration of the vitall spirit, but for the generation, nourishment & increment of the Lungs. Thus much we thinke our selues bound to haue sayd, not only to redeeme the credite of our maister *Galen*, but especially to vindicate and redeeme the trueth, albeit it be with the losse of a learned man, such as we willingly acknowledge *Petreus* to be; but he must be content to suffer himselfe to be gaynsayed if he gaynsay the truth, and if any thing fal from vs in discourse which may sound somwhat more harsh in his eares or those that follow him, that also must be attributed to the heate of disputation, for much may be forgiuen a Souldeir when he is heated in the medley which might bee imputed to him for cruelty in cold bloud.

THE THIRD EXERCISE.

Another new Demonstration of the vse of the Inoculations, deuised by Francis Rosset, a learned Physitian belonging to the French King.

Laurentius reports that when Doctor *Francis Rosset* the French Kings learned Physitian heard of this difference of opinions betweene him and *Petreus* concerning the vse of the Inoculations, he wrote vnto him that he had found out a new vse of both these Communions of the vessells of the Heart in the Infant, and that he sent also to him this Table which we haue annexed.

Rossets opinion of the vse of the Inoculations.

His opinion is, that both these Inoculations were ordayned onely for the conueyance of aer, directing it to the Lungs before it should come at the Heart, and mingling it with both kindes of bloud venall and arteriall prepared before in the Liuer and the Spleene: For as after birth the outward aer is not carried crude & raw into the hart, but passing through the

rough artery is prepared in the rare ſubſtance of the Lungs, and is made fit for the heart; ſo in thoſe that be not yet borne the internall aer muſt neceſſarily come to the Lungs for the ſame end where it vndergoeth a peculiar Caſtigation before it bee admitted to the heart: Moreouer, from the thinneſſe of that aer and the pulſatiue motion of the heart this commodity the Lungs muſt needs haue, that their *Parenchyma* in the infant & the veſſels therein are accuſtomed and prepared to the motions of Expiration and Inſpiration which are to follow after he is borne, for the aer enlargeth the pores in them and ſo fitteth them for the vſe of the childe when he cryeth.

Wherefore the two inoculations in the infant vnborne, and the rough arterie after the birth may be compared to *Caſtor* and *Pollux*, of which when one ariſeth the other is deſtinied to ſet.

In The Infant.

2. *The Vmbilicall veſſels, the veſſels of the Meſenterie being idle.*	2. *the veſſels of the Meſentery, the veſſels of the nauell working.*	2. *The veſſels of the Meſenterie, the Nauell veſſels being idle.*	2. *The Nauill veſſels, the veſſels of the Meſenterie working.*
3. *The Vrachus, the Vreters being Idle.*	3. *The Vreters, the vrachos vvorking.*	3. *The Vreters, the Vrachos beeing Idle.*	3. *The Vrachos, the Vreters working.*
4. *The Inoculations of the Heart, the Rough Artery or Weazon being idle.*	4. *The weazon or Rough Artery, the Inoculations working.*	4. *The Rough Arterie, the Inoculations beeing Idle.*	4. *The Inoculations of the Heart, the rough artery working.*

The Expoſition of the Table.

Euen as the operation at certaine times, and the reſt at others, of the three firſt, to wit, the Chorion, the Nauell veſſels and the Vrachos is anſwereable to the other three ſet againſt them, to wit, the Stomacke, the Meſentery veſſels and the vreters, each one reſpecting his conſort or ſubſtitute in the adminiſtration of one and the ſame thing neceſſary to life: ſo likewiſe is there the ſame ſucceſsion of operation and reſt at different times betweene the fourth paire of Conſorts, to wit, the inoculations of the heart and the rough Arterie or Weazon, in the adminiſtration of one and the ſame thing neceſſary to life. *Roſſet* his demonſtration.

For ſeeing there can be nothing found nor imagined in the whole bodye, which in the wombe, when the rough artery is at reſt, ſhould ſupply his office which is neceſſarie to life, vnleſſe it be the inoculations of the veſſels of the heart; which inoculations in the wombe do worke but ceaſe their labour when the infant is borne, the rough Artery then vndertaking his inceſſant labour himſelfe: it muſt needs follow that the vſe of the inoculations in the wombe is the very ſame that there is of the rough artery after the infant is borne. Now all men acknowledge that the rough artery is ordained for the tranſuection or tranſportation of the externall and ambient aer to the Lunges of the infant which prepare it, for the heart ſtandeth in neede of aer ſo altered. Wherefore the true vſe and office of the inoculations (which onely haue vſe whilſt the infant is in the wombe) is the tranſvection or tranſportation of aer (but that internall comming out of the Mothers womb through the Chorion and the vmbilicall veſſels) to the ſame Lungs of the infant which are to prepare it for his heart.

The 11. moth the last time.

The last limit is the eleauenth moneth, the times betweene are the ninth and the tenth.

Rossets opinion disproued.

This is *Rossets* opinion, wherein he laboureth to establish, that both the *Anastomoses* or inoculations are appoynted onely to leade ayre to the Lungs, and that by them the Infant doth respire and the Lungs are moued for the new generation of vitall spirits. But our opinion is, that the Infant doth not at al Respire but Transpire only, as we shal shew in the next question; neither yet doe we thinke that it was necessary there should haue bin made so notable inoculations if only the conueyance of ayre to the Lungs had bin necessary. For seeing in perfect creatures and those that haue most vse and strength of voyce, there is but one weazon or rough Artery ordayned, why should not one inoculation haue serued in the Infant whilest yet he maketh no vse of his Lungs for voice? It had bin more probable if he had said, that one of the Inoculations was made to leade ayre the other to lead bloud.

Moreouer if onely ayre be ledde by these inoculations to the vessels of the Lungs, why doth there appeare in the venall Artery so redde bloud, and in the arteriall veine arteriall bloud full of spirits? With what bloud shall the red and thicke Lungs of the Infant be nourished? In a tender Infant that Transpiration which is made by the arteries & other blind passages is sufficient for the conseruation and refection of his weake heat.

The conclusion.

We conclude therefore that both the inoculations were originally made to generate and nourish the Lungs, because whereas the Lungs of an Infant before birth do differ frō his lungs after birth, in colour, thickneſse and fastnes of flesh; they needed also another kind of bloud for their generation and nourishment before then they do after. And thus we are come to an end of that admirable worke of Nature in the inoculations of the vessels of the Infants Heart.

QVEST. XXVI. *Whether the Infant in the wombe doe respire and stand in need of the labour of his Lungs.*

What respiration is.

Concerning the nature of Respiration we shall haue a fitter place to dispute in the next Booke where we treate of the Lungs. In this place it shall bee sufficient to giue you *Galens* description thereof in his Commentary vpon the Booke *de salubri diæta*, where he sayth. *ἀναπνοὴ or Respiration, is when the breath is drawne in and let out by the mouth*: so that in Respiration it is necessary the Chest should be contracted and againe dilated and the Lungs moued thereafter. If therefore I shall prooue that in the infant the Chest is not contracted or dilated nor the Lungs moued, it will follow that he doth not Respire but Transpire only.

That the Infant doth transpire only not respire in the wombe.

The vitall faculty in bloudy and hot Creatures stands neede of two things for the conseruation therof, Respiration and Pulsation: but those Creatures which are without bloud and imperfect, which haue little heate, doe liue contented onely with the Pulsation of the Arteries and transpiration. So those we call ἄιμα and which liue in holes all winter doe transpire but respire not: so likewise *Hysterical* women, that is, such as are in fits of the mother, the heate of whose heart is languid and weake being dissolued by a venemous breath of corrupted seede, do liue a time without respiration, and many haue been buried for dead when they were yet aliue.

The Infant because he hath but a weake heate, and is in the wombe before the day of his birth as it were an imperfect creature, is contented onely with transpiration and therefore he draweth not his breath by his mouth, neither vseth hee the helpe of his Chest or Lungs. Moreouer Respiration is onely ordayned for the behoofe thereof, that the spirituous substance which is established in the glowing hot left ventricle thereof the, might with the ayre be cooled as it were with a fanne, and beside purged and refreshed; but there is no generation of vitall spirits in the Infant, as by and by wee shall demonstrate: and therefore there is no neede of respiration; for the finall cause fayling which moueth all the rest Nature is too wise to vndertake any labour. The infant therefore doth not respire because he *ought* not.

The Infant neither ought nor can respire.

Adde hereto that hee neither *can* respire: for being shut vp in his mothers wombe and compassed about with membranes, if he should draw in breath at his mouth with the ayre he should also draw in the water wherein he swimmeth, and at the first draught would be so suffocated as they that are drowned in a riuer. Again, he hath no ayre that he might draw, for there is no space in the vvombe that he doth not fill, and beside the orifice of the vvomb is so close locked vp that it vvill not admitte a little vvinde to enter into it. Again, that no ayre is inspirated by the mouth or the nosethrils, the substance and colour of the Lungs do suf-

sufficiently declare. For all creatures which draw aer at their mouths and noses haue white and thin Lungs, but the Lungs of the infant, as hath beene often saide, are red and thicke, and are nourished with red and thicke blood brought vnto them by vessellies hauing single coats, that is, by veines. Wherefore the infant doth not respire, because neyther ought hee if he could, nor can if he ought. *Rosset* Obiects, that by both the inoculations there is plenty of aer transported to the infants Lunges, because it dilateth and contracteth his Chest. But if that were so, then should it follow that the Chest is mooued after the motion of the Lungs; for the Lungs being puffed vp by the aer inspirated should enlarge the chest; and againe falling vpon the expiration of the aer should compresse the same. So the lungs should not be filled because the Chest is distended as it is in a paire of bellowes; but because the Lungs are filled the Chest should be distended as it is in a bottle or bladder, which to say were very absurd, as *Galen* teacheth in a thousand places. For the Lungs follow the motion of the chest for the auoiding of vacuity, as in the next booke we shall more plainly proue.

Rossets obiecti. on answered.

Neither is the distention and contraction of the Chest simply necessary for the maintenance of life; for those creatures which lurke in holes all winter, we cal thē φωλεύοντα ζῶα, & some women do liue without that motion of the chest. Respiration therfore in the *Embryo* or young infant is not absolutely necessary.

Respiration is not absolutely necessarie to life.

Some there be, who thinke that infants doe respire in the wombe as diuing Fisher-men; who will remaine more houres then one in the bottom of the water, and returne fresh vp and laden with Fish. Why should not the infant being warme in the womb as wel liue, his weazon haply a litle helping him, as the cold fisher draw aer out of himself with his mouth being compassed round about with cold water? The same thing also they confirme by the authority of many authentic all authors. *Hippocrates* in his Booke *De Natura pueri* saith, *First the infant breatheth a little and draweth a little blood from the wombe; and his breathing is encreased when he draweth more blood, it descending more p'entifully into the womb. Galen de locis affectis*, If the heart be depriued of Respiration, the man must of necessity instantly perish. Is not the infant a man? Furthermore, women feele their infants to mooue with Animall and voluntary motion. Why therefore are not the Lungs and the heart moued. As therefore in the first months when the infant beginneth to moue, he is truly said to mooue though it be obscurely: so though he breatheth obscurely, yet he may truly be saide to respire. *Galen* in his 4. Book *de causis pulsuum* saith, that women with child haue greater, quicker and swifter pulses then they haue when they are not with childe; because they are compelled to breath not onely for themselues but also for their infants. But all these thinges do prooue indeede that infants do transpire, but they do not prooue that they do respire. For, in respiration the Chest is contracted and distended and aer is breathed in by the mouth & the nose; which that it is not so in the infant we haue already demonstrated. Indeede by the vmbilical arteries there is aer transported togither with the spirituous blood into the whol body of the infant, & from the arteries there are many inoculations into the veins; whence it commeth to passe that though the arteries be tied, yet the creature doth not presently die as being a while sustained by that aer which the whole body receiueth from them.

That the Infāt doth respire. A comparison

Authorities.

The Solution of the Arguments.

QVEST. XXVII. *Whether the vitall Faculty which procreateth the spirits is idle in the infant, and whether his heart is mooued by it owne proper power. A Paradoxe.*

A paradoxe, that the vitall Facuity of the heart in the infant is idle.

COncerning the life of the Infant, that is, how hee excerciseth his vital faculties there is a new Paradoxe, which we will Discusse. I doubt not but at the first view it will seeme to many men absurd, but if it bee better attended I presume it will appeare so strong and so wel supported with strong demonstrations that it will be hard for a contentious spirit to shake them. The Paradox is this: *There is in the infant no necessity of the lungs & the heart, because he liueth without their official action.*

This if I can prooue, I shall ouerthrow the iudgement and determination of *Aristotle* & the Peripatetiks concerning the soueraignty of the Heart in mans body. The demonstration of our Paradox shalbe wholy Physiologicall and Anatomicall.

The Demonstration.

The Faculties of the Soule are reckoned by *Aristotle* to be three, the Vegetatiue, the Sensatiue, and the Intellectuall. The Physitians account so many, but giue them other Names: The Naturall, the Vitall, and the Animal. That which the Peripatetiks call the Vegitatiue differeth nothing from the Physitians Naturall. For as we say the whole Natural Faculty is

conteined in the *Increasing*, *Nouriſhing*, and *Procreating* vertues; ſo *Ariſtotle* in his ſecond *de Anima* ſaith, that the ſame vertues ſerue the vegetatiue ſoule. This vegetatiue faculty is common to all things that are animated, that is, which haue any kinde of life in them, and proper to them onely. For all things that haue life are nouriſhed, but the Vital faculty of the Phyſitians, which is the procreator of the ſpirits of life, which ſhineth in reſpiration and in the pulſe, doth not appeare in plants and things without bloode, becauſe their colde and craſſe ſpirits are ſcarſe at all expended or waſted. In hotter creatures there was neede of a fire-hearth, from whence the vaniſhing heate of the particular parts might bee redintigrated and refreſhed by the influence of another. That liuely and quickning *Nectar* is the vitall ſpirit which the heart ἀρχὴ τῦ θερμῦ καὶ τῦ ζῆν, *The Originall of heate and life* continually generateth of bloode and aer mingled together by his admirable motion; as a water Engine worketh vp a ſtreame. That this vital faculty of the Phyſitians doth not ſhine in the infant neither yet his heart mooue by a proper and ingenite power although he liue, we are fully perſwaded by theſe arguments.

The first Argument.

The heart is mooued to generate vitall ſpirits, and the ſame to diffuſe out of his left ventricle as out of a liuing fountaine to the channels of the great Artery to refreſh the fading & decaying heat, to ſupply by his ſourſe of vitall ſpirits the liuelode of the particular parts. This is all the neceſsity of his perpetual motion, this the Final cauſe. But in the infant there is no generation of vitall ſpirits in the ventricles of the heart, neither are vitall ſpirits deriued from his heart into the Arteries; *Ergo* his heart mooueth not, there being no neceſsity of the motion.

What neceſsity there is of the motion of the heart.

The *Maior* propoſition of it ſelfe is cleare enough. For who ſeeth not that in the Diaſtole or diſtenſion of the heart, both the matters of the ſpirit Aer and Blood are drawn into the heart? The Aer by the Venall artery into the left ventricle, the bloode by the hollowe veine into the right: againe, that in the Syſtole or contraction of the heart both the ſooty vapors which are the recrements of the ſpirits are purged, and the vitall ſpirits driuen into the pipes of the great artery as into water-courſes? Inſomuch that this generation of the ſpirits which it accompliſheth by his perpetuall motion ſeemeth to be the onely officiall action of the heart. The *Minor* propoſition is thus confirmed.

There is no generation of vitall ſpirits in the infant.

The vitall ſpirit is generated of aer and blood mingled together. Both the matters before they attaine the left ventricle of the heart do ſtand in neede of preparation. The aer by his abode in the ſubſtance of the Lungs attaineth a quality familiar to the inbred ſpirit. The blood is prepared in the right, which they call φλεβώδη and the bloody ventricle. But in the infant there is neyther any plenty of aer conueyed into the Lungs, (for the Weazon is idle) neither is there any bloode powred into the right ventricle. There is therefore in the heart of the infant no ſhop nor worke-houſe of the vital ſpirits. That neither Aer nor Blood is deriued into the Ventricles of the infants heart is manifeſtly prooued by the ſtructure of his veſſels. For the veſſels are vnited; the hollow veine and the venal artery by a large hole, the great artery and the arteriall veine by an arteriall pipe or Canale: wherefore the Hollow veine doth not poure blood into the right ventricle, as it doth after we are borne, but into the venall artery through that hole for the nouriſhment of the Lungs. The venal artery leadeth not aer but blood, and that thicke and venall. The great artery doth not drawe ſpirits from the heart but from the vmbilicall arteries, which it tranſmitteth by the arteriall pipe into the arteriall veine.

Now if the vitall ſpirits were generated in the left ventricle of the heart, what need were there of that Arteriall pipe, ſeeing there is in the heart a wide veſſell which is diuerſely diſperſed through the whole ſubſtance of the Lungs, I meane the venall artery? This ſurelie is a ſtrong demonſtration whoſe force no man can perceiue, vnleſſe he be skild in Anatomy, for it dependeth wholly vpon ocular demonſtration, and the credite of a mans owne ſight. But this we will eſtabliſh by other reaſons.

The ſeoond argument.

There is in the infant no neceſsity of that common ſtorehouſe or worke houſe of the ſpirits, becauſe the two vmbilicall arteries do ſupply vnto him arteriall blood, and a ſufficient proportion of vitall ſpirites and thoſe very pure and bright, as beeing made by the ſtrong heate of the Mothers heart. Nature doth nothing idly or in veine, why therefore ſhould ſhe make two vmbilicall arteries if new arteriall blood were to be generated in the infantes heart? You will ſay that the Mothers arteriall blood was vnprofitable, and not ſo fit for the vſe of the infant, and therefore it needed to be re-boyled by his heart. But I deſire to bee ſhewed the wayes whereby that arteriall blood can be tranſmitted into the left ventricle; by the

There is no neceſsitie of new vital ſpirits.

the mouth of the great artery it cannot passe togetherward because Nature hath bolted it with 3. values which look from within outward; albeit we think with *Galen* that some small quantity of the bloud sypeth into the Heart to nourish it and preserue his life. From the great artery it is freely powred into the arteriall veine through the arteriall pipe, but from the arterial veine into the heart there is no way open: for the membranes or values of this vessell are open outwardly but closed within, which giue way to any thing that commeth out of the hart, but do intercept the returne of it into the heart. Seeing therfore that the arteriall bloud of the mother doth not forsake the Arteries; neither hath any accesse vnto the left ventricle of the Infants heart, wee cannot admit any new preparation of the old, or preparation of any new.

Again, if that the spirit of the mother and the arteriall bloud be prepared for the nourishment of the Lungs, and for the conseruation of their heate, as *Petreus* would haue it: why also should not the other parts of the body liue by the influence and illustration of the same spirite? Or if the heart of the Infant doe generate vital spirits whereby the life of the whole is preserued, why shall it be thought insufficient for the preseruation of the Lungs which are but a little part of the whole? VVherefore the Infant truely liueth by his owne proper life, but he neuer ingendreth new spirits nor hath any vse of the motion of the heart. Notwithstanding wee must not say that therefore the heart is idle, for Philosophers say, that is onely idle which doth not worke when it ought and when it can.

The third argument.

Why the hart of the Infant cannot be said to be idle.

The Heart of the *Embryo* neither can make vitall spirits, nor ought if it could. It ought not, because the two vmbilicall Arteries doe supply both a sufficient number of spirites and those also very pure. Nether can it, because there is a want of matter, for it hath no ayre which it should draw.

As therefore we doe not acknowledge any new Chilification or Sanguification in the Infant, (for where should the recrements of either of them be reserued or treasured for seauen months together.) So neither doe we admit a new generation of vitall spirites in the Heart of the Infant. But you will obiect that Infants Arteries are mooued, and all motions of the arteries are from the Heart, because the Heart and the Arteries are continuated together. VVherefore if the Arteries be mooued together with the Heart, it will follow necessarily that we must admitte in the Infant the vitall faculty by which the spirites are ingendred.

Obiection.

I answere, that the Arteries of the Infant are indeed mooued, but that their motion followeth or floweth from the Arteries of the mother; so that his Arteries doe not beate by a proper and ingenite faculty of their owne, nor by any power issuing from his heart, but by a force and efficacy transmitted from the heart and the arteries of the mother. That these things are thus, this elegant demonstration I thinke will sufficiently proue. It is most certaine that the Veines and the Arteries of the wombe doe so adhere to the Veines and Arteries of the *Chorion*, that both arteriall and venall bloud doe flowe out of one vnto the other. And this continuity of the vessels, *Galen* maketh often mention of, for in his Booke *de dissectione vteri* he sayeth, *The end of that vessell which is propagated through the wombe, giueth beginning to that which is in the Chorion, so that you may call these two one vessell*, for their mouthes are so vnited, that the Veine draweth bloud from the Veine, and the Artery spirit from the Artery.

Answere.

The arteries of the Infant are moued after the motion of the mothers arteries

The first demonstration.

If this be true in the Arteries so opening into the mouths either of other, it must needs follow that the end of the artery of the mothers wombe when it beateth must driue arteriall bloud into that part of the *Chorion* which is continuall therewith, otherwise that arteriall bloud must either recoyle into the wombe out of the which it is issued; or else there must bee a conculcation of two bodies confused and mingled in the same time and place, mutually penetrating one the other; whence it shall come to passe that if we graunt there is a dilatation in the *diastole*, wee must also yeelde that there is at the same time and in the same vessell a compression in the *systole*.

Furthermore, is it not true which the Philosopher so often vrgeth, that a part of that which is continuall being moued the whole is moued vnlesse it bee hindered? The arteries of the Infant are continuated with the arteries of the mother; therefore when the mothers arteries are dilated, it is of necessity that the arteries also of the *Chorion* must be dilated. But if that pulsatiue faculty did flow from the heart of the *Embryo*, there should flowe also vitall spirits from the left ventricle into the arteries of the Infant, which alwayes be accompanyed with arteriall bloud, and so the arteriall bloud of the mother should bee alwayes mixed

The second,

with the arteriall bloud of the Infant; and there should be a double motion in the arteries of the Infant, one from the heart of the *Embryo*, the other from the mothers arteries which would not be answerable but contrary the one to the other.

VVe conclude therefore that the Arteries of the Infant are moued after the mothers arteries, because they are continuated with them: and therefore that that vitall faculty which procreateth the vitall spirits and the arteriall bloud, must by no meanes be admitted to bee in the Infant.

Galens opinion.

Galen sometimes seemeth to haue beene of this opinion: for in his Booke *de formatione fœtus*, hee sayeth that the Infant liueth after the manner of a Plant; and therefore standeth neither in neede of the action of the Heart nor of the Brayne, as neither of the eyes nor of the eares. As therefore a Plant oweth all his life vnto the earth, so the Infant oweth all to the mother: yea sometime hee sayeth that the Infant is as it were a part of the mothers body. As therefore a part of the body needeth not any particular respiration, nor any particular stomacke to digest his Aliment, yet of necessity requireth the pulsation of Arteries; so the Infant liueth contented onely with transpiration, which is accomplished by the *Dyastole* and *Systole* of the Arteries.

Galen.

In the 21. Chapter of his sixt Booke *de vsu partium* *Galen* sayeth, *Wee neede not wonder that the Heart of the Infant to his proper life needeth but a little spirit, which he may draw out of the great Artery, seeing it sendeth neither bloud nor spirits to the Lungs nor to the Arteries of the whole body as it doth in perfect creatures.* VVhere marke that hee sayeth, *The Heart may draw a little out of the great Artery.* For the values or floud-gates there set by Nature, do not hinder a little arteriall bloud and spirites from siping into the Heart, but they hinder a sudden and plentifull confluence, such as should be necessary, if of them the Heart shoulde make vitall spirits and arteriall bloud for the whole body of the Infant.

The contrary opinion. That the arteries of the Infant are moued by a power issuing from his hart. Authorities out of *Galen*.

This I say was *Galens* opinion: yet in many places he seemeth to say the quite contrary; that the Arteries of the Infant are moued by a faculty sent from his Heart vnto them, and that the Heart it selfe is moued by an in-bred and proper motion. In the 22. Chapter of the seauenth Booke *de vsu partium*. *The Heart* (sayth he) *not onely in perfect creatures but also in Infants, supplyeth to their Arteries the power by which they are moued*: and in 21. Chapter of the sixt Book, *If you tie the Arteries of the Nauel whilst the Infant is in the womb, all the Arteries which are in the Chorion will cease beating, & yet those Arteries which are in the body of the Embryo will continue their pulsation: but if with the vmbilicall Arteries you tye also the vmbilicall veines, then will the arteries which are in the body of the Infant leaue beating also.* By which it is manifest, first that that power which moueth the arteries of the *Chorion* proceedeth from the heart of the Infant; againe, that the arteries get spirits from the veines by their inoculations. In the same Booke in another place hee sayeth, *The Heart in the Infant when it dilateth it selfe, draweth bloud and spirites from out of the venall Artery.* In the ninth Chapter of his Booke *de formatione fœtus*. *When the Heart of the Infant commeth to haue ventricles, and hath receiued venall and arteriall bloud, then it pulseth, and together with it selfe moueth the Arteries, so that it liueth now not onely as a Plant, but also as a Creature.* This opinion may also be confirmed by reasons.

The first argument.

Seeing the Heart is the hottest of all the Bowels and as it were a fire-hearth, if you deprive it of motion it hath nothing left wherewith it may bee refrigerated; by transpiration it cannot, because it is included in a hotte and narrow roome, nor by the appulsion of externall ayre; for the solidity and thightnesse of the membranes wherewith it is compassed hinder the accesse thereof; adde hereto that those watery excrements doe hinder the perspiration. Neither hath the Heart of the Infant any refrigeration from the mothers arteries by the accesse of a new matter or spirit, for nothing can arriue into the Heart of the Infant from his arteries because of the membranes which lye vpon the mouth of the great arterie.

The 2. argument.

The motion therefore of the Heart was necessary, by the benefite whereof both bloud and spirit are drawne into it, and from thence communicated to the whole body. The credite also of this opinion is increased by Histories: For many women report that some haue beene cut out of their mothers womb after they were dead and so saued, as *Scipio* and *Manilius*. The Ciuill Lawyers doe condemne him as a murtherer that shall bury a woman great with childe before he hath taken the Infant from her, because togither with the dead mother he seemeth, or his held in construction, to haue buried a liuing Infant; which Law being made with the consent of Physitians, doeth sufficiently declare that the Infant may

Histories of many cut out of their mothers wombs.

suruiue

ſuruiue after the Mother is dead.

It is reported that *Gorgias* the Epirote, after his Mother was dead and vppon the Beere to be buried, yſſued aliue from her wombe, which could not haue beene vnleſſe the heart of the infant had had in it a vitall faculty, which without the aſsiſtance and communion of the mothers heart for a while did ſuſtaine his life.

But I thinke it will not be hard to giue a ſufficient anſwere to all theſe authorities and arguments. For *Galens* authority we make the leſſe account of it, becauſe it contradicteth himſelf. Moreouer we ſay that the experiment which *Galen* biddeth vstry is impoſsible for you cannot intercept the vmbilicall veine and arteries of the infant vnleſſe the Mother bee dead and her wombe opened, and then we ſay the infant doth reſpire not tranſpire. And whereas they ſay that the heart hath not wherewith it may be refrigerated vnleſſe it be moued. VVe anſwere, that the infant contained in the priſon of the womb, hath ſufficient for the preſeruation of his life from the mothers Arteries, becauſe it liueth as thoſe creatures do, which the Grecians call ἀναπνοϊκὰ ζῶα, beſide it receiueth ſome refrigeration from the lukewarme water wherein it ſwimmeth. Anſweres to the authorities and arguments.

The laſt reaſon from the cutting out of liuing Infantes out of their dead Mothers, may ſeeme to ſome to vrge much, but the anſwere is at hande. That the vitall faculty diffuſed through all the arteries, without the communion of the heart may for a ſhort time preſerue the infant aliue after the Mothers death.

We haue ſeene (ſayth *Galen* in his ſecond Booke *de Placitis*) *a Sacrificed Beaſt walke after his heart was taken away, and haue often made experiment of the ſame in a Dogge.* What alſo if I ſhall ſay, that thoſe Mothers were Hyſtericall and eſteemed as dead when yet they were aliue, which thing is not vnvſuall? The truth therfore of our opinion remaineth firme, that the heart and the arteries of the infant do pulſe or beate from a power proceeding from the heart and arteries of the Mother, not from any proper and ingenit faculty of their owne, & that no new Arteriall blood is generated in his left ventricle, ſeeing the Mothers Arteries do ſupply a ſufficient quantity, and that very pure. Galen. The Concluſion.

From hence let the Peripatetiks learne, how vnaduiſedly *Ariſtotle* calleth the heart the firſt liuer, mouer, and blood-maker. For both the Arteries of the infant do moue before his heart, and the heart liueth onely by the pulſation of the Arteries. Finally, as long as the infant is included in the wombe of his mother, we do not beleeue that his heart is the Shop or Store houſe either of vitall ſpirits, or of Ateriall blood. Againſt the Peripateriks principality of the heart.

QVEST. XXVIII. *Whether there be in the infant any generation of Animal ſpirits, and what poſition the Infant hath in the womb.*

THE mouing Faculty floweth into the fleſh of the Muſcles from the brain by the Nerues, not by a ſimple irradiation or ſeparated quality, but by a Corporeall ſubſtance, which the Phyſitians call *Animalem ſpiritum*, an *Animal ſpirit*. Seeing then the Infant in the wombe mooueth of his own accord ſometimes to the right ſide, ſometimes to the left, and oftentimes kicketh with his heeles, it followeth neceſſarily that he hath alſo Animall ſpirits. But whether he draweth theſe from his Mothers wombe as he doth the vitall, or generateth them in the *ſinus* or ſubſtance of the braine by a proper and inbred faculty, it hath of long time beene a great queſtion. I thinke that they are generated in the braine, and my reaſons are theſe. Becauſe there is no Communion or connexion betweene the Nerues of the wombe and of the infant, as there is betweene their Veines and Arteries. Now onely the Nerues conuey the Animall ſpirits. The generation of the Animall ſpirits in the infant.

You will Obiect, that the Animall ſpirit ſtandeth in neede of aer for his conſeruation & expurgation, but no aer is inſpirated as long as the infant is in the Mothers wombe. I anſwere; that this Animall ſpirit is cheriſhed, purged & tempered by that tranſpiration which is made by the vmbilicall arteries, but his generation we thinke to be the ſame in the womb that is after the infant is borne, which how it is we ſhal declare more at large in the ſeuenth Booke where we ſhall of purpoſe entreate of it. Obiection. Solution.

Concerning the time of the infantes motion, *Hippocrates* ſeemeth not alwaies of one minde. For in his Booke *de Morbis mulierum* he ſaith, that male children moue the third moneth, and females the fourth; but in the third Section of his ſecond Booke *Epidemion* he ſaith, the infant is mooued the ſeuentith day in theſe words, *Whatſoeuer is mooued the ſeuenth day is perfected in the Triplicities.* And in his Booke *de Nutritione*, *thirty dayes forme the* In the time of the infantes motion *Hippo.* varieth.

infant,

The places reconciled.

infant, 70 *mooueth it*, *and* 210. *perfect it*. You may reconcile *Hippocrates* to himselfe in my opinion, if you say, that there is one motion obscure, another so manifest that the eye may iudge of it and the hand may feele it if it be laide vpon the belly. In 70. dayes the Infant may mooue but the motion shall be neyther visible nor to bee felt till after the thirde or fourth month. And surely my selfe haue knowne a woman in three children confidentlie auouch, that after 8. or 9. weekes she hath alwayes felt her infant mooue very sensibly, which I could not beleeue, till I had well considered of this place in *Hippocrates*.

That the Infant may mooue at viii. weekes.

Concerning the position of the infant, Different places reconciled

Concerning the position also or situation of the infant in the wombe, which is referred to the moouing Faculty, there are some places which neede to be reconciled. *Hippocrates* in his Booke *De Natura pueri* saith, that in the womb the infants head is neere vnto his feet. *Thou canst not iudge* (saith he) *though thou shouldst see an infant in the womb, whether his head be p'aced aboue or below.* But in his Booke *de Octimestri partu* hee writeth, that the head is placed in the vpper part of the wombe in these words, *All Infants are begotten hauing their heads vpward*. *Aristotle* in the 8. chapter of his 7. Booke *De Natura Animalium* seemeth to reconcile these places on this manner; *All creatures* (saith hee) *in the first months after their Conformation beare their heads vpward, but when they encrease and grow toward their byrth, their heads bend downward.*

A diuers reading in *Hippo.*

Againe, in *Hippocrates* Booke *De Natura pueri* almost all Copies haue it thus. *The Infant seated in the wombe hath his hands at his cheekes*, yet all interpreters translate it *ad Genua at the knees*. I thinke that both readings may be maintained; for there are some Copyes of both readings. For the Infant hath his hands at his cheekes and at his knees. The palmes of his hands take hold on his knees, and the backes of his hand touch his cheekes. For, if as *Aristotle* writeth in the place next before quoted, the infant is so rowled vp that his nose is betwixt his knees, his eyes vppon his knees, his eares on either side his knees, and that with his hands he take hold of his knees, he must necessarily rest both his cheekes vpon his hands. Those things some haue written of the different situation of Males and Females, are but deuices of their owne braine. But those things which *Aristotle* hath written in his seauenth Booke *De Natura Animalium* concerning the different situation of diuerse creatures, are well worth the obseruation and our knowledge; Notwithstanding, I do not thinke fit to transcribe them heere, but referre him that desireth satisfaction vnto *Aristotle* himselfe.

How both readings are made good.

And thus much shall be sufficient to haue spoken of the infant all the while he is conteyned and contenteth himselfe with the prison of the wombe; it remaineth now in the last place, that we speake of the birth of the infant.

QVEST. XXIX. *Of the Nature and Differences of the birth.*

WE now enter into a vast Sea, a huge and enorme Tract when wee vndertake to dispute of the Nature, Times and Causes of the birth of Man; wherein wee shall meete with many contrary gusts of opinions, many vnpassable and thorny wayes. How many reciprocall waues in the concertations of the Ancients? how many quick sands in the accounts of months and dayes? howe many rockes in the search after the causes of things? amongst which vnlesse a man bee well steared by reason, he must needs set vpon some misaduenture? Notwithstanding, so necessary and profitable a voyage this is, as we will aduenture our selues; the Pole we are guided by is fixed truth, and the Pilote shall be *Hippocrates*, who as saith *Macrobius*, *Coulde neuer deceiue or be deceiued*: out of his Bookes *De Septimestri & Octimestri partu*, *De Natura pueri*, *De Principijs*, *de Alimento*, and *De Morbis mulierum*, will we draw our demonstrations.

Three heads of the question.

But that we may proceed in order through the whol course of our disputation, that the capacities of such as are not throughly grounded may not be confounded, we will diuide our discourse into three heads. In the first, we will open vnto you the Nature of the Birth and all the differences of the same. In the second, wee will handle the Times of the Birth by a computation of the yeares, the months, and the dayes. In the last place, wee will manifest the Causes of the varieties of the Birth, as well the Generall as the Particular, the Naturall, the Physicall, the Arithmeticall, the Geometricall and the Astrologiall Causes.

What a byrth is.

To begin therefore with the first. The Birth, which the Græcians call τόκος, we define to be an Edition or bringing into the world of an infant perfected and absolued in the womb: so that whatsoeuer month, day, or houre, the infant arriueth into the worlde, that arriuall may

may properly and truely be called the birth. To this perfection wee speake of, there is required not onely a dearticulation of the parts, for then if a woman should miscarry at foure moneths that miscarriage should be called a Birth; but also their strength & growth, which because the Infant attayneth not before the seauenth moneth, we cannot properly call it a Birth before the seauenth moneth, but either an abortment or a miscarrying. An abortment the Grecians call by diuerse names, ἀποφθορὰν, ἄμβλωσιν, διαφθορὰν, ἐκπρωσμὸν, ἔκβλητον, ἔκπρωμα, κύημα ἀνεμᾶτον. VVe therefore define an abortment to be Either the issuing of an imperfect Infant or his extinction and death in the wombe. Some there are who will not haue it called an abortment before the infant hath moued, so that a woman shall not bee sayed to abort but from the third moneth to the seauenth, and that before the motion it shall be called an effluxion or miscariage.

What is required to a perfect birth.

The names of an abortment

The definitiō

The error of some.

But these men seeme to me not to conceiue *Hippocrates* meaning aright: for *Hippocrates* after the *Embryo* is formed vseth to cal it an abortment if it come before the due time, whether it be before the motion of the Infant or after it. As in the 44. Aphorisme of the first Section, *Those women that are too much extenuated doe abort at two moneths*: and in the Aphorisme following in the same Section, *Those that are naturally disposed, doe abort at three moneths*. But if the Geniture be auoyded before conformation, then is it not properly called an abortment, but ἔκρυσις an *Effluxion*, so sayeth *Hippocrates* in his Booke *de septimestri partu*, *Those corruptions which happen a few dayes after the Conception, are called effluxions not abortments*. *Aristotle* also in the fourth Chapter of his seauenth Booke *de Natura Animalium*, calleth those corruptions which fall out before perfect conformation, *Effluxions*. Wherefore some say that *Hippocrates* is not to bee accused of impiety or of breach of his oath, because hee counselled the dauncing Dame hee calleth *Psaltria* to prouoke an abortment, because she lost not an Infant, but suffered onely an effluxion seauen dayes after shee had conceiued.

Hippocrates.

What an effluxion is.

Hippocrates ill excused.

But howsoeuer we in Schooles may distinguish thus nicely, yet God iudgeth after another manner as we may perceiue by his iudgement vpon *Onan*. Neither do we by abortment onely vnderstand an exclusion of an imperfect Infant, but we say that a woman may abort in her wombe though the *Embryo* be not brought away: so sayeth *Hippocrates* in his first Booke *de morbis mulierum*: *When a woman aborteth and the Infant is not excluded*. So that abortment signifieth not onely an exclusion of the Infant before the due time, but also the extinction or death of the same in the wombe before the due time of birth. For an Infant may be carried in the wombe after he is dead many yeares, & may bee proued by many examples. Among the rest that is notable, of the Infant which the mother bare in her body 28. yeares which was turned into a stone, as it is recorded by *Iohannes Albosius* a learned Physitian. Likewise that about Newarke not many yeares since, which after it dyed in the mothers wombe remayned there a good space, and after was vomited vp by peece-meale out of the stomacke: a Story past all beleefe sauing that it hath so many eye-witnesses yet liuing and ready to iustifie the trueth of it. Thus we see out of *Hippocrates* what is a *Birth*, what an *Abortment*, and what an *Effluxion*.

His large acceptation of an abortmēt.

Two strange stories.

Octimestris partus is not an abortment.

Birth is when an Infant perfected in the wombe commeth into the world whether it issue aliue or dead: So that they are in no small error who call the Infant of eight moneths old an abortment, because it is not aliue: for it is not simply and absolutely of the essence of the birth that the Infant should be borne aliue, but that it should be borne perfect, now at eight moneths it is perfect. To be aliue or not aliue, to be legitimate or not ligitimate, are differences of the Birth as wee shall say by and by. An abortment is an exclusion or extinction of an vnperfect infant: an Effluxion or miscariage is an auoyding of the geniture before perfect conformation.

Hauing thus made plaine the Nature of the birth, wee come nowe to the differences thereof. A Birth is either Naturall or not Naturall, Legitimate or Illegitimate. To a Naturall birth three things are required. The first, that there bee an equall contention of the infant and the mother. For the action of the birth is common both to the infant and the mother. But to which of these we ought to attribute the beginning of the motion, whether to the wombe or to the infant, *Galen* expoundeth in his Commentarie vppon the 37. Aphorisme of the fift Section, *The Infant bringeth to the mother the beginning of the birth*. For being become larger and hotter and needing more store of Aliment and spirite, with often and violent motions of his hands and feete hee breaketh the membranes. And the wombe ouerburdned with so great a waight and so vnruly an inmate, desiring to lay down her

The differences of the birth.

The first condition required in a naturall birth.

her vnwealdy burden, wholly contracteth it ſelfe to the ſhutting out of the infant. So that from an equall contention of the infant and the wombe, the birth proceedeth κατὰ φύσιν, *according to Nature.* But if neither of them endeuour, or but one of them fayle, then is the birth *not Naturall.* For if all the worke lye vpon the hand of the mother, then is the byrth hard and laborious: now that hapneth when the infant is weake, or his ſtrength ſpent, or he be dead; which *Hippocrates* expreſſeth in theſe words, in his firſt Booke *de morbis mulierum. The birth is then moſt difficult when the Infant iſſueth either dead or apoplectical*, that is, depriued of motion and ſence.

The 2. condition.

A deſcription of the natural figure.

Whythe head forward is the moſt naturall figure.

The ſecond condition of the Naturall birth is, that it come foorth in that figure which is according to Nature. This figure *Hippocrates* firſt of all men deſcribed in his firſt Book *de morbis mulierum*, and in his Bookes *de Natura pueri*, and *de Octimeſtri partu. The Childe commeth with his head forward if he come according to Nature.* Nowe why this figure and forme of iſſuing is according to Nature, *Hippocrates* rendreth a reaſon. *Becauſe the Infant hanging vpon the Nauel as a ballance vpon a beame, his vpper parts are the heauier*, and therfore his head turneth ſooner downward. Adde hereto that if the infant come with his head forward, the reſt of his parts being flexible like waxe doe not hinder the birth but yeelde and giue way vnto it. But if he come with his feete forward, his armes may be ſo ſpred and extended that they may hinder the reſt of the body. And this is *Hippocrates* opinion in his Booke *de Octimeſtri partu. The flexible parts of the Infant are no hinderance vnto him if he iſſue with his head forward, but if he come with his feete forward, then they ſtop the paſſage.* That this figure, of the head forward, is the moſt Naturall & ſafe way for the infant, *Pliny* confirmeth in the 8. Chapter of his ſeauenth Booke *de Naturalis Hiſtoria. The olde cuſtome is ſayeth he that dead folk are carried to their graues with their feet forward, becauſe death is contrary to life.* As therefore a man commeth into the world with his head firſt, ſo being dead hee muſt be carried out of the world with his feete firſt.

Why dead men are carriedwith their feet forward.

Beſide this, al other figures of the Birth are to be called *not Naturall.* Now there are diuers figures of the birth παρὰ φύσιν *not Naturall*, but three eſpecial; with their feete forward, with the ſide firſt, or double; all which *Hippocrates* expreſſeth in his Bookes *de morbis mulierum*, & *de Natura pueri. It is dangerous when the feete come forward, for in ſuch a birth oftentimes the mother periſheth or the Infant, or both together.* To deprecate or auert this danger, the auntient Romanes built Alters to the two *Carmentæ*: the one of them was called *Poſtuerta*, the other *Proſa* of the right or wrong proceeding of the birth. And ſuch births are commonly called *Agrippæ*, as it were *ægre partus.* So *Agrippina* ſayde her ſonne *Nero* came into the world with his feet forward.

Diuerſe vnnaturall figures of the birth.

Agrippe why ſo called.

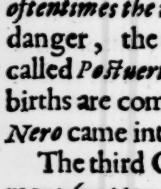
The 3. condition.

The third Condition of a Naturall birth is that it bee ſwift, eaſie and without any vehement *ſymptomes.* I call that a lawfull or legitimate birth which commeth in due time, & that illigitimate which happeneth before or after the due time. The eight moneth birth is illigitimate, becauſe it preuenteth the ninth moneth or ſtayeth after the ſeuenth month: and this is the Nature of the Birth, theſe are all the differencies thereof.

QVEST. XXX. *How many times there be of a Mans Birth, and what they are.*

Ariſtotle.

The times only of mans birth vncertaine.



Ariſtotle that Genius and Interpreter of Nature, as he hath in all things acquitted himſelfe wondrous well; ſo herein alſo he hath written excellently, that whereas Nature hath appoynted almoſt to all Creatures a determinate and certaine time for the bringing foorth of their young; circumſcribed and conſtant limits of their geſtation: yet to man ſhee hath granted a larger and freer patent for the time of his procration and geſtation. Houſe Doues do euery month bill and breede young; a Bitch whelps at foure moneths; a Mare Foales the ninth, and an Elephant the ſecond yeare. Onely man hath diuerſe times wherein he is brought foorth, the 7. 8. 9. 10. and 11. moneths. This women doe all of them confeſſe, whome wee ought to beleeue ſayth *Hippocrates* in his Booke *de Septimeſtri partu*, becauſe they are moſt skilfull in this kinde of learning.

The 7. month the firſt time.

This alſo is confirmed by the authority of *Hippocrates*, *Ariſtotle*, *Plutarch*, *Galen* and *Aphrodyſæus*; and beſide by certaine lawes of the Romanes. The ſeuenth month is the firſt limit of a mans birth, and before ſeauen moneths no infant ſuruiueth, albeit ſome Egyptians, the Poets of *Naxus*, and many Spaniards report that ſome haue beene borne aliue the ſixt moneth.

The

The seuenth-moneth birth, *Hippocrates* saieth is vitall or dooth suruiue in his booke *De Principijs*. *The Infant borne the seuenth month is reasonably borne and liueth.* He is reasonably borne, because he wanteth nothing in the perfection of his parts; for in the two months following there is nothing added to the perfection of the parts, but vnto the perfection of his strength. The 7 month childe Vitall. *Hippocrates.*

Aristotle in his 7. booke *De Natura animalium* affirmeth the same, as also *Aphrodisæus* in his Problemes. *Galen* in his Commentary vpon *Hippocrates* booke *de Septimestri partu* saith, that he hath seene many children borne the seuenth month suruiue and do well. The same in Honor of *Hippocrates* was concluded by the Roman Lawes, and standeth in force at this day euen among our selues. *Aristotle.* *Galen.* Lawes of the Romanes.

Pliny reporteth, that *Sempronius* and *Corbulo*, two Consular Romanes, were borne of their Mother *Vestilia* the seauenth month. I haue also credibly heard it reported, that that good old man Doctor *Turner* of S. *Ellins* now lately gone to heauen, was borne the seauenth month and preserued by some small sustenance till he was able to sucke, which was about two months after he was borne. And if you obiect *Hippocrates*, who in his Booke *de Septimestri partu*, saith, that there be few seuen-month children, and of those few many perish, and therefore *Aristotle* biddeth that they should bee laide in wooll and carefullie swathed. I will giue you this answere, that there are many seauen-month birthes, because there is a great latitude of the seauenth month. *Pliny.* *D. Turner.* Obiection. Solution

Those that are borne in the beginning of the seuenth month may indeed liue, but they are exceeding weake and do not recouer strength in forty dayes, and of these we must vnderstand that place of *Hippocrates*; for he saith they are borne after 182. dayes and a part of a day, now 182. dayes do make but the beginning of the seauenth month. But those that are borne in the end of the seauenth month, that is, after 210. dayes are strong, and fewe of them perish. Of such he speaketh in his Booke *de Principijs*, where he saith; The 7. month-infants are borne according to *reason*, and do liue because they accomplish three tenths of weekes, and euery tenth fulfilleth seauenty dayes. The differēce of the 7. moneth infants.

Againe, the seauenth-month infant is either a Male or a Female; A male because hee is sooner formed, mooued and perfected in the wombe, if he be borne the seauenth month he suruiueth. A Female because she keepeth not that proportion which is required to the Conformation, Motion and Birth, if she be borne the 7 month she will haue life, but not hold it long. This first rule we establish as a Law, that the seuen-month childe is legitimate and vitall, and that this is the first limit of a mans birth. The bringing foorth of a childe at 8. monthes is called, not an abortment, a birth, but yet it is neither a vital nor a legitimate birth. *Hippocrates* in his Booke *de Principijs*. *No Infant borne the eight month suruiueth*, and the same he repeateth in his Booke *de Octimestri partu*, and *De alimento*, elegantly indeede, but very obscurely, where he saith, *The birth of 240. dayes* (such is the eight-month birth) *is and is not*. As if he should say, the infant is indeede borne the 8. month, but so, that it had as good not haue bin borne, because it cannot suruiue. The 8. month infant is not Vital.

In Egypt where that fruitfull *Nylus* runnes, and in *Spaine* where women haue easy trauels, and where the heauen and the earth agree together to bee kinde to man, there manie men say, that some 8. month infants do liue. *Æsclepiades* saith, that the women of *Naxus* doe bring foorth their children aliue the 8. month, and they suruiue either because *Iuno Lucina* hath giuen them this priuiledge for *Bacchus* sake, or because *Bacchus* was borne that month, after whose name it is called *Dyonisia Naxos*. But these are rare things, and beside are different from the Vniuersal Nature as the Philosophers speake. Add heereto, that in the account of the months women are often deceiued, so that they seeme to themselues to bring foorth the eight month when it is indeed the ninth; for there are some whose courses flow the second month after their conception, and such women think they haue not conceiued when indeede they haue conceyued. In Egypt som suruiue at 8. months.

Aristotle in his tenth book *de Historia Animalium* sheweth how there may many errors happen in the computation of the time of their conceptions. *There are some* (saith he) *who think that there can be no conception vnlesse both parents do at the same time eiaculate their seed.* Nowe such are deceyued; because the body that is best disposed soonest looseth, wherefore that seede being very strong is not corrupted, but beeing drawne it is reserued for that mixtion which is to be afterward. How women are deceyued in the acompt of their Conceptions.

They erre also who thinke they haue not conceyued vnlesse the wombe bee dry and all the seede be retained; because of the whole seede which proceedeth aswel from the man as

from

Many women think they haue conceiued whē they haue not.

from the woman the matrix draweth first no more then it can, then no more then it should draw. Many women therefore haue conceiued which thinke they haue not conceiued, and these doe easily mistake the sixt for the seauenth, the eight for the ninth months.

The 9-month birth is most legitimate.

The nine-moneth birth is of all other the most vitall and legitimate, as that which is in the middle of the two extreames, and is beside most familiar to Nature. Concerning the ten-moneth birth *Hippocrates* hath written many things in his Bookes *de Natura pueri*, and *de septimestri partu*. *Homer Odyss.* λ maketh *Neptune* to speak thus vnto the *Nimphe*. *After a yeare is accomplished thou shalt bring forth a beautifull burthen.* That is to say the tenth moneth, for of ten moneths consisteth the yeare among the *Aeolians*, as also among the ancient Romanes, now *Homer* we know was an *Aeolian*.

The 10 mōth birth vitall.

11. month-birth controuerted.

How women are deceiued in their computation.

Concerning the eleuenth-moneth birth there is great difference among authours; *Hippocrates* seemeth to haue conceiued diuersly of it; in his Booke *de Natura pueri* he determineth that the tenth moneth is the longest limit of gestation, *within ten moneths at the furthest* sayeth he *the Infant is borne*. But those women who thinke they go vnto the eleuenth month are deceiued in the number of dayes and computation of the time of their Conception, for sometime the wombe is distended with winde and breedeth a false conceit of their being with childe. Oftentimes vpon the suppression of their courses their bellies swell and they thinke they are conceiued, making their accompt from the time of that suppression.

Aristotle vnthankfull to *Hip* his good maister.

Aristotle, who indeede tooke all that he writ concerning the Nature of Creatures onely from *Hippocrates*, and yet (vngratefull man as he is, neuer maketh mention of him) reproueth those women who say they haue borne their children eleuen and twelue months. The beginning sayth he of Conception most women are ignorant off, especially if they couple and conceiue when before their wombes are distended with winde; for then they esteeme that they haue conceiued when their bellies beginne to be distended, whereas indeede they are first distended with winde and afterward conceiue: For *Hippocrates* determineth that the tenth month is the vtmost limit of gestation; (and *Vlpianus* the Lawyer admitteth no children to the inheritance who were borne after the tenth moneth;) but in his Booke *De septimestri* and *octimestri partu*, he acknowledgeth the 11. month.

Hippoc reconciled to himselfe.

You shall reconcile *Hippocrates* to himselfe, if you say, that the end of the tenth moneth is the absolute and longest limit of gestation, and that a woman cannot fulfill eleauen compleat moneths, but if she bring forth in the eleuenth month it is in the beginning thereof, and that is *Hippocrates* meaning when in his Booke *de octimestri partu* hee sayth, that some women carry their burthens vntill the eleuenth month, he meaneth vnto the beginning of the 11. moneth.

Auicen of a birth at 14. months.

As for the twelfth, the thirteenth and the foureteenth moneths *Massurius* reporteth that *L. Papyrius* the *Prator* awarded an inheritance of Land against an heyre whose mother confessed that she bore him after thirteene moneths; because the time of his birth seemeth to him to be litigious. *Auicen* writeth that he saw a childe borne fourteene months after Conception: but if any such thing happen, we conceiue it to bee a rare accident and beyond the consideration of Art.

We conclude therefore that the first limit of a mans birth is the seauenth moneth, the last is the eleuenth, the intermidiate times are the ninth and the tenth.

Months are manifold.

Now what are seuen-moneth, eight-month, nine-month, and ten-month births, and of how many dayes euery one of these consisteth, and also what account and supputation of dayes we are to make it remayneth that we should declare, for vppon this Axle-tree is the whole Controuersie rowled, this laberynth hath innumerable windings and turnings, out of which no man shall be able to redeeme himselfe who is ignorant of *Hippocrates* computation of moneths, *decades*, weeks and dayes; wherefore we will a little while stay our reader vpon the consideration of them.

Mensis solaris.

Mensis lunaris.

A Moneth according to the Astrologians is manifould, one called *Solaris* another called *Lunaris*, a third Common, that is to say, according to the *Julian* Kalender. That is called a Solaric moneth wherein the Sunne runneth through thirty degrees of the Zodiacke, and it contayneth perpetually thirty dayes. The Lunary moneth according to *Galen* is double, the one of *Progression* the other of *Apparition*. The moneth of *Progression* he calleth that space which commeth betweene one coniunction of the Moone with the Sunne and another, and it conteyneth nine and twenty dayes and a halfe. A moneth of *Apparition* consisteth onely of 27. dayes, because three dayes are subtracted wherein the Moone lurketh

The month of progressiō

The month of Apparition.

keth as it were and giueth not her light. The Common month or the month of the Kalender doth not alwayes consist of the same number of dayes. For the month of February hath xxviii. dayes, May xxx. Iuly xxxi. And this is the variety and difference of months. Nowe what is *Hippocrates* month is very difficult to determine, some doe thinke it to be the Lunary, and the Lunary of Progression onely. And this may be warranted by the authoritie of *Hippocrates*: for in the beginning of his Book *de Septimestri partu* he writeth, that 2. months consist of nine and fifty dayes, and that fiue months are accomplished of an hundred seuen and forty dayes and a halfe. Now fiue times twenty nine, make an hundred forty fiue, wherto if you add two dayes and a halfe, the summe will amount to 147 dayes & a halfe; so that euery month shall containe nine and twenty dayes and a halfe. *Galen* in his Computation of the Criticall dayes and the dayes of Gestation, accounteth according to the Lunarie month, and in his Commentary vpon *Hippocrates* Booke *de Septimestri partu* is of opinion that no infant suruiueth after two hundred and foure daies.

The common month. What is *Hip.* month according to some.

We on the contrary do imagine that *Hippocrates* Months are Solarie consisting of thirty daies, as we gather by his owne computation. For in his Booke *de Principijs* he saith, that the seauenth-month birth hath three Denaries or *Decades* of weekes, and in euery *Decade* are 70. dayes; and that three Decades of weekes make 210. dayes.

We thinke *Hip* month to be Solary, consisting of 30. dayes Authorities to proue it.

If therefore the seuenth-month birth do accomplish two hundered and ten dayes, then euery month shall conteine thirty dayes, because seauen times thirty makes two hundered and ten.

Againe, in the same Booke he writeth; that a perfect birth is not accomplished till nine months and ten dayes, but nine times thirty makes two hundred and seauenty, whereto if you add ten, the sum wil amount to two hundred and eighty.

Moreouer, in his Booke *de Alimento* he writeth, that the birth at two hundred and forty dayes, (by which all men vnderstand the eight month-birth) *is and is not*: now two hundred and forty dayes make eight Solary months. Furthermore in the third Section of the second Booke *Epidemion*, *What soeuer is mooued within seuenty dayes, is perfected within the triplication.* Now three times seauenty make two hundred and ten, which accomplish seuen compleate months.

Finally and most manifestly in his Booke *de Octimestri partu* he teacheth that wee must make our computation of months in the gestation of the Infant by the Solary months consisting of thirty dayes. *The New Moone* (saith he) *is one day, & the thirtith part of the month.* Two dayes make the fifteenth part of the month, and three daies a tenth; wherefore wee conclude, that the months of the birth are Solary rather then Lunary. And truly the efficacy and power of the Sun is more auaileable to generation then that of the Moone, whence it is that *Aristotle* in the second of his Physicks calleth the Sun *Stellã Salutarem* & γενεσιον, that is a healthfull and fruitfull Starre, because it is the parent and procreatrix of al things. For *the Sun and a man do generate a man.* As for the Decads and weeks of *Hippocrates*, there is no reason we should much trouble our selues about them, for they are as cleare as the midday-sun it selfe. Euery Decade conteining seuenty daies, and euery weeke seuen.

One scruple there remaineth to be remooued, wherewith I confesse I was a great while puzled, and that is, why the Computation of daies to make the seuenth-month birth is not one and the same: for in his Booke *de Principijs* hee saith, that the seauenth-month birth is brought into the world the two hundred and tenth day, which opinion of his, *Auicen* the Prince of the Arabians followeth. *Fen.* 21. *lib.* 21. *cap.* 2. of the generation of the *Embryo*. But in his Booke *de Septimestri partu* and in the very beginning he saith, *that the seueuth-month birth is borne within an hundred and eighty two dayes, and a part of a day*, which also he repeateth in his Booke *De Octimestri partu*, where he sayth, that the seauenth-month birth is fulfilled in halfe a yeare and a part of a day, that is to say, in a hundred eighty two daies and fifteene houres.

How diuerse *Hip.* is in computation of dayes.

Some of the Interpreters, that they might auoide these snares, haue disallowed of his Booke *de Septimestri partu*, as if it were not *Hippocrates* owne, at least they boldly affirme that this place is corrupted. But wee on the other side are as confident that it is truly Hippocraticall. For not onely *Galen* Commented vpon it, a few fragments of whose labour remaine to this day, but also the Lawyers of that time when Learning did most flourish at *Rome* and *Athens* did translate this very sentence according as we at this day read it into the number of their Sanctions. Wherefore these diuers not contrary places concerning the number of dayes we will thus reconcile.

That *Hippoc.* Booke *de Sept. partu* is legitimate.

Hip. interpreted.

The Latitude of the seauenth month is very great, neither is the seauenth-moneth birth alwayes brought into the world in one and the same day. There is a seauenth moneth beginning, and a seauenth month perfected. The Beginning consisteth of a hundred & eighty daies & a part; the perfection consisteth of two hundred & ten dayes. Before an hundred eighty two dayes no infant suruiueth, so that this is the first limit of the seauenth moneth. After two hundred and ten daies it is no more called a seuenth-month but an eight-month birth. The first births in the beginning of the seauenth moneth are indeede vitall yet verie languid and weake: the latter are very strong. Wherefore *Hippocrates* in the places before quoted expressed onely the two extreame times of the seauenth-month birth, that is to say, the first and the last. The middle times he maketh no mention of, as of two hundred & foure daies, &c; because they are sufficiently knowne by the nature of that extreame vnto which they approach the neerest. And this is not my interpretation of *Hippocrates*, but *Hippocrates* owne. For, as in his Booke *de Octimestri partu* he calleth those *Decimestres* not onely who accomplish ten whole months, but also that reach a few dayes within the tenth month: So those are called *Septimestres*, who beside six full months do attaine some dayes of the seauenth. And yet more plainly in his Book *de Alimento* after he hath described the *Septimestres*, *Octimesters*, *Nonimestres*, and *Decimestres partus*; at length he breaketh out into these words, *In these months are begotten or rather breede more and fewer according vnto the whole and the parts*, that is, either in a part of the moneth, or in the whole and full moneth. And in his Booke *de Septimestri partu* he saith, that the fiue months which come betweene the first and the seuenth must be numbred whole: but the first and the seuenth it skilleth not much though they be imperfect.

The vtmost time of the seuen-month birth.

So in the computation of the Critical dayes, those daies which go before the *Crisis* must be accompted whole; but the Criticall day it selfe wherein Nature endeauoureth the *Crisis* hath a great latitude; for a *Crisis* yea a happy and prosperous one, may fal out in the beginning, in the middest, or in the end of the seauenth or the fourteenth daies: wherefore those months which go before the birth, must be al accompted whol excepting the first. Againe, the very month of the birth which is of the same nature for accompt with the Critticall day, hath two extreames and many intermediate times. In any of which if the infant be borne he may suruiue. And thus I thinke you may cleare your selfe out of the Thornie and intricate passages of months and dayes in the Computation of the legitimate or illegitimate times of the birth.

The intermediate daies & months are onely perfect.

QVEST. XXXI. *What are the vniuersall and particular Causes of the Birth.*

Democritus. The *Scepticks.* *Aristotle.*

Democritus a great Philosopher of his time, complaineth that the truth is drowned in a deepe well. The *Pyrronij* or Scepticke Philosophers thinke that all things are vncertaine and that nothing can be determinately knowne. *Aristotle* the Father of the Schoole of Philosophers saith, that the certaine and Naturall causes of all things naturall are onely knowne to Philosophers; which before Philosophy it selfe was borne our admired maister *Hippocrates*, in his Booke *de Aere aquis, & locis* hath thus expressed, οὐδὲν ἄνω φύσιος γίνεται, *Nothing in Nature is done vvithout Nature*, that is, without a naturall cause. These causes if any man with *Heraclitus* shal deny, he shall not onely entangle himselfe in a thousand Labyrinths of absurdities, but also forfeite all knowledge and assured demonstration; for to know, saith the Philosopher, is to vnderstand the Causes of things; Seeing therefore the birth is a naturall action, and that the times therof are very different, it shal not be amisse a little in this place to enlarge our selues in the disquisition of the causes thereof.

Hippocrates.

Heraclitus.

The vniuersal causes of the birth.

The Causes therefore of the birth are some of them vniuersall, others particular. The vniuersall causes are common not onely to man but also to al creatures; and some of them are on the part of the birth; others on the part of the Matrix or woombe; because the byrth proceedeth from an equall contention of the birth, and the bearer. The Cause on the part of the birth *Hippocrates* in his Booke *de Natura pueri*, elegantly expresseth to be the defect of both sorts of aliment: Spirituous and Solid on this manner; *When the Infant becommeth larger and stronger, the Mother cannot supply it with fit and sufficient Aliment, which while it seeketh with often kicking it breaketh the Membranes, and being vnlooſed from those bandes ſſueth foorth.*

On the part of the infant.

The Mola or Moone calfe may be carried in the womb many yeares, because it is neither

ther nouriſhed nor doth tranſpire; wherefore deſiring neither Aliment nor ayre, it is ſtil retayned. There are ingendred oftentimes in the wombes of women, Monſters and Creatures of diuers kindes, as Serpents and Mould-warps which becauſe they haue little bloud haue alſo little heate and being contented with tranſpiration alone doe lurke many yeares in the corners of the wombe, neither would euer iſſue of their owne accorde vnleſſe they were driuen forth either by the contention of the wombe or by the helpe of the Phyſitian. The want therefore of nouriſhment is the firſt cauſe of the birth. Why the *Mola* and many monſters lie long in the womb.

There is alſo another vniuerſall cauſe on the part of the wombe: for the wombe hauing a determinate quantity & magnitude beyond which it cannot be extended, when once vpon the increaſe of the Infant it is come to that extent, it laboureth to lay downe the burthen wherby it is oppreſſed: and according hereto *Hippocrates* ſaith in his firſt book *de morbis mulierum* that abortments do happen when the wombe is too little, that is, when the Infant is ſo encreaſed that it can be no longer contayned in the wombe. *The wombe* ſaith hee *hath peculiar diſpoſitions bred with it which cauſe abortment*, and among thoſe diſpoſitions he accounteth the narrowneſſe thereof: wherefore the Infant ſeeking nouriſhment and the wombe not admitting further diſtention, do make the birth. The vniuerſal cauſe of the birth on the part of the wombe. *Hippocrates.*

The particular cauſes doe belong onely to the birth of a man, becauſe man onely among all creatures hath the times and ſpaces of geſtation and birth very diuerſe and different, of which differences the cauſes alſo are as different. Firſt it is manifeſt that all bruite beaſtes are at certaine times prouoked to Generation: as therefore the times of their coition are certaine: ſo alſo are the times wherein they bring foorth; mankinde becauſe at all times and ſeaſons hee is fitte for Generation, doeth at all ſeaſons alſo bring foorth his burthen. The particular cauſes of the birth.

Now the limits of geſtation and birth of the Infant are manifold and diuers; not on the part of the vniuerſall agent, that is of Nature; for the power of Nature is the ſame in man and in beaſt; the motion one and one eſtabliſhed Law: but the variety comes from the diuerſity of matter, which in a man vndergoeth manifould alterations more then in a beaſt: for bruite beaſtes vſe alwayes the ſame ſimple dyet, a man doth not onely vary in the matter but in the times of his repaſt. The other creatures after they haue conceiued will no more admit the Male, which is not ſo with a woman, whence comes no ſmall alteration in the body of the Infant. The other creatures are not tranſported with paſsions, which how hurtfull they are vnto men euery man hath too much experience in himſelfe and *Plato* in *Charmide* elegantly recorded, writing That all the miſchiefes that happen to mens bodies proceed from the affections of the minde. The diuerſity is from the matter. The 1. cauſe The ſecond. The third. *Plato.*

Some there are who referre the cauſes of the variety of the birth to the different Nature of the ſeede, ſome ripening ſooner ſome later. To theſe we will adde the ſingular prouidence of Nature for the conſeruation of mankinde, which is the Final cauſe: For being more carefull of man (whome *Pliny* calleth Natures darling) then of bruite beaſtes, ſhee hath granted vnto him more times and limits both of geſtation and birth. The times of birth are the 7.8.9.10. and eleuenth monethes: but why the ſeuenth and ninth moneths are vital, that is, why children ſuruiue who are borne in thoſe moneths and not in the eight this indeed is hard to be knowne. The fourth. The fiſt. Why the infant ſuruiueth at 7. months and not at 8.

The *Pythogorians*, *Geomitritians*, *Aſtrologians*, and *Phiſitians* are of diuerſe minds concerning this matter, and becauſe it is an elegant controuerſie and full of variety wee will take liberty in this place to diſcuſſe them all. The opinion of the *Pythagorians.*

The *Pythagorians* and *Arethmeticians* referre all thinges to number; for they make and ordaine a threefould order in things; of *formes*, *figures* and *numbers*, among which, *numbers* are the chiefe: for in the whole Scripture wee reade that all things are diſpoſed in number, waigth and meaſure.

Of Numbers ſome are equall ſome are vnequall; the equal numbers they eall fœminine, the vnequall maſculine; the firſt imperfect, diuiſible and vnfruitfull; the latter perfect, fruitfull and indiuiſible; and therfore ſay they theſe numbers haue the nature of a principle; for the equall number is generated of two vnequals; but an equall neuer generateth an vnequall. Furthermore among the vnequall numbers the ſeauenth hath the firſt place, whoſe maieſty and diuinitie is ſo great, that the antients tearmed it ſacred and venerable. The *Magi* of the *Indians* and the wiſe Prieſts of the *Egyptians* called the ſeuenth, the number of the greater and the leſſer world. Differences of numbers. The excellency of the number of 7.

Phylo the Iew in his Booke *de mundi opificio* attributeth this prerogatiue to the ſeuenth

that it alone can neither generate nor bee generated: of other numbers which are within tenne, ſome doe generate but are not generated as the number of one or the vnity; ſome are begoten but doe not beget as the number of eight; ſome both beget and are begotten as the number of foure: only ſeuen neither begetteth nor is begotten, and hence commeth the perfection and dignity thereof; for whatſoeuer neither begetteth nor is begotten that remayneth vnmouable. Againe, the *Pythagoreans* call the ſeptenary number the tye or knotte of mans life, which *Tully* in *Scipio* his dreame acknowledgeth, where he ſayth, *That ſeauen is the knot of all things.*

Harmony.

There is alſo in this number moſt harmony, as being the fountain of a pleaſant *Diagramma*, becauſe it contayneth all the harmonies, *Diateſſeron*, *Diapente*, *Diapaſon*; as alſo all proportions Arithmeticall, Geometricall and Muſicall.

What the diuines ſay of the number ſeauen.

The Diuines call it the number of *Perfection*, becauſe all things were perfected the ſeuenth day. The number of *Reſt*, becauſe the ſeauenth day God reſted from all his workes. The number of *Sanctification*, becauſe it was commaunded to bee ſanctified or kept holy. Finally, the number of *Reuenge*, of *Repentance* and of *Beatitude*: whence it was that the Poet ſayde, *ô terque, quaterque beati, O thrice and foure times happy.*

Phylo Iudæus and *Linus* an old Poet haue written many things in the commendation of this number of ſeauen. To omit that which ſome haue obſerued, that there are ſeauen wonders of the world, ſeauen wiſe men among the auntients, ſeauen greater and leſſer Triones in heauen, ſeauen circles wherewith the heauens is ingirt, ſeauen wandring ſtarres, ſeuen ſtarres in the Beare, ſeauen ſtarres of the *Pleiades*, ſeauen changes of the voyce, ſeauen phyſicall and naturall motions, ſeuen vowels among the Greekes, ſeauen ages; that the ſeauenth age ſhall be a golden age, ſeauen mouthes of *Nilus*, ſeauen mettalles, ſeauen liberall Arts, ſeauen windowes in the head, ſeauen cauſes of all humaine actions, ſeauen Cities that ſtroue for *Homer*, that the ſeauenth Sonne is able to cure the Kings Euill, and a ſeuenth Daughter if ſhe be preſent quickeneth a womans trauell, the hearbe Tormentill which hath ſeauen leaues reſiſteth all poyſons. All theſe things I ſay we wittingly and willingly paſſe ouer, for it muſt bee confeſſed that vnder the name of numbers there are many friuolous and ſuperſtitious toyes thruſt vppon the world: I come to Philoſophicall and Phyſicall demonſtrations.

It is to bee marked that the Phyſitians and Philoſophers haue obſerued how our life is diſpenſed by ſeauens.

The life of man cõſiſteth of ſeauens.

Hippocrates in his Booke *de principiis*, ſayeth that *the age of Man* conſiſteth of the ſeptenarie number of dayes: For many of them who in ſeauen dayes ſpace doe neuer eate nor drinke, doe dye one of thoſe dayes, aſwell becauſe the Gut called *Ieiunum* is contracted, as alſo becauſe the ſtomack in ſo long ceſſation of his office becommeth forgetfull afterward to do his duty.

The Seede of the man which within ſeauen houres after eiaculation returneth not backe, wee may bouldly pronounce is Conceiued: ſo the ſeauenth day after Conception, the firſt rudiments of all the ſpermaticall partes doe appeare, and the Geniture ſayth *Hippocrates hath the ſeuenth day whatſoeuer the body ought to haue.*

The ſeauenth-moneth birthes are vitall not the eight, and the ſeauenth day after the birth the Infant caſts the remaynder of his Nauell: after twice ſeauen dayes hee beginnes to moue his eyes towardes the light, after ſeauen times ſeauen hee is able to moue his head and eyes euery way. The ſeauenth moneth hee beginnes to breede his teeth, after twice ſeauen hee is able to ſit without feare of falling, after thrice ſeauen hee beginnes to ſpeake, after foure times ſeauen to goe, and after fiue times ſeauen to leaue ſucking.

The ſeauenth yeare hee changeth his teeth, their third Generation beeing then made of moſt ſolide Aliments as *Hippocrates* writeth in his Booke *de principiis*; at that time alſo his ſpeech growes perfect, whence the Grecians doe make ſeauen vowelles. After twice ſeauen yeares the ſignes of youth beginne to breake out, in maydens the courſes flowe, breaſtes ſwell, and they are fitte for husbands. In men the voyce changeth, and they grow petulant by reaſon of the vigour of their naturall heate. After thrice ſeauen yeares they grow towards their ſtrength which remayneth conſtant the fourth, fift and the ſixt ſeuens, and that age is called *virilis* and *conſtans ætas*, that is, *Man-hood*. The ſeauenth ſeptenarie is called *Quadratus*, becauſe then a man is euery way accompliſhed both in bodye and in mind.

The

The ninth is esteemed Clymacterical and very dangerous, for it hath beene alwayes obserued (as *Aulus Gellius* noteth) that this time of a mans life is for the most part accompanied with some notable danger of the life, or greefe of the mind. And therefore we read in the same Author, that *Augustus Cæsar* congratulateth his Nephewe *Caius* concerning this Climacterical yeare on this manner. *All hayle my pleasant Nephew Caius, whom beleeue me, I do alwayes desire when thou art absent from me; but especially at such times as these my eyes do euen faile with looking for my Caius, yet whersoeuer thou art this day I hope that with good hea'th and good cheare thou doest celebrate this my 64. birth-day. For as thou seest wee haue ouercome the 63. yeare, the common Clymacterical and dangerous yeare for old men.* *Auguſt. Cesar to Caius.*

The tenth Septenary which fulfilleth the seauentith yeare, is esteemed to be the limit of life, and so the Kingly Prophet singeth in the Psalme, *The dayes of a man are seauenty yeares, beyond which all is labor and sorrow.* Wherefore all Septinary dayes and moneths and yeares are especially to bee considered, because in them there happen notable muratians. Psal. 90, 10.

Hence it is that *Ficinus* the Platonist giueth him Counsell that desireth to prolong his life, euery seuenth yeare to take counsell of an Astrologian and a Physitian. Of the Astrologian, that he may vnderstand what dangers and where do hang ouer his head; and of a Physitian, that by a prescript rule of dyet he may auoide the threatnings of the Starres and their maleficall influence.

Aristotle in his seauenth Booke *De Historia Animalium* doth also acknowledge this prerogatiue of the number of seauen, because in euery Septinary the greatest changes do vse to happen. *Galen* deliuering the precepts of health, maketh the distinction of Ages according to seauens. It is not therefore without good warrant, that the *Pythagorians* call the septinary number the beginning or principle of all things. *Tully* the tye or knot of all thinges; and Physitians warranted by certaine experience, the King or prince of the Decretorie or Criticall dayes. Wherefore the Pythagorians and Arithmetitians do therefore conclude, that the seauen-month birth is vitall because it consisteth of an vnequall and most perfect number. *Pythagoras* and *Tully.*

And this *Hippocrates* in his Booke *De Principijs* doth also acknowledge, for therefore hee thinketh that Infants borne the seauenth-month do suruiue, because they haue attayned a iust and full number of seauens. And that the eight-month birth is not Vital, because it hath not fulfilled the full Decades of weekes. Moreouer in his Booke *de Septim. partu* he writeth, that the Conceptions, Abortments and Births of Infants are iudged, as wee speake, in the same times in which diseases haue their iudgement or Crisis. Now we know that all diseases are most whot iudged on vnequall dayes, and that the Septinary number is onely truly Criticall. *Hippocrates* acknowledgeth the power of the septinary number.

If it be obiected, that the tenth month although it be equall and fœminine is yet for the birth Vitall and legitimate the Pythagorians will make answere, that ten is the perfection of all Numbers and conteineth in it selfe all numbers of perfection. And this is the opinion of the Pythagorians and Arithmetitians of the causes of the seauen-moneth and eight-month birthes, who conceite that all things are to bee referred vnto the force of Numbers. That the 10. number is perfect.

For my owne part I thinke with *Aristotle* in his Metaphysickes, that Number of it selfe hath no operatiue power, for so it is a quanrity; but the nature of Number as it is the form of time concluding all the workes of Nature hath a strong efficacy. And this Nature & necessity as it were of Nature it selfe, *Hippocrates* in the end of his Book *De principijs* promiseth to explaine. What wee thinke of Nũbers.

The Astrologians and Figure-flingers do referre the causes of the seuenth-month, eight-month, and nine-month births to the diuerse Aspects of the Planets, for ouer euery moneth they thinke each Planet hath predominance. *Saturne* ouer the first, who with his coldnes & drought reteyneth the liquid and moyst seed, and congealeth it as it were into a conception. Ouer the second *Iupiter*, who by his warmth and Vitall heat causeth it to increase. Ouer the thirde *Mars*, who with his heate and drought maketh the members beginne to mooue. Ouer the fourth the *Sun*, who by the power of his woonderfull heate enlargeth all the passages. Ouer the fift *Venus*, who addeth grace and beauty to the infant. Ouer the sixt *Mercury*, who polliſheth & absolueth the Organs of motion. Ouer the seuenth the Moon; who filleth the empty spaces and distances of the Fibres with flesh & fat, and with hir moysture relaxeth the orifice of the wombe that the birth may be the more easie. If therefore the infant do the seauenth-moneth yssue furnished with all these endowments of the Pla- The opinion of the Astrologians. Saturne. Iupiter. Mars Sol. Venus. Mercury. Luna.

nets, then is he Vital and is likely to ſuruiue; but if being weak he be not able to looſen him ſelfe from the ſides of the wombe, then *Saturne* that maleficall Planet and aduerſarie to the principles of our life, returneth againe vppon him and ſo like a Tyrant holdeth the Infant priſoner; or if in that month he come into the world he preſently periſheth, as hauing his Vitall heate nipped by the cold of that churliſh Planet. Add heereto, that the weake infant is not able to beare or endure ſo ſudden an alteration from the Moone to Saturne, as if it were from the loweſt ſtaffe to the top of the Ladder, becauſe all ſudden mutations are enemies to Nature.

But if he ouercome the eight month, then to Saturne ſucceedeth Iupiter that benefical Planet, by whoſe proſperous and healthfull aſpect all the ill diſpoſition that came by Saturne is fruſtrated and auoyded; wherefore the ninth moneth the infant is borne vitall and liuely, as alſo the tenth and the eleauenth, becauſe of the familiarity of Mars and Sol with the Principles of our life. And this is the opinion of the Aſtrologers concerning the Cauſes of our birth, which is indeed elegant and maketh a faire ſhewe but is in the meane time full of Error as *Picus Mirandula* hath prooued in a Booke which he hath written againſt Aſtrologers. For how may it be, that Saturne ſhould alwayes beare ſway the firſt and the 8. months, when as a women may conceiue in anie months of the yeare any day in the month or any houre in the day? Why do Hindes calue the eight month and their yong ſuruine, as *Ariſtotle* writeth in his ſixt Booke *De Natura Animalium*. *Pliny* is of opinion in the fifte chapter of his ſeuenth Book *De Naturali Hiſtoria*. That only thoſe children are Vital if they be borne the ſeauenth month, who were conceyued the day before or after the Full of the Moone, or in the New Moone. But all theſe are idle and addle immaginations of vvanton braines.

The opinion of the Aſtrologians confuted.

Pliny his idle opinion.

The Geometricians referre the Cauſes of the birth vnto the proportion of the Conformation and motion of the Infant. For (ſay they) there is a double proportion of the conformation to the motion, and a trebble proportion of the motion to the birth, which proportion if the Infant holde, then ſhall hee arriue aliue and liuely into the worlde. So the ſeauenth month birth is vitall, becauſe it is formed the fiue and thirtith, mooued the ſeuentith, and borne the two hundred and tenth day.

The Geometritians proportions

And this opinion may be confirmed by the authority of *Hippocrates*, for in the third Section of his ſecond Book *Epidemiõ* he ſaith: *whatſoeuer is mooued in the ſeuentith day is perfected in the triplicities*. But *Auicen* confuteth this opinion. For if onely the proportion betwixt the conformation and the motion of the infant were the cauſe that he ſuruiued; thé ſhould he aſwell ſuruiue the eight as the ſeuenth moneth, becauſe they keepe the ſame proportion. For inſtance; Say that an infant be formed the fortith day, then ſhall hee moue the eightith, and be borne the two hundred and fortith. And in this birth the proportion is exquiſitly held, becauſe twice forty make eighty, and thrice eighty two hundred and fortie dayes. Now *Hippocrates* in his Booke *De Alimento* ſaith, that an infant borne at 240. daies (which all men vnderſtand to be the eight-moſth birth) *is and is not*. But the authority of *Hippocrates* may well ſtand with this opinion, for it is not his meaning that this proportion is the cauſe of the life of the infant, but ſimply and abſolutely hee ſayth, that there is a certaine proportion betwixt the conformation, Motion and Birth of the infant, which no man will deny.

Hip. authority *Auicen*,

Hip. explained

It remaineth now, that wee acquaint you with the Philoſophers and Phyſitians reaſons why the ſeuenth-month birth is Vitall and not the eight? Nature although ſhe be illiterate and vntaught, yet hath ſhe conſtant Lawes which her ſelfe hath impoſed vppon her ſelfe; definite alſo and limited motions which ſhe alwayes keepeth without inconſtancy or mutability, vnleſſe ſhe be hindred by ſome internall or externall principle. As therefore ſhee neuer endeauoureth any perfect Criticall euacuation vnleſſe the humor bee before boyled and prepared: So ſhe neuer vndertaketh a Legitimate birth till the infant bee perfected and abſolued in all his numbers. And as in crudity no good Criſis is to be hoped for according to *Hippocrates*: ſo before the infant be perfected, the birth cannot bee ligitimate or Vitall. For the birth ſaith *Galen* is a kinde of Criſis. Now before the ſeuenth moneth the infant is not perfected, and therefore before the ſeauenth month he cannot be borne aliue. But the ſeauen-month if he be ſtrong he breaketh the Membranes, maketh way for himſelfe and ſuruiueth becauſe he is perfect, eſpecially if it be a male child.

The 5. opinio of the Philoſophers and Phyſitians.

The Lawes of of Nature are certaine.

No vital birth before perfection

The eight month birth why not vital. 1. Reaſon.

The eight month although he be perfect hee cannot ſuruiue, becauſe hee is not able to beare two afflictions, one immediately ſucceeding in the necke of another. For in the ſe-

uenth

uenth moneth he laboreth sore, and repeateth his contention the eight, before his strength is refreshed.

And this is *Hippocrates* opinion in the very beginning of his Booke *de octimestri partu*, *Concerning the eight-moneth birth I am of this iudgement, that it is impossible that the Infant should beare two succeeding afflictions, and therefore those Infants doe not suruiue.* For they are twice afflicted, because to the euils they suffered in the wombe are added also the payne in the birth. *Hippocrates* authority.

Again, the eight-month birth is not vital, because it commeth after the birth day, which should haue beene the seauenth moneth, and before the birth day which is to bee the ninth moneth. Whence we may gather that some ill accident hath betided the Infant or the mother which hindred the birth the 7. month and preuented the ninth. The 2. reason

And hitherto belongeth that golden sentence of our admired maister *Hippocrates* in the eight Section of his sixt Booke *Epidemion*. *If nothing happen within the prescript time of the birth, whatsoeuer is borne shall suruiue.*

But now why a woman doth not beare her burthen beyond the tenth and the eleauenth months. *Hippocrates* in his Booke *de Natura pueri* referreth the cause to the want of Aliment. Now the Aliment fayleth as well because a great part of the bloud flowes back vnto the Pappes for the generation of Milke, as also because the Infant is nourished only with pure and sweete bloud which the mother can no longer in sufficient quantity supply vnto him. Neither is that to bee passed ouer with silence which *Hippocrates* obserued in the Booke before named, to wit, that in some women the Aliment fayleth sooner, in some later. Those which are not accustomed to bring foorth haue lesse Aliment then others for their Infants, because the bloud is not accustomed to turne his course toward the wombe. Againe, those women who haue lesse store of their courses and of Milke their Aliment faileth the sooneste. Why a woman goeth not aboue 11. moneths. What women defraud their Infants soonest.

It is also worth our obseruation that large and great creatures do carry their burthens the longest, because they doe not so soone attaine the perfection of their increment or growth: So an Elephant bringeth not forth before the second yeare after her conception, but house-doues breed euery month. Why great creatures carry their yong long.

Man being of all Creatures the most perfect, the most wise, the most temperate and as it were the measure of all others, hath also moderate times of gestation, that is, the 7. and the 9. months if Nature be not interrupted or preuented.

QVEST. XXXII. *Whether in a desperate byrth the Casarian Section be to be attempted.*

Aristotle in his seauenth Booke *de Natura Animalium*, sayeth that among all creatures a womans trauell is most laborious and difficult, as wel because she leadeth a soft and sedentary life, as for that a mans Brain is the largest and so his head great, especially as long as he is in his mothers womb; now the head vseth to come forward in the birth. This birth as sayeth *Galen* in the eight Chapter of his fifteenth Booke *de vsu partium*, exceedeth all admiration; for the mouth or orifice of the wombe, which all the time of the gestation is so closed that a needles poynt cannot passe into it; in the birth is so enlarged that the Infant yssueth out thererat. Why the birth of man is most difficult. A miracle of Nature in the birth.

But there are many obstacles which intercept the passage of the Infant by the orifice and necke of the wombe; as the thickneste and magnitude of the Infant, or naturall straytneste of the inward orifice and of the neck; a distortion, inflamation, some tumor against nature, a fleshy Caruncle, a scarre, or the faulty confirmation of the share-bones. For oftentimes in the inner part of the share-bone there is a sharp processe which intercludeth the passage of the Infant vnto the birth blace, and then there is no hope that the woman can be deliuered: Wherefore either the Infant must perish or the mother, or both together. In this so hard and desperate an extremity, the question is what may be attempted? wee answere. If the mother be dead and the childe yet liuing, then presently without any delay the wombe of the mother must be ript open. And those children that are thus taken foorth are called *Cæsares*, or *Cæsones* from the cutting of the mothers wombe, from whence the *Cæsars* had their names. After this manner as *Pliny* reporteth in the ninth Chapter of the seauenth Booke of his Naturall History, was *Scipio Affricanus* the elder, *Iulius Cæsar* and *Manilius* borne. What things hinder the outgate of the infant. The wombe must be presently opned if the mother be dead.

But if the mother be yet aliue and the Infant by no other meanes can safely bee brought forth

Though the mother liue, yet this ſection may be attempted. *Hippocrates, Paulus.*

foorth the ſame ſection or opening of the wombe may bee adminiſtred; for common experience and the authority of antient Phyſitians doe aſſure vs that the wounds of the muſcles of the lower belly and of the *Peritonæum* or rim are not mortall.

Hippocrates in the third Section of his ſixt booke *Epidemion*, commaundeth vs to cutte our Dropſie patients inſtantly: now this Section for the Dropſie is a wounding of the *Epigaſtrium* or lower belly and the *Peritonæum*: as for the wombe it ſelfe *Paulus Aegineta* teacheth vs that the wounds thereof are not mortall. *It appeareth vnto vs* ſaith he *that though the whole Matrix bee taken away, the woman will ordinarily ſuruiue.*

Franciſcus. Roſſet.

Concerning this *Cæſarian* ſection, *Franciſcus Roſſetus* the French Kings Phyſitian hath ſet foorth an elegant Booke ſo beautified with Hiſtories and abounding with good arguments, that wee ſhould abuſe our time and your patience to tranſcribe them in this place: wherefore wee remitte thoſe who deſire further ſatisfaction heerein to that learned Authour.

QVEST. XXXIII. *Whether in the Birth the Share and Haunch-bones doe part aſunder.*

The wonderfull indeuour of nature in the birth.

THE workes of Nature in the conformation, life and nouriſhment of the Infant are indeede full of admiration, but her laſt endeuour in the birth thereof is indeede the crowne of all the reſt, as that which exceedeth all admiration. For the orifice of the wombe which after the firſt apprehenſion and conception of the ſeede was ſo exquiſitely cloſed that it will not admit the point of a Probe: now that the Infant with turning, kicking and breaking of the membranes prepareth toward his enlargement, it is ſo relaxed as if it were a gate wide open.

But becauſe Nature is ſo wiſe and prouident that ſhee vndertaketh nothing without due preparation, therefore in the laſt moneths of geſtation ſhe lyneth the inner ſurface of the orifice with a ſlimy and mucous humor, which thereupon becomming moyſt and ſoft doth more eaſily diſtend or inlarge it ſelfe without feare of laceration or tearing.

Now whereas the wombe is contayned within the capacity of the hanch-bones, and is walled about on the fore-ſide with the ſhare-bones, on the backe-ſide with the holy and rump-bones, and on either ſide with the hanches, whereof ſome are ioyned together with a faſt and immouable articulation, other by the mediation of a cartilage or griſtle: whether in the birth there bee a diuulſion or ſeparation of theſe bones, that now is the queſtion we haue in hand.

That the bones are parted in the birth. Authorities. *Hippocrates.*

Some learned men are of opinion that the ſhare-bones and the haunch-bones are ſeuered, which alſo may bee confirmed by the authorities of many right learned men and by reaſons which carry with them a faire ſhew of trueth. *Hippocrates* in the end of his Booke *de Natura pueri* wrote on this manner. *In the very birth the whole body is as it were vppon the racke, but eſpecially the loynes and the hanches, for their Coxendices are diſtracted and parted aſunder.* And *Auicen* in his third Booke *Fen.* 21. *Tract at.* 1. *Cap.* 2. ſayeth. *When the Infant is borne the wombe is opened with ſuch an apertion as cannot be made in any other place, and it is neceſſary that ſome iunctures muſt be ſeparated, which are ſo ſuſtayned by the helpe of God ſo diſpoſing and preparing, and afterward doe returne to their natural continuation; and this action of all the workes of Nature is the ſtrongeſt and moſt forcible.* *Rabbi Zoar* vppon the firſt of Exodus. *Thou ſhalt not eaſily finde any thing in the whole adminiſtration of Nature more to be admyred then that diſtraction of the ſhare-bones in womens trauell, which indeed is done by the prouidence of God to whom Nature is but a ſeruiceable hand-mayd, for otherwyſe no ſtrength almoſt is able to ſeperate them. The like alſo we haue ſeene in the ſhooting of Stagges hornes which euery yeare fall and grow againe.*

Auicen. *Rab. Zoar.*

Pineus opinio His firſt reaſon.

Seuerinus Pinæus in his Phyſiologicall & Anatomicall work is of the ſame opinion, which alſo he ſtrengtheneth by ſome reaſons. Before the ſeuenth moneth, ſayth he, the wombe and with it the Infant doth alwayes aſcend; after the ſeauenth moneth hee deſcendeth and prepareth himſelfe toward his enlargement. At that time the priuities of the woman with childe are moyſtned with a mucous ſlime, and the parts are dilated and relaxed, with which humour alſo by degrees the griſtles of the ſhare-bones are inebriated, that in the birth they might bee the more laxe. Furthermore almoſt all the griſtles of the body in progreſſe of time doe dry into a bony ſubſtance as may be ſeene in the chinne; but the cartilage which tyeth together the ſhare-bones remayneth griſtlely to the end of our life, neither euer becommeth bony, becauſe in the birth it is to be diſtended and enlarged. Moreouer if you well

The ſecond.

The third.

well consider virgins of 16. or 18. yeares old, and againe take notice of them after they haue conceiued, thou shalt perceiue that their hanches are distended, their *Hypogastrium* enlarged and their buttockes become broader, especially when they are neere the time of theyr deliuerance: and therefore it followeth that those partes are dilated. Moreouer, those who haue liued long virgins haue harder trauels then yonger wenches, because their gristles in those places are more dried and lesse relaxed. The fourth.

Finally, such as neuer haue conceiued haue thinner gristles, and such as haue ofteneſt conceiued haue them most thicke and are broadest in the hanches. Wherefore in the birth the share-bones are parted assunder one from another, and the hanch-bones from the *Os Sacrum* or holy-bone. And for the confirmation of his his opinion, he telleth a Story of a woman who was new deliuered and shortly after hanged, whose share-bones were so distracted that one of the *Coxæ* was lifted vp and the other depressed. The fift. A history.

For my owne part that I may freely speake what I thinke, I do not think that these bones in the birth can be vnioynted, for they are so fast knit together that no violence can seuer them. And if they bee separated asunder how shall they be againe coupled? with what Cement or Glue shall they be vnited? For a new Synchondrosis or articulation by the mediation of a Cartilage cannot be made. If you say with *Hippocrates* that they chinke a little, I will not be against it. Also that the gristly end of the Holy bone, which they call *Coccyx* or the rumpe, may be totally retracted and so giue way to the infant that there should bee a greater space left for his out-gate, that I can well beleeue. As for *Pinæus* arguments they may thus be in order answered. It is indeede said and saide truly, that in the last months of Gestation the inner orifice of the wombe is lined with a slimy humor, proceeding eyther from the vterine vessels, or from the humours sweating through the Membranes, or otherwise from the reliques of the infant; but that humor say we cannot attaine vnto the Share-bones or to the Cartilages betweene, them neither yet vnto the hanch-bones; because the womb doth not imediately touch the share-bones; for betwixt the wombe and the bones lyeth the bladder lurking betweene the two coats of the *Peritonæum* and compassed round about with the *Peritonæum* as it were with a purse or Sachell. Our opinion that the bones cannot be seuered. *Pinæus* Arguments answered. To the first.

And whereas he saith, that the Cartilage which knitteth together the Share-bones neuer becommeth bony but alwayes remaineth gristly that it might bee relaxed in the birth; it is but a slight reason; for neither in men is that gristle euer found to be bony. In young wenches after they haue conceiued, their hanches are distended and the capacity becommeth larger, and that because at that time all the parts of their bodies do grow & the heate which before was well neere choaked with the aboundance of humors beginneth to shine foorth and gather strength. Elder Maidens hauing conceyued haue harder trauelles then yonger, not because the gristles are drier but because their wombs are drier; for those that vse to conceiue and beare children haue moister wombes, larger vessels and all the capacities more large and ample and therefore their trauell is more easie. One History dooth nothing moue vs, for we haue seene many who haue perished in the very brunt of their trauell in whom there hath appeared no such matter, and we obserue that women in their trauels do more complaine of the paine of their *Os sacrum* and rump, then of the region of the share-bones. To the secõd. To the third. To the fourth To the fift.

And thus are we come to an end of our long Discourse of the History of the Infant and the Controuersies thereto belonging, wherein how we haue acquitted our selues it resteth in thee gentle Reader to iudge; this one thing wee know, that wee haue wrought out our way through many difficulties, which if they shall prooue as profitable and pleasant vnto thee as they haue beene to vs difficult to ouercome, wee haue aboundant recompence.

Now we proceede in our entended iourney to the Chest, wherein what Admirable rarieties Nature hath bestowed, we referre thee to our Discourse to be satisfied.

The End of the History of the Infant, and of the Controuersies thereto belonging.

THE SIXT BOOKE,

Of the Middle Region, called the Cheſt or the Thorax, which conteyneth the Vitall partes to *to which alſo wee will referre the Necke with the Weazon.*

The Præface.

HAuing thus abſolued the Lower Region with the parts thereof as wel Nutritiue as Generatiue, togither with the hiſtory of the Infant; it followeth that we aſcend by the ſtaires of the ridge to the middle Bellie, wherein as in a curious Cabinet Nature hath locked vp the vitall Inſtruments and wheeles whereby the Watch of our life is perpetually mooued from the firſt houre to the laſt minute by ſo iuſt a counterpoiſe as no Art of man could euer attaine vnto, albeit ſome rare Enginers haue gone very farre in imitation thereof. If we ſhould enter into the cauſes of this perpetual motion, as it would be very hard to find them out, ſo would it ſpend much time to enquire after them. The higheſt cauſe is the hande of God, who hath prepared the Pullies, hung on the weights and gouernes and winds vp the Chime at his own good pleaſure. For if the Philoſopher were not able (though he were nere of councell to Nature) to diſcerne with the ſharp edge of his incomparable capacity the reaſon of the reciprocal ebbing and flowing of the Sea: how ſhall we be able to yeelde a reaſon of the Dilatation and Contraction of the Heart. Notwithſtanding it is commonly conceyued that the moſt immediate cauſe is the auoiding of Vacuity that Arch-enemy of Nature. For the Faculty of pulſation although it be potientially in the heart of the infant in the Mothers wombe, yet it is not drawne into acte till the Cheſt diſtending it ſelfe doth draw in the aire wherof that Vitall ſpirit is made, about whoſe generation that Pulſatiue vertue is wholly occupyed. As for the motion of the Arteries, we conceiue that they follow the motion of the heart, like as a Lute lying by another that is played vpon, will repreſent or returne the diſtinct Tune thereof.

I might heere enter into a large diſcourſe of the excellency of the Heart; how in this Litle world, it is like the Sun in the Great world; how it continually ſupplieth the expence of Vitall ſpirits; how it quickneth and ſtrengthneth the Naturall heate of the whole body; how it is an Embleme of an excellent Magiſtrate; how the Lungs as freſh Fannes do temper the flaming heate of the hearts furnace, and how as Bellowes they kindle the ſame againe. For albeit this Sun of the body can neuer be truly ecclipſed, this Genial fire neuer extinguiſhed without the diſſolution of the *individuum*; yet we ſee in many cold diſeaſes of the braine & malignant exhalations from the wombe, that to our ſenſe this ſparke of Sacred fire is deaded and put out, which notwithſtanding by the helpe of the Lungues is afterward blowne vp into a luculent flame.

Beſide the Organs of life, there belongeth alſo to this Region another no leſſe admirable inſtrument of Nature, whereby the voice is ſo diuerſified, that vpon the ground therof that Noble Science of Muſicke hath beene from the beginning and ſtill is infinitely propagated and yet the end or perfection thereof not attained vnto. But why do I go about in this place to exemplifie the adminiſtrations of Nature in this middle Region? conſidering that to ſay a little is derogatory from the woorth of the argument; to ſay much were heere in vaine, ſeeing the following Diſcourſe is purpoſely addreſſed for the Readers ſatisfaction therein.

CHAP.

CHAP. I.

Of the Thorax or Cheſt, and the Diuiſion of it.

THE middle belly is called θώραξ, of a word which ſignifieth to leap or dance, becauſe in it the heart continually mooueth from the ingate to the outgate of life. It is comprehended by the ribs, or rather circumſcribed by the Ribs and Patell bones, and is ſeparated from the lower Belly by the Midriffe or *Diaphragma*, and it is the ſeate or conceptacle of the vitall Faculty which harboureth eſpecially in the heart, for whoſe ſake this Cheſt or *Thorax* was made; the habitation of the breathing partes, and the ſhop wherein the voice is framed; and for this cauſe it is called of *Hippocrates* χέλυς *teſtudo*, a Citterne or Crowd, becauſe the ſound of it maketh Muſick. It is placed between the vpper and lower bellies, that the Natiue heate which reſideth in the Heart may bee equally communicated to all the parts.

The Cheſt. How it is limited.

The cheſt was made for the heart. Compared to a Crowd.

The Figure of it.

The Figure of it is very capacious, being long & round like an Egge, whoſe magnitude may be gueſſed by the compaſſe it carrieth without. Before and behinde it is wider in man (ſaith *Ariſtotle* 2. *Hiſt. Anim.* 1.) then in other creatures; before, that there might be ſufficient ſpace for the Heart and Lungs to mooue and ſpred themſelues in, both for the voyce

Table 1. *ſheweth the body when all the bowels are taken out of the Lower Belly, and reclined backeward, that the Scituation of the Midriffe might better be diſcerned, it ſheweth alſo the other part of the Cheſt as yet couered.*

yy the intercoſtall Muſcles.
A B. the pectorall Muſcle, or the firſt Muſcle of the arme in his proper ſeate at A, the ſame ſeparated as farre as his implantation at B.
C C. the Muſcle called *Serratus maior*, or the ſecond Muſcle of the Cheſt.
D. *Serratus minor*, or the firſt Muſcle of the Shoulder blade.
E. the Muſcle called *Deltois* or *Epomis*, the ſecond Muſcle of the arme his originall is at *t*.
F. The *Clauicula* or Coller bone.

and

and for reſpiration ſaith *Galen* in the 6. chap. of his 13. Booke *de vſu partium*, that we might haue abundance of ſpirits; for that in it the ſprightfull blood is laboured of blood and aer, and the voice alſo is to be formed of the aer. Behinde it is wide, that a man may ly at eaſe vpon his backe; in other creatures it is faſhioned like the Keele of a Shippe; betwixt their fore feete in foure-footed Beaſts for their better footmanſhip; in Birdes for the nimbler motion of their wings when they flye. If it had beene otherwiſe framed in men (ſaith *Galen* in the 11. chapter of his 13. Booke *de vſu partium*) it would haue hindred the actions of their armes and in Beaſts it would not haue ſuffered their fore-bowes to haue beene ſo cloſe brought to their cheſt, which would haue hindred them much in their gate.

The ſubſtãce and ſtructure

The ſubſtance of it is neyther altogether bony as the ſcull is, for then it could not haue beene mooued, nor altogether fleſhy as the Lower belly, for then the Muſcles would haue falne vpon the heart and the Lungs euen of their owne accord: wherefore that both there might be a ſpace within for the motion, and alſo al the whole frame of the inſtrument might be mooued together, the Muſcles and the bones are ſet as it were by courſes one beſide another. For becauſe the heart, one of the principall bowels, was to be ſeated in this Cheſt, it needed a more ſafe and ſecure muniment or defence, and therefore it is walled about with bones: but becauſe the exceeding great heate of the heart ſtoode in neede of much colde aer, by which as by a fan it might be ventilated and preſerued, it was neceſſary that the cheſt ſhould be moueable, that in the dilatation of it aer being drawn into the Lungs might refreſh the heart, and in the contraction the ſooty vapors might bee expelled. Wherefore it was neceſſary that it ſhould be compoſed of many bones, which becauſe they ſhould mutually follow the motion one of another, it was requiſite alſo that they ſhould bee ioyned togither with ſome pliable ſubſtance, ſuch as is a Cartilage or griſtle.

The Reaſons of it.

The Cheſt therfore is moued with Muſcles & made vp and compacted with bones, & therefore is rightly called the Middle venter, not onely becauſe of his ſcituation, but alſo by reaſon of his ſubſtance, neither wholy bony as the heade, nor wholy fleſhy as the lower Venter.

How rightly called the Middle belly.

The whole *Thorax* or Cheſt is diuided inro a fore-part, which is called στῆθος or στέρνον, commonly the breſt; the ſide parts called πλευρὰ, *Latera* the Sides; and the back part called νῶτον or μετάφρενον, *Dorſum* the Backe, all which appeare in this precedent Table.

The Diuiſion of the Cheſt.

The parts of this Cheſt are ſome conteyning, ſome conteyned. The conteining parts are common or proper, the Common are the Skin-ſcarfe or Cuticle, the Skin, the Fat, the Fleſhy pannicle, and the Membrane of the Muſcles. The Proper are ſoft or hard, the ſoft are fleſhy, as the Muſcles (and the breaſts, of which we haue ſpoken before as rather belonging to the lower Venter, though for ornament and commodious vſe they haue their ſeat here) or Membranous, as the *Pleura* and the *Mediaſtinum*.

The parts of it.

The hard parts are bones or griſtles. And firſt of the Conteyning parts, after of thoſe conteined, according to the order of Diſſection.

CHAP. II. *Of the Skin, the Fat, and the skinne veſſelles of the Cheſt and the Necke.*

How the cõmõ inueſting parts differ from the ſame in other parts

BEcauſe we haue entreated at large in the former Book of the common conteyning parts, we will onely heere ſhew how farre in this place they differ from the ſame in other parts, and ſo paſſe on vnto the Proper Conteyning parts.

The Haires of the arme-pits.

The Scarſe-skin and skin of the Cheſt, do heerein differ from the ſame in the Lower belly, becauſe in the arme-pits it is hairy, which haires are called by *Hadrianus Iunius*, *Grandebalæ*, I thinke coyned of a Greeke word which ſignifieth to ſend foorth, and a Latine which ſignifieth great (becauſe in ſome men of all the haires of the body they com out the greateſt and moſt briſtlie) imitating *Plautus*, who to ſerue his turne maketh the word *Grandegro*, to ſtalke on with wide ſteps of *Grande* and *eo*.

Their vſe.

But the vſe of theſe haires is, that thoſe parts which ſweate ſooneſt and moſt (for heere are the Emunctories of the heart, vnto which it ſendeth his excrements as we ſee ordinarily in plague ſores) might not bee galled or fretted with the often and ſtrong motions of the armes. In many men alſo the fore-part of their Cheſt is more hairy then the *Abdomen*, and as in the Lower belly is the Nauell, ſo in this middle belly are the nipples of the breſts perforated as we haue ſaide in both ſexes.

The

The fat in this place is not ſo plentifull as in the belly (excepting the breaſtes) leaſt with his waight it ſhould hinder reſpiration. The fat.

Betwixt the fleſhy membrane and the skinne runne certaine veſſels called *Skin-veines*, The veſſels. ſome by the ſides of the necke and the head from the two outward iugular veines, which with their ſurcles runne along the fore-part of the necke; others on the backe-ſide from a Veines. braunch which the ſhoulder veine called *humeraria* ſendeth vpward, others are diſperſed through the foreparts of the Cheſt, to wit, two comming from the *Axillary* veines, one of which is a branch of the *Axillary* veine the other of the *humeraria*, like as through the back are diſſeminated certaine ſmall branches from the ſame veines. The Arteries which come hither are exceeding ſmall and capillary. Finally, there are certaine nerues ſent from the nerues that lye lower vnder the muskles and the skinne, but two more notable then the reſt which meete about the teates, which are the cauſe of their ſo exquiſite ſence.

CHAP. III. *Of the muſcles of the middle belly and of the parts of the necke.*

THE Muſcles of the middle venter are double, for either they lye vppon the ribbes or are ſcituated betweene them; yet all of them are not made onely for the motion of the Cheſt; for albeit they ariſe from the Cheſt, yet they moue either the armes or the ſhoulder blades or the backe or elſe the Cheſt it ſelfe, and ſuch are called the *proper muſcles of the Cheſt*, & theſe muſcles are placed without or within: thoſe that are ſeated without are on the forepart or on the back-part.

On the forepart there are three on either ſide.

Muſcles on the fore ſide of the cheſt.

1 *Pectoralis*, the pectorall, and it is the firſt muſcle of the arme, which is broade and large and ſeated vnder the Pappes.

2 *Serratus maior*, *the greater ſaw*, the ſecond muſcle of the Cheſt which lyeth vppon the ribbs, and to them is inſerted as it were with fingers, whence it hath the name of *the ſaw*, and occupieth eſpecially the ſide.

3 *Serratus minor*, *the leſſer ſaw*, or the firſt muſcle of the ſhoulder-blade, it is triangular, and lieth vnder the pectorall muſcle.

On the back part there are ten on either ſide.

Muſcles on the backſide of the cheſt.

1 *Cucullaris* or the *Munks-hood* the greater part of the ſecond muſcle of the *ſcapula* or ſhoulder blade.

2 A part of the third muſcle of the arme called *Latiſſimus* or the broadeſt muſcle, becauſe it taketh vp almoſt all the back-part of the lower belly.

3 *Rhomboydes*, the third muſcle of the ſhoulder-blade ſcituate vnder the *Munks-hoode*.

4 *Serratus Poſticus ſuperior*, *the vpper hinder ſaw*, or the fourth muſcle of the Cheſt lying vnder the *Rhomboides*.

5 *Serratus poſticus interior*, the *lower hinder ſaw*, or the fift muſcle of the Cheſt, ſcituated vnder the muſcle called *Latiſſimus*.

6. *Sacrolumbus*, or the ſixt of the cheſt.

7. *Longiſſimus*, the long muſcle, the 2. of the backe.

8. *Semi-ſpinatus*, the fourth muſcle of the backe.

9. *Spleny pars inferior*, the lower part of the *ſplenii* or of the firſt muſcle of the head placed vnder the *vpper hinder ſaw*.

10. *Complexi pars inferior*, the lower part of the *Complexus*, or the 2. muſcle of the head.

On the inſide. On the inſide there is one triangular, the ſixt of the Cheſt, lying vnder the lower part of the breſt-bone, of which in the 19. Chapter of this Book. Thoſe muſcles that are between the ribs called *intercoſtales* we ſhall intreat of by and by, when wee haue numbred vnto you the parts of the necke.

I do in this place deſcribe the necke, becauſe the chiefe parts therein contayned belong vnto the vitall parts, as the muſcles of the voyce, the weazon, the *larynx* and ſuch like.

It is therefore called *Colum a colendo*, becauſe we vſe to adorne this part with chaines & iewelles. *Galen* called it τραχηλος becauſe of the ſharpneſſe of the bones of it. It is a mid- The necke. dle part betweene the Cheſt and the head made for the vſe of the Cheſt and the Lungs; long that in the length of it the voice might bee better modulated or tuned, and therefore birds haue the moſt variety of tunes of any vnreaſonable creatures, but fiſhes becauſe they

haue no Lungs and so are mute, haue no necks, but all creatures that haue Lungs haue also necks. It is round because of the bodies which are seated in it. The parts contayned in it are the iugular veines externall and internall: the Arteries called *Cutotides*, nerues of the sixt paire and the recurrent nerues: all which are placed on the sides, but before, the weazon called *aspera arteria* or the sharpe artery and the gullet called *œsophagus* of which we haue spoken before. The muscles which are in the necke are many, some mooue the necke it selfe, some the *larynx* or throttle, some the bone *Hyois*, some the tongue, some the head, the lower Iaw and the shoulder blades. Of these some are scituated before some behinde. Behinde those that follow which we will name as they lie each vpon other.

The figure. The parts contained.

Concerning the muscles of it.

1 *Cucullaris pars superior*, the vpper part of the *Munks-hoode* or the second muscle of the shoulder blade, descending from the *occipitium* or nowle of the head.
2 *Leuator*. The fourth of the shoulder blade seated more toward the sides.
3. *Splenius*, The first muscle of the head.
4. *Complexus*, The second of the head.
5. *Recti maiores*, The third paire of the head.
6. *Obliqui superiores*, the fift paire of the head.
7. *Obliqui inferiores*, The sixt paire of the head
8. *Recti minores*, The fourth paire of the head which lye vnder the second muscle of the backe.
9. *Transuersalis*, The third of the necke.
10. *Scalenus*, The second of the neck, it lieth on the side from the first rib into the neck.
11. *Spinatus*, The fourth of the necke.

Before: these, beside these which grow to the iaw and are vnder the Chin.

1. *Quadratus seu Platysma myodes*, The first musele common to the cheeks and the lips.
2. *Mastoydes*, The seauenth of the head, from the pattell bone to the sides of the head.
3. *Sternohyoidei*, The first paire of the bone *Hyois*, which lye vpon the wezon.
4. *Coracohyoidei*, The fourth paire of the bone *Hyois* seated at the sides.
5. *Oesophagiæi*, The third paire of the common muscles of the *Larynx* or throttle.
6. *Longi duo*, The first muscles of the neck.

But we returne vnto the Chest, and first to the *Intercostall* muscles as being proper only to the Chest, & therefore we will here follow their discription more accuratly in this place.

CHAP. IIII. *Of the Muscles betweene the Ribbes called Intercostales.*

The *Intercostal* muscles

THe Muscles which are wouen between the ribbes and do fill vp the distances between them are called μεσοπλευροι *Intercostales*. *Gal* in his Book *de vsu respirationis*, accounts them according to the eleauen ribs 22. other where thrice so many and two ouer, that is 68. as sayeth *Archangelus*, but hee himselfe reckons them 34. wee will account them 44. For because there are on either side eleuen distances and in euery distance there are two muscles, there are on either side 22. Of which some are externall [Table 1.yy] which are eleauen, and so many internall or within. These are fleshy and narrow but long, according to the proportion of the distances; their fibres are carried obliquely from one ribbe to another in a contrary position, so that those of the inward and outward muscles lying one vpon another doe mutually intersect themselues in the manner of a Saint Andrewes crosse, or this letter X. The outward of these muscles or the superior are carried from the lower partes of the vpper end of the ribbes to the vpper parts of the lower end of the ribbes: for they beginne in the backe part from the transuerse processes of the rack-bones to which the ribbes are annexed and passe with their fibres obliquely forward all along the bought of the ribbes to the beginning of the cartilages; (where the bony parts of the ribbes doe end) and are ioyned to the breast-bone; they want tendons because of the narrownes of the place, neither do they reach thorough the distances of the gristles.

Their number.

The interior or inward muscles quite contrary are carried from the vpper part of the lower ends of the ribbes to the lower part of the vpper end of the ribs, but do not beginne from the processes of the rack-bones, but from that part in which the ribs are bent, and run forward with their oblique ascendent fibres, and fall vpon the distances of the ribbes as well where they are bony as where they are gristly, and keeping alwayes the same *series* or course of

of Fibres passe on to the very bones of the brest, yet so, that in the distances of the gristles they are lifted vp alittle to the outward face of the Distance, and so supply the places of the exterior where they are defectiue or wanting. And this is the cause why the Fibres in the distances of the gristles do appeare diuerse from those in the distances of the ribbes themselues. And if you take off these Fibres betweene the gristles, you shal finde also others vnder them of another position, which are the Fibres of the sixt Muscle of the Chest which is called the triangular Muscle.

Diuers fibres one vnder an other.

From the vndue distinction of these Fibres, some haue made 68. intercostall Muscles, when indeede they are but 44. reckoning those differing Muscles which are betwixt the bony parts of the ribs [Tab. 2. fig 1, cc] from those that are betweene their gristly parts. [tab. 2. fig. 1. dd] And whereas the distances of the ribs are eleuen, six of the true ribs and fiue of the bastard ribs; they think, that there are four in euery distance of the two ribs, two where they are bony, and two where they are gristly, and those internall and externall. but in euery distance of the bastard ribbes they will haue but two, one externall and another internall.

Auicen.

How *Auicen* and *Columbus* wer deceiued.

A note concerning the originall & end of these Muscles.

But we must further obserue, that the outwarde Muscles, by how much they arise neerer to the rack-bones, by so much the sooner do they determine in the fore-parts of the ribs; so againe the inward, by how much the later they arise from the bent of the rib, by so much do they come short of the brest-bone.

Why they are obliquely placed and intersect themselues *Varolius* hath elegantly shewd; proouing that it was so necessary for the dilatation and constriction of the chest. For because the distance which is betweene one rib and another, was not answerable to the length of the Muscles required necessarily for the dilatation and constriction of the Chest, therefore they are disposed betweene the ribs not with right Fibres (& euen *Galen* intimated so much in the 23. chapter of his Booke *De Dissectione Musculorum*, but was not vnderstood, at least not obserued by the Ancients) but with oblique; and that this helpeth dilaration we may euidently see, becaus euery thing retcheth more being drawn obliquely, then if it be drawn right out, as Cloth, Leather and such like, which we call drawing Biace. For constriction also it is as fit, because the Muscle is contracted more or lesse according as it is greater or lesser. Wherefore, if they had had right Fibres, they must needs haue beene short and so their contraction much straightned, neither coulde they haue sufficiently bound in the Chest.

Why these Muscles are obliquely placed of necessity.

How they help dilatatio.

How they helpe constriction.

Moreouer, because euery Muscle drawes according to the course of his Fibres; therefore least the ribs in their oblique motion should ioyn close together, the intercostal Muscles are framed double (a thing vnknowne to the Ancients) that with their contrary fibres they might intersect themselues. For when two opposite bodies do together drawe obliquely, there resulteth by their opposition one straight and direct motion.

Why these Muscles are double.

The Vse of these Muscles (as most Anatomists haue recorded) is to constringe & dilate the Chest. Of the exterior in expiration to beare down the ribs together, and so to streighten the Chest; of the interiour to distend and separate the ribs, and so to enlarge the cauity of the Chest for inspiration. But when *Galen* saith in the 15. chapter of the fift Booke *de vsu partium*. *That the intercostall Muscles helpe the Midriffe, that they might draw the Chest inward*, it is to be vnderstood not that they further the proper motion of the Midriffe, but that they mooue the ribs inward; which is their proper function. But what kinde of motion is this? For either they bring one ribbe to another or seuer one rib from another, or they lift vp the ribs or presse them downe. The two former motions they performe not; for there is no vse of any such motion, neither can any of them of it selfe as a voluntary instrument dilate the place wherein it is, or separate one rib from another; neither can they lifte vp the ribs, for the Muscles which lift them vp are placed without the chest and haue their originall from elsewhere, and are called the proper Muscles of the Chest. It remaineth therefore that they do presse the ribs onely, and that but lightly, that the contraction of the chest may so becom equall, being drawn down together with their contraction and the contraction of the Midriffe: and so that is made good which *Galen* saith, that they helpe the Midriffe. We may also say they help the sixt Muscle of the chest which is vnder the brest-bone. Yet we will not deny but that they confer also to dilatation, but that by accident as *Fallopius* and *Platerus* haue obserued, to wit, as they supply the place of a Ligament, and ioyne the ribs one to another. For when the lower ribs are drawne downeward and dilated by the proper Muscles of the chest; or when the vpper ribs are eleuated by their

Galen

How the intercostall Muscles helpe the Midriffe.

The Vse of Muscles.

They onelie depresse the ribs.

How they cõferre to dilatation.

proper muſcles, it is of neceſsity that the middle ribbes ſhould follow the draught, and ſo the middle diſtances in deep Inſpirations are dilated by the helpe of the intercoſtall whether as they be muſcles or as they bee ligaments; which yet they could not performe if the proper muſcles of the Cheſt were wanting: and therefore we may more properly ſay that in this caſe the intercoſtall muſcles are moued by the proper muſcles of the cheſt, then wee can ſay they moue of themſelues, though their motion is not meerely conſtrayned but begunne and as it were led the way by other muſcles; and haply ſuch a kinde of motion there is alſo betwixt the *Serratus maior* and the oblique externall muſcles of the *Abdomen*. There is another way alſo how the middle diſtances of the ribbes may bee dilated by the intercoſtall muſcles; for if on either ſide the firſt muſcle of the cheſt (which is called *ſubclauius* ſituated betwixt the firſt rib and the patell bone or clauicle and hath oblique fibres like the intercoſtals) do draw vp the firſt ribbe, then by conſequtiõ the other diſtances vnder ſhall alſo in ſome ſort be dilated.

They are rather moued then moue.

Another way how they dilate the diſtances of the ribs

CHAP. V. *Of the midriffe called Diaphragma.*

The Midriffe. The names and reaſons of them.

THe Midriffe called in Greeke by *Plato* διαφράγμα, of a word which ſignifieth to diſtinguiſh, becauſe it diſtinguiſheth or ſeparateth the inſtruments of nouriſhment from the inſtruments of life and reſpiration; and in Latine *ſeptum tranſuerſum* or the ouerthwart partition, becauſe running ouerthwart the bulke of the body it parteth it into two *venters* [as is manifeſt in the firſt Table.] This the Antients as *Hippoc.* in his Booke *de principiis* called φρένες *i.* the minde, not that it hath any intelligible faculty, but becauſe of his notable ſympathy with the Brayne: for when this is affected, inſtantly the minde and all the ſences are out of order, and vpon the inflamation of it, followeth a kind of *phrenitis* or rather a continual aberratiõ of the mind, and in maydens ſometimes madneſſe it ſelfe, as *Hippocrates* ſayeth in his Booke *de iis quæ virgines*.

Madneſſe in maides.

It is a muſcle.

It is the 65. muſcle ſeruing for reſpiration, and differs from all the muſcles of the body in excellency, ſcituation, figure and action. It is one, very great and ſtrong, common to both ſides, and as large as the capacity of the lower part of the Cheſt; as Table 1. declareth.

His ſcituation in the cauity of the body is ouerthwart & oblique [looke Table 1.[a]] and declining ſomewhat downward ouer all that vtmoſt compaſſe of the Cheſt which is limited by the griſtles of the baſtard ribbes and the lower part of the breaſt-bone: This muſcle whileſt it is at quiet remayneth lifted vp as we ſee in dead carcaſſes, and maketh a great cauity, but when it worketh and is contracted it beareth downeward.

The frame of the Midriffe.

The midriffe riſeth with two long and fleſhy productions [table 1. and table 2. figure 2.[h i]] from the bare rack-bones of the loynes to which it adhereth very ſtrongly, & a great way together, for euery muſcle muſt haue ſomething to reſt his head vpon, and moſt commonly it both ariſeth from and is implanted into an immoueable part. The two productions at the ſides of the great Artery doe cleaue to the muſcles of the loynes [table 1.[m]] and becomming broader by degrees doe meete at the eleuenth rack-bone of the Cheſt, and ſo make the muſcle circular or round, and it is tyed in his fleſhy circumference to the inſide of the Cheſt and the ends of the baſtard ribbes all along the twelfth ribbe at the lower part of the breaſt-bone and at the breaſt-blade [table 1.[n]] which was made for his defence; but in the middeſt it endeth into a ſtrong membranous and neruous tendon [tab. 2. figure 2.[b c]] framed of very firme ſinewes and membranes. Now it was very neceſſary that it ſhould bee neruous in the middeſt, partly for the more ſecurity, that it might endure diuers motions without hurt, & not be endangered with payn becauſe of their violence: partly that the hollow veine [table 1. and table 2. figure 2.[m]] and the *æſophagus* or gullet [table 1. and table 2. fig. 2.[l]] which paſſe through it, might not be ſtreightned, and ſo the courſe of meate and bloud hindered. Wherefore howſoeuer this muſcle worketh, ſeeing onely his fleſhy fibres [table 2. figure 2.[f g]] are contracted or drawne together, the neruous part about thoſe veſſels is neuer conſtringed: but rather when the fibres are contracted the neruous part from the center to the circumference is diſtended, and the holes through which thoſe veſſels go wider opened. Moreouer, it is vnited to two of the muſcles of the *Abdomen*, the oblique aſcendent and the tranſuerſe, and aboue it is ſo ſtraightly ioyned to the purſe of the heart or *pericardium*, that without tearing it cannot be ſeparated from it.

The connexion of it.

Why it is neruous in the midſt.

More of the Cõnexion.

The figure of it is almoſt [table 2. fig. 2. ſheweth it] circular, round like a Plaice or Thornbacke, or likeſt a racket which we vſe in the Tennis-court, eſpecially if the racket be ſtraight ſtreatched, and the proceſſes are very like to the handle of the racket.

The figure.

His

His ſubſtance is partly [table 2. figure 2.[fg]] fleſhy partly neruous [table 2. figure 2.[abcd]] as if it were compounded of two broade circles, but ending in one part in an acute angle [table 2. fig. 2.[d]] of which the fleſhy circle is on euery ſide annexed to the cheſt [ſee the firſt table] and compaſſeth the other neruous circle which is in the center, to which as vnto a center many fibres like lines do runne from the circumference and as it were from the beginning or originall of the muſcle, which that you may rightly diſcerne you muſt ſeparate the *Peritonæum* or rimme from the midriffe, which in Hogs may be done eaſily, but in a man and a dog not without difficulty. The ſubſtance. The fibres of it.

It hath a double membrane one lower from the *Peritonæum*, another vpper ariſing from the *pleura* with which it is compaſſed for more ſtrength; although it haue another coat of his owne but a very thinne one, that it might bee diſtinguiſhed from all other parts by proper circumſcription. Veines it hath ariſing from the trunke of the hollow [table 1.[m] table 6.[A]] veine called *Phrenicæ* (ſometimes alſo it receiueth branches from the fatty veine called *Adipoſa*) which are accõpanied with arteries from the great artery [tab. 1.[e]] called alſo *Phrenica*; [the veines table 1.[n]. table 6.[c] the arteries table 1.[oo] table 13.[xx]] the veines carry vnto it bloud for his nouriſhment; the arteries vitall ſpirits together with the vitall faculty, & beſide by ventilation with their motion they preſerue his naturall heat. The membranes of it. His veines. Arteries.

It hath two nerues [table 2. figure 1.[pp]] proceeding out of the lower rackebones or *vertebræ* of the necke made of three ſurcles on each ſide (and this is peculiar to this muſcle, for other parts vnder the patell bones or *clauicles* receiue none from the marrow of the necke) which nerues being carried through the cauity of the Cheſt are contorted or wound about the *Mediaſtinum*, & by it faſtned and ſtayed aloft leaſt they ſhould be hurt. And it was neceſſary that theſe nerues ſhould come from an vpper place, that they might more equally exted their action into euery part of it: wherfore they are diſſeminated through his whole ſubſtance, that they might affoorde vnto it all ſence and motion whence it is of very exquiſite ſence, and when it is iniured for the moſt part death followeth. Sinewes. A propriety. Why his nerues come from aboue.

It hath two paſſages or holes, one on the right hand [table 1. and table 2. figure 2.[m]] in the middle neruous part for the aſcent of the hollow veine out of the vpper and gibbous part of the Liuer vnto the Heart; another on the left hand [table 1. and table 2. figure 2.[l]] a little backwarder & greater, through which paſſeth the *Oeſophagus* or gullet and 2. nerues vnto the ſtomacke, vnto which not withſtanding his membranes do grow and encompaſſe ſtreightly and very ſtrongly. The paſſages

At the originall or beginning of this muſcle or midriffe betweene his productions [tab. 1. and table 2. figure [hi]] at the racke-bones, there is a diuiſion [table 1. and table 2. figure 2.[k]] reſembling a ſemicircle or halfe Moone for the deſcent of the great Artery & the vein without a peere or *non parill*; and for nerues of the ſixt payre fixed to the ribbes which are carried vnder the *pleura*; and this diuiſion imbraceth the racke-bones vpon which the great artery leaneth. His diuiſion for the artery and the veine *non parill.*

The chiefe vſe of the Midriffe, which *Galen* found out, as appeareth in the 15. and 7. Chapters of his 5. Booke *de vſu partium*, and which dependeth eſpecially vpon her ſcituation, is that it might be the organ or inſtrument of free, gentle, and voluntary reſpiration or breathing, euen as the inſtruments of violent or deepe breathings are the 64. muſcles which are about the Cheſt exactly dilating or contracting it. For his fibres being equally retracted or drawne together, all the baſtard ribs are drawne toward the centre of the Cheſt, and ſo they draw the vtmoſt parts of the Cheſt vnto the rack-bones, and conſtringe or contract the lower part whereupon the Midriffe is lift vp, ſtreached and ſerueth for expiration. Hence it is that in a dead body it alwayes appeareth contracted and ſtreatched for the life endeth with expiration; and if the Cheſt be perforated within the ribs or Midriffe, it falleth ſtraight looſe downeward, and ſuffereth the Liuer & the ſtomack which before were ſomewhat ſuſpended, to fall. But when the fibres are looſened the Midriffe falleth; for the baſtard ribs are looſened, & the lower parts of the Cheſt, and conſequently the Lungs are dilated & ſo we draw in breath: wherfore when the Midriffe is hindred or affected, then muſt needs follow difficulty of reſpiration as *Galen* ſaith in the 8. Chapter of his 4. Booke *de locis affectis*. This motion according to ſome authors, *Archangelus* among the reſt, is mixed of a voluntary & a naturall motion, voluntary it is but not ſimply, becauſe there is a neceſsity which vrgeth and exacteth this motion: as in reſpiration a neceſsity of cooling the hart vrgeth euen as in vnburdening the belly & making water the excrements do vrge and prouoke the *ſphincter* muſcles of the Fundament and of the Bladder. The vſes of the midriffe. The chiefe vſe Of what kind the motion of the midriffe is.

The first Figure sheweth the middle Belly, the Skinne and the Muscles being cut away, the Breast-bone also is remooued and the ribbes broken, that the capacity of the Chest, the Membranes thereof and the Lungs might better be discerned.

OO. Braunches of the vessels before named which go to the *mediastinum*.
PP. The nerues of the midriffe supported by the *mediastinum*.
Q. A veine which together with the nerue descendeth to the midriffe.
RSTV. A part of the Lungs in the left side of the cauity. R and T shew the vpper lobe, S and V the lower.

Figure II. sheweth the midriffe taken out of the body.

a. The midriffe.
b c d e. The sinewy part thereof.
f g. The fleshy part thereof.
h i. Two fleshy originals.
k. A diuision or perforation of the midriffe where through the great artery is transmitted.
l. The perforation on the left side, which giueth way to the gullet.
m. The right perforation through which the hollow veine ascendeth.

Another vse. Another vse of the midriffe is to ventilate or fanne the *Hypochondria*, especially the Liuer, because in his conuex or vpper part it wanteth Arteries to doe that office; as also the moyst vapours contayned in the capacity of the lower belly, least being at rest they should putrifie and corrupt; for which cause *Hippocrates* in his first Booke *de morbis mulierum* calleth it the breather or bellowes of the lower belly

A third vse. Another vse of it is, as *Galen* aduiseth vs in the 9. Chapter of his second Book *de motu musculorum* to helpe forward the expulsion of the excrements and the Infant in trauell by helping the muscles of the *Abdomen* as wee haue shewed in the former Booke; for which it is the more conuenient because of his oblique scituation. For aboue it presseth the guttes as it were with hands, and so driueth the excrements downward, which otherwise might as well be excluded vpward as downward if this helpe were not.

The last vse of the midriffe. *Plato*. *Aristotle*. *Plinies* conceit The last vse is, that according to *Plato*, it might deuide the *Irascible* or Angry part and faculty of the Soule from the Concupiscible & lustfull; or according to *Aristotle*, it might distinguish the naturall parts from the vitall, the ignoble from the noble, that the vapours which arise from the lower parts as from the sinke of the body, might not offend the heart the seate of life and sence as he thought. *Pliny* ascribed to it the subtility or niceness of the wit, and esteemed it the seate of mirth which appeareth by tickling: for if the skinne about the *Hypochondria* be gentlely touched we are tickled and laugh presently; but more rare

rare was that of a young man in my knowledge, who had the cauſe of an Epilepſie in his foot, which at certaine times would riſe vp and might be ſtayed by binding the legge and thigh, but when the vapor or breath came vp about the place of the Midriffe, then would he laugh extreamly and preſently after fall in his Epilepticall fit. But the Philoſophers reaſon was, becauſe the motion commeth preſently to that place; for that the skin is thin and warmeth the part, though lightly yet enough to open it, & ſo moueth the minde euen againſt the will of him that is mooued. For in the ſingle Combats of Sword-Fencers (called *Gladiatores*) at ſharpe vſuall in thoſe times, ſome haue bin ſeene to dye laughing when they haue bin thruſt through about that part.

Another. How tickling cauſeth laughter.

And the reaſon why onely men of all creatures are tickliſh, is partly the thinneſſe of the skin, partly becauſe a man onely of all creatures can laugh; for titilation is the cauſe of Laughter, when ſuch a part is mooued as from which the affection may riſe vp and fil the wings of the noſe.

CHAP. VI. *Of the Membrane called Pleura.*

The Pleura.

THE *Pleura* is a Membrane taking his name from the Ribbes which they call πλευρὰς, becauſe it is ſtretched vnder them all, excepting the twelfe, and truely it is called a Membrane becauſe of his ſubſtance, and a coate becauſe of his Vſe.

His figure & magnitude.

It is a Membrane encloſing the whole cauity of the Cheſt, wherefore his Figure and magnitude is anſwerable to that cauity, which is Semiouall or like half an egge.

His Originall

It ariſeth and is bred of ſpermaticall filaments or threds of the ſeed and the mothers blood powred betweene them after the manner of a *Parenchyma* or as the fleſh of the Liuer or other of the bowels; or it is produced from the Membranes of the Braine which inueſt the Marrow of the backe, which being brought together with ſome Nerues into the Cheſt do on both ſides frame it; wherefore there it is thicker and cleaueth ſtrongly to the rack bones or *Vertebræ* of the backe, from which vnleſſe it be broken it cannot be ſeparated, becauſe from theuce it hath his beginning of place or production.

His cõnexion

It is tyed backward to the racke bones of the backe, which is the reaſon that ſome haue ſaid it ariſeth from their Ligaments, or from the Ligaments of the *Vertebræ* of the Cheſt as *Falloppius*; before, it is tyed to the breſt-brone; on the ſides to the Membranes of the intercoſtall Muſcles, and to the Membranes which immediately compaſſe the rib bones; aboue to the Clauicles or Patel-bones; below in his *Baſis* as *Galen* calleth it, 5. *Adminiſt. Anat.* 8. or bottome, to the Midriffe, and in the middeſt vnto the Lunges and heart-purſe or *Pericardium*.

His ſubſtance and ſtructure

His ſubſtance is like that of the *Peritonæum* or rim of the belly, but in ſtrength & thickeneſſe ſomewhat exceeding it; for becauſe it was to paſſe betweene the bonie hardneſſe of the ribs and the ſoft bodies of the Lungs, it was ordained neither too ſoft nor too hard, yet ſomewhat hard the better to defend the Vital parts; thight & cloſe wrought yet light, that the weight of it might not hinder the motion of the Cheſt, but ſtrong and neruous, harde to be diuided, and ſometimes in ſome diſeaſes of the Cheſt it hath beene obſerued by *Platerus* to grow ten fold thicker then vſually it is.

It is double & why.

It is all ouer double, partly becauſe of the hardneſſe of the bones, that the inner ſide which is very ſenſible might not be hurt by the continuall motion of the Lunges, partlie that betwixt both the Membranes the intercoſtall veſſels might more ſafely paſſe.

The one of theſe is thicker, eſpecially about the backe where it may bee cleane ſeuered from the ribs, and it is harder becauſe of the continuall motion of the Lungs and his inner face is ſmooth and ſmeared ouer with moyſture, the vtter ſuperficies or face of it is vnequall and rugged. The other is thinner, and of ſome is called the Membrane compaſsing the ribs. Betweene theſe two is the matter of the Pleuriſie oftentimes collected (becauſe there are veſſels which run betweene them) and not onely betweene the Pleura and the intercoſtall Muſcles. From this Membrane ſometimes on one ſide ſometime on another, (as *Veſalius* and *Valuerda* haue well obſerued) but eſpecially on the left ſide, doe certaine ſinnowy Fibres come, by whoſe interpoſition the Lungs are ſtrongly tyed to this *Pleura* in men when they be in health, and among them is ſeene ſome ſmall portions of fat neere the rack-bones of the back where the veſſels are greater, as it is in the *Peritonæũ*; but this is but rare. And as the intercoſtall Muſcles like other Muſcles haue their proper Membrane, ſo the ribbes like other bones are compaſſed with their *Perioſtion* or proper and immediate

Where the matter of the pleurify ly eth

Membrane,

Membrane, which *Veſalius* that oculate Anatomiſt tooke to be one of theſe Membranes which we haue deſcribed.

His perforations. Aboue. Below. At the ſides. His veſſelles.

It is perforated where it ſendeth veſſels into the Cheſt or out of it. It ſendeth out aboue the iugular and Axillary Veines, and the *Carotides* or Axillarie Arteries; but it letteth in the Gullet, the Weazon, and a Nerue of the ſixt paire belonging to the Midriffe; below, it is perforated at the *Diaphragma* or Midriffe; for the aſcent of the Hollow veine, and the deſcent of the Gullet as was ſaide in the former chapter; at the ſides for the intercoſtall veſſels. The veſſels which are tied vnto it as they paſſe vnto the Neighbour partes doe lend it ſmall braunches which come moſt plentifully from the Mammary and intercoſtall veſſels. Hence it is that it is often inflamed with great tenſion and a pricking or goading paine.

His vſe.

His vſe is much like the vſe of the *Peritonæum* or Rimme in the Lower belly; for as the *Peritonæum* is ſtretched about all the partes of the Lower belly, and affordeth vnto euerie one of them a common coate; ſo the *Pleura* is ſtretched vnder all the cauitie of the Cheſt, and giueth a common coate ſaith *Galen* to all the inſtruments of breathing, as alſo to the midriffe and the intercoſtall muſcles and the veſſels, and defendeth and knitteth them altogether. It giueth alſo to the veſſels a ſafe waſtage and a kinde of ſtability, and where it is ſtretched vnder the ribs, it ſerueth the Lunges for a defence, that they light not vppon the bare bones when they dilateth themſelues in the gathering in of breath, and ſo be hurt with their hardneſſe, and beſide that the Lunges in their motion do not entangle themſelues in the diſtances of the ribs.

CHAP. VII. *Of the Mediaſtinum.*

The *Mediaſtinum*. His Names.

THE *Mediaſtinum* ſo called, becauſe it mediateth or diuideth the Cheſt in the middeſt. *Collumbus* calleth it *Interſepimentum* and *Diſſepimentum*, as a hedge that diuideth two Paſtures. It is double: The right [Tab.3.[GG] the right,[HH] the left] and the lefte, which *Galen* calleth ὑμένες διαφράττοντες, becauſe they diuide the cauitie of the Cheſt, which the *Pleura* encompaſſeth into two partes. For the cauitie of the Cheſt is not one open and continuall, but is diuided by theſe membranes.

His ſcituation

Wherefore in the middle of the cheſt there is one on either ſide which paſſe from aboue downeward according to his Longitude euen vnto the Midriffe, and backeward from the Breaſt-bone vnto the Racke-bones, ſo that the cheſt is by this meanes diuided into two circles, or if you had rather, they frame a certaine Triangle of vnequall and oblique ſides, for they haue ſpace enough to reſemble this Figure: becauſe of the deapth and length of the Breaſt.

His originall.

Theſe Membranes do ariſe from the *pleura*, which where it climbeth from his originall on either ſide to the ſides of the breaſt-bone, creepeth ſo backe againe towardes the ridge where his beginning was, that it attaineth from the middeſt of the breaſt to the very ſpine of the backe. Theſe are thinner then the *pleura*, and ſofter that they may more eaſilie follow the motion of the heart; on the outſide as they looke to the Lungs (to which they ſometimes grow) they are ſmooth, and oftentimes about the veſſelles they appeare interlaced with much fat, ſo as they may bee compared to the Kall or *Omentum*; on the inſide rough, becauſe of the Fibres with which the Membranes are ioyned, as alſo to the *Pericardium*; and in the hollow of the throate the *Thymus* ſo called (of which we ſhall heare afterwards) groweth vnto them. Heere, according to the length of the racke-bones of the backe vnto which they are ioyned by the mediation of the *pleura*, they euen touch together, and make but a very narrow cauity, but are after by degrees ſeuered and at the Breaſt-bone ſtand as wide aſunder as the Breſt-bone is broade, to which they cleaue euen from one end of it to the other; and this diſtance [Tab.3.[II]] is intertexed or wouen between with diuers thredy Fibres and Membranes; but they are wideſt aſunder and make the largeſt diſtance at the *Diaphragma* or Midriffe, to which they are ioyned as far [Tab.2.fig.1;[K]] as his neruous part reacheth, inſomuch that this cauity which is ſmooth and moiſt, before containeth the heart knit vp in his purſe and the hollow-veine aſcending vpward, and behinde the gullet with the ſtomacke Nerues.

His ſubſtance

Their diſtãce.

Wher the diſtãce is wideſt

In the fore-part of this Cauity there is oftentimes a matter conteyned, which cauſeth a diſeaſe reſembling a Pleuriſie, which matter if the breaſt-bone (ſaieth *Columbus*) bee verie cunninglie perforated may bee ſafely drawne out. In Dogges this Cauitie is more large but hath no ſuch webbe of Fibres as in a man. The Veynes and Arteries that it hath are very

---

very ſmall from the Mammary [Tab. 3. ccc] which paſſe from the hole of the throat downward vnder the breſt-bone, from which in their paſſage as alſo from the vein *Non-paril* they borrow a ſurcle. [Tab. 2. fig. 1. °°, from the Mammary veſſels.] Moreouer in a man it receiueth a good large veine out of the hollow of the throate, which deſcendeth accompanyed with a Nerue [Tab. 2. fig. 1, ~] by the whol length of both the Membranes to the Midriffe, but groweth onely to their outſide; ſometimes alſo it receiueth ſmall branches from thoſe Veſſels which we haue before named *Phrenica* that is the veſſels of the Midriffe.

The vſe of this *Mediaſtinũ* or bound hedge is firſt to hold the hart vp ſuſpended (for being tyed to the purſe of the heart it muſt needs do that office) leſt if it had no ſuch tye, but hung downe at liberty, in the diuerſe poſition of the body it might fal to the ſides, to the breſt, to the ſpine, or elſe downward. Secondly, this ſerues to ſtrengthen and ſecure the paſſage of the veſſels. Moreouer, it incompaſſeth the parts conteyned in the Cheſt that they ſhould not hurt the Lunges in his motion. And finally, it diuideth the Cheſt into two partes or cauities which is their chiefe profit ſaith *Galen* in the 3. chapter of his 6. Booke *de vſu part.* ſo that if one part be hurt, yet the other may be ſafe: as wee haue knowne a theefe Anatomized who was a ſtrong and ſtout fellon, but had one ſide, that is, the right ſide of his lungs withered almoſt all away and dryed vp into a very ſmall quantity, but the other remained faire and freſh as any other mans. So in wounds, if one part bee very ſorely wounded, ſo

The vſes of this *Mediaſtinum*.

Their cheefe vſe.

A ſtrong and ſtout mã with one Lung.

that

that because of the entrance of the outward aer the motion of the Lungs do cease; yet the other part will not be wanting to susteine life by performing his part of the worke. For, if both parts of the Lungs be wounded any thing wide through, the voice and respiration to
5. *Vitiat. Exert.* must needs perish: although I saw when I was a Boy a Knight wounded quite thorough the backe on both sides the bone, and so deepe that on both sides in his dressing his breath would at the mouth of the wound blow out a Candle, and yet the Patient hath perfectlye recouered. And this shall suffice to haue spoken of the Conteyning parts of the Chest, especially of those that are soft, for the hard parts which are the bones and the gristles, will fall out better to be handled afterward. Now wee will pursue our Historie vnto the partes conteyned.

CHAP. VIII. *Of the Thymus and Purse of the Heart called Pericardium, and the water conteyned therein.*

The parts conteyned in the Chest. Bowels and Vessels.

THE conteined parts of the Chest are double, Bowels and Vesselles. The Bowels are two, the heart couered with his purse and the Lungs. The vessels are branches of the great Veine and the great Artery, borne vppe in the hollow or lower part of the throate with a glandulous body called *Thymus*, double Nerues from the marrowe of the racke bones of the Chest, from which the intercostall nerues do come; and also from the marrow or substance of the brain conteined within the scull, from which the sixt paire or coniugation proceedeth, & from it the *Costalis* or the sinew of the ribs, the Stomachial and Recurrent both the right and the left; and finally, the Weazon called *Aspera Arteria*, and a part of the *œsophagus* or Gullet. But first of the *Thymus*.

veins, arteries *Thymus*. Nerues. The sixt coniugation.

The *Thymus*. The *Thymus* which *Galen* in the fourth Chapter of his sixt Booke *De vsu partium*, calleth θυμόν, his Interpreter, the lowest of the Glandules, is of a glandulous body, soft and spongie. (*Galen Administ. Anat.* 7, 9. cals it the great and softest Glandule) which in the vpper part of the Chest neere the hole of the throate lyeth vnder the brest-bone, and serueth for a pillow or boulster to secure all the diuisions of the Hollowe veine and the great Artery, and all the sproughts that come from them, which are in this place very many and diuerse, going to the armes and the shoulder-blades; as also the Hollow-veine it selfe, that it be not hurt by the hardnesse of the brest-bone, from whome in lieu it receiueth certaine small vessels. For this is an ordinary and perpetuall worke of Nature, that whersoeuer shee diuideth a great vessell, there she interponeth a Glandule to fill vp the diuision. This is that part in Calues, which is accounted among the delicates of the Table, and is called *Lactes* or the sweete bread.

Why it is framed. Note.

The *pericardium* or purse of the heart. His Figure. Connexions.

The Purse of the Heart, called of the Grecians *Pericardium*; of the Latines *Cordis involucrum* and *Capsula*, *Camera*, or *Aula Cordis*, *Hippocrates* in his Booke *de Corde*, calleth *Coleus*. It is a large Membrane, couering and incompassing all the hart; and carrieth his Pyramidall Figure [Tab. 4. fig. 1. D E F] or rather is like a pine Kernell, hauing a broad *Basis* boue, and ending by degrees in an obtuse angle. [Tab. 4. fig. 1, F] This is placed in the midst of the double *Mediastinum*, and is embraced by it on either side, to which it groweth round about by the mediation of many Fibres. It is also tied before, to the *Pleura*, where the Gristles of the sixt and seauenth ribs on the lefte side are ioyned to the Membranes of the *Mediastinum*, where they part or gape from the brest-bone; behinde to the spine of the backe; below to the sinewy circle [Table. 4. fig. 1. from a to o] or Tendon of the Midriffe his point [Tab. 4. fig. 1. F] doth so strongly adhere especially on the left, as also on the right [Tab. 4. fig 1, o] side that it cannot be separated without tearing it asunder, and this Connexion is peculiar onely to man. For in other creatures as Dogges & Apes, it standeth off from the Midriffe and is not tyed to it.

His originall.

The Originall [Table. 4. fig. 1, B Fig. 2. ^] of this Membrane at his *Basis* is large, produced from the coats which the *Pleura* affoordeth vnto the foure vessels which yssue out of the heart; for these vesselles in all that distance which is betweene the *Busis* or broad end of the heart and this *Pericardium*, haue not the common coate from the *Pleura*, because it is employed in the frame of the *Pericardium*.

His substance & therefore of it.

His substance both for thicknesse and strength (as *Galen* saieth in the first chapter of his sixt Booke *de vsu partium*) is very proportionate; if it had been harder then it is, it wold haue offended the Lungs by pressing them; if softer, it selfe might haue bin pained by the bones: for as his position is betweene two contraries, so is his substance middle betweene two extremes

For it is so much softer then a bone, as it is harder then the Lungs; but indeede the *Pericardium* toucheth not the Lungues but by the interposition of the *Mediastinum*, least they should hinder another in their motion, alwayes I except the forepart of the brest-bone, where the Membranes of the *Mediastinum* stand of one from another.

This purse is hard, because of the continuall motion of the heart; on the outside fibrous, within smooth and slippery, that the heart might mooue more freely in it, but on neyther side hath it any fat, although *Aristotle* saith otherwise, whom *Vesalius* imagined to bee deceyued by taking for it the Membranes of the *Mediastinum*, which are indeede sometimes fat as we haue saide.

His Connexions.

It is tied at the *Basis* of the heart, which is at the fift rackbone of the Chest, to the vessels which come thence [Tab.4.fig.1, [a] fig.2 [A]] which also it boulstereth; but to the body of the heart it is not tied but is as farre from it at the Basis, the point and the sides [Tab.4.fig.2, [a] sheweth the *Pericardium* bent backe to the sides] as is sufficient for the dilatation of the heart, and for the serous humor heerein conteined. Wherefore it is on euery side a little distant from it; which distance if it had been larger it would haue taken vp too much of the cauity of the chest, and so haue bin a hinderance to Respiration.

His perforations.

It is continuall or whole round about except in the basis, where it hath at the least fiue perforations for the entrance of the hollow veine [Tab.4.fig.1 [A] Fig.2.[F]] & for his egresse, as also to let out the arteriall veine, [Tab.4.fig.2 [C]] the Venall Artery, and the great Artery. [Tab.4.fig.2 [a]].

Table 4. figure 1. sheweth the heart included within his purse or Pericardium, *together with the Lungs, and a part of the Midriffe.*

Figure second, sheweth the Pericardium opened, and so the situation of the hart and particularly the fore-parte thereof.

Q. A part of the Midriffe.

It

His veſſels. It receiueth very ſmall veines [table 4. figure 1. C] and threddy, partly from thoſe that are ſent to the *mediaſtinum*, partly from the veins called *Phrenica* where they are ioyned to the midriffe; ſome ſay it hath a ſmall braunch from the *Axillary* veine which they call the *Capſulary* or purſe-braunch; though *Laurentius* will haue it to come from the *ſubclauian* veine. It hath no arteries vnleſſe they be exceeding ſmal, becauſe being ſo neare vnto the heart it may receiue vitall ſpirits at hand from it. His nerues are very ſmall and ſometimes ſcarcely ſenſible, but from the left branch of the Recurrent ſinew to giue him ſence.

His vſes. His vſe is to be as a habitation and ſhelter for the heart or as a mantle to couer it, and being of all membranes (except the *dura mater* of the Braine) the ſtrongeſt, it keepeth it alſo from preſſure that his motion bee not impeached, and that it touch not the hard bone. Moreouer it conteyneth a ſerous humour whereof wee will ſpeake in the next place, and ſerueth in ſtead of a ligament together with the helpe of the membranes of the *Mediaſtinum* to reteyne the heart in his right ſeate. *Galen* in the 13. Chapter of his 7. Book *de Anatomicis Admin.* telleth a ſtrange ſtory of a childe whoſe breaſt-bone was cut out, and this *Pericardium* rotted part of it off, and yet the child recouered.

A ſtory.

The humour contayned in this purſe. In this purſe there is contayned a watery humour as *Galen* calleth it, carrying the forme of vrine: wherefore the diuine ſenior *Hippocrates* who in his Booke *de Corde* calleth it ὦρον, ſayeth that the heart dwels in a Bladder, yet this water hath no acrimony or ſaltneſſe in it.

What is the matter of it. It ſpringeth partly from a humour which ſypeth out of the veſſels (I meane the veines and arteries of the heart) which the heart as *Hippocrates* ſpeaketh drinketh in, licking vp withall the drinke of the Lungs and piſſeth it out againe (for the watery humor is by the high ſeruour of the heart driuen forth, as we ſee in greene wood when it is burnt) partly of a portion of the drinke which ſoaketh in the paſſage through the ſides of the weazon, as it were a deaw and falleth downe hither, and from hence ſome of it into the venall arteries. The firſt is proued by the cure of the palpitation of the heart which is cauſed of the aboundance or ouerplus of this humour, which is turned ſayeth *Galen* in the ſecond Chapter of his 5. Booke *de locis affectis* by bloud letting; when together with the bloud the ſerous humour is let out which before fel into the *Pericardium*.

That it ſipeth out of the veſſels.

That it is part of our drinke. The latter is euicted by an example propounded by *Hippocrates*, for ſayth he, if you giue a Pigge that is very dry water mingled with minium or vermilion and preſently ſtick it, you ſhall finde all his winde-pipes along dyed with this coloured drink; ſome would haue it to be generated from moyſt vapours and exhalations rayſed from the humours of the heart, and driuen forth by his perpetuall motion and high heate vnto the *Pericardium*, by whoſe denſity they are turned into water: and of that opinion are *Falopius*, *Laurentius* & *Archangelus*; who remembreth ſixe opinions concerning the matter of it, which we ſhall hereafter make mention of.

That it is found in liuing bodies. But more in dead and why This humour is found not onely in dead bodies as ſome would, but alſo in liuing, but more plentifull after death (except in thoſe that die of conſumptions in whome it is little and yellowiſh) becauſe the many ſpirits which are about the heart, the body being cold are turned into water euen as thoſe vapors which are rayſed from the earth are by the coldnes of the middle region of the ayre conuerted into water: wee alſo affirme that it muſt of neceſsity be in liuing bodies, and not onely in thoſe that are diſeaſed, as they that are troubled with palpitation of the heart, but alſo in all ſound bodies; yet in ſome more plentifull in others more ſparing, but in all moderate; becauſe if it bee conſumed there followeth a conſumption, if it be aboundant palpitation of the heart, and if it bee ſo much that it hinder the dilatation of the heart then followeth ſuffocation and death it ſelfe. That it is in liuing bodies may be proued by the teſtimony of *Hippocrates* in his Book of the heart, where he ſayeth there is a little humout like vnto vrine, as alſo by the example of our Sauiour out of whoſe precious ſide iſſued water and bloud. It appeareth alſo by the diſſection of liuing creatures which euery yeare is performed for further aduertiſemēt, eſpecially a ſheep or ſuch like great with young, *Veſalius* addeth an example of a man whoſe heart was taken out of his body whileſt he liued at *Padua* in *Italy*. Finally the vſe and neceſsity of it doth euict the ſame.

In ſound bodies as wel as in diſeaſed.

The example of our Sauior

The vſes of it. For the vſe of it is to keepe moyſt the heart and his veſſels; a hot part, it is ſo as the left ventricle will euen ſcald a mans finger if it be put into it, and ſo continually moued that vnleſſe it were thus tempered it would gather a very torrifying heate, by cooling it alſo it keepeth it freſh and flouriſhing. It moyſtneth alſo the *Pericardium* wherein it is conteyned, which otherwiſe by the great heate of the heart would bee exiccated or dried vp. By it alſo

veine

ſo the motion of the heart becommeth more facile and eaſie, and this motion ſpendeth it and reſolueth it inſenſibly by the pores as it is bred; but if in the paſſage it bee ſtayed then ſaith *Varolius* are there many hairs found growing right againſt it on the breſt. Finally, it taketh away the ſenſe or feeling of the waight of the heart, becauſe the heart ſwimmeth as it were in it, euen as we ſee the infant ſwimmeth in ſweate in the wombe, aſwell to take away the ſenſe of the waight of ſo great a burthē from the Mother, as alſo that it might not fal hard to any part in her body; you may add to this if you pleaſe, that it helpeth forward the concretion of the fat about the heart. The cauſe of haire vpon the breſt.

In the cauity alſo of the Cheſt there is found ſuch a like water mingled with blood with which the parts of the cheſt are continually moiſtned and cooled. And thus much of theſe circumſtances of the heart. Now followe the Veſſelles of the cheſt. Another water and blood mingled in the Cheſt.

CHAP. IX. *Of the aſcending trunke of the Hollow veine.*

THE trunke of the Hollow-veine hauing perforated the *Diaphragma* or Midriffe, [Tab 5. fig. 1. from ^A to ^D Table. 6. from ^B to ^H] runneth along the Cheſt as high as the Patell-

TT the externall iugular veines.
V the external iugular vein diuided into two vnder the roote of the eare.
X the inner branch thereof.
Y the outer branch thereof.
Z A braunch proceeding from the vtter veine next aboue named, to the face.
a the fore-head veine.
e A branch creeping vp the temples.
* A ſurcle reaching to the nowle or back-ſide of the head.
aa the veine called *Cephalica* or the vtter veine of the arme.

bb the veine called *Muſcula ſuperior*. *dd* A veine climbing to the top of the ſhoulder which is ſomtimes double. *mm* the veine called *Baſilica*. ζ the trunke of the hollow veine vnder the Liuer. *x* the right fatty veine or *Adipoſa dextra*. *n* the left fatty veine or *Adipoſa ſiniſtra*. θ the emulgent veines. λλμμ the right and left ſpermaticke veines. Y the beginning of the veſſell called *vas varicoſum* or the bodden veſſell. ξ the veines called *Lumbares* or belonging to the loynes. ο the bifurcation of the hollow veine into the *Iliack* branches. *π* the vpper veine called *muſcula*. ρς A diuiſion of the left *Iliack* branch into an *interior* marked with ρ and an exterior marked ς. τ The veine called *muſcula media*. φ the veine called *ſacra*. ϕ The veine called *Hypogaſtrica* which is a branch of the inner bow marked with χ deſcending to the bladder & the wombe. ω A veine proceeding out of the externall branch marked with ς which is ioyned to the ſmall branches of the inner vein not far from the perforation or hole of the ſhare-bone. Γ The veine called *Epigaſtrica* which is an *exterior* ſhoote of the branch ς riſing vpward. Δ the veine called *pudenda*, an *interior* ſhoot of the braunch χ going to the genitals. Θ the firſt skin-vein of the leg deſcending to the toes of the feete. Λ a branch offered to the place of the groyn or lesk. Ξ a branch creeping through the skin of the thigh. Ω the vein called *muſcula inferior*, creeping through the place where the hip is articulated or ioyned with the thigh. 1 A vein diſtributed to the 7. and 9. muſcles of the leg. 2 A veine conueyed to the ſixt muſcle of the thigh.

to

o which as into a Ciſterne it powreth his blood. The ſecond is called *Coronaria cordis* [tab. 5.fig.2 a. Tab.6,a] the crowne veine of the heart, becauſe like a Crowne it compaſſeth the Baſis of the heart. This diſperſeth many branches through the outward ſurface of the heart euen to the Cone or point thereof eſpecially on the left ſide, becauſe the ſubſtaunce of it there is thickeſt and therefore needeth more Aliment. *Coronaria.*

Afterward the Hollow-veine perforateth the *Pericardium* againe, and againe groweth round but much leſſe then before, and riſeth vp where the right Lung is parted from the left, and ſo paſſeth to the *Iugulum*, but aboue the heart in the middeſt of the bodye it parteth with a notable trunke or branch to be diſtributed to the Spondels and the ſpaces betweene the ribs.

And this is the third branch called *Vena* ἄζυγος, or *ſine pari*, that is, the vn-mated Veyne which we haue before called *Non-paril* [Tab. 5.fig.1. C.fig.2 a Fig.4 a] becauſe commonly in a man it is but one, as alſo in Dogges, and hath not another on the other ſide like vnto it. *Vena* ἄζυγος.

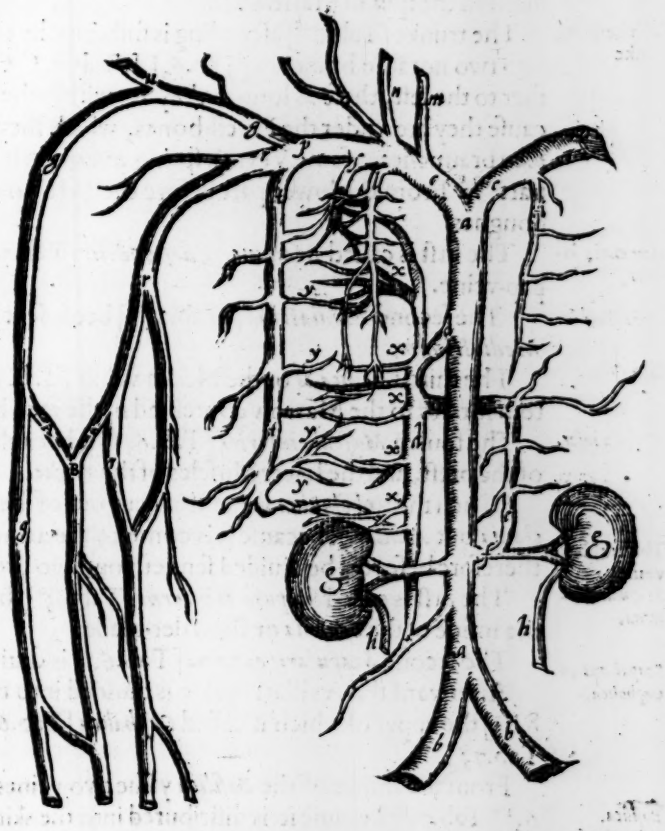
It ariſeth out of the backward and lower ſide of the hollow veine [Tab.5.fig.4.^] aboue the hart, betweene the fourth and fift ſpondell of the Cheſt, but more toward the right ſide then toward the left. In thoſe creatures that chew the cud it is double, as alſo in ſome men (happly in thoſe that wee call *Ambidexters*, that can vſe both hands alike) but verie rarely, yet *Fallopius* hath worthily obſerued, that there is in men a left branch which doth the office of the *Vena ſine pari* [Table 7,1] ariſing from the left *ſubclauian* branch, and affoordeth branches to ſome of the diſtances betweene the ribbes. Sometimes it ariſeth not out of the

Why ſome men are ambi-dexters. *Fallopius.*

aa. The hollow vein from the *Iugulum* to the holy bone.
bb the diuiſion of the hollow vein into the Iliack branches.
cc The diuiſion of the hollow veine at the *Iugulum* on both ſides into the *Subclauian* branches.
dd The trunke of the veine *Azygos* which inſinuateth it ſelfe into a branch of the Hollow veine at *.
e, f A left branch from the veine *Azygos*, inſerted into the emulgent veine at *f*.
gg The Kidnies.
hh the Vreters.
i The left vpper intercoſtall veine.
l the right deſcending Mammary veine.
m the internall Iugular veine.
n the externall iugular veine.
o the veine *Muſcula* going to the Muſcles of the necke.
p The diuiſion of the *ſubclauian* branch into the *Cephalica* & *Baſilica* veines.
qqq the *Cephalica* vein cald alſo *humeraria*
rr The *Baſilica* veine, which ſome alſo call *Axillaris*.
ſ The vpper Cheſt-veine called *Thoracica*.
t the lower cheſt-veine going to the outward Muſcles of the Cheſt.
u A branch of the *Cephalica* veine deriued vnto the Muſcles that lift vp the arme & to the skin therabout before it paſſe vnder the ſhoulder.
xxxx Certain veins in the Cheſt from the *Azygos*, which are vnited with the outward branches yſſuing from the exteriour Cheſt-veine, which is deriued out of the *Baſilica*.
yyyy The outwarde Veines of the Cheſt which are vnited with the inner braunches of the *Azygos*.

Although it ſhewe the Trunke of the hollowe veyne diſſeminated thorough both the Bellies, notwithſtanding it ſerueth eſpecially to exhibit the diſtribution of the veine Azygos, *and the coniunction of the branches thereof with the veynes of the Cheſt, which heere is onely ſhewed on the right ſide.*

TABVLA VII.



z A branch of the *Baſilica*, which is ioyned with the *Cephalica* A. A branch of the *Cephalica*, which is ioyned with the *Baſilica*, z. B The veine called *Mediana* or the middle veine.

Subclauian branch, but out of the trunke of the hollow veine neere the third Spondel of the Cheſt before the diuiſion thereof.

The branches of *Vena ſine pari.*

Commonly from the trunke of the veine ἄζυγος [Tab. 5. fig. 4.[a] Tab. 6.[rr] Tab. 7.[d]] out of the backſide of it as well on the left hand as on the right, but on the right eſpecially branches are diſtributed to the diſtances, ſometimes of all but moſt what of the ten lower ribs, [Tab. 5. fig. 4.] which are called *Intercoſtales rami* [Tab. 6,[oo]] braunches betweene the ribs. This Veine alſo without his mate, affoordeth many ſurcles to the Gullet, and ſometimes nere the fourth Spondell of the Cheſt it ſendeth a branch vpwarde [Tab. 7. at the vpper[d]] from which are deriued ſurcles to the foure vpper ribs.

The Intercoſtal braniches.

The Intercoſtall branches alſo yeelde ſmall ſtrings of veſſels [Tab. 7,[xxx]] which yſſue out of the Cheſt, which are inoculated with ſurcles of the veine called *Thoracica inferior*, [Tab. 7.[yyy]] whence it is that we with good ſucceſſe in Pleuriſies open the *internall* Veyne of the affected ſide.

The diuiſion of *Vena* ἄζυγος.

The trunke of the ἄζυγος at the 8. or 9. rib is aboue the ſpine diuided into a right branch and a left [Tab. 5. C, O] which both paſſe downward. The left which is the larger determineth into the midd e of the emulgent. The right is ioyned to the hollow veine aboue the emulgent, to the emulgent more rarely, moſt commonly it is implanted into the laſt veyne of the Loines, [Tab. 7, *] and hence it is that in the beginning of the Pleuriſie it is profitable to open the veine in the ham or in the foote.

Intercoſtalis Superior

The fourth is that Veine we call *Intercoſtalis ſuperior*, or the vpper Intercoſtall vein [Tab. 5, fig. 1,[x]. Tab. 6,[x]] on each ſide one ariſing from the *Subclauian* braunch about the beginning of the Iugular veines [Tab. 6.[ss]] and reflected vnder the Artery of the arme, and is diuided into two branches eſpecially on the right ſide, which are diſtributed to the diſtances of the two vppermoſt ribs, ſometimes to the three vppermoſt, and are ioyned with the Mammarie branches which creepe along the griſtles. [Tab. 6.[ll]] But this Vein is ſomtimes wanting, that is, when the Veine ἄζυγος affoordeth branches to all the ribs, as we ſaid euen now that ſometimes it did. Alſo from all the Intercoſtall veynes there are ſmall tendrilles which paſſe into the holes of the racke-bones for their nouriſhment, as alſo for the nouriſhment of the ſpinall Marrow.

the aſcending trunke

The trunke [Tab. 6[tt]] aſcending is ſuſtained by the Sweete-bread [Tab. 3,[x]] and diuided into two notable branches [Tab. 6, I I. Tab. 7, C C] one tending to the right hand, the other to the left, theſe as long as they are within the Cheſt, are called *Rami ſubclauij*, becauſe they are vnder the Patell-bones, which they call *Claues*. From each of theſe *Subclauian* braunches, ſome Veynes ſpring out of their vpper part, ſome out of theyr neather part. From the lower part before the *Subclauian* braunch is diuided dooe yſſue foure boughes.

Mammaria inferior.

The firſt is called *Mammaria deſcendens* [Tab. 5. fig: 1,[xx]. tab. 6,[ll]. ta. 7,[i]] the deſcending pap-veine.

Mediaſtina.

The ſecond *Mediaſtina*, [Tab. 2,[q]] becauſe it is Diſſeminated eſpecially through the *Mediaſtinum.*

Cerujcalis

The third *Cerujcalis* or the Necke-veine [Tab. 5.[oo]. Table 6,[nn]] becauſe it communicateth ſurcles to the Marrow conteined in the rack-bones of the necke.

Muſcula infer.

The fourth *Muſcula inferior* [Tab. 6, O] becauſe it is diſtributed into the vpper Muſcles of the breſt, and the lower Muſcles of the necke.

The Axillarie veine.

When the *Subclauian* veine attaineth out of the Cheſt [Tab. 7,[x]] it is called no more *ſubclauia* but *Axillaris*, becauſe it is come to the arme-hole called *Axilla*. The Axillary veine therefore before it be diuided ſendeth out two propagations.

Scapularis interna.

The firſt is called *Scapularis interna* [Tab. 6,[q]] becauſe it is diſperſed to the Muſcles on the inſide of the *Scapula* or ſhoulder-blade.

Scapul externa Cephalica.

The ſecond *Scapularis externa* [Tab. 6,[d]] is diuided to the outſide of the blade.

Afterward the Axillarie veine is diuided into two branches [Tab. 5,[ll]. table 6.[mm]. table 8.[qr]] the vpper of which is called *Cephalica* [Tab. 6.[a] Table 7,[q]] the lower *Baſilica*. [Tab. 6[a] Tab. 7,[r]]

Baſilica. Thoracica ſup. Thoracica infer

From the trunke of the *Baſilica* yſſue two veines. The firſt called *Thoracica ſuperior* [Tab 6,[pp] Tab. 7,[r]] becauſe it is diſtributed into the skin and Muſcles which couer the cheſt.

The ſecond *Thoracica inferior* [Tab. 6[xx]. Ta. 7,[tt]] becauſe it runneth along the ſide of the Cheſt, and the branches of this Veine are inoculated [Table 7,[yy]] with the ſurcles of the Veine ἄζυγος. Table 7[xx]]

From

From the vpper part of the *ſubclauian* veine 3. veines doe ariſe.

The firſt is called *muſcula ſuperior* [table 7° table 6. bb] becauſe it is diſtributed into the muſcles and skin on the backſide of the necke. *Muſcula ſuperior.*

The ſecond *Iugularis externa* [tab. 5.fig.1. ll tab.6. rr tab.7n] is commonly on each ſide one, but ſometimes double, and is againe diuided vnder the roote of the eare. *Iugularis externa.*

The third *Iugularis interna* [table 5.fig.1 kk tab.6. rr tab.7.m] is greater in a man then it is proportionably in other creatures, becauſe a mans brayne is greater; iuſt at the head it is diuided. *Iugularis interna.*

But becauſe all theſe veines we muſt handle more acurately in our booke of the veſſels, it ſhal be ſufficient here only to haue named them and ſhewed them vnto you, we proceed to the Nerues.

CHAP. X. *Of the Nerues in the Cheſt and the necke.*

THE Nerues diſſeminated through the Cheſt and the necke are of two ſorts, yet all proceeding from the marrow of the brayne; the firſt ſort whileſt the marrow is in the skull, the other after it is in the racke-bone, and is called *ſpinalis medulla.*

Out of the marrow yet in the skull: the ſixt paire come. [ta. 8.fig. 1: ee] They ſeeme to be but one nerue, but indeed are two inueſted with one membrane, and paſſe out at a hole betweene the nowle and the temporal bones. The *anterior* and leſſer part of this nerue is diſſeminated into the muſcles of the tongue and into the mouth. The *poſterior* and greater ſendeth branches to the muſcles of the neck, [table 8. figure 1. f] to the ſecond mooving the ſhoulder blade, and deſcending more inward to the muſcles that are in the cauity of the *larynx* or throttle [table 8. figure 1. q] ſome ſlender ones alſo to the muſcles of the bone *Hyois.* The ſixt paire of ſinewes.

Aboue the *Iugulum* or Region of the Coller-bone before it enter into the Cheſt, this branch is diuided into two [tab.8,fig. 1.h] boughes, the one outward and the greater, the other inner and the leſſe.

The outward bough maketh the Recurrent nerues, found out firſt by *Galen.* They are alſo called the Vocall nerues, becauſe if they bee wounded, the creature looſeth his voyce as we haue often tryed in the diſſection of liuing Dogges, for if one be cut or tyed he looſeth halfe his voyce, if both, he looſeth it wholly. The Recurrent nerues.

The outward branch of the right nerue preſently after the diuiſion [table 8.figure 1.h] ſendeth ſurcles on both ſides [tab.8.figure 1.kk] to the muſcles ariſing from the breſt-bone and the *clauicles* or coller-bones; & preſently when it commeth to the *Axillary* artery [tab. 8.fig.2r] it tranſmitteth as it were about an Axle-tree [tab.8. fig.2.r] three braunches from the inner ſide [tab.8.fig 1.l] which being reflected toward the head and vnited do make the right Recurrent; [tab.8.fig.2. qq and fig.1.m] and it is inſerted with the left into the ſecond griſtle of the *larynx* [ta.8.fig.1.n] and implanted into the *glottis* & the muſcles of the *larynx.* The right nerue of the 8. coniugatiõ.

The foreſayd branch after it hath made the Recurrent nerue, deſcendeth obliquely vnder the coller-bone, and in the way outwardly affordeth ſurcles to the *pleura* [ta. 8.fig.1.qq] and to the coat of the lungs, inwardly to the *pericardium* or purſe of the heart [tab.8.fig.1.r] and to the heart it ſelfe, and then maketh the nerue called *Stomachichus dexter* or [tab. 8.figure 1. ff] the right ſtomacke nerue which reacheth ouer to the left ſide, as the left doth to the right ſide, and ſo at length is conſumed into the left orifice of the ſtomacke, whence it hath his denomination. *Stomachicus dexter.*

The inward branch of the right nerue is called *Coſtalis* [table 8.figure 1.iii] which affordeth braunches to all the bowels of the lower belly, and reacheth as far as the holy-bone, and is diſtributed into three branches. *Coſtalis* hath 3. branches.

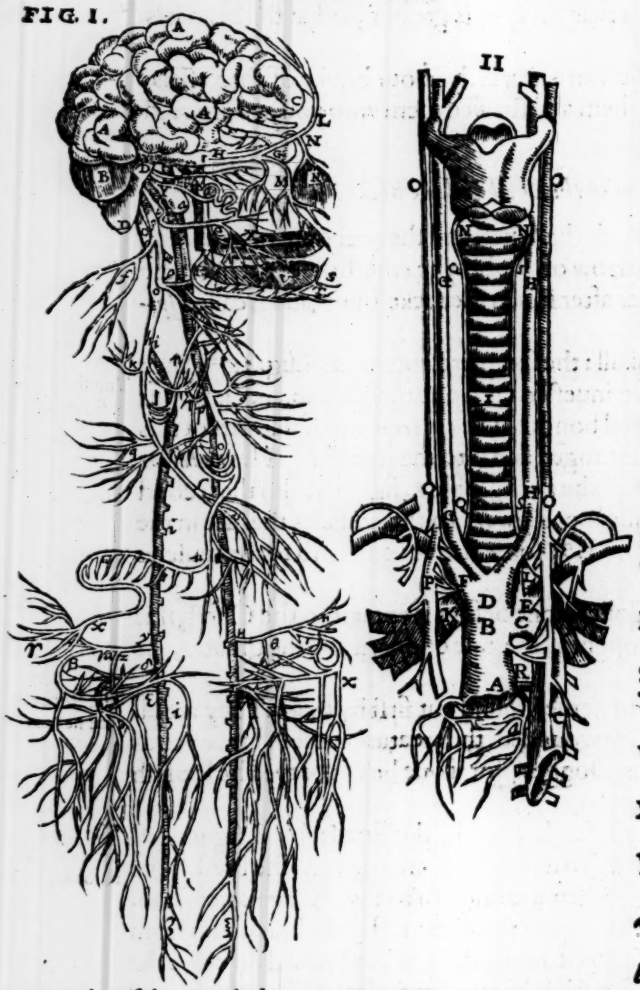
The firſt [tab.8.fig.1.y] creepeth to the lower membrane of the kell, & is ſubdiuided into three ſmall branches, whereof one goeth to the Collick gut [table 8.fig. 1.z] and this is the reaſon that after a long fit of the collicke men grow hoarſe; another [table 8.fig.1.a] to the beginning of the guts which is ſo ſmall, that it can hardly be perceiued. The third affordeth ſurcles [tab.8.fig.1.b] to the bottome of the ſtomacke: on the right ſide thereof, and to the vpper membrane of the kell, the reſt of it is ſpent in the coat of the Liuer [tab.8.fig.1.y] and the bladder of gall. The ſecond and the lower [tab.8.fig.1.s] reacheth to the right kidney, and hence it is that men vomit in fits of the ſtone.

The third which is the greateſt [ta.8.fig.1.c] paſſeth to the Meſentery and the guts. The

Table 8. Figure 1. ſheweth the Brayne and the after-Brayne or Cerebellum together with the nerues (as the common opinion is) proceeding out of them: and this Table we haue eſpecially ſet in this place to ſhew the diſtribution of the nerues of the ſixt coniugation through both the bellies.

TABVLA VIII.

FIG. 1.



A The Brayne.
B The *Cerebellum* or after-brayne.
C A proceſſe of the braine, but not that which is called *Mammillaris*.
DD The marrow of the backe as it is yet within the skull.
E The *Mammillary* proceſſe or inſtrument of ſmelling.
F the opticke nerue.
G the coate of the eye into which the opticke nerue is ſpread.
H the nerue that moueth the eye or the ſecond (payre.
I the third coniugation, or the harder and leſſer branch of the nerues of the third coniugation brought forward.
K The fourth coniugation or the greater and thicker Nerue of the third payre bending downward.
L A branch of the nerue marked with I, which goeth to the fore-head.
M Another braunch of the nerue I, reaching to the vpper iaw.
NN A nerue proceeding from the branch I, interxed or wouen with the coate of the noſe.
O the nerue of the tẽporal muſcle yſſuing from the branch, I.
P A nerue contorted of the nerues K and b.
Q A nerue proceeding from the braunch K, to the ſoccets of the vpper teeth.
R A nerue creeping from the nerue K, to the lower iaw. (lip.
S A ſurcle of the branch R offered to the lower
TT other ſurcles from the braneh R attayning to the lower teeth.
V V A branch of the nerue K, diffuſed into the coate of the toung.
XX the fourth paire of ſinewes which goe into the coat of the pallat.
Y the fiſt payre of ſinewes which are the nerues of hearing.
a The membrane of the eare, vnto which that fiſt nerue goeth.
b c Two ſmall branches of the fiſt coniugation vniting themſelues with the nerue P. *d* The eight coniugation or a nerue of the fiſt payre attayning vnto the face. *ee* The ſixt payre of nerues. *f* A branch from the nerue *e*, reaching to the muſcles of the neck. *g* Smal branches deriued vnto the throttle or *larynx*. *h* the byfurcation of the nerue into two branches. *i i i* An inner branch hanging to the rack-bones, and ſtrengthning the *intercoſtall* nerues, and is therefore called *Intercoſtalis*. *k k* Surcles of the vtter braunch going to the heades of the muſcles, to the breaſt-bone and to the coller-bones. *l m* branches of the right nerue *l*, making the right Recurrent nerue. *mn* the inſertion of the Recurrent ſinewes into the muſcles of the *larynx*. *o p* branches of the left nerue *o*, making the left Recurrent ſinew *p*. *qq* branches from the ſixt coniugation going to the coat of the lungs. *r* Small nerues of the heart and of the purſe thereof called the *Pericardium*, as alſo ſome approaching to the coate of the lungs. *ſ* nerues on either ſide ſent to the ſtomack. *t* the right ſtomacke nerue going to the left orifice of the ſtomack. *u u* the left ſtomack nerue going to the right orifice of the ſtomack. *x* A nerue from the branch *u*, paſsing into the hollownes of the liuer. *y* the nerue belonging to the right ſide of the kell. *z* the nerue belonging to the collick gut. *α* A nerue creeping to the gut called *duodenum* and the beginning of the *ieiunum* or empty gut. *β* A nerue implanted in the right ſide of the bottom of the ſtomack. *γ* A nerue belonging to the Liuer and bladder of gall. *δ* A nerue reaching vnto the right kidney. *ε* A branch reaching the *Meſenterium* and the guts. *ζ* A braunch ſprinkled to the right part of the bladder. *η* A branch going through the left part of the kell. *θ* Surcles deriued to the collick gut & the kell. *ι* Smal branches inſerted into the ſpleen. *κκ* A nerue approaching to the left ſide of the bottom of the ſtomack. *λ* a branch belonging to the left ſide of the *meſentery* and the guts. *μ* A branch which attayneth to the left kidney. *ξ* Small nerues creeping through the left ſide of the bladder. *ο* The 7. payre of ſinewes. *π* A branch deriued from the ſixt coniugation to the muſcles which ariſe from the proceſſe called *Styloides*. *ρ* A branch of the 7. coniugation which goeth to the muſcles of the toung, of the bone *Hyois*, and of the throttle or *larynx*. *σ* A coniũction or coition of the ſixt and 7 paire into one nerue.

Figure 2. exhibiteth the Recurrent ſinewes together with a portion of the great Artery and the Rough Artery called the weazon.

A The orifice of the great Artery cut from the heart. *aa* The coronall arteries. BCD The diuiſion of the great artery into two trunks, the deſcending C, the aſcending D. E The left *Axillary* artery. F The right *Axillary* artery. G The right *Carotis* or ſleepy artery. H The left *Carotis*. I the trunke of the rough artery. KL the diuiſion of the rough artery. M the head of the rough artery called the *larynx* or throttle. NN Certaine glandules or kernels at the root of it. OO the right and the left nerues. P a reuolution of ſmall branches of the right nerue to the right axillary artery. QQ The right Recurrent nerue. R a reuolution of ſmal branches of the left nerue to the deſcending trunk of the great artery. SS The left Recurrent ſinew.

reſt deſcendeth directly to the bladder. [Tab.8,fig.1,ζ]

The left Nerue of the ſixt coniugation [Tab. 8. figu. 1,ᵉ Fig. 2 °] is diuerſified after the ſame manner with the right, and when it attaineth to the coller, is diuided into an outward and an inward branch. The outward communicateth it ſelfe to the *pleura* [Tab.8.fig,1 ᵍ] & the coate of the Lungs, and deſcending to the trunke of the great artery [Tab.8,fig.1,C] tranſmitteth commonly three ſmall ſurcles, which being reflected and vnited [Tab.8,Fig. 1 ᵏ] make the left recurrent Nerue. [Tab.8,fig.1,ˢˢ] The remainder of this outward bough enclining to the right hand maketh the Nerue, which they call *Stomachicum ſiniſtrum*, the left Stomacke Nerue [Tab.8,fig.1,ᵘᵘ] which vnder the gullet is ioyned with the right Stomacke Nerue. [Tab.8,fig.1,ᶜ]

the left nerue of the 6. coniugation

The left Recurrent.

The inward bough of the left Nerue paſſeth through the cheſt where it maketh *Siniſtrum coſtalem*, the left Rib-nerue, and vnder the Midriffe it is diuided into three branches. The firſt and vppermoſt [Tab.8.fig.1ᵘ] goeth to the Kell, from which doe proceede two ſmall ſurcles, one to the collicke gut [Tab.8.fig.1,θ] and the lower Membrane of the Kel; [Tab. 8,fig.1,ᵗ] the other to the bottome of the ſtomacke [Tab.8,fig.1,ϰϰ] and the vpper Membrane of the Kell; that branch which remaineth is inſerted into the Spleene [Table 8. Fig. 1,ᵡ]

His inwarde bough diuided into three

2 The ſecond [Tab.8.fig.1,ᵘ] runneth to the left ſide of the Meſentery, and vnto the guts thereabout, and ſometimes ſome ſurcles there-from accompany the Semmary Veſſels euen to the Teſticles.

3 The third [Tab.8,fig.1,ᵛ] attaineth to the left Kidney: the remainder of the whole branch is conſumed in the left ſide of the bladder. [Tab.8,fig.1 ξ]

And thus much of the diuarication or diſtribution of the Nerues from the ſixt coniugation which yſſue from the marrow of the braine contained within the ſcull.

The Nerues that yſſue out of the marrow of the Braine after it is conteined in the ſpondels of the backe, and is commonly called *Spinalis medulla* are of two ſortes, ſome of the Necke, others of the cheſt.

Two ſorts of Nerues.

Of the Nerues of the Necke there are ſeauen pairs, and from the three laſt proceedeth one branch called the Midriffe-Nerue, made of three ſurcles al diſperſed into the *Diaphragma* or Midriffe.

Ceuicales pairs ſeuen.

Of the Nerues of the cheſt there are twelue paire called *Intercoſtales Nerui*, becauſe they pertaine to euery diſtinction betweene the Ribs, and runne cloſe to the bone on the the lower ſide thereof all along the length of it; for in the bottome of the Rib there is a cauity where the Artery veine and Nerue doe meete; and therefore when you ſhall open a mans ſide diſeaſed of the *Empyema*, you muſt make your inciſion at the vpper part of the Ribbe.

Theracici pairs 12.

A note how to make inciſion in the *Empyema*.

And this ſhall ſuffice to haue ſpoken of the Nerues belonging to the cheſt at this time and in this place, the more accurate Diſcourſe you muſt looke for in our Booke of the Veſſelles.

CHAP. XI. *Of the Heart.*

THE heart is a principall part; not as *Ariſtotle* called it principall, who placed in it all the actions of life and ſenſe; but as being the fountaine of the Vitall Faculty and ſpirit, the place and nouriſhment of naturall heat, wherby the naturall heate of all the parts is preſerued, and by his influence repaired; the ſeate of the Iraſcible or angry parts of the ſoule, the root of the Arteries and Author of the Pulſe.

It is called *Cor a currendo*, becauſe it ſeemeth continually to run, for that it is continually mooued. The Greekes call it καρδία, either of a worde which ſignifieth to beate or pante, which is [illegible] proper word for the beating of the heart; or from a word which ſignifieth a Bakers moulding-boord, becauſe in it the Alimentary blood is as it were kneded, wrought, moulded, and driuen out into thinneſſe, till it turne into a vitall ſpirite; or finally from a word which ſignifieth principality, becauſe it is a principall part as well as the braine; yet ſo that as the Braine is of greater dignity, ſo the heart is of greater neceſsity; for the leaſt hurt of this moſt what cauſeth death; and *Galen* ſaith, that death neuer happeneth but when the heart is immoderately diſtempered. Whereupon alſo *Ariſtotle* ſaith, There was neuer any creature ſeene without a heart, becauſe without it there can bee no Originall at all of heate.

Names

The neceſſity of the Heart.

It

It is ſcituated in the midſt of the cauity of the cheſt in a Noble place as it were a Prince; and after the manner of thoſe which being but one do occupie the middeſt as well for ſecurity, as that the body may be equally ballanced. At the fift rib it is embraced by the lobes of the Lungs as it were with fingers [Tab: 3 N O P Q. Tab. 9. fig. 1 and 2. Table. 10, fig. 1, and 2] round about, that equally out of all the Lungs, it might draw breath by the venall arterie, and might againe deliuer ouer and diffuſe blood by the arteriall veine, and life and heat by the great Artery to all the outward parts; & it is locked vp in his owne Capcaſe [Tab. 9. fig 1, D E F. Fig. 2 BB] but ſo that the Baſis reſteth exactly in the middeſt, whether we regard the right hand or the left, the fore-part or the back, the vpper or the lower; but the point [tab. 9. fig. 2 B] reacheth to the left hand, yet forward as farre as the left Nipple, ſo that in a liuing man it looketh directly forwarde (with a kinde of ſtrutting poſition) to the Griſtles of the ſixt and ſeuenth ribs of the left ſide where they are ioyned to the breſtbone, that it may the better warme the forepart againſt which we moue.

Why it ought to encline to one ſide.

And truly it behooued that it ſhould encline to one ſide that it might giue way to the Midriffe, and ſo neither of their motions (which are both perpetuall) ſhould be hindred; but not vnto the right ſide, for that the hollow veine takes vp as he aſcendeth thorough the cheſt; happely alſo Nature was heere of *Ariſtotles* minde in the fourth chapter of his third Booke *de partibus Animalium* (for he was often of hers) that the leſte ſide was the colder and therefore ſhe placed this hot part in it;

Why to the left.

for on the right are the hollow veine and the *Non-paril*, which heate it ſufficiently; and ſo both ſides are prouided of heate and ſtrength alike. Notwithſtanding the common people are deceyued, who thinke it lyeth wholy on the left ſide becauſe the motion and pulſation

The common error of the multitude.

is moſt felt on that ſide, when indeede it lyeth in the very middeſt, as in the more Noble place; but the left ventricle which is the Store-houſe of ſpirites and the great arterie were the cauſe of their error, as *Galen* ſaith in the ſecond chapter of his ſixt Book *de vſu partium*: Add heereto, that in dead carkaſſes it is drawn ſomewhat to the left ſide, partly by his own waight, partly by the waight of the great artery which is faſtned vnto it.

His connexiō.

It is tied by the mediation of the *Pericardium* or purſe to the *Mediaſtinum* [Tab. 9. fig. 1. from F to G] and to the Midriffe, as alſo by his veſſels to other parts. For *Galen* ſaith, that principals in ſom things are to be tied together, and communicate one with another: otherwiſe it is looſe, that it may mooue the more freely.

His Figure.

The Figure of it as *Hippocrates* ſaith in his Booke *de Corde* is *Pyramidal*, [expreſſed ſo in the Tab. 9. fig: 2] or rather turbinated and ſomewhat anſwering to the proportion of a Pine Kernell, becauſe a man is broad and ſhort cheſted. For the Baſis aboue [Tab. 9. fig: 2, C] is large and circular but not exactly round, and after it by degrees endeth [Tab. 9, figu: 2, F] in a cone or dull and blunt round point; for ſuch a figure was fitteſt for his function, becauſe length maketh much for traction or drawing, & roundnes for amplitude & ſtrength: ſo in great dilatations it is ſpherical that it might hold more; and in his contractions long and as it were Pyramidall, eſpecially in bruite beaſts.

The names of the Baſis.

His ſuperiour part which is called the Baſis, the head, and the roote [Tab. 9. fig: 2 C D] is broader becauſe of the veſſels which in that place haue ingate and outgate, haply alſo becauſe of his motion, that in this broad Baſis the excauations or cauities might be the larger that when it is contracted both kindes of Blood arteriall and venall might haue place and room to retire to, and not be too vehemently wrought or pent vp in too ſtraight a room, leſt it ſhould violate the continuity of his ſubſtance or of the fibres therein.

His lower part is called the *vertex* or top, *Mucro* or point, the *Cone*, the heighth of the heart. *Hippocrates* calleth it the taile [Tab. 4. figure. 2 F] which *Galen* ſaith in the ſeauenth

The names of the Lower end.

chapter of his 6. Booke *de vſu partium* is the baſeſt part, as the Baſis is the nobleſt. Before the heart is gibbous or bunching, behinde hollow and in the ſides prominent. The Superficies or ſurface of it is ſmooth and polliſhed all ouer, were it not that in ſome places the Fat, in other the Coronarie veſſelles ſtrutting with bloode, did make it vneuen.

His quantitie or magnitude

His quantity or magnitude is not alike in all, & in a man proportionably, as alſo the brain and the Liuer greater then in other creatures being as long as the bredth of fixe Fingers & four broad, and ſo many high. But in fearfull creatures as the hare, Hinde, aſſe, and ſuch like it is proportionably very great, for the heat when it hath too much ſcope or roomth (ſayeth *Ariſtotle*) is eaſily diſſipated and vaniſheth.

The parts of the heart. Externall.

The parts of the heart are ſome externall, others internall. The externall are the Purſe, of which we haue already ſpoken, the coate, the fat, the veſſels which are of two ſorts, ſome which encompaſſe the hart, others which reach vnto the entrances into his Ventricles and the

the eares. The inward parts are the fleſhy ſubſtance and the Fibres, the Ventricles and the Values or Flood-gates.

The coate is proper to the heart, very thin and fine. *Veſalius* likens it to the Membrane that compaſſeth the Muſcles, this inueſteth it as that of the Muſcles, and ſo ſtrengthneth his ſubſtance from which it cannot be ſeuered. The fat called *pinguedo* with *Columbus*, *or Adeps* with *Galen* and *Ariſtotle* or both with *Archangelus*, is very plentifully gathered about it like Glue, eſpecially at the *Baſis* where the greater veſſels are placed, becauſe there is the concoction celebrated of thoſe things that are conteined in it, & not in the Cone or point. This fat is harder then it is in any other part; and therefore it ſhould ſeeme rather to be *Adeps* then *Pinguedo*, and that is *Galens* and *Ariſtotles* reaſon; for if it were *Pinguedo* it would melt with the extreame heate of the heart to great diſaduantage. Howſoeuer the vſe of this fat is to moiſten the hart, leaſt being ouer-heated with his continuall motion it ſhould grow dry and exiccated, but this kinde of fatty humidity is hardly conſumed, but remaineth to cheriſh it, and to annoint and ſupple the veſſels that they cleaue not with too great heate and drought.

The Coate.

The Fatte of what kind it is

The vſe of fat.

Moreouer, the heart being the fountaine of heate which continually flameth, it ſerueth for a ſufficient and neceſſary Nutriment whereby it is cheriſhed and refreſhed, & in great affamiſhments nouriſhed and ſuſtained, leaſt otherwiſe the heart ſhould too ſoone depopulate and conſume the radicall moyſture. Wherefore *Galen* aſcribeth this vſe to fat, that in great heates, famines, & violent exerciſes, it ſhould ſtand at the ſtake to ſupply the want

of

of Nature at a pinch. So sayeth *Auicen*, Fats of all kindes are increased or diminished in the body according to the increase or diminution of heate, wherefore heate feedeth vppon them. We haue often obserued in opening of the ventricles of the heart, in the very cauities of them a certaine gobbet or morsell if not of fat yet of a substance very like it, so that we haue more wondred how that should in such a furnace congeale, then the other in the out side. The cone is alwayes moystned by the humor contayned in the *Pericardium*.

A substance like fat obser. tied in theven tricles of the heart.

The vesselles of the heart are of all kinds, which doe compasse the heart round about, [table 9. figure 2.[l] and branches from these [ll] table 10. figure 2.[p]] The veine is called *Coronaria* or the Crowne veine arising from the trunke of the hollow veine [table 6.[z]] before it bee inserted into the right ventricle, and sometimes it is double: this engirteth round like a crowne the *basis* of the heart, and hath a value set to it, least the bloud should recoyle into the hollow veine.

The veine called *Coronaria*.

From this crowne veine are sprinkled branches downward along the face of the heart, which on the left side are more and larger, because it is thicker & more solid then the right side. This bringeth good and thicke bloud, laboured onely in the Liuer to nourish this thicke and solid part, that the Aliment might be proportionable to that it should nourish. By this vessell also it may be beleeued that the Naturall Soule residing in the Naturall spirite is brought into the heart with all his faculties.

What nourishment the hart needed.

The Arteries.

It hath also two Arteries called *Coronarias* [table 12. figure 1.[aa]] proceeding from the descending trunk of the great Artery, which together with the vein are distributed through his substance to cherish his in-bred heate, and supplying vitall spirites doe preserue his life: for if the heart did liue by the spirits perfected in his left ventricle and carried vnto his substance without Arteries, then also might the same spirit passe through the pores of the hart and so be lost.

By what spirits the heart liueth.

The nerues.

It hath also Nerues but very small ones, from the sixt coniugation [table 10. figure 1.[x]] or from the nerues which are sent vnto the *Pericardium* which are distributed into his *basis* [table 10. figure 2.[h]] close by the arteriall veine, but not very perspicuously; and as some thinke for sence onely and not for motion; because his motion is Natural and not Animal. But saith *Archangelus* if there must be but one and not two principles of motion in vs, then shall the Brayne be also the originall of all motions, because it is the seate of the sensible Soule; (for that opinion of *Aristotles* who attributeth vnto the heart onely all the powers and faculties of the soule, *Galen* and the later writers do with one consent disauow) and so this nerue shall minister vnto the heart not onely sence but also motion and both their faculties, and also the faculty of pulsation or the motion of dilatation and constriction. And this nerue sometimes though seldome is suddenly stopped, whence commeth hasty and vnexpected death, which wee call sudden death, the faculties of life and pulsation being restrayned so that they cannot flow into the heart. But we with *Gal.* in the 8. Chap. of his seauenth Booke *de Anatom. Administ.* will determine for our partes, that the faculty of pulsation ariseth out of the body of the heart not from the nerues; for then when these are cut away, the pulse should cease; and the hart taken out of the chest could not be moued, which we find otherwise by dissection of liuing creatures.

Archangelus his conceit that the motion of the hart commeth frō his nerues.

A cause of sudden death.

CHAP. XII. *Of the substance, ventricles and eares of the heart.*

The substāce of the heart. Why so thick.

THE substance of the heart is a thicke [table 10. figure 3. sheweth this] and red flesh, being made of the thicker part of the bloud; it is lesse redd then the flesh of muscles but harder, more solide and dense, that the spirits and inbred heate which are contayned in the heart and from thence powred into al parts of the body should not exhale; and that it might not bee broken or rent in his strong motions and continuall dilatation and constriction. And it is more compact, spisse and solid in the cone then in the *basis*, because there the right fibres meeting togeth[illegible]e more compact, right as it is obserued in the heads or tendons of the muscles. This flesh is the seat of the vitall Faculty and the primary and chiefe cause of the functions of the heart, which consiste especially in the making of vitall bloud and spirites. For it hath all manner of fibres right, oblique and transuerse, most strong and most compact and mingled one with another (and therefore not conspicuous as in a muscle) as well for the better performance of his motion, as for a defence against iniuries; wherefore according to the opinion of *Galen* in the 6. Chapter of his third book *de motu musculorum*, and in the 7. Chapter of his 8. Booke *de vsu partium* (who sometime calleth it after the common name of the bowels a

Where is the seat of the vital faculty.

The heart hath all kinde of fibres.

paren-

Parenchyma; sometime the fleshy bowell) it is not a muscle, because it hath all kinde of fibres and is not moued with a voluntary motion, for after *Gal.* determination a muscle is the instrument of voluntary motion: but the motion of the heart which dependeth vppon his substance and flesh is not Voluntary but Naturall, neither can cease so long as the creature liueth; but the action of the muscles resteth sometimes and is againe set on woorke according to the determinate purpose of the Creature to wh ch it is obedient. Notwithstanding *Hippocrates* in his Booke *de Corde* calleth it a very strong muscle and not vnwoorthily, for he defineth a muscle to bee flesh rowled into a globe, and such is the flesh of the heart: wherefore both of them resting vpon their own definitions haue deliuered the trueth. And therfore *Picholomenie* answered for *Hippocra.* that there is in vs one motion Naturall whose muscle is the heart; another motion voluntary to which all the other muscles of the bodye are obedient; and he maketh a generall definition of a muscle, that it is a fleshy instrument working motion in a creature: vnder which the heart also may be contayned.

How *Hippoc.* is to be vnderstood when he calleth the heart a muscle.

The perpetuall motion of the heart because of the continuall generation of spirites (because euery part standeth in neede of them) is double consisting of a *Dyastole* or dilatation, and a *Systole* or contraction; which is accomplished by the fibres: for as long as the Creature liueth it is dilated and contracted, and betwixt either of these motions commeth a rest or cessation: for contrary motions, saith the Philosopher, cannot be without a rest between them.

The double motion of the heart.

Contrary motions must haue a rest between the.

It is dilated when the cone or end is drawne to the *basis* with right fibres, and then it becommeth short indeed, but his sides are so distended that it appeareth spherical or round. The vse of this motion is to drawe bloud into the right ventricle by the hollow veine, and ayre into the left by the venall artery, the values falling downe and giuing way to their entrance: but it is contracted when the cone or poynt departeth from the *basis*, and then the heart becommeth longer indeed but narrower, the right fibres being loosed to their length and the transuerse which encompasse the heart round being strongly gathered together & straightned, the values of the hollow veine and the venall arterie partly shutte, but those of the great artery & the arteriall veine are opened, yeelding out-gate to the bloud out of the right ventricle by the arteriall veine into the Lungs, and to the vitall spirite out of the leste ventricle into the great artery, and to a portion of the vitall bloud together with the soote through the venall artery. This motion of the heart is called *Systole* or contraction and depression.

How the hart is dilated.

How it is contracted.

This contraction is not a little helped, if not altogether performed, by certayne strong ligaments [table 10. figure 6.[t] figure 7.[mm]] which are streatched in the inmost parts of the ventricles of the heart; for when these being contracted doe fall, they also drawe together with them the coats of the heart inward.

Ligaments in the heart helpers or authors of contraction.

Finally the oblique fibres which lye obliquely along the length of the hart, are the cause of the small rest that is betweene these contrary motions; and those things whether bloud or spirits, which are drawne into the heart by their helpe are a little while reteyned in the ventricles, the heart being on euery side straightned about those things it contayneth: but if in the dissection of a liuing creature you carefully obserue the motion of the heart, you shall discerne foure motions distinguished by their seuerall times and places, whereof two are proper to the eares of the heart, and two to the ventricles. The cauities of the heart which we call ventricles, *Hippocrates* called γαστέρας. *i.* Bellies, so doth *Galen* in the 11. Chapter of his 6. Booke *de vsu partium*, but by a diuerse name χοιλίας. They are two very notable differing in largenes and in form.

The rest of the hart how wrought.

4. Motions in the heart distinguished by their times and places.

The right [tab. 10. figure 3.[oo]] is not exactly round, and hath a proper superficiall circumscription of his own, semicircular and crescent like a halfe Moone, for the belly of the partition which is like a semiorbe stands out into it. This sayeth *Hippocrates* compasseth *Caudam cordis*, that is the taile, he meaneth the poynt or cone of the heart, but reacheth not to the very extremity, yet lower sayeth *Vesalius* then the left ventricle doth. It is broader also and larger much then the other, because it is to containe a farre greater quantity of bloud, therefore *Galen* in the 7. and 12. Chapters of his sixt Booke *de vsu partium* and an antient Greeke Physitian of *Ephesus* called *Ruffus*, call it the bloudy ventricle and *venosus*, that is the veiny ventricle. His flesh is more laxe and soft and his partition thinner [tab. 10. figure 5.[q q]] in compensation of the waight of that it contayneth, that the heart might not be ouer-ballanced. Into this the ascending hollow veine whilest the heart is dilated powreth bloud, that in the dennes which are among the fibres of it, it might by the heate of the

heart be reboyled, attenuated and purified, both for the generation of vitall ſpirits, as alſo for the nouriſhment of the Lungs: for the greater part of that bloud in the *Syſtole* or contriction of the heart is powred out into the Lungs by the Arteriall veine, but the thinner part ſweateth through the partition into the left vētricle; for this right vētricle was created eſpecially for the Lungs ſake, as being found onely in thoſe creatures which haue Lungs; but in thoſe creatures which doe not reſpire but onely tranſpire as Fiſhes, this right ventricle is not found. And ſo the heart maketh recompence vnto the Lungs ſayeth *Galen* in the 10. chap. of his 6. book *de vſu partium*, which drew in ayre for his behoolfe, by making and ſending them nouriſhment fit for them. Reſpiration & tranſpiration.

The left ventricle [table 10. figure 3. mm] is made iuſt in the middeſt of the heart; if you take away that part which made the right you ſhall better perceiue it. It is narrower then the former, becauſe it is made to contayne a leſſe quantity of matter, and his cauity is rounder, and goeth ſayth *Galen* in the firſt chapter of his 7. booke *de Anatom. Adminiſt.* (though *Veſalius* be of another minde as we haue ſayed) vnto the verie end of the cone. His fleſh or wall is thrice ſo thicke [table 10. fig. 8. qq] as that of the other, as well becauſe of the ſmalneſſe of his cauity which muſt needs leaue the ſides thicker, as alſo for that it preſerueth the in-bred heate: it is alſo harder and more ſolide to keepe in the vitall ſpirits that they do not exhale or vapour out, and to poyſe the body; the thicknes of this and ſubtilitie of the contents anſwering to the largenes of the other, and thicknes of his contents, that ſo the hart might not incline too much on either ſide. In this the vitall ſpirites are laboured and contayned together with the arteriall bloud, wherefore *Galen* in the 7. and 11. chapters of his ſixt booke *de vſu partium*, and *Ruffus* call it the ſpirituall, others the ſpongie, ayry and arteriall ventricle. The left ventricle. The reaſon of his thicknes. The poyſe of the heart.

For in the cauity of this ventricle the vitall ſpirits are laboured, and from hence by the arteries are diſtributed through the whole body to cheriſh the in-bred heat of the parts, to reuiue it when it growes dull and drowſie, and to reſtore it when it is conſumed. What is contained in it.

The matter of this ſpirite ſayeth *Galen* is double, ayrie and bloudy mingled together. The ayre drawn in by the mouth and the noſe & prepared in the Lungs, is carried through the venall artery into the left ventricle whileſt the heart is dilated. And the bloud attenuated and concocted in the right ventricle, is partly diſtributed into the Lungs by the arterial veine for their nouriſhment, partly is drawne by the left ventricle through his wall and retayned by an in-bred propriety which being mingled with the ayre is abſolued and perfected by the proper vertue of the heart, his in-bred ſpirit, heate and perpetuall motion, and ſo putteth on the forme of a ſpirit, which is continually nouriſhed by the arteriall bloud. This bloud thus fraught with ſpirits in the contraction of the heart is powred out into the great artery to ſuſtayne the life of the whole body; for all life is from the heart and the vitall ſpirite. The matter of the vital ſpirit.

The inward face of both the ventricles is vnequall and rugged, that the ſubſtances which come into the heart ſhould not ſlippe out before they are perfected, for which purpoſe alſo the values doe ſtand in great ſtead. The inward ſuperficies of the ventricles

That inequality commeth partly by reaſon of many ſmall dennes which are more notable in the left ventricle, (wherefore *Hippocrates* in his booke *de Corde*, ſayeth it is more broken and abrupt then the right, becauſe here Nature hid the diuine fire which the Poets feyne *Prometheus* ſtole from heauen to giue life vnto man: and *Hippocrates* becauſe of the great heat of this place thought it to be the ſeate of the Soule) partly becauſe there are certaine ſmall fleſhy particles [table 10. figure 5. oo figure 6. l figure mm figure 8. m table 12. fig. 2. ff] which about the cone of the heart appeare ſmall & ſlender, to which the neruous fibres of the values [table 10. figure 7. gg figure 8. l] called by *Galen* in the 8. Chapter of his 6. Booke *de vſu partium*, and by *Archangelus* the ligaments of the heart, do grow. Whence the inequality is. *Prometheus* fire

Theſe ventricles are diuided by a wall or partition [table 10. figure 3. n figure 6. nn figure 7. figure 8. n] leaſt the contents ſhould bee mingled and ſhufled together, which on the right ſide beareth out as we ſayed and is gibbous; on the left concaue and hollow, and is of the ſame thickneſſe with the left ſide of the left ventricle, as if the heart were only made for the left ventricles ſake. The wall of the ventricles

This wall is alſo full of holes and ſmall trenches (it may be *Ariſtotle* therefore called it third ventricle) that in them the bloud might be wrought into a further thinneſſe; porous alſo it is eſpecially on the right ſide, that the bloud might more freely paſſe out of the right into the left ſide for the generation of vital ſpirits, which *Galen* inſinuateth in theſe words, in

the 15. Chapter of his third booke *de Naturalibus facultatibus*. *Out of the right cauity that which is thinneſt is drawne by the pores of the wall*, whoſe vtmoſt ends a man can ſcarce diſcerne, becauſe in dead bodies all ſuch paſſages fall together. That the bloud is carried by theſe paſſages it appeareth becauſe nature neuer endeuoured any thing raſhly or in veine; but there are many trenches as it were and deep caues in the partition which haue narrow determinations. Thus far *Galen*.

How beſt diſcerned.

The opinion of ſome learned men.

Theſe breathing paſſages are moſt conſpicuous in an Oxe heart after it is long ſodden. But there are ſome as *Varolius*, *Columbus* and *Vlmus*, who deny that there is any ſuch paſſage, and wil that the bloud ſhould be carried by the arteriall veine out of the right ventricle into the Lungs, part of which to remayne for their nouriſhment, and the remaydner to be conuayed after ſome alteration in the Lungs mingled with the ayre which is drawne by the breath through the venall artery into the left ventricle of the heart for the nouriſhment and generation of the vitall bloud and ſpirits.

But wee will leaue this ſubtle queſtion to Philoſophers, for vs it ſhall bee ſufficient to haue made this mention of both waies by which it may paſſe, leauing the Controuerſie to farther diſquiſition.

The deafe-eares.

At the Baſis of the heart on either ſide hangeth an appendixe [Table 9. figure 2.[n] tab. 10. figure 3.[nn]] which is called the Eare, not from any profite, action or vſe it hath ſayeth *Galen* in the fifteenth Chapter of his ſixt Booke *de vſu partium*, and therefore wee in Engliſh call it commonly the deafe-eare, but for the ſimilitude; for it hath a long Baſis and endeth in an obtuſe or blunt cone or poynt.

Their ſcituation.

The right.

Theſe are placed about the ventricles before the orifices or entrances of the veſſels which carry matter into the heart. The right [Table 9. figure 2.[t] table 10. figure 1.[t] fig. 2.[a]] which is placed neare [table 10. figure 3.[a]] the hollow veine is the larger, and maketh as it were a common body together with the veine, and his cone or poynt looketh vpward.

The left.

But the left [Table 10. figure 2.[r] figure 3.[r]] placed at the arteriall veine [Table 10. figure 3. [p]] is much leſſe, becauſe the orifice of this veſſell is much leſſe then that of the hollow veine, and beſide ayre followeth more freely at a narrow paſſage then bloud. It is alſo ſharpe

Why the eares haue correſpondency with the ventricles.

and runs more on the ſide of the heart and is more rugged and vneuen on the outſide then the right, harder alſo and more fleſhy and thicker, for the eares haue a correſpondency with the ventricles, as ſeeming to bee by Nature framed to bee aſſiſtant in ſome preparation of the matters which belong to the heart. They are hollow as making way vnto the heart.

Their ſubſtance is peculiar and ſuch as is found in no other parte; much like the ſcarfe skinne, and membranous that they might endure the force of attraction without breaking, and alſo that they might better follow the motion of the hart; for they are like values ſtreched and contracted; when they are full and extended then are they gibbous and ſmooth,

Their figure

but when they are contracted then they appeare outwardly rugous and wrinkled, and within they reſemble the vnequall *ſuperficies* [Tab. 10. figure 5. the right inuerted[t] rugous fig. 7. the left inuerted[r] fig. 8.[n]] of the ventricles.

Subſtance.

They are thin that they might more eaſily be contracted, ſoft, and neruous for ſtrength for that is ſtrongeſt which is moſt ſinewy.

Their vſe.

The vſe of theſe eares is that whereas the bloud and ayre ruſh violently toward the heart theſe ſhould take them vp by the way, and keepe them as in a ſafe and let them into the heart by degrees, otherwiſe the creature ſhould bee in danger of ſuffocation and the heart of violence in their ſudden affluence. Moreouer they defend the veſſelles to which they are ſet in the motions of the heart which haue a ſoft and thinne coate, and therefore otherwiſe when they are ſtreatched in ſudden repletion might be ſubiect to cracke or burſt. *Hippocrates* ſayd they ſerued the heart as fannes to coole it, or as bellowes to ſmithes forges to gather in the ſpirits as they gather in wind.

CHAP. XIII. *Of the veſſels of the Heart and their values.*

4. veſſels.

THere are ſeene about the Baſis of the heart in the outward ſides of the ventricles foure veſſelles and ſo many orificies, whoſe originall ſome would deriue from the heart, as *Veſalius* and *Varolius*, and they are in each ventricle two. *Hippocrates* in his Booke *de Corde* calleth them the fountayns of humane Nature.

Their poſitiō.

In the right the hollow veine [Table 9. figure 2.[r] Table 10. figure 1. C figure 2.[nn]] and the arteriall veine. [table 9. fig. 2.[o]] In the left the venall artery [table 10. fig. 2.[o]

and

and the great artery. [Table 9. figure 2.[M] Table 10. figure 1.[M] figure 2.[OP]] Within these vessells are certaine values or leafe-gates placed, which *Hippocrates* called the secret filmes of the heart, and *Galen* membranes and the *Epiphysis* of membranes eleuen in number, all arising from the orificies of the vessells. Some of these are three-forcked, some like halfe Moones: some againe are carried from without inward into the ventricles of the heart, to which they are tyed with strong membranes, especially to the partition toward the cone or poynt, that in the dilatation of the heart the ligaments might draw the values vnto them selues, and as it were turne them vp to the body of the heart: others are carried from an inward position outward, as soone as the two vessells do peepe out of the heart. In those vessells which receiue matter into the heart they are strong, because they are not onely to hinder the regresse but also are to draw; but in those that send out matter out of the heart, they are weaker.

The values.
11. in number
Their forme.
Foras intus.
Intus foras.
Where stronger and why.

In the dilatation of the heart they are all extended, the forked values making certain gaping fissures betweene their forkes, by which the matters are let in; those like the halfe-Moone or the semicircular values doe shut close the endes of their vessells and so hinder those matters that are gone out for returning in againe.

The work of the values in dilatation.

In the contraction of the heart they are all likewise contracted, & then the forked ones do close vp those yawning fissures which they made in their dilatation and so hinder those matters that are gone out for returning in againe. These circular values flagging to the sides of the vessels doe leaue open way for the bloud and spirits to issue out. Of these values *Hippocrates* made first mention, and extolleth their structure as a wonderfull secret of Nature, and they are sayeth *Galen* in the 11. Chapter of his sixt Booke *de vsu partium*. framed with such exquisite Art that if they bee all at once streatched and stand vpright, then they stop the whole orifice of the vessell.

In contractiō.
Hip. first mentioned them.

They haue all one common vse which is to hinder that which is gotten into the heart for passing out againe. They haue also proper vses, the vse of those that are set within and goe outward, is to leade out matters out of the heart and not suffer them to come back: the vse of those that are set without and goe inward, is to keepe the matters gotten in, that they get not out againe, and both these that the labour of the heart should not be in vaine.

Their vse commen.
Proper.

But because the constitution of these vessels is one in the heart of an Infant whilest it is in the wombe, and another in the heart after the birth, wee will intreat of them seuerally. And first as they are in a man after he is borne into the world.

The hollow veine hauing perforated [Table 10. figure 1.[P] figure 2.[NN] sheweth the passage of the veine] the midriffe, and being come vnto the hearte first sending out a short braunch from his lefte side, is receiued by the right deafe-eare with his ample and patent orifice [Table 10. figure 1. from [C] to [B]] thrice as large as the orifice of the great artery, and is presently inserted into the right [Table 10. figure 5. CC sheweth his orifice] ventricle; to which it adhereth so firmely that vnneth it can be separated from it. Whence came the occasion of *Aristotles* error and his followers, who thinke that there the hollow veine [tab. 10. figure 1. C] as also all the rest haue their originall. And for the strengthening of the heart, this great braunch becomes like a ligament, and his vse is to bring the bloud which is sent vpward from the Liuer vnto the right ventricle and there to powre it into the heart whilest it is dilated, to bee farther attenuated therein, as well for the nourishment of the Lungs which require a thinner bloud, as especially for matter to make the arteriall bloud and spirites afterward to bee perfected in the left ventricle. The greater part of which is afterward sent out in the contraction of the heart by the arteriall veine [Table 10. figure 5. P.]

Of the hollow veine in the heart.

To this orifice groweth a membranous [Table 10. figure 1. HH] circle, which addeth strength to the heart, it passeth inward and not farre from the beginning is diuided or slitte into three small but strong portall membranes [Table 10. figure 5.[KLM]] or values whose Basis is large, and they end in an obtuse or dull poynt, and when they are shutte and doe as it were wincke together, they are like broade headed Iaulins or broade arrowe heades triangular, and euery angle forked; all which forks consist and growe together of small threds of fibres [Table 10. figure 5.[NN]] (which *Aristotle* mistooke for nerues) ioyned together with fleshy breaches, [Table 10. figure 5.[OO]] which by those fibres as by ligaments are stretched in the contraction of the heart, and those being streatched the orifice is almost cleane shut vp. But when this circle is open together with his fibres it resembleth a Crowne such as Princes in old time wore.

The circular membrane.
Breaches.

But theſe Values, as alſo thoſe of the venall Artery doe encline from without inwarde, that the bloode in the contraction of the heart ſhould not regurgitate into the Hollowe veine: how then is it poſſible that blood ſhould bee laboured in the heart for the nouriſhment of the whole body when as no blood can paſſe out of this Ventricle into the hollow veine but onely into the Lungs? Wherfore it was neceſſary that Nature ſhould prouide a way out of the Lungs into the hollow vein, from whence branches might be diſperſed thoroughout the whole body.

The Arteriall Veine.

A veine by office.

An artery by ſubſtance.

his Originall.

Archangelus his argument.

The other Veſſell of the right Ventricle is the Arteriall Veine [Tab.9.figure 2 °. Tab.10, figure 6 c D Tab.11,figure 1 C] or the arteriall veſſell. A veine it is, becauſe of the office it hath to tranſport blood, an artery becauſe his frame and ſubſtance is like that of an arterie. It is faſtned to the ventricle with a leſſe orifice [Tab.10,figure 6,c D] then the hollow vein, [Tab.10,figure 5,CCC] and from thence ſome ſay it hath his originall, yet it may better be imagined to be a branch and off-ſpring of the great arterie, becauſe (as ſaith *Archangelus*) it is moſt likely that a veine ſhould come from a veine, and an artery from an arterie; therefore the Venall artery, which though it haue the vſe of an Artery, yet hauing the ſingle coate but of a veine hath his Originall from the Hollow-veine made alſo of one ſingle coat. And ſo the arteriall veine hauing the vſe of a veine but the double coat of an arterie, moſt likely proceedeth from the great arterie which hath a double coate. Of which opinion alſo are *Varolius* and *Laurentius*, & it is further confirmed by their Connexion which in the Infant vnborne is more conſpicuous.

The true original of the arterial veine

The vſe of the ſingle coat of this Arterie.

But the verie trueth as I conceiue is, that it ariſeth as other ſpermaticall parts do from the ſeede. His coate is not ſimple as that of a veine, but double [Tab.11,fig.3. B C] as an arterie, and that for the vſe as well of the Infant in the wombe as of the man afterward; of the Infant, that the Mothers arteriall blood and vitall ſpirit which it carrieth into the Lunges, dooing therein the office of an arterie, ſhould not breath out as it would if it were as thin as a veine: of the man afterward (and in him it dooth onely the dutie of a veine, not of an arterie) partly becauſe in reſpirations it was not fit it ſhould bee eaſily dilated and contracted, as it would haue beene if it had had the ſingle coate of a veine, for then there woulde not haue beene capacitie ſufficient in the Cheſt for the inſtruments of breathing, and beſide the blood ſhould haue had too free and full acceſſe to the heart; partly, becauſe the Lungs which are of a ſpongy and light ſubſtance required to be nouriſhed with a thinne and vaporous not with a thicke and craſſe bloode (for euery thing is nouriſhed with aliment likeſt vnto it ſelfe) which could not haue beene either ſo prepared or ſo conteined in a veſſell with a ſingle coate, as in one with a double.

Hip. his good vſe of this ſingle coate.

Wee will add alſo that cauſe whereof *Hippocrates* maketh mention, that is, that the right ventricle which is not ſo hot as the left, might not be as much cooled as the lefte, and ſo at length his heate extinguiſhed. For ſeeing that the branches of the Weazon which drawe in the cold aer are diuided betweene the branches of the arteriall veine and venall arterie, [Tab.11,figure 1,F c D] if the coate of the arteriall veine were but one, it would receyue as much aer as the venall artery whoſe coate likewiſe is but one, and ſo both ventricles ſhould be alike refrigerated; whence it muſt needes follow, that the lefte hauing more heate then the right, the heat of the right muſt of neceſſity be in time extinguiſhed, the heat of the left remaining inviolate; wherefore Nature made this veſſell thicker and ſo narrower, to carry aer not ſo much for refrigeration as for refection.

This is a verie notabl veſſell, that ſo much as it becommeth leſſe by the thickeneſſe of his coates, might be recompenced in the largeneſſe of the Veſſell, and ſo the Lunges haue ſufficient nouriſhment.

his amplitude

His diuiſion.

It leaneth vpon the great Arterie, and turning his bulke vnto the left ſide, is diuided into two [Table 10, figure 6,c D. Tab. 11, figure 3 F F] trunkes which are carried to the lefte and the right Lungs, and there diſtributed quite through into inumerable [Tab.11,Fig.3, G G] branches.

His Vſe

The vſe of this veſſell is in the contraction of the heart, to receyue the greater part of the blood out of the right Ventricle (in which it is made thinner and lighter, that it might paſſe out more forcibly) and to carry it into the Lunges for their nouriſhment. For the heart ſeemeth to make retribution to the Lunges, yeelding them bloode for their nouriſhment, becauſe they ſent aer vnto him for his refection.

But although this Veine was made thicke and hard, that it might not too eaſilie be either contracted or dilated, yet it is not ſo hard, but that his branches are contracted & dilated

Table 11. Figure 1. sheweth the fore-side of the Lungs taken out out of the Chest, from which the Heart with his Membranes are cut.

lated by the chest; and so in the next dilatation of the heart the blood must needes returne into the heart by the same way it came out; but against this inconuenience prouision is made by three Values [Tab. 10, figure 6, KFG] which are set to the Orifice of this trunk where it swelleth a little.

These Values haue their Originall from the very coate of the Veine, and beeing placed inward do looke outwarde, and each of them is like a semi-circle or halfe-moone, or the Latine Letter *C*. If all these three be together stretched and set vpright, they seeme to bee but one great Value stopping vp the whole Orifice, & whilst they are stretched carry their Figure of the halfe-Moone; but when they sinke or flagge then they become rugous and resemble the Moone in the first quarter. Whence the Values are. Their figure.

Their outward Couering or Circūference, as also is that of the great Artery, is more solid then the rest of their body; for where in both Orificies they touch themselues or ioyn some way together, they become so indurated, that they appeare to bee like a long and rounde tilage. The vtter coate of this Vessel.

The Venall artery [Tab. 10, fig. 2 G M not rightly expressed Table 11, fig. 1, D] is a vessell of the left Ventricle. An artery because of his vse, for it containeth and bringeth aer, as also because it beateth as other Pulses doe; not so indeede that it can bee discerned The venal arteries.

It hath pulſation though not viſible.

by the eye; but ſo it muſt of neceſsity bee, becauſe it is continuated with the left ventricle where is the originall of pulſation. A veine it is as being of the ſubſtance that veines are of.

It proceedeth out of the left ventricle of the heart at his Baſis with a ſpacious & round & open orifice [table 10. figure 7. cc] greater then that of the great artery. It is ſuppoſed to haue his beginning out of the ſofter part of the ventricle; but it may better be beleeued to haue ſprong out of the hollow veine if wee marke the connexion that is found in Infants vnborne.

His coate but ſingle.

It hath but one thinne and ſimple coate in growne bodies, that the Lungs might bee nouriſhed with defæcated thinne and vaporous bloud brought by it but ſent by the heart, and that in a greater quantity then a thick ſtiffe veſſell would carry: becauſe the Lungs are parts of great expence as well becauſe of their continuall motion, as alſo for the rareneſſe and looſeneſſe of their ſubſtance which ſuffereth the thinner part of the bloud to exhale from them: againe it was needfull that this veſſell ſhould be capacious, becauſe the heat of the left ventricle required great ſtore of ayre for the tempering of it, beſide that it needed for the reparation of ſpirits: for in growne men it hath the vſe of an artery to carry ayre, & not of a veine as it had whileſt the Infant was in the mothers wombe: and againe, the larger it is and more ſpacious the better may the ſmoake and ſoote paſſe through it into the braunches of the weazon without infecting the ayre it brinketh into the heart, which in a narrower paſſage would neceſſarily haue beene mingled: and in the Infant it had no vſe of a double coate becauſe it onely carried the Aliment of the Lungs vnto them from the hollow veine.

Why this veſſel is to be capacious, many reaſons.

It is a notable veſſell, and as ſoone as it is gotten out of the heart is diuided into two trunks [table 11. figure 4. BBCD] ſo that it ſeemeth to be a double orifice of the ſame veſſell. The right of theſe is ſent vnder the Baſis of the heart into the right Lung, [table 11. figure 1. D] The left into the left like the arteriall vein, and ſo they are both diſſeminated through the Lungs, and make the repreſentation of rootes [tab. 11. figure 4. EEEE] and may be compared to the rootes of the gate-veine: for as it doth ſucke the nouriſhment with his ends or extremities, ſo the venall artery is deriued into the Lungs to draw ayre out of the braunches of the weazon. But at the originall of this veſſell and the great artery, they both meete and are ioyned together, by the interpoſition of a good thicke and large particle which in the Infant was perforated and made a paſſage as we ſhall declare hereafter. The vſe of this venal artery is in the dilatation of the heart to draw ayre out of the Lungs for the generation of ſpirits, and in his contraction to expell or drawe out into the Lungs a portion of the vitall bloud for their nouriſhment and life, as alſo the ſoote and ſmoake that ariſeth from the flame of the heart: but leaſt all the ayre ſhould returne again out of the hart into the Lungs, there groweth to the orifice of this veſſell a membranous circle [table 10. figure 7. DD] out of the ſubſtance of the heart, which is ledde inward and deuided into two values [table 10. figure 7. FF table 12. fig. 2. f] bending from without inward; which as they exceede in largenes the values of the hollow veine, ſo alſo they are ſtronger, hauing longer thredy ſtrings [Table 10. figure 7. GG] to which more fleſhy [Table 10. figure 7. HH table 12. figure 2 ff] explantations or riſings do accrew; one of theſe values looketh to the right ſide another to the left, which when they are ioyned do reſemble a Biſhops myter.

The right branch.
The Left.

The vſe of the venal artery.

His values.

Why but two

They are but two becauſe this veſſell was not to be ouer cloſely ſhut and that for two cauſes: firſt, ſeeing that all parts need vitall ſpirits and bloud to be ſent vnto them for their life the Lungs alſo muſt neede them; wherefore as they receiued Alimentary and nouriſhing bloud by the arteriall veine, ſo were they to receiue vitall by the venall artery; therefore in the venall artery there is alwayes contayned ſubtile and arterial bloud, which that it may be, it hath onely two values ſet to it, that in the contraction of the heart the way might not be altogether ſtopped vp, but ſo much ſpace lefte as was neceſſary for the tranſvection of vitall bloud.

The neceſſity of them.

But if the values were wanting then would the arteriall bloud in contraction flow forth in greater quantity and with more violence, and ſo the great artery and conſequently the whole body ſhould be defrauded. Againe, that if there ſhould bee any ſmouldry excrements ingendred betweene the ayre attracted and the natiue heate which is conteyned in this ventricle, they might haue free egreſſe this way into the Lungs and ſo goe out by the weazon; which otherwiſe if they were retayned might endanger the ſuffocation and extinction of the creatures naturall heate.

The

The ſecond veſſell of the left ventricle is the great artery, of which though wee doe entreat at large in his proper place, yet it will be neceſſary to diſcourſe of it here ſo far as ſhall make for out preſent purpoſe.

CHAP. XIIII. *Of the great Artery and his values and vſe about the Heart.*

THis great Artery called *Aorta* was made before the heart, hauing as the heart a beginning of generation from the ſeed, out of which it is immediately made at the ſame time that the other parts are. Albeit his originall of diſpenſation and radication be from the left ventricle of the heart, from whence it iſſueth with an open mouth and patent orifice to receiue from the ſame when it is contracted bloud and vitall ſpirit laboured in it to be diſtributed together with the heat into the whole body. Which bloud and ſpirits that they ſhould not returne into the heart againe when it is dilated there are ſet in his orifice [Table 10. figure 8.[a]] three [Table 10. figure 8.[acp]. Table 13. character 1.2.3] values like halfe Moones bending from within outward as it is in the arteriall veine, but greater and ſtronger becauſe the body of the great artery is harder then that of the arteriall veine: theſe values are alſo a hinderance that the nouriſhment or Chylus drawne by the meſaraicke arteries out of the guttes ſhould not be preſently conuayed into the heart. The great artery. His values.

There is alſo placed at his orifice to eſtabliſh him the better, a hard ſubſtance ſometimes griſtlely, [Table 10. figure 8. SS] which in ſome Creatures are red Deere is a very griſtle, ſometimes in greater creatures it is a bony griſtle for it ſeldome growes into a very bone, as *Galen* ſayeth in the 10. Chapter of his 7. Booke *de Adminiſt. Anatom* it doth in an Elephant: but in a man it is not ſo to bee found. And theſe are the particles of the heart in a perfect Creature after it is brought into the world: nowe it followeth that we ſpeake of the veſſels in the heart of an Infant before the birth. The cartilage Or bone.

CHAP. XV. *Of the vnion of the veſſelles of the heart in the Infant vnborne which is aboliſhed after they come into the world.*

THE ſtructure and connexion of the veſſels of the heart in an Infant vnborne or any other creature yet in the Dammes belly differeth much from that it appeareth to be afterward when the burthen is brought into the world. This *Galen* moſt perfectly and manifeſtly explayned in the 10. Chapter of his ſixt Booke *de vſu partium*. And albeit moſt Anatomiſts after him haue lightly paſſed it ouer, yet will we ſtand ſomewhat more vppon it. *Galen* the true obſeruer of theſe vnions.

We ſayed before that there were foure veſſels of the heart, two in the right ventricle, to wit, the hollow veine [Table 12. figure 1,2,3.[a b]] and the arteriall veine [Table 12. fig. 1.[m]] and two in the left, the great Arterie [Table 12. fig. 1 2, and 3.[d f]] and the venal artery: [Table 12. figure 1 2, and 3. which in the ſecond figure is manifeſt] which veſſels in the Infant are ſo vnited and coupled two & two together. The hollow veine a veſſell of the right ventricle, with the venall artery a veſſell of the left ventricle: and the great Artery a veſſell of the left ventricle with the arteriall veine a veſſell of the right ventricle: which veſſels in men after they are borne are diſioyned aſunder. How the vnions are made

But theſe vnitings are not alwayes after one manner: for the former, partly becauſe of the neighbour-hood of the veſſels, partly becauſe of the likeneſſe of ſubſtances they being both veines, is accompliſhed by the coniunction of their mouthes called *Anaſtomoſis*, wee call it inoculation from the ſimilitude it hath with that poynt of husbandry where a ſcience or but a leafe is ſo fitted to another kinde as that the ſap may runne equally through them both. The former.

The latter vnion becauſe of the diſtance of the veſſels to be vnited is accompliſhed by a Canale or Pipe. The firſt vnion which is by *Anaſtomoſis* or inoculation or apertion and opening of two veſſels one into another, is of the hollow veine with the venall artery [tab. 12. fig. 1, & 2.[a g]] which is to be obſerued vnder the right eare of the hart before the hollow veine open it ſelfe into the right ventricle [Table 12. figure 2. appeareth at [h]] and near that region where the coronall veine ariſeth. Th: latter.

For touching one another ſo that you may eaſily thinke them to be but one veſſell, Nature bored them with one hole common to them both [Table 12.[a g h]] which is large and patent and of an ouall figure by which the bloud paſſeth out of the hollow veine into the venall artery and ſo is carried to the Lungs. But leaſt the bloud ſhould flowe backe into Their common bore or hole.

the

The membrane.

the hollow vein there is ſet to the regiō of this bore or hole which looketh toward the venal attery, a membrane like a couering or lid [Table 12. figure 2. and 3, 1.] thin, hard and tranſparent, larger then the hole or paſſage which is faſtned onely at the roote; but the reſt of the body of it hangeth looſe in the cauity of the veſſell, that falling looſely and flagging into it ſelfe it might the more eaſily bee turned vp to the veſſell of the Lungs. *i.* the venall artery and giue way to the bloud flowing forcibly out of the hollow veine; but hindering it from returning thither againe. Wherefore the venall artery in the Infant doeth the office of a veine to the Lungs, but after the birth the office of an artery; for in theſe whileſt the heart is dilated the bloud is powred out of the hollow veine into the right ventricle, and from thence when the heart is contracted thruſt out by the arteriall veine into the Lungs. But in the Infant the heart being not moued and yet the Lungs requiring nouriſhment & encreaſe, Nature deuiſed the former way by which the bloud brought vppe by the hollow veine is not powred into the ventricle of the heart, ſeeing neither the Lungs ſtood in need of attenuated bloud, neither was there any generation of vitall ſpirites, but runneth ſtraight into the venall artery and thence into the Lungs.

The vſe of the venal artery in the infant.

In the child after-birth.

The admirable works of God.

Theſe are admirable workes of Nature, but the conglutination or ioyning together of the foreſayd hole preſently after, paſſeth all admiration; for as ſoone as euer the creature is borne into the world, breatheth and the heart is mooued, it hath no further neede of this hole or paſſage, wherefore by degrees the membrane is dryed vp and the bore cloſeth and groweth together, ſo that if you looke for it a few weekes after either in the heart of an Infant or of a Calfe, you would deny that euer it was perforated, but in dryer creatures it ſooner groweth vp, in moyſter creatures later.

The 2. vnion by a pipe.

The other vnion is of the great artery with the arterial veine [Tab. 12. figure 1, 2 and 3 fg] by a canale or pipe [Table 12. figure 1 l] for ſeeing the venall artery performed the office of a veine to the Lungs, it was neceſſary that the arteriall veine ſhould chaunge his vſe into that of an artery: wherefore Nature alſo made a perforation into the great artery. But becauſe theſe two veſſelles were a little diſtant one from the other [Table 12. figure 1. dm] ſhe made another third veſſell but very ſmall by which they might bee ioyned, ſo that they are ioyned not by inoculation but by a pipe or canale.

Where the pipe beginneth.

This canall or pipe beginneth [Table 12. figure 1. l] not from the trunke or ſtocke of the great artery, but from that region of the trunke carried downward [Table 12. figure 1, 2, & 3. f] where the left nerue of the ſixt payre or coniugation making the Recurrent is circumvolued or rowled about, & the pipe paſſeth not ouerthwart but obliquely or ſidelong from the great artery [Table 12. figure 1. from d to m] to the arteriall veine, where it is deuided into two trunkes and appeareth as if the arteriall veine were deuided into three trunkes, of which the firſt paſſed vnto the left Lung, the ſecond vnto the right, and the third (which is a little leſſe then the other two) ſhould obliquely reach vnto the great artery, and is from the Baſis of the heart in an Infant diſtant about the breadth of two fingers, in a grown child after birth the breadth of foure: and the longitude of it is ſo notable that you may put vp your finger betweene the two veſſelles, but in Oxen you may eaſily put vp two fingers or more.

Why it hath no membrane or couer as the former perforation hath.

This canale or pipe or veſſell call it which you pleaſe, hath no membrane ioyned to it which might hinder the regreſſe of the bloud out of the great artery into the arterial veine, becauſe the length and obliquity of the pipe it ſelfe is ſufficient for that purpoſe. This canale or pipe is not encreaſed as other parts of the creature are, but as Nature drieth vp the vmbilicall or nauel-veine & arteries which are at the ſpine when ſhee hath no further vſe of them and maketh of them ſmall tyes; after the ſame manner the forenamed coniunctions of the veſſels which reach vnto the heart when the creatures is brought forth are aboliſhed, & this pipe is by degrees attenuated ſo that in a ſhort time it is quite dryed vp. But in children of three or foure yeares of age it may be found, becauſe of the thickneſſe of his roote, but not perforated or hollow.

The vſe of theſe coniunctions.

Theſe vnions or coniunctions are made for the behoofe of the lungs that they might be formed, growe and encreaſe; and therefore the pure bloud of the mother is carried out of the hollow veine directly by the venall artery into the Lungs by inoculation for their generation: for they are formed at the ſame time with the heart, & being generated and formed they are nouriſhed by the ſame matter, and encreaſed as long as the burthen is carried in the wombe: but the vitall ſpirit is miniſtred to the great artery together with the mothers arteriall bloud from the vmbilicall arteries, and from thence are carried into the Lungs to pre-

Table 12. in 3. Figures, *ſheweth the vnion of the veſſels of the heart, as it is found in the Infant, but aboliſhed ſoon after it is brought into the world.*

preſerue their life through the Canale or pipe by the arteriall veine. Wherefore the vſe of the coniunction is, that whilſt the Naturall and vitall blood is tranſported vnto the Lungs, it might not fall into the ventricles of the heart; for becauſe the heart is not moued it would remaine there, and ſo ſhould the Lungs be defrauded; but when the creature is come into the world, it vſeth no more of the mothers blood but his owne, where it cannot holde the ſame courſe; but it muſt fall into the heart, and there as afore is ſhewed muſt bee changed. But it ſhall not be amiſſe to relate the order of Anatomicall adminiſtration for the finding of theſe vnions.

How to finde out theſe vnions in diſſection.

The firſt vnion which is by inoculation, doth elegantly appeare, if the Trunk of the Hollow-veine carried through the Cheſt from the Midriffe vnto the right eare of the heart bee diuided in the middeſt, for then will appeare two holes or paſſages; the greater which is that of the inoculation into the venall artery, and the leſſer which is the hole or paſſage of the the coronary veine of the heart. But the ſecond vnion which is by the Canale or pipe is demonſtrated, if the deſcending trunke of the great Arterie be diuided thorough the middeſt euen vnto his outgate out of the left ventricle of the heart, for then withinwarde will appeare the ſmall and narrow paſſage of the pipe into the arteriall veine.

CHAP

CHAP. XVI. *Of the Branches of the great Artery diſſeminated through the Cheſt and the Necke.*

THE great Artery is the largeſt [Tab.13,figure 1 *] at the left ventricle of the heart whence it ariſeth, and before it fall from the *Pericardium* or purſe it bringeth foorth aboue his Values or Membranes [Tab.13,fig.3, character 1,2,3] ſometimes one, ſometimes two Arteries, which we call *Coronarias*, [Tab.13,fig.1,BB] becauſe like a crowne they compaſſe the *Baſis* of the

Tab.13. Fig.1, ſheweth the trunke of the great Artery, togither with his branches as they are diſſeminated through the three bellies or Regions of the body.

The ſecond Figure ſheweth a portion of the Arterie as it is on the backeſide, from whence it ſendeth branches to the diſtances betwixt the Lower ribbes.

The thirde Figure, ſheweth a portion of the great Artery, where it yſſueth out of the Heart is heere ſhewed open: & by that meanes wee may better perceyue his Coates and Fibres.

heart: afterward it yſſueth out of the *Pericardium* and is vnequally diuided into two parts, one aſcending vpward to the head [Tab.13.fig.1 [k]] which alſo is the leſſe, the other and larger by farre tendeth downward [Tab.13,fig.1 [n]] becauſe the parts below the Heart, are many more then thoſe aboue.

Out of the greater deſcending trunke [Tab.13.fig.1 [p]] which in the Cheſt is large and thicke, theſe branches following do yſſue. The deſcending trunke,

The lower *Intercoſtall* Arteries [Tab.13,fig.1 [mmm]] which are ſent vnto the diſtaffes of the eight low ribs. *Intercoſtalis.*

The Artery called *Phrenica*, that is, of the Midriffe, on each ſide one [Table.13 fig.1, [xx]] which are diſſeminated through the Midriffe and the *Pericardium*. *Phrenica.*

The remainder of the trunke pierceth through the Fiſſure or perforation of the midriffe [Tab.13.fig.1, *] and cleauing to the bodies of the Spondels or rack-bones, doth diuerſelie communicate it ſelfe through the lower belly.

The leſſer and aſcending [Tab.13.fig.1 [y]] trunke being faſtned to the Weazon is communicated to all the parts of the body aboue the heart; and firſt of all it is forked into two notable branches, which vnder the Pattell or coller-bones bendeth to the firſt ribbe of his owne ſide, and therefore it is called *Arteria ſubclauia*, for the Latines call the coller *Bones Clauicula*, [Tab.13,fig.1, [yo]] then the trunke is diuided into the two arteries called *Carotides* or the ſleepy Arteries. The aſcending trunke. *Subclauia*

The right *Subclauia* [Tab.13,fig.1 [r] his originall is at [a]] iſſueth out of the great artery, euen where it is parted into the ſleepie arteries, it is higher, larger and runneth more ouerthwart then the left, whoſe courſe to the arme is rather oblique then tranſuerſe. The right.

From theſe *Subclauia* before they fall out of the Cheſt (for after they are out of the cheſt they are no more called *Subclauia* but *Axillares*) [Tab.13.fig.1 [zz]] as ſoon as they touch the firſt rib do paſſe certaine propagations.

From their Lower part, that which is called *Intercoſtalis ſuperior*. [Tab.13.fig.1 11] *Intercoſtal. ſup.*

From their Vpper part yſſue, firſt the *Mammaria* [Tab.13.fig.1 [ll]] which vnder the breſt bone being reflected together with a Veine, deſcendeth vnto the Paps and the Muſcles, [Tab.13.fig.1 [ccc]] betwixt the griſtles of the true ribbes, and ſo deſcendeth vnder the right Muſcles of the Lower belly vnto the Nauell, where it is diuided into many ſurcles [Table 13,figure 1 [dd]] and ſo meeteth with the Epigaſtricall Arterie aſcending vpward. [Table 13 fig.1, [ee]] *Mammaria*

Secondly the *Ceruicalis*, [Tab.13,fig 1, [mm]] which yſſueth more backeward toward the bodies of the rack-bones, and at the 7. ſpondell of the necke entreth in at the holes of the tranſuerſe proceſſes of thoſe ſpondels, and ſo is communicated to the Muſcles, the marrow of the necke, and the Spondels themſelues. Betwixt the firſt ſpondell and the nowl-bone theſe Arteries on either ſide [Tab.13,fig.1 [nn]] enter into the ſcull, and at the Baſis of the braine they are vnited. *Ceruicalis.*

Thirdly, the *Muſcula* [Tab.13,fig.1 [oo]] becauſe it watereth the Muſcles of the necke. *Muſcula*

From the Axillary artery, [Table. 13, fig. 1 [pp]] ſo called becauſe it paſſeth by the Axilla or Arme-hole before it reach vnto the arme, do yſſue from the lower part *Thoracica ſuperior* [Tab.13,fig.1 [qq]] which deriueth his braneches to the Muſcles lying vpon the breaſt. *Thoracica inferior* [Tab.13 fig 1 [rr]] which creepeth downe the whole ſide of the cheſt. *Scapularis* [Tab.1, fig.13, S] diſſeminated to the Muſcles in the hollowe part of the Shoulder-blade. From the vpper part *Humeraria* [Tab.13,fig.1, [tt]] which climbeth to the toppe of the ſhoulder, and is diſtributed into the Muſcles thereabout. That which remayneth of the Axillary artery [Tab.13,fig.1, [qq]] being accompanied with the Axillary veine paſſeth vnto the arme. From the Axillary Artery. *Thoracica ſuper* *Thoracica infer* *Scapularis.* *Humeraria.*

That which remaineth of the aſcendent trunke [Tab.13, fig.1, *] lying vpon the ſharpe Artery and ſupported by the Sweete bread, whilſt it is yet in the cauity of the cheſt is diuided into two vnequall branches which they cal *Carotides*, [Table 13,fig.1 [xy]] or the ſleepie Arteries, which riſing directly vpward are by the mediation of a Membrane tied to the weazon and the internall iugular veines, and ſo attaine vnto the head. But of theſe wee ſhall ſpeake more in the eight Booke. *Carotides.*

CHAP.

CHAP. XVII. *Of the Lungs.*

THE Lungs which are the inſtruments both of the voice and alſo of reſpiration, the Grecians cal *Pneumones*, becauſe of the reception of the ayre which they call *pneuma*, or from a word which ſignifieth to breath, for by breathing inward they drawe ayre, and by breathing outward doe put it foorth againe.

Why placed in the cheſt.

Theſe Lungs are allowed by Nature to all breathing creatures, and placed in the cauity of the Cheſt [tab. 3. NOP] becauſe they were to be a little diſtant from the mouth leaſt by the affluence of the ayre they ſhould haue beene preſently cooled. In liuing creatures whileſt they breath inward they fill the whole cauity of the Cheſt, excepting the region which wee haue already ſayed the membranes of the *Mediaſtinum* [Table 3. Σ] and the heart couered with his purſe doe occupy: but when the creature breatheth out then they fall, but not ſo as they doe in dead bodies flat and flaccid, becauſe they are ſtill full of ayre and bloud: and although they may bee puffed vp in a dead body by putting a payre of bellowes into the weazon, yet hardly can you rayſe them to ſuch a height as that they will occupy ſo much place as they doe in a liuing body. For being to contayne ſo much ayre as ſhould ſuffice the diuerſe motions of the heart, that we might not be conſtrayned to be alwayes fetching breath to ſpeake, ſing, or cry out, it behoued well that their quantity ſhould be very great.

How to puffe them vp in dead bodies.

Why ſo great.

Their connexion.

And although for the moſt part they hang looſe and at liberty that they might more freely mooue, yet by the mediation of the veſſelles of the weazon they are ſuſpended and hung to the neck and the back leaſt they ſhould fall downward, and by the interpoſition of the *Mediaſtinum* [tab. 3. GH to ^] they are tyed forward to the breaſt-bone, backward to the rack-bones; alſo in ſome places at the ſides of the cheſt they grow to the *pleura* with fibrous tyes produced from their owne membrane, which is peculiarly obſerued in men as in the wiſeſt creature: by which meanes the Lungs which of themſelues are deuoyd of all motion more eaſily follow the motion of the Cheſt do otherwiſe then for the auoyding of *vacuum* or emptineſſe.

How they follow the motion of the cheſt.

Galen verily thought that the Lungs followed the motion of the cheſt for the auoiding of that *vacuum* or emptineſſe, which is ſo irreconcileable an enimy of Nature, becauſe the cheſt being diſtended they are dilated as they are filled with ayre drawne in; and the ſame cheſt being contracted and the Lungs euacuated by expiration, they fall into themſelues: which he ſheweth by an inſtance of a wound of the cheſt. For if the Cheſt be wounded ſo that the ayre can get into it, the Lungs ſayth he become immouable and do not follow the dilatation of the cheſt, becauſe there is ayre which filleth the vacuity or emptineſſe of the cheſt; but when the cheſt is ſound and diſtended, the Lungs are neceſſarily dilated leaſt there ſhould bee *vacuum* or emptines, and the ſame Lungs, not for the auoyding of emptines, but either being compreſſed by the cheſt, or becauſe of the ayre breathed out or both together, they fall neceſſarily.

Galens opinion for the auoyding of *vacuum* or emptines.

His demonſtration.

But we adde, that Nature taking knowledge of the neceſsity of the motion of the lungs, that the cheſt being perforated the ayre going in by the wound might not hinder the dilatation of the Lungs which is cauſed for the auoyding of emptineſſe, hath knit them in men onely as we ſaid before to the *pleura*, that ſo by the neceſsity of this connexion they ſhould follow the dilatation of the cheſt though it were perforated. They alſo adhere to the heart by the arteriall veine [tab. 9. fig. 2. c] and the venall artery.

How the lungs moue when the cheſt is wounded.

They haue their figure (which is ſhewed in the 3. and 4. Tables) according to the proportion of the parts vpon which they reſt: wherefore on the outſide that they might be fitted to the cauity of the cheſt, they are gibbous and ſwelling; on their inſide hollow [table 9. figure 1. and 2. table 14. figure 1.] to giue way to the heart couered with his purſe, which with their lobes or diuiſions they encompaſſe round about. When both parts the right and the leſte are ioyned, they repreſent the ſhape of a clouen foote of an Oxe or ſuch like, [Table 14. figure 1. and 2.] for as the hoofes before are diuided aſunder by a line as it were, ſo the Lungs backward [Tab. 13. fig. 2.] (becauſe of the bodies of the *vertebræ* or ſpondels) haue an oblique impreſsion or diuiſion, and forward they cleaue in the very middeſt. They are diuided by the *Mediaſtinum* [table 3. GG HH] into a right Lung and a leſte, that one part being hurt the other might ſerue the vſe of the Creature (for oftentimes as wee ſee in the cutting vp of ſuch as dye of Conſumptions of the Lungs, the one Lung on the one ſide beeing vlcerated yea and conſumed, yet the man may liue long with the vſe of the other) and

Their figure.

Like a clouen hoofe.

How they are deuided.

They are onely ioyned together by the mediation of veſſels [Table. 14,fig. 1] which are diſſeminated into them from the Weazon & the heart. Againe, each Lung is diuided into two Lobes or Finnes if you draw a line from the place of the fourth rackbone or *vertebra* of the Cheſt: obliquely ouerthwart [Tab.14,fig.2] to wit, the vpper Lobe or Fin & the lower, yet ſo, that in a man they adhere together by Membranous Fibres, ſo that there is rather a note or footſtep of diuiſion then any true diuiſion indeede, (though it bee otherwiſe in Dogges) and the lower is longer then the vpper. And it is ſo diuided, as well that the whole Lungs might more ſafely and ſwiftly be dilated and contracted (the aer breathed in more eaſily penetrating into their narroweſt paſſages) as alſo that they might the more firmely embrace the heart, and not be compreſſed when we bow downward. And althogh they be found to be diſtinguiſhed (though not with any true diuiſion) ſomtimes into three, ſometimes into more, ſometimes into two, yet rarely ſhall we find in a man, becauſe of the ſhortnes of his breſt, fiue Lobes; in a dogge and an Ape often: and if it happen to be ſo, then ſaith *Galen* in the 2. and 10. Chapters of his 7. Booke *de vſu part*, they ly very high into the throat vnder the hollow-vein. Their ſubſtance [Tab.14,fig 2,] is fleſhy (wherupon it is called *Parenchyma* & a fleſhy bowell) wouen with three ſorts of veſſels [Tab.14,fig.2 ^{bcd}] and couered with a thin Membrane, which varieth in ſoftnes and colour, according to the age of the party. In yonger men it is faſter, in the prime of our age rare caue and hollow. For the Lungs being not mooued in the wombe of the Mother as neither the heart, are then thicke and firme as is the ſubſtance of the Liuer; red alſo from the colour of their nouriſhment, for nouriſhed they are in the Mothers wombe with that wherewith they were generated, that is, blood brought out of the Hollow veine to the venall artery by inoculation, and ſpirits ſent from the great artery to the arteriall veine by the pipe or canale before mẽtioned: but the infant being borne when the heart beginneth to mooue, his motion and heate ſoſteneth and puffeth vp their fleſh by little and little, and ſo being mooued with the motion of the Cheſt, they alſo become pliable to the motions thereof, and are lifted vp and fall againe with eaſe; they lye alſo bedded as it were betweene the diuiſions of the veſſels filling vp the empty places, and by that meanes are a defence and ſtrengthning vnto them that they be not broken in their continuall motions. And this is the reaſon that *Plato* calleth their motion ἅλμα μαλακὸν, *ſaltus mollis* a ſoft motion, which is furthered in that their ſubſtance is full of a ſlimy and viſcid moyſture, inſomuch that *Varolius* ſaith that after death if they be cut, yet will they glue together againe by this viſcidity.

The Lobes or Finnes of the Lungs

Their ſubſtãce

How their ſubſtance and colour diffe-reth before & after birth.

Plato his *Mollis ſaltus.*

Why they ioyne after death, being cut or ſliced.

Their ſubſtãce

Their ſubſtance alſo is laxe, ſpongy and rare, made as it were of the froth of the blood, that it may better admit the aer drawne in like a paire of Bellowes, and be freely filled therwith. Their colour is yellowiſh, oftentimes aſhie, ſpotted with certaine dull and blackiſh ſpeckes or cloudye ſtreames; and in thoſe that dye of any long and lingering diſeaſe they grow yet blacker.

Their colour.

They haue a Membrane bred out of the *Pleura*, for where the veſſels paſſe into the lungs [Tab.14,fig.1, ^{cd}] ther their common coate ſprung from the *Pleura* departeth from them, and is finely ſtretched ouer the ſuperficies or vpper face of the Lungs, to forme & containe their ſoft ſubſtance, which otherwiſe being ſhaken with continuall motions would quickly breake off by peece-meale.

Their Membrane.

This Membrane is thin, that it ſhould not be burthenſome, and ſoft that it might better ſtretch with the motion of the Lungs, full alſo of pores though after death inſenſible, that if any quitture or matter ſhould be gathered in the cheſt in a pleuriſy or inflamation of the Lungs called *Peripneumonia*, it might by theſe pores haue yſſue, & ſo be ſpit out by Cough; albeit we are not ignorant that in both theſe diſeaſes the Lungs themſelues are affected; which we are taught by the diſſection of Pleuriticall bodies; and alſo by them which haue recouered of Pleuriſies, in whom doth remaine difficulty of breathing, and ſome payne in the weakned ſide as long as they liue.

Why the membrane is porous.

This poroſite alſo makes their vpper face ſmooth, and bedewed with a kind of ſlimy moiſture. Into this Membrane, becauſe it needed but a little ſenſe, there are ſmal Nerues diſſeminated from the ſixt coniugation, on the right ſide [Tab.8.fig.1 ^{r}] after the right Recurrent is framed, but on the left ſide [Tab.8,fig.1 ^{q}] before the framing of the recurrent, theſe Nerues do not reach vnto the ſubſtance of the Lungs, leaſt they ſhould be pained or wearied in their continuall motion; and hence alſo it is, that all the vlcers of the Lunges are without paine.

Why Vlcers of the Lunges are with paine

They haue diſſeminated through them three veſſels [Tab.14,fig.1, ^{bcd}] whoſe diuerſe

A A, 1, 2. The Gullet called *œsophagus*, vnder the wezon or Rough arterie.

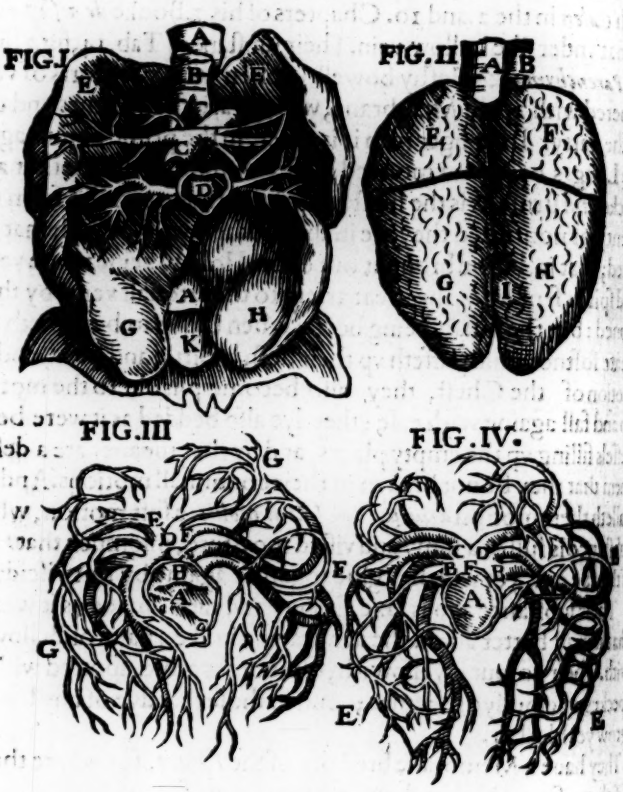
Figure 3. Sheweth the Arteriall Veine.

Figure 4. Sheweth the Venall Arterie separated from the substance of the Lungs.

TABVLA XIIII.



branches side ouer and mingle one with another. These are diuided first into two, as the Lungs themselues are, and presently after into other parts, euery one keeping his course til at length they end in threddy branches at the very superficies of the Lungs, between which vessels their substance is circumfused as it is in the Liuer. One of these vessels proper vnto the Lungs is called the rough Artery, or *Aspera Arteria*, we commonly call it the wezon or winde-pipe. [Tab. 14, fig. 1 ª and Tab. 15] The branches of this pipe are very great, and disseminated through the middest of the others, and bringeth aer drawne by the mouth and the nose to the Lungs, of which we wil speake in the next chapter.

The winde-pipe or weazon called *Aspera Arteria.*

Two vessels it receyueth from the heart, of which wee haue spoken before, one called the arteriall veine [tab. 14. fig. 1, ᶜ Fig. 13. the whole arteriall veine] which out of the right ventricle ministreth to the Lungs Alimentarie blood therein attenuated for their nourishment, and with this blood the naturall spirit and the naturall soule therein residing with all her powers and faculties are communicated to the Lungs.

The Arteriall veine.

The other called the venall artery [tab. 14, fig. 1 ᴰ figure. 4 the venall arterie separated] which is an instrument onely of the spirits, but conteyneth also pure, thinne and vaporous blood; wherefore the aer which was attracted by the winde-pipe, and prepared in the lungs it leadeth to the heart, and from the leste ventricle bringeth foorth vitall bloode with the vital

vitall ſpirit and faculty to the Lungs, partly that therewith they may bee nouriſhed, partly for their life that the in-bred heate may be cheriſhed, (for life is from the vitall ſpirite and the arteriall bloud perfected in the left ventricle of the hearte) partly that by it the ſmoake and ſoot may be carried out of the heart. Whence life is.

Theſe two veſſels are farre greater then the magnitude of the Lungs may ſeeme to require if the proportion be compared to that of other parts, & that becauſe the Lungs with their perpetuall motion do conſume and diſsipate much moyſture; and moreouer becauſe they ſerue not onely to carry out naturall bloud and vitall bloud with vitall ſpirits; but alſo by their extremities doe receiue from the ends of the winde-pipe ayre which they lead into the ventricles of the heart; and if any ſmall braunch of theſe veſſelles be broken the Lungs become purulent and yeeld matter vp in coughing, as *Hippocrates* ſayeth in his firſt Booke *de morbis*, and in the ſame place addeth, that the Lungs with their heat do draw vnto them ſelues phlegme out of the whole body, eſpecially out of the head. Why theſe veſſels are ſo large.

And as the ſubſtance of the Lungs is differing from the ſubſtance of the whole body, ſo is their manner of nouriſhing; for there is no part either ſo rare, light and ſpirituous, or which is nouriſhed with ſo pure, thinne and vaporous bloud; wherefore the Lungs haue veſſelles contrary to thoſe which are in other parts: for in other parts the veins haue a rare and thin coat, that the thick bloud might be freely and ſpeedily diſtributed to the parts about them; for bodies are nouriſhed with bloud drawne through the verie coate of the veſſels, but the arteries are thicke and denſe or thight that the neighbour parts may for their life draw only ſubtile and ſpirituous bloud and but a little of it; becauſe no particle of the body though neuer ſo ſmall can bee preſerued without it: but in the Lungs all is farre otherwiſe. The coates of the veines [Tab. 14. figure 3. ac] are thicke and thight, that nothing but that which is very thinne may ſweate out, becauſe euery thing is nouriſhed with Aliment of his owne Nature, and the bodie of the Lungs being light and rare doe therefore ſtand in neede of a pure vaporous and thin bloud. Their difference from other parts in ſubſtance & maner of nouriſhment. How extraordinary in the Lungs.

But becauſe the Lungs as well in reſpect of their perpetual motion, as for their ſtore of heate which they haue partly by the vicinity or neighbour-hood of the heart, partly by the aſsiduity of their motion; doe neede more plentifull nouriſhment then other parts: therefore Nature hath giuen to their arteries the coate of a veine [Table 14. figure 4. r] that they might yeelde vnto the Lungs thinne and ſpirituous bloud plentifully and in aboundance: that becauſe the veines in regard of their thickneſſe or denſity yeelded them leſſe ſtore of nouriſhment, aboundant recompence might be made by the arteries which becauſe of their thinnes and rarity cannot containe it from them.

Theſe three veſſels ſome will haue to be moued according to the motion of the Lungs; others according to the heart; onely the weazon or aſper arterie is dilated when the lungs are dilated. But the venall artery is moued truely after the motion of the heart, but not with the ſame motion nor with the ſame power or vertue that the arteries or pulſes are moued with. For the heart in his dilatation drawes ayre from the venall artery; in his contraction he thruſteth foorth a part of the vitall bloud together with the ſooty excrements: wherefore this venall artery is emptied in the dialtation of the heart and filled in his contraction. How theſe 3. veſſels are moued, & by what vertue.

The vſes of the Lungs is, firſt to be the inſtruments of reſpiration and of the voyce, (for all thoſe creatures that want Lungs vſe not to breath and are mute beſide) for beeing dilated, like a paire of bellowes they receiue in ayre from the braunches of the windepipe, which they prepare as being the ſhoppe of the ſpirites, and by degrees change it for the vſe of the heart, which otherwiſe ſhould receiue it impure and ruſhing ſuddenly and at once in to him; and by this delay and preparation it becommeth a conuenient nouriſhment for the in-bred ſpirite. For ſome quality of the aire is familiar and agreeing with that inbred ſpirit, another is full of enmity and wil corrupt it; and hence it is that we ſee thoſe that dwel in houſes newly limed get diſeaſes, and eſpecially the fume or ſmoother of coales and ſuch like will preſently kill a man. The vſes of the Lungs. New limed houſes are dangerous to dwel in.

This ayre the heart in his dilatation draweth vnto it ſelfe by the branches of the venall artery out of the rootes of the winde-pipe whoſe mouthes doe meet, whereby hee is cooled; for euery thing that is hot is nouriſhed, cheriſhed and conſerued by that which is moderately cold, as *Hippocrates* ſaith in his Booke *de natura pueri*: For as a flame being ſtraitned in a narrow place and not ventilated with the ayre is conſumed; ſo our Naturall heate when it wants cooling growes weaker (as they know well which ſit in hot houſes) and faint

and is at length extinguished; for as a flame it is continually mooued; wherefore the Philosophers called the Lungs the Fan or flabell of the heart; and *Plato* thought that the heart when it was heated with anger was tempered againe by the Lungs.

Gal de vſu reſpir. expoundeth this saying of *Hippoc.*

Againe, when they are constringed and contracted in expiration (for in inspiration and expiration life doth consist saith the Philosopher in the 21. chapter of his Booke *De respiratione*) they driue out the aer that remaineth by the same way, that it may giue place vnto that which is fresh, and make also matter for the voice: this aer when it comes in is colde, when it goeth out hot, because it hath met with the heate that is conteyned in the Heart. Another vse of them is in expiration to auoide the fuliginous and smoaky sootinesse of the heart and spirits, and the thin and thicke excrements of the Lungs gathered in the braunches of the sharpe Artery or Weazon by coughing into the winde-pipe, which are carried vp as in a Reede and spit out of the mouth, yea sometimes cast out with a cough.

CHAP. XVIII. *Of the Weazon or winde-pipe called the sharpe Artery, or Aspera Arteria.*

Of the winde-pipe.

THE third proper vessell of the Lungs the Ancients called simply the Artery, because it containeth aer; the later Writers with *Galen* call it the sharpe artery, because of the inequality of his substaunce, and to distinguish it from the smooth Arteries; we call it commonly the weazon or winde-pipe.

His position.

It is one and a great pipe [Tab. 15, fig. 1 and 2] giuen to all creatures which haue Lungs, it looketh toward the holes of the nose which open into the mouth, and is placed before the Gullet or *œsophagus* [Tab. 14, fig. 1 AA] vpon which it lyeth in the bottome of the throate, and is carried directly downward from the mouth along the necke (which seemeth to be framed especially for this cause) into the Lungs, into which it alwayes gapeth very wide, and in his lower part is diuided into many smaller Pipes, called by *Hippocrates* in his Booke *de locis in homine*, *Syringas* and *Aortas*, which determine in the Lungs with manifold branches. [Tab. 15, fig. 1, bb, cc]

The throttle or Larynx.

The vpper part of it which is the head, is called *Larynx*, we call it the throttle: [Tab. 15 fig. 1 and 2 g h] of it we will speake in our History of the mouth: the rest [Tab. 15, fig. 1 aa] is called *Branchus*, because it is moystened with drinke.

His connexiō

The head of it or the Throttle is tyed to the throate by his inwarde coate, then by his outward coate it groweth forward, and at the sides to the Muscles and Vessels that neighbour about it, but behinde to the *œsophagus* or Gullet by certaine Fibrous tyes that it may descend downward the safer.

His substance

The substance of this part is partly Membranous, [Tab. 15, fig. 2 f] partly gristly, [Tab. 15, fig. 2 dd] and is inuested with two coates, one outward arising from the *Pleura* which is thinne and groweth exceeding fast to the Membranous bandes of the Cartilages or Gristles, and is as it were a couering to the pipe, which by this coates interposition is tyed to the parts neere hand, and ioyneth the Recurrent sinnewes neerer to this arterie, and beside leadeth them more safely along.

His outwarde coate.

The inwarde coate.

The other coate is inwarde, arising from the coate that inuesteth the Palate of the mouth: this encompasseth the whole pipe, whereby the gristles are more firmelie ioyned together; it is thight and solide and much thicker then the outward, by which his thickenesse and solidity the artery is warranted from the iniuries which might come by any sharp Rheume or other matter that should fall from the head or bee hawked vp, as sometimes salt Flegme and putrid, sometimes bilious or cholericke, sometimet ill qualited and sharpe quitture which is coughed out of the Lungs, or by any sharpe things that should fall or bee swallowed downe, as fumes or vapors and meats or drinkes of a tart or sharpe quality; yet is this coate in the branches dispersed into the Lungs farre thinner then in the throtle, least it should hinder the attraction of the aer, or the expulsion of the smoake or soote, but in the middle of the pipe it is of a middle consistence.

The sound of the voyce in burning Agues.

This coate wouen with right Fibres which runne through his length, is soft & smooth and smeared ouer with a fatty and vnctious humor that the artery might not bee dryed eyther when hot aer is drawne in, or when sharpe fumes yssue out in great outeries or clamorous motions, for that such drinesse would be very offensiue to the voice and the transmission of aer: for when the parts which appertaine to the throate and to this vveazon are vehemently dryed, as it happeneth in burning agues, then follow those sounds of the voice which *Hippocrates* in many places, calleth κλαγγώδεις *Clangoſas*, which beginne base and end sharp

Tab.15. Fig.1. ſheweth the foreſide of the throttle and the weazon, and the branches of the ſame diſſeminated through the ſubſtance of the Lungs. Fig.2. ſheweth the backeſide of the Throttle, and of the trunke of the weazon.

ccc 1. The diſtribution of thoſe branches through the Lungs.
dd 2. The ſemi-circular griſtles of the weazon.
ee 1,2. The Membranous Ligaments.
f 2. The Membranous part of the weazon-pipe.
g 1. The forepart of the Throttle or Larynx.
h 2. The back-part of the ſame.
ii 1. the two Glandules.
kk 1. The Griſtle called *Sentalis*.
l,1,2. The *Epiglottis*.
mm 2. The griſtle called *Arythenoides*.
nn 2. The griſtle called *Crycoides*.
o 2. the ſlit which we call the *Glottis*.

ſharpe, as if the voice failed in the end as it doth in drunken men; and this kinde of voyce is of euil preſage in ſuch Agues; but when the parts are abundantly moiſtned as in deſtillations & poaſes, then the ſound is raucous or hoarſe, but beſide ſuch deſtillations it is moiſtened by a humor conteined in certaine Glandules [Tab.15,fig:1.11] ſet at the root of the throttle or Larynx, and others that lye vpon them (for it is rare to finde ſmall Glandules in the pipe it ſelfe though ſometimes it be ſo) as alſo by a part of the drinke which inſenſiblie deſcendeth by the ſides of the pipe [Tab.15,fig.1 aa] as we ſhall ſay when we come vnto the Hiſtory of the Larynx. The Glandules of the Throttle.

This coate is alſo verie ſenſible, that it might quickly finde fault with that that troubles it and ſolicit the Lungs to cough it vp. Betweene theſe two coates are placed the griſtles, and their proper Membranous Ligaments. [Ta.15,fig2 ee] For this winde-pipe is made of many griſtles like rings, but not fully round [Tab.15,fig:2 dd] wanting a fourth part on the backe-ſide, which are called *Sigmoides*, reſembling the old Greeke *Sigma*, and our Ↄ thus turned backward, the Phyſitians in *Galens* time called them *Bronchia*. Theſe all along are equally diſtant one from another, and the vpper are greater then the lower, and thicker in their bredth, eſpecially in the middeſt, becauſe their middeſt ſtandeth formoſt; that the artery might not eaſily be hurt by outward iniuries. The Griſtles of the Weazō. Their Forme. Conexion & Scituation.

Theſe by little and little are attenuated and grow thinner, and ſo go as it were into a mẽbrane, and are knit to the proper membrane of euery griſtle [tab:15,fig:1 e e] by the interpoſition as it were of a *Perioſtion* Ligament-wiſe: but this ligament if it may be ſo called, is in brute beaſts more Membranous, and in men more fleſhy: or ſhal we cal theſe ligaments [tab:15,fig:2 ee] ſmall muſcles, becauſe they interſect themſelues like the intercoſtall Muſcles, and fill vp the diſtances of the griſtles.

And becauſe the griſtles do not make a perfect circle or rundle on the backpart, they are ſo ioyned by the help of membranous productions brought from the ends of the griſtles, that the griſtles with theſe membranes [tab.15,fig: 2 f] doe make a perfect and full though not a round circle. And this their ſubſtance and ſtructure was more meet for their vſe then any other. For if either the weazon had beene made of one griſtle, or of many altogether round, it would haue bin alwayes alike open, which would haue bred a difficulty in inſpiration and expiration, becauſe it is neceſſary that it ſhould ariſe and fal with the lungs. It could not haue bin made onely of a membrane, for then the membrane being ſoft would fal, and ſo the cauity not alwaies be kept open; beſide that, or any other ſuch ſoft ſubſtance had bin vnmeete for the generation of the voice, as wee may perceiue in inſtruments when the ſtrings are moiſt. How they are ioined behind. Why this their ſtructure is beſt.

But becauſe this pipe was to be the inſtrument not onely of reſpiration, but alſo of the voyce, it behooued that this ſubſtance ſhould be griſtly and rigid, or ſtiffe and harde like a pipe, not onely for the freer egreſſe and regreſſe of the aer, but alſo for the neceſsity of the voice, becauſe the ſound could not be made without the colliſion or beating of the aer as it goeth out againſt a hard body. For that which ſoundeth muſt be ſmooth and ſolid, that there may bee a ſymetrie or proportion, and yet are ſiſtance betweene the aer and the ſubſtance againſt which the aer ſmiteth at which it may a little reſt, wherfore in reſpect of the ſound it might haue conſiſted onely of one griſtly ſubſtance, but becauſe the voice coulde not be formed without inſpiration and expiration and theſe ſtood in neede of dilatation & conſtriction, it was neceſſary it ſhould be compounded of many griſtles and Membranous Ligaments, by which it might performe the foreſaide motions. Wherefore when we draw in our breath, the ligaments which tye the Griſtles together are ſtretched, and do ſeparate the griſtles ſo much aſſunder as themſelues are ſtretched. Contrarywiſe when wee breath out, thoſe ligaments are looſed and doubled and fall into themſelues ſo that the Griſtles touch one another, which may bee perceiued in a dead bodie if you blowe winde into his weazon: and therefore the Griſtles and the inſtruments of the voice and the membranous ligaments which ioyne them together, are inſtruments of reſpiration. For the artery it ſelfe prepareth the voice for the throttle or *Larynx*, for that is the firſt and moſt principal inſtru- inſtrument of the voice, as we ſhall declare afterwards.

How ſound is made.

The Griſtles ſerue the voice and the Ligamentes the breathing

Add to this, that if the griſtly rings had been perfectly round, not onely the gullet which is ſoft would haue beene hurt by their hardneſſe, but it would haue beene alſo a hindrance to the ſwallowing of the meate, by reſtraining the iuſt dilatation of the gullet, eſpecially in the ſwallowing of ſolid meates, which they haue proofe of who rauenouſly deuoure their meate before it be chewed: wherefore, that the *Larynx* which is altogether griſtlie, ſhould be no impediment to the Gullet, the Gullet in ſwallowing is drawne downeward, and the throttle aſcendeth vpward.

The inconueniency of the rings if they had bin round

When this pipe commeth [Tab.15, fig. 1, ^{aa}] into the capacity or hollownes of the cheſt to his fourth rack-bone, it is diuided into two trunkes [Tab.15, fig.1 and 2 ^{bb}] the right going to the right ſide, the left to the left ſide of the lungs, into which when they are paſſed, they are againe ſubdiuided on eyther ſide into two other branches to each Lobe, and theſe into many others, [Tab.15, fig.1, ^{cccc}] whoſe griſtles are ſometimes triangular, ſometimes ſquare, ſometimes otherwiſe formed, and paſſe on diſſeminated euen to the extreamities of the Lungs, that they might better fit themſelues to their dilatation and conſtriction, neither be obſtructed but bee free for inſpiration and expiration, and alwayes open for the auoyding of any matter Rheumaticke, Bloody or Purulent by Cough or otherwiſe. The branches of theſe diuiſions are placed betweene the branches of the venall arterie and the arteriall veine [Tab.14, fig.1 ^{acb}] in the middeſt, and are greater then either of the other, but ſo that the Veine is on the backſide of it, and the artery on the right, which preſently as it comes out of the heart entreth the Lungs, for that it was not ſafe that his thinne coat ſhould runne along without ſome Firmament, hauing ſo actiue and ſlippant matter in it. Neceſſary it was that theſe branches of the Weazon ſhould be neere vnto both thoſe veſſels and ioyne mouths with them; and firſt with the Venall artery, that ſo there might bee free paſſage out of the Rough Artery into the ſmooth for the aer to paſſe to the left ventricle of the heart, and as free an outlet for the vapors and ſoote, but not for bloode & other humors, vnleſſe it be by violent Coughing; wherefore, if at any time they become more open then they ſhould be, eyther by breaking one of them, or by opening of their orifices, or if any of them ſhould be gnawne aſunder, then part of the bloode contained in the branches of the ſmooth Arteries is powred into theſe Rough, which hindreth the recourſe of the breath taking vp the paſſages of it, and ſo ſuddenly followeth a cough, and the bloode comes vp into the mouth; but if that which inſenſibly ſlid downe the Weazon, & ſo paſſed vnto his loweſt pipes do thicken in the outlets which are very ſmal, it breeds ſuch a difficulty of breathing, as that his breath ſeemeth continually to faile, and he in great neceſſity of perpetuall inſpiration.

The diuiſion of the windepipe.

Why the branches of the windpipe ioin mouths with the venal Artery.

The cauſes of coughing of blood.

The cauſe of ſhortneſſe of breath.

Secondly, it was neceſſary it ſhould ioyne with the arteriall veine, and that by inoculation, that from the veine it might receiue blood for his nouriſhment. And this is the manner of the coniunction of the Weazon to the Heart by the mediation of the ſmooth arteries, and how ſmall propagations of the Veines are inſerted into the ſtrings of the windepipe for their nouriſhment, becauſe of themſelues they are altogether without blood, but the

Why they ioyn with the arterial veine

The

the ſmooth or venall arteries haue no Veynes inſerted into them, becauſe they them-ſelues containe blood. Moreouer, the Rough arteries hath ſmall veſſels deriued vnto them from the neighbour veſſels.

This Vſes of this Weazon are, that the Lungs as a paire of bellowes might by it, as by a Conduite or pipe draw aer in reſpiration atracted by the noſe and mouth (for the lungs being dilated, onely the rough artery is dilated) and ſend it to the heart, and by the ſame paſſage conſtringed, ſend out from the heart the hot aer which is vnprofitable for it, together with ſmoaky vapors and ſooty excrements, and deliuer them out of the mouth and noſe. And againe, that it might be the inſtrument of the voice; for to the generation of the voyce which is formed in the Throttle, the aer which is breathed in, and is the proper matter of the voice is required, euen as wee may obſerue that in the pipes of the bellowes when they are filled with aer, there is a ſound engendred. Wherefore *Hippocrates* in his Booke *De Morbs* called it *Organum vocale & ſpirabile*, a breathing and vocall inſtrument. And finally, that with violent exſufflation either in coughing, of deepe hauking (for that which is lightly hawked vp comes but from the roots of the tongue) thoſe things which fel from the head, or are gathered in the Lungs might by it bee caſt forth.

The vſes of the Weazon. First. Second. Third.

CHAP. XIX. *Of the Muſcles and Nerues which are in the cauity of the Cheſt.*

HAuing runne through all the parts conteyned in the Cheſt, and as it were remooued them out of the way, we meete with certaine Muſcles, Nerues and Bones.

Table 16. ſheweth the Cauitie of both Bellies without the bowels and the Midriffe, as alſo what Muſcles & what bones remaine when the bowelles and breſt-bone are remooued.

TABVLA XVI.

A B. The firſt Muſcle mooving the Necke, or the long Muſcle.
C C. The ſecond Muſcle mooving the neck called *Scalenus*.
DDDDD. the outward intercoſtal muſcles
EEEEE. The inward intercoſtall Muſcles.
FF. The Muſcle called *Serratus* maior, or the ſecond Muſcle of the Cheſt.
G. The Muſcle called *Serratus minor*, or the firſt Muſcle of the ſhoulder-blade freed from his Originall.
H. The Muſcle called *Pectoralis* or the firſt muſcle of the arme ſeparated frō his original
I the Muſcle *Deltoides* or the 2. of the arme.
K The ſhoulder-bone without fleſh.
L the firſt muſcle of the *Cubite*, cald *Biceps*.
M the 2. Muſcle of the *Cubite* cald *Brachiaus*.
N the Clauicle or coller bone bent outward
O the firſt muſcle of the Cheſt cald *ſubelauius*
P The higher proceſſe of the Shoulderblade
Q The ſixt muſcle of the head or the Lower Oblique.
R. The ſecond Muſcle of the head.
S. The fourth Muſcle of the Shoulder-blade or the *Leuator*.
TV. The two bellies of the fourth Muſcle of the bone *Hyois*.
XX *aa*. The fift Muſcle of the backe, whoſe beginning is at *aa*.
YY *bb*, *cc*. The firſt Muſcle of the thigh, called *Pſoa*, whoſe Original is at *cc*. and his Tendon at *bb*.
ZZ. The 7. Muſcle of the Thigh.
d The holy-bone or *os ſacrū*, out of the holes whereof at *o* certaine Nerues do yſſue.
e A part of the fift Muſcle of the thigh at the ſhare-bone. *f* The ſhare-bone bared.
k The ninth Muſcle of the Thigh, or the firſt Muſcle whereby it is turned.

The

Two muſcles. The Muſcles are two, called *Ceruicis longi* [tab. 15.[AB]] the long muſcles of the neck, which being ſcituated vnder the gullet are affixed to the rack-bones. The muſcles which are ſeated on the ſides and behind and doe extend the head and the necke, wee haue in ſome ſort deſcribed before in the third Chapter of this Booke.

Two kinds of nerues. There are alſo two kinde of Nerues which paſſe thorough the cheſt; one from the ſixt paire of the marrow in the brayne, exhibited in the firſt figure of the 8. table: another from the ſpinall marrow which is either in the racke-bones of the necke or of the cheſt; of which alſo we haue ſpoken before in the 10. Chapter.

CHAP. XX. *Of the Clauicles, Breaſt-bone and the Ribs.*

Figure of Coller. THE Clauicles or Coller-bones are called in Greek κλεῖδες becauſe they ſhut vp the whole Cheſt; they are two, on each ſide one, ſcituated ouerthwart in the bottome of the necke and top of the breaſt. Their figure is not ſtraight but outwardly embowed at the *iugulum* [tab. 17. fig. 2.[n]] and on the inſide hollow; contrariwiſe at the ſhoulder they are hollow on the outſide and imbowed within, [tab. 17. fig. 1, 2, 3.] but in men they are not ſo crooked as in Apes, and doe neare reſemble the letter *ſ*. Likewiſe in women they are leſſe crooked then they are in men [table 17. fig. 4.[n]] which maketh them leſſe nimble in the mouing of their armes, as wee may ſee when they offer to caſt a ſtone: notwithſtanding they haue a manifeſt protuberation or ſwelling, & alſo two lines [tab. 17. fig. 1, 3.[n] fig. 2, 3.[FG]] that from thence the *ſubclauian* muſcle and a part alſo of the *Pectoral* might ariſe. They are alſo on either ſide exaſperated [table 17. fig. 1.[x] fig. 3.[r]] toward their ends, from which exaſperation or inequality doe proceed certaine ligamens; as alſo the ſeuenth muſcle of the head called *Maſtoides*.

Why not ſo crooked in women.

Their inequality or rough nes.

Why called *Iugula*. Theſe *Clauicles* on either ſide faſten the ſhoulder-blade to the breaſt-bone by *Diarthroſis*, a notable griſtle being betweene them. [Table 17. figure 5.[rs]] *Celſus* called them *iugula a iungendo*, of ioyning or becauſe they are like to the yoake wherein Oxen are ioyned which we call *Iugum*.

Their vſe. Their vſe is to hinder the ſhoulder-blade and armes from falling vpon the breaſt.

The breaſt-bone. The breaſt-bone is called στέρνον, becauſe it is diſpoſed in the middeſt betwixt the ribs, [Table 17. figure 9 [ghi]] or the breaſt-bone, becauſe it maketh the forepart of the Cheſt and ſecureth the parts vnder it. It is a little bowed, long and broad like the handle of a Dagger as the antients vſed it [Table 17. fig. 6, 7.] and therefore it is called ξυφοειδὴς, the ſword-like cartilage or the *Breaſt blade*.

The ſubſtãce of it. The ſubſtance of it is not ſolide as other bones, but fungous or ſpongy redde and compounded of bones and griſtles. In a childe new borne it is altogether griſtlely, excepting the vppermoſt which is a bone from the beginning. Then it is deuided into eight partes; ſeauen of them receiue the griſtles of the ſeauen perfect ribbes; the eight receiueth the griſtle called *enſe-formis*. After ſeauen yeares they growe better compacted and haue fewer partitions and at length are onely foure. The firſt [Table 17. figure 5.[a]] which is the broadeſt; the ſecond and the laſt, the reſt betweene ioyne into one. The vppermoſt [tab. 17. figure 6.[abc]] is larger and thicker then the reſt, and repreſenteth the broad knubs or ſtay at the end of the Dagger handle. The ſecond is like [tab. 17. fig. 6.[pqr]] the graſping place, & in the ſides of it hath many cauities or boſomes [Table 17. fig. 6.[klmn]] not equally diſtant one from another, wherein the griſtles of the third, fourth, fifth and ſixt ribs are receiued. The third bone is leſſe then the firſt [tab. 17. fig. 6, 7.[f]] but broader then the ſecond, & theſe are all that appeare bony in a growne man.

The diuiſion of it.

The quantity of the parts.

The griſtles of this bone. The griſtles of it beſide thoſe two which are betweene the coller-bone and it, are, one betwixt the firſt bone and the ſecond, [Table 17. figure 6.[h]] another in the end of it long, immouable and triangular [Table 17. figure 6, 7.[x]] which is commonly ſharpned at the end like the poynt of a ſworde, whence it hath his denomination, for it is peculiarly called the *Breaſt-blade*. If this griſtle be in children curued downeward it offendeth the Liuer and the ſtomacke and ſuch children pine away and dye. Here alſo is that cauity which is commonly called *Scrobiculus cordis*, the Trench or Spoone of the heart. Note alſo that in woemen the breaſt bone is flatter then it is in men becauſe their paps are larger.

The vſe of this breaſt-bone. The vſe of this breaſt-bone is the ſame with the ribbes. The vſe of the breaſt-blade is partly to defend the parts vnder it, partly to giue ſcope to the motion of the midriffe.

The ribs which the Greekes call πλευραὶ and σπάθαι, are commonly as well in men as in women on either ſide twelue. [Table 17. figure 9. 10. character from one to 12.] They are many

Table 17. hath twelue Figures, whereof foure ſhewe the Coller-bone. The firſt the anterior part: the ſecond the poſterior: the third the lower part: the fourth the Coller-bone of a woman which is ſtraighter then of a man.

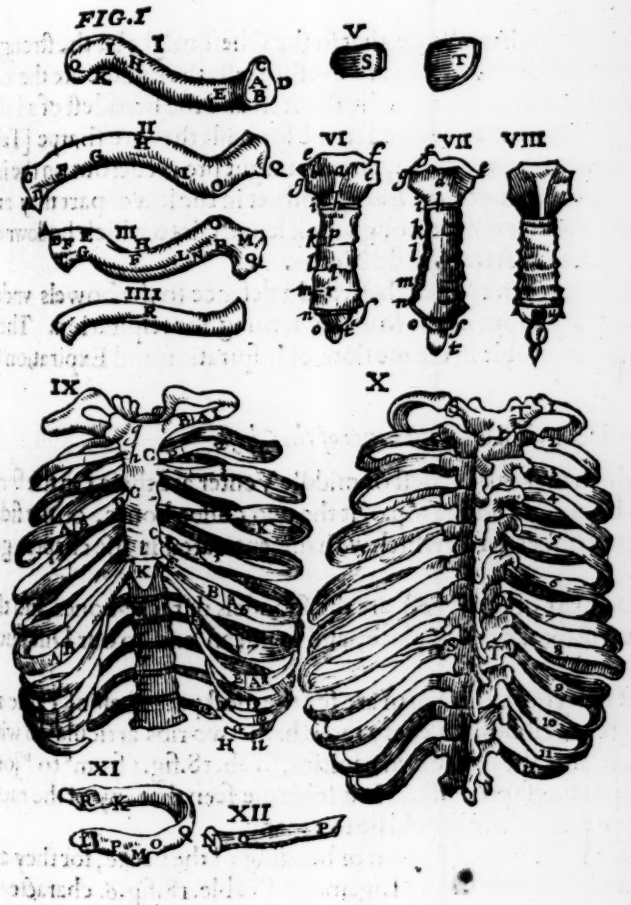
The fift Figure ſheweth two griſtles placed on either ſide betwixt the ioynts of the Coller-bone.

The ſixt Figure ſheweth the foreſide of the breaſt-bone. The ſeuenth the back-part thereof. The eight ſheweth the foreſide of the breaſt-bone of a woman, together with the hole therein after the faſhion of a Heart.

Figure 9. ſheweth the foreſide of the bones of the Cheſt. The tenth the backeſide. The eleauenth one of the true ribs broken. The twelfth ſheweth the back part of the twelfth broken.

From the firſt Character to the twelfth, in the 9. and 10. Figures are exhibited the twelue ribs: the ſeauen vppermoſt true ribs: the fiue lowermoſt baſtard ribs.

TABVLA. XVII.



A 1 2 3. The head of the clauicle which is ioyned to the breaſt-bone.

B 1. The firſt angle or corner of this head.

C D 1 2 3. The ſecond and third angles

E 1 3, The eminent and forward line of the clauicle.

F G 2 3. The lower line which neare G is rugged.

H 1 2 3, The middeſt of the clauicle or coller-bone which is round.

I 1 2, The *exterior* part which is broader and crooked.

K 1, A roughnes in that place.

L M N 3, The lower ſide of the clauicle which is ſituated and rough, and about N ther riſeth a ligament which is fixed into the inner proceſſe of the ſhoulder blade.

O 2 3, A ſwelling of the clauicle oppoſite to the breaſt-bone.

P 3, the lowes roughneſſe of the inner ſide,

Q 1 2 3, The playne or ſmooth heade wherewith it is ioyned to the ſhoulder blade.

R 4, the coller-bone of a woman.

S 5, That cartilage or griſtle of the coller-bone which is betwixt his ioynt with the ſhoulder blade.

T 5, the other griſtle which is betwixt his ioynt with the breaſt bone.

a 6, The ſwelling or bunching prominence of the firſt bone of the *ſternon* or breaſt-bone.

bc 6, An impreſſion or doke on eyther hand at the ſides of the ſayed prominence.

d 7, The backeſide of the breaſt-bone which is ſomewhat hollow.

ef 6, The boſome or cauity which admitteth the coller-bones.

g 6 7, The boſome of cauity to which the firſt rib is articulated.

h 6 7, the articulation or ioyning of the firſt bone with the ſecond.

i 6 7, The *ſinus* or hollownes to which the ſecond rib is ioyned.

k l m n o 6 7, Other *ſinus* or boſomes to which the fiue following ribs are articulated.

p q r 6, the lines which remayne after the bones do grow into one.

ſ 6 7, the third bone of the *ſternon*.

t 6 7, the griſtle of that third bone.

u 8, A hole made in the bottom of the breſt bone carrying the repreſentaion of a heart. *Fig.* 9. 10. 11. & 12.

A B 9, The ioyning of the ribs with their griſtles. C D 9, The articulation of the griſtles of the ribs with the breaſt bone. E 9, The blunt heade of the griſtle. F F 9, the griſtles of the baſtard ribs which are ſharpe. *g h i* 9, the breaſt-bone in the midſt of the ribs. G H 9, the diſtance betwixt the 11. ribbe where the griſtle ſometime is parted from the other griſtles, but at 12, alwayes. I I 9, An vnequall prominence of the griſtles. K 9, the ſword-like cartilage. K 11, A boſome running along in the inner ſide of the rib. L M 11, the head wherewith the rib is articulated or ioyned to the ſpondel or rack-bone L. and M ſheweth the head wherby it is ioined to the tranſuerſe proceſſe. N 12, the blunt head of the 11, and 12, ibs. O 11, 12, A knub into which the 11, muſcle of the back is inſerted. P 11, An *aſperity* or roughnes betwixt the two heads which bringeth forth a ligament. Q 11. A roughnes with a light extuberation into which the muſcle of the cheſt called *Sacro lumbus* is implanted. R 11, The fungous ſubſtance of the rib appearing when it is broken.

many that hauing many muskles, the cheſt might more eaſily be moued, yet ſeldome fewer or more then 12.

Their diuiſion

They are diuided into true or legitimate, & baſtard or ſpurious ribs: the legitimate are the ſeauen vppermoſt, [Tab. 17. fig. 9. from char. 1 to 8] ſo called becauſe they perfect their ſemi-circle. They are ioyned backward with ſtrong Ligaments to the racke bones of the back [Tab. 17, fig: 10 ˢ ᵀ] by *Diarthroſis*, & that with a double knot to make them the faſter.

Their Connexion. And Names.

The vpper knot is to the body of the Spondell, the lower to the latter all proceſſe. Forward they are articulated to the breſt-bone [Tab. 17, fig. 9 ᶜ] by certaine griſtles growing vppon their heads. The two vppermoſt of theſe are called *Retortæ*, the two next *Solidæ*, the three laſt *Pectorales*. The baſtard ribs are the fiue lower; ſofter as being almoſt griſtly, at leſt they end into a perfect griſtle. Theſe fiue are retorted or bent vpward, and ſo are glewed together [Tab. 17, fig. 9 ᶠᶠ] excepting the laſt which is the twelfth.

Theſe are alſo imperfect, becauſe they are knit onely to the ſpondels but touch not the breſt bone, that ſo the Lower belly eſpecially the ſtomacke and the wombe might better bee dilated or enlarged. The eleuenth and the twelfth are ſometimes tyed vnto the Midriffe.

The ſubſtance of the Ribbes.

The ſubſtance of the ribs is not onely bony (though that bonyneſſe be but ſpongy) [tab. 17. fig. 11, ᴮ] but euery one hath his proper Cartilage both behinde where they are tyed to the Spondels, and alſo before where they are ioyned to the breſt-bone [Table. 17, fig. 9, ᴬᴬ ſhewes the coniunction of the ribbes with their Cartilages, and ᶜ ᴰ the coniunction of the cartilages of the breſt-bone.]

Their Figure Magnitude.

Their figure is ſemi-circular or bent like a Bowe, that ſo the Cheſt might be the ſtronger and more capacious. The vpper and neather ribs are the ſhorteſt, the middle are the longeſt and the broadeſt excepting the firſt which is the ſhorteſt and the broadeſt of all the reſt. On the outſide eſpecially where they are tyed to the ſpondils they are ſharpe [Tab. 17, fig, 11 ᵀ] and vnequall, that from thence the Ligaments might proceede: but on the inſide they are ſmooth leaſt they ſhoulde hurt the *Pleura*, and yet in the lower part they are

Their cauity.

hollowed [Tab. 17, fig. 11 ᴷ] like a gutter quite through their length, into which hollowes they receiue three Veſſels, a Veine, an Artery, and a Nerue.

Their vſe.

The vſe of the ribbes is to be a ſtrength to the Cheſt, and a defence to the bowels vnder them, they receyue alſo the implantations of the Muſcles ſeruing for reſpiration. Their Griſtles alſo doe make them more plyable in the motions of Inſpiration and Expiration euen when we are aſleepe.

CHAP. XXI. *Of the bones of the Cheſt.*

THE bones which make the Cheſt or middle Venter are theſe. On the fore-part the breſt-bone, and on the top of it the two coller-bones, on the ſides foure and twenty ribbes, of all which we haue entreated in the chapter going before.

The ſpondels.

On the backe-part of the Cheſt are the ſpondels or racke-bones, and the ſhoulder-blades, of which we will ſpeake in this place, and ſo put an end to our Diſcourſe of the Middle Venter.

Their number

The Spondels therefore of the Thorax in a man are for the moſt part twelue [Table 20 Fig. 1. at ᴰ] iuſt ſo many as there are ribbes, for euery racke hath two ribs articulated with it, [Tab. 18 fig. 5. ᴰ ᴾ] wherefore alſo they haue two cauities, [Tab. 18. fig. 1 from ᶜ to ᴰ] one at their ſides, another at their tranſuerſe proceſſe. It is ſeldome ſeen that any of the racks are wanting, but much more rare that there ſhould be too many.

The reaſon of their number.

The reaſon of their multitude is the better flexion or bending of the backe, for they are put together with ioynts knit and tyed with ſtrong Ligaments [Table. 18. fig. 6. character 5. Tab. 20. fig. 1, ᴿᴿ] betwixt euerie one of which there runneth a Cartilage to make the motion more nimble and glad. [Tab. 18 fig. 6. char. 1, & 3]

Their Forme or Figure.

Theſe Spondels haue bodies bunching out in the middeſt round, embowed aboue [tab 18. fig. 1] and below [Tab. 18. fig. 1, 2, 3, 4 ᴬ] plaine, thicker alſo then the rackes of the neck and leſſe ſolid, thrilled alſo with ſmall holes made for the paſſage of thoſe veſſelles that deriue nouriſhment vnto them and the marrow of the backe.

Their proceſſes.

Their proceſſes are ſome ſharpe, cald *Spinales* [Tab. 18, fig. 1, & 2 ᴹᴹ] which bend downward: others tranſuerſe [Tab. 18. fig. 1, 2, 3, 4 ᴿ ᵀ] which are thicker, ſolid and long ending in a round head for the firme articulation of the ribs: againe, others aſcending which are two

[Tab

Tab. xviij. ſheweth the backeward bones of the Cheſt.
Figure 1. exhibiteth the fore-face of the middle Spondell vnto which the other ten are very like.
Figure 2. The backe-part of the ſame Spondel.
Figure 3. The backe-part of the eleuenth Spondel.
Figure 4. the backe part of the twelfth ſpondel.
Figure 5. The three middle Spondelles of the Cheſt, together with their articulation with the rib.

Figure 7. ſheweth the inward part of the right ſhoulder-blade.
Figure 8. the outward, as the 9. Figure ſheweth the ſide.

TABVLA. XVIII.

A 1,2.3,4. The vpper-part of the Spondel, to which the lower part is anſwereable.
✣ 3. The vpper *Appendix* of the head of the *Vertebra*, to which the lower *Appendixe* is like.
BC 1. The boſome which receyueth the rib marked with B, another leſſe boſom at C.
D 3 5. The boſome of the eleauenth racke-bone to which the eleauenth rib is articulated, and in the fiſt Figure it is ſhewed together with the rib.
E 4. A *Sinus* or hollowneſſe in the twelfth Spondell.
F 4. A roughnes or inequality in the bone bringing foorth the Ligament or tye of this ioynt.
G 2,3,4. The holes that are in the backſide of the bodies of the rack-bones.
HI,1,2,3,4 The tranſuerſe proceſſes of the rack-bones of the Cheſt.
KK,1,5. A *Sinus* in the top of the tranſuerſe proceſſes, to which the rib is articulated.
L 1,2. the gibbous or embowed part of the tranſuerſe proceſſe,
M 1. the hollow part of the tranſuerſe proceſſe.
NOP,1,2. The ſpine diſtinguiſhed in the three ſides by three lines.
Q 1. A ſharpneſſe in the inſide of the ſpine.
R 3. The ſpine of the eleuenth racke-bone.
S 4. the ſpine of the twelfth racke bone.
TV 1 the foreface of the aſcending proceſſes.
XY 2,3 the backſace of theſe proceſſes.
ab,2,3. the outward face of the deſcending proceſſes.
c 1. Their foreſace cruſted ouer.
ef 4 The aſcending proceſſes of the twelfth rack bone which goe vnder the eleuēth.
gb 4. The deſcending proceſſes of the xii. racke bone, which are articulated to the Cauities of the aſcending proceſſes of the firſt racke bone of the loines.
i,l,l, 5. The three middle *Vertebræ* ioyned together.
m n 5. the boſome which is in the body of the *Vertebra*, and receiueth the heade of the rib.

r 5 the articulation of the rib to the tranſuerſe proceſſe. *p* 5 the circular bowing of the ribbes from D to *p*. backward, from thence to *ſ* forward. *qr* 5. the ioyning of the rib with his Cartilage. *ſ* 5. the blunt heade of the Cartilage. *Char.* 1,2, fig. 6 A Cartilage ioyning the *Appendices* of eyther rackbone to their Bodies. *Char.* 3,4 Fig, 6 the appendices of eyther rackbone. *Char.* 5. Figure. 6 A griſtly Ligament ioyning both the rack bones. *Heere followeth a threefold delineation of the Scapula or Shoulder-blade.* AB,7,8. The boſome or cauity of the blade which is called *Acetabulū*, into which the bone of the ſhoulder entreth. *a* 8, A griſtle which enlargeth that cauity, which is alſo by it ſelfe deſcribed and noted in K. CD 7,8. the neck of the ſhoulder-blade. E 7,8, the leſſer proceſſe of the ſhoulder-blade. F 7,8, the knub of the ſame, vnto which the Clauicle is connected. *f* 7, the roughneſſe thereof which bringeth foorth a Ligament. GH,8,9 The Spine of the ſhoulder-blade. I,8,9. the thicker part of the ſpine which hath an Appendix. K,7,8,9 *Acromion* conſiſting of an Appendixe. L 7. the *ſinus* of that *Acromion* ſuſtaining the Coller-bone. MMMM. Certaine ſmall dens made by the contaction of the ribs. NOP 7, the inward hollow part of the roote of the ſpine at NO. the inward extuberation of the lower ſide at P. *p* 7, the ſharpeneſſe of the ſhoulder-blade in the vpper ſide. Q 7. the *ſinus* of the lower ſide from whence ariſeth the firſt Muſcle extending the Cubite. S 8 the outward protuberation or ſwelling of the Lower ſide. T 8, An impreſsion of the lower ſide from which ariſeth the fourth Muſcle of the arme called *Rotundus maior*. V,V 8 the cauitie of the outſide of the *Scapula*. X 7,8,9 An Appendix of the *Baſis* of the ſhoulder blade. Y 7,8,9, Another Appendixe of the lower angle. Z 7,8,9 The vpper angle of the baſis of the ſhoulder blade. ✣ 7, the inner protuberation or ſwelling of this angle. *a* 7,9 the boſome of the vpper ſide of the ſhoulder blade. *b* 9, The thinneſt part of the ſhoulder blade. *c* 9, Heere ſometime is found a ſmall hole through which the veins do creep for the nouriſhment of the bone.

[Table 18.figure 1.[TV]] and two deſcending [tab. 18.figure 2,and 3.[ab]] notwithſtanding the tranſuerſe proceſſe of the 11. and 12. ſpondels [tab.18.fig.4.[efhg]]doe differ from the proceſſes of the reſt.

Appendices 5. The haue alſo fiue *Appendices*, two at their bodies aboue and [tab.18.fig.3.[ϕ]]beneath; two at the tranſuerſe proceſſes,and one at the end of euery ſpine.

Their perforations. The holes or perforations of theſe rack-bones are bored according to the thickneſſe of the marrow that muſt iſſue out of them [table 18. figure 2,3,4.[o]] for as the marrow in diſcending is attenuated,ſo are the holes of the lower ſpondels ſtraightned.

CHAP. XXII. *Of the ſhoulder-blades and racks of the neck.*

The ſhoulder blade. THe ſhoulder-blade called *Os ſcapulæ* is on each ſide one [Table 18.figure 7,8, 9.] which hangeth vpon the ribs on the backeſide like a buckler,and is articulated with the ſhoulder or arme and the coller-bone,ioyned alſo to the ribs, the bone *Hyois* and the *occipitium* or nowle-bone by the mediation of the muſcles.

His connexion.

His figure. The Figure is almoſt triangular, on the inſide it is concauous or hollow [Table 18,fig.7 [x]] on the outſide [Table 18. figure 8.[vv]] it buncheth, and that bunch is called the Baſis of the bone ;it hath alſo an angle or corner,and a ribbe both aboue and below, from which is produced a ſpine tending vpward.[table 1.8.fig.9.[ox]]The vpper angle is ſhewed in the 18. table fig.7,8,9.

The proceſſes. The proceſſes of this *ſcapula* aboue are three; the firſt is very ſhort and determineth with a ſhort necke [table 18. fig.7,8.[cp]] into a hollowed head [table 18. figure 7,8.[ar]] ſuch as the Anatomiſts cal *Acetabulum* wherin it receiueth the head of the ſhoulder-bone. And this hollowed head of the *ſcapula* is compaſſed with a thicke griſtle[table 18.figure 8.[a and r]] whereby the cauity is enlarged,leaſt that the head of the ſhoulder ſhould eaſily fal thereout.

Acetabulum.

The ſecond proceſſe is the very end of the ſpine and hangeth ouer the ioynt of the ſhoulder; and therefore it is called *Humeri mucroor ſummus humerus*, The top of the ſhoulder, [Table 18. figure 7,8,9.[x]] and by this proceſſe the ſhoulder-blade is ioyned to the coller-bone.

The third is inward and leſſe [table 18.fig,7,8.[r]] called *Sigmoides*, and this contayneth the ſhoulder-bone in his ſeate.

The *appendices*. The appendices,or if you will,appurtenances of the ſhoulder-blade are fiue, three are in the inſide and at the Baſis [table 18.figure 7,8,9.[xr]]affording a beginning to ſome muſcles; and two other out of which iſſue the ligaments which ioyne the ſhoulder to that hollow head of the blade wee ſpake of and alſo the coller-bone to the ſecond proceſſe which we called the top of the ſhoulder.

It hath alſo a double cauity one aboue, the other beneath the ſpine with the Anatomiſts *Inter ſcapulium*.

The ſubſtance The bone of the blade is very vnequall, for in the middeſt it is the thinneſt, the proceſſes thicke, medullous and ſpongy; it hath alſo certaine perforations by which veines and arteries are admitted for his nouriſhment.

The Neck which was framed to ſuſtaine the head and to mooue the ſame, conſiſteth of The ſpondels of the neck. many ſpondels called *vertebræ* or rack-bones which are commonly ſeauen [tab.19.fig.1,3, 4.] differing one from another and from the reſt of the *vertebræ* of the ſpine.

The firſt rack bone. The firſt [Table 19. figure 2,3.[ff] table 20. figure 2,1,4,] is called *Atlas*, and hath a thinner yet thighter and faſter body then the reſt,and wanteth the vpper proceſſe or the ſpine.

The proceſſes of it. The aſcending and deſending proceſſes of this rack are hollowed on either ſide, [table 20. figure 2, 3.[ff]] aboue to receiue the two proceſſes of the *occipitium* [table 19. figure 1.[xc]] for the better motion of the head, below to receiue the proceſſes of the ſecond *vertebra* [table 20.figure 5. 6.[MN]] it hath alſo at the ſides thereof two tranſuerſe proceſſes [table 19. fig. 2,3.[ll] table 20.fig.2,3,4.[oo]]perforated [table 19. figure 2.[x] table 20.figure 2.[x] ſheweth the perforation] for the aſcent of a veine and an artery into the brayne.

The cauity of it. It hath alſo a cauity or *ſinus* [table 20.figure 2,3.[s]] cruſted ouer with a griſtle [table 20. figure 2,3.[c]] wherein it receiueth the tooth [table 20.figure 7. O] of the following *vertebra*,and at the proceſſes where the racks are ioyned there is alſo a *ſinus* on either hand: in the firſt [table 20. figure 4.[z]] and the ſecond [table 20.figure 6.[y]] it is like a chinck or rift: in the reſt it is orbicular as alſo it is long in the rackes of the cheſt. Through theſe cauities the

The vſe of the cauities.

Table 19. sheweth the bones of the necke.

Figure 1. the bone of the occipitium or nowle separated from the skull.

Figure 2. sheweth the coniunction of the seuen vertebræ of the necke as it appeareth in the back-part.

Figure 3. sheweth the forepart.

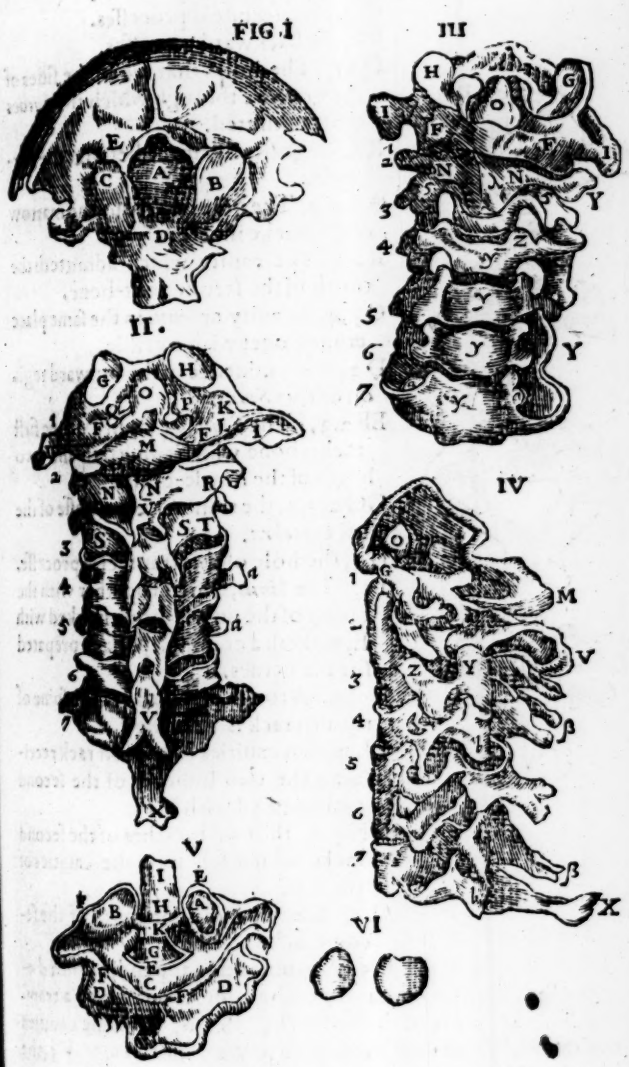
TABVLA. XIX.



A 1, The hole in the nowle-bone made for the outlet of the spinal marrow.

BC 1, Two heades of the bone *occiput* or nowl-bone, which are articulated to the first rack-bone of the neck.

D 1, The roughnes wherein the ligament is inserted.

E 1, A *Sinus* or hollownes in the backepart of those heads, making a way for the first payre of sinewes.

FF 2,3, The first rackbone of the neck.

GH 2,3,4, the cauity of the first rack-bone receiuing the two heades of the nowle-bone.

H 2,3, The transuerse processe of the first *vertebra*.

K 2, the hole of this transuerse processe.

L 2, A cauity which with the cauity of the nowle-bone marked with E maketh a common passage which is prepared for the nerues.

M 2,4, A rough place there where the first rackbone of the neck wanteth the spine.

NNλ 2,3, the second *vertebra* of the necke whose body bunching in the middest & depressed on either side, λ in the third figure exhibiteth.

O 2,3,4, the appendix or processe of the second *vertebra* called the *Tooth*.

P 2, A hole made of the cauity of that Tooth & of the first rack-bone, through which smal branches of nerues are transmitted.

Q 2, A roughnesse wherein the hole is not perceiued to be thrilled through.

R 2, The descending processes of the second *vertebra*.

S 2,3, the third *vertebra* of the neck.

T 2, The descending processe of the third *vertebra*.

VV 2,4, The processes of the racke-bones on the backeside diuided thorough the middest.

X 2,4, The backeward processe of the seauenth rack-bone which is not clouen as the former ββ.

Y 3,4, The highest processe of the racke-bones.

Z 3,4, the two first extraordinary processes in the highest part of the *vertebra*.

αα 2, The extraordinary part of the laterall processes.

ββ 4, The processes deuided through the middest.

γγγ 3, the bodies of the racke-bones.

αα 3,4, the holes of the laterall processes.

bb 4, The lower nodes or knots of the processe. Character 1,2,3,4,5,6,7. Shew the seuen *vertebræ* or racks of the neck.

Figure V.

ABCD, The first *vertebra* of the necke. ABC, the second DD. EF, A membranous ligament knitting the first *vertebra* to the nowle bone at E. and the first to the second at F. G, the body of the second *vertebra*. H, The tooth of the second *vertebra*. I, the ligament tying the tooth to the nowle-bone. K, A ligament compassing the tooth of the first racke-bone.

Figure VI. The gristles which *Vesalius* saith are sometimes found betwixt the two first *vertebræ*.

the coniugation of the nerues and the braunches of the veines and arteries do passe, which minister nourishment vnto the marrow and to the bones.

The second *vertebra* [table 19. fig. 2,3.^N table 20. figure 5,6,7.] besides his body, his late-

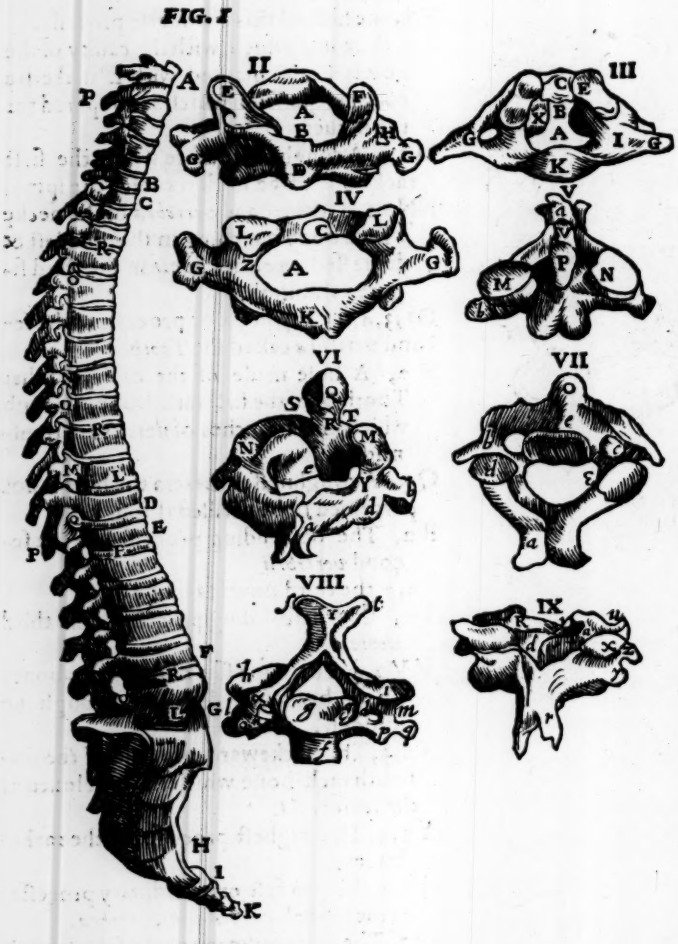
Figure 8. the foreward and vpper face of the third vertebra.

Figure 9. the backer and vpper face thereof.

TABVLA. XX.



From A to B, The ſeuen *vertebres* of the necke.

From C to D, The twelue *vertebres* of the cheſt.

From E to F, The fiue rack-bones of the Loynes.

From G to H, The *Os ſacrum* or Holy-bone.

From I to K, The bone *Coccyx* or the rump-bone according to the late writers.

LL, the bodies of the *vertebræ*.

M, the tranſuerſe proceſſes of the *vertebræ*.

N, the deſcendent proceſſes.

OO, the aſcendent proceſſes.

PP, the backward proceſſes.

QQ The holes that are in the ſides of the *vertebræ* through which the nerues are tranſmitted.

RR, A griſtly ligament betwixt the *vertebræ*.

A 2,3,4, The hole whereout the marrow of the backe iſſueth.

B 2,3, The cauity which admitteth the tooth of the ſecond rack-bone.

C 3,4, A cauity or *Sinus* in the ſame place cruſted ouer with a griſtle.

D 2, A prominence in the outward region of this *Sinus*.

EF 2,3, The *Sinus* or cauity of the firſt racke-bone which admitteth the two heads of the nowle-bone.

GG 2,3,4, the tranſuerſe proceſſe of the firſt *vertebra*.

H 1, the hole of this tranſuerſe proceſſe.

I 3, The *Sinus*, which together with the cauity of the nowle-bone marked with E, maketh a common paſſage prepared for the nerues.

K 3,4, A rough place where the ſpine of the firſt rack is wanting.

LL 4. two cauities of the firſt rack receiuing the two bunches of the ſecond rack marked with MN.

MN 5,6, the two bunches of the ſecond racke which fall into the cauities of the firſt.

O 7, The appendix or tooth of the ſecond rack.

P 5, A knub of this appendix cruſted ouer with a griſtle. Q 6, the backſide of the tooth. R 6, the *Sinus* or cauity of the ſame, about which a tranſuerſe ligament is rowled contayning the ſayd tooth in the cauity of the firſt rack. ST 6, Certaine cauities at the ſides of the tooth whence the roots iſſue of the fore-branch of the ſecond payre of ſinewes. V 5, the poynt of the tooth. X 3, An *aſperity* or roughnes where there is a hole but not thrilled through. Y 6, A cauity of the ſecond rack which togither with the cauity marked with *Z* maketh a hole, through which the nerues do iſſue. Z 4, the *Sinus* of the firſt rack. *a* 5,6,7, the double ſpine of the ſecond rack. *b* 5, 6,7, the tranſuerſe proceſſe of the ſecond rack. *c* 7, the hole of the ſaid tranſuerſe proceſſe. *d* 6,7, the deſcending proceſſe of the ſecond rack whoſe cauity is marked with *d* in the ſixt figure. *e* 6,7. the place where the body of the ſecond rack deſcendeth downward. *f g g* 8, The lower ſide of the body of the third rack at *f*, the two eminent parts of the ſame at *g g*. *h i* 8, the aſcending proceſſes. *l m* 8, The two deſcending proceſſes. *n o p q* 8, The tranſuerſe proceſſes. *r* 8,9, the ſpine or the backward proceſſe. *ſ t* 8, the two toppes of the ſpine. *u* 9, the deſcending proceſſe of the third rack. *x* 9, the aſcending proceſſe. *y*, the tranſuerſe proceſſe of the third rack. *α* 8:9, the hole of this tranſuerſe proceſſe. *β* 9, the vpper hollowed part of the body of the third rack. *γ* 9, the *Sinus* or cauity which maketh the lower part of a hole through which the coniugations of the nerues are led. *ε* 7, the vpper part of the ſame hole.

laterall proceſſes [table 20.figu. 5,6,7.[b]] which are ſhort and obliquely perforated [table 2.figure 7.[c]] his backward proceſſe bifurcated [table 20.figure 5,6,7.[a]] becauſe of the muſcles,& beſide his aſcending proceſſes lightly bunching out,and his deſcending [tab.19.fig. 2.[a] tab.20.fig.6,7.[d]] lightly hollowed;beſide all theſe(I ſay)there ariſeth out of the middle of his body an appendix commonly called a proceſſe which is round and long [table 19. fig.2.3.4.O table 20.fig.6.[e] fig.7.O.] and is called ὀδοντοειδὴς becauſe it is like that tooth of a man which we call the Dog-tooth. The ſurface of this tooth is ſomewhat rough,to giue an originall to a ligament [table 19. fig. 5.[z]] whereby it is tyed to the occipitium: it is alſo compaſſed with a round and ſolide ligament [table 19.figure 5.[x]] leſt the marrow ſhould be compreſſed: it is alſo ioyned with the firſt by a broad ligament [table 20. fig. 5.[r]] compaſsing it about. His tooth.

The third ſpondell of the necke [table 19. fig. 2,3,[ss] Table 20. fig.8,9,] which is called ἄξων (and groweth together very firmely on the foreſide with the other foure) as alſo the 3. following haue their laterall proceſſes bifurcated or forked [Table 19.fig. 2.[vv] fig.4.[ß]]becauſe of the implantation of the muſcles. But the ſeauenth ſpondell [table 19.figure 2,3, 4.character 7.]is like the rack-bones of the cheſt,and his backward proceſſe is not alwayes forked [table 19.fig,2.4.[x]]but ſometimes whole, the body below is playne that it may fully ioyne with the following *vertebra*. The 3. ſpondell. The ſeuenth.

All of them(except the firſt)haue appendices betweene which doe run thicke and ſoft griſtles to make them more nimble and free. Their *appendices*.

And thus much ſhall ſuffice for the bones of the cheſt in this place; where alſo we will put an end to the Hiſtory of the middle belly, and proceede to the Controuerſies concerning the ſame.

¶ A Dilucidation or Expoſition of the Controuerſies concerning the Cheſt and Heart, &c.

QVEST. I. *An Anatomicall demonſtration concerning the Phrenſie of the Midriffe.*

THE ancient Phyſicians before *Plato*,did not call the Midriffe *Diaphragma*, but φρένες, not becauſe there was in it any ſeate of wiſedome which theGreeke worde ſignifieth, but becauſe when this muſcle is inflamed, preſently followeth the diſeaſe called *Phrenitis* or the phrenſie, which is a continuall abalienation or diſtemper of the minde,ioyned with an acute feuer and want of reſt or ſleep. The inflamations of many parts breede this deliration as of the liuer,the Stomacke and the Lungs;but ſuch diſtemper is but vncertaine and at ſome times not continual,only the inflamation of the midriffe breedeth a perpetuall or continual phrenſie,which ſo neerely reſembleth the true phrenſie ariſing from the inflamation of the brain and his membranes,that it may deceiue a Phyſicion vnleſſe he be right skilfull: we wil deliuer in this place the ſignes how they may be diſtinguiſhed. They are therefore diſcerned the one from the other by reſpiration, by the voyce and by the handling of the *Hypochondria*. The true and primarie phrenſie which commeth from the inflamation of the braine or his membranes, maketh the reſpiration great, and that is deepe and long, that is ſeldome and rare with much diſtance betweene the breathings: but in the phrenſie of the midriffe the reſpiration is ſmall and frequent or quicke,ſmall or ſhallow,becauſe the inſtrument of reſpiration is inflamed,ſo that the cheſt cannot moue or be inlarged in all his demenſions in inſpiration,nor yet be freely collected or gathered vp together in expiration, as it may be in the former,where the inſtrument of Why the midriffe is called *phrenes*. What is a phrenſie. How the phrenſie of the midriffe is diſtinguiſhed from that of the Liuer,& other parts. How from the phrenſie of the braine. How by the reſpiration.

breathing is not taynted or violated, but onely the brayne: frequent also it is and quick, often returning, because of the necessity imposed by the flame of the ague; for so the shallow breathing is recompenced by often breathing.

How by the voice.

Secondly, these phrensies are distinguished by the voyce: for in the phrensie of the brayne the voyce is base, they cry out, spurne and byte any that comes neere them: contrariwise in the phrensie of the midriffe the voyce is acute or treble, because the chiefe instrument of free respiration is affected, and being drawne vpward by the inflamation, the chest becommeth narrower; for the magnitude and basenes of the voice followes the constitution of this instrument.

How by the retraction of the *Hypochondria*.

The *Anatomical* demonstration.

The three demonstratiue signes of the pluriſie from the midriffe

Why when the midriffe is inflamed, there followeth a phrensy

The true cause.

The last and most proper signe of this phrensie of the midriffe, *Hippocrates* deliuereth in the 5 ſ. Aphorisme *Coacarumpænotionum*, where he sayth: In these men their *Hypochondria* appeare *intro ſurſum revulſa. i.* to be drawne inward and vpward: the demonstration of which saying is to bee made by Anatomy thus: The midriffe in the vpper side is couered with the *pleura*; on the lower with the *Peritonæum* or rim of the belly, which incloseth as in a sacke all the naturall instruments and parts conteyned in the lower belly, and giueth euery one of them his owne coate. The midriffe then being inflamed, is drawne vpward, and carrieth with it the *peritonæum*, with the *peritonæum* are the *hypochondria*, the Liuer, the Spleene, the Stomack, and all the bowels retracted; also hence comes that inward and vpward revulsion of the *Hypochondria Hippocrates* mentioneth: wherefore these are the three proper and demonstratiue signes of the phrensie from the midriffe: small or shallow and frequent respiration, a shrill or treble voyce, and the vpward and inward revulsion of the *Hypochondria*. But why happeneth it, that when the midriffe is inflamed, there followeth a phrensie? Some thinke that when the midriffe is inflamed, the brayne is also presently alike affected; for the inflamation of the midriffe hindering respiration, the heat is increased in the chest and the heart, the bloud is attenuated and groweth cholerick and flyeth vp into the brayn, whence commeth an *erisypelas*, that is, a cholericke inflamation of the brayn, the immediate cause of the true phrensie; but these things are ridiculous. For if it were so, then whensoeuer the Lungs also are inflamed, presently a perpetual phrensie would follow; because there followeth both a difficulty of breathing, and the Lungs are nourished with a bilious, that is, a very thin bloud: moreouer, if an *Erisypelas* should breede in the brayne, then were the phrensie a true phrensie, & not depending vpon the inflamation of the midriffe. Others referre the cause of the phrensie to an analogy or proportion in all correspondency betweene the midriffe and the brayne. But because the marrow of the backe is more correspondent to the brayne, and yet when that is inflamed, there followeth not alwayes a perpetuall phrensie, we doe worthily search farther for the cause. Wee therefore vnderstand that there is a double concurring in this busines, to wit, a wonderfull connexion and society of these two parts, and then the perpetuall motion of the midriffe. The society is by nerues, which communicate both heate and a vaporous spirite to the brayne. And the continuall and strong motion of the midriffe driueth vp with force and violence sinoaky vapours to the brayne. For if you onely admitte the society or sympathy of the nerues, why should not the same phrensie fall out when the mouth of the stomacke is inflamed, which hath notable stomachicall sinewes which from the brayne are inserted into it?

QVEST. II. *Of the motion of the Heart and the Arteries or Pulse, a Philosophicall discourse.*

Euery man carries a perpetuall motion about him

THE busie wit of man obseruing the perpetuall motions of the heauens, hath long trauelled to imitate the same, and in making experiments, hath framed excellent and admirable peeces of workmanship, whilest euery one carried a perpetuall motion about himselfe, which happly hee little remembred or thought vpon, and that is the perpetuall motion of the heart, which from the day of birth, til the day of death, neuer ceaseth, but moueth continually: by what engines & pullies, what poyses and counter-poyses, what affluencies and refluencies this perpetuity is accomplished, we imagine will neither be vnprofitable nor vnpleasant to vnderstand, especially to those who desire to know and acknowledge the admirable workes of God in this little world of the body of man, as wel as his great administrations in the greater. We read

The cause of *Aristot.* death.

of *Aristotle*, that when hee was in banishment in *Chalcide*, and obserued the seauen-fold Ebbing and Flowing in one day & a night of the *Euripus* or narrow *Frith* between *Aulis* and the Iland *Eubra*, and could not finde out the cause of it, he pyned away euen to death with sor-

ſorrow. Me thinks therefore that euery man when he puts his hand but into his boſome and feeleth there a continuall pulſation, by which hee knoweth his owne life is gouerned, ſhould alſo bee deſirous to vnderſtand what maner of engine this is, which being ſo ſmall that he may couer it with his hand, hath yet ſuch diuerſities of mouing cauſes therein, eſpecially conſidering that a little skill to cleere and dreſſe the wheeles may keepe this watch of his life in motion, which otherwiſe will furre vp and ſtand in his diſſolution. We will therefore a little payne our ſelues, to diſcourſe of the manifold difficulties wherein the cauſes of this motion are ſo intangled, that ſome not meerely learned haue thought, that they are onely knowne to God and Nature and to none other.

The heart cõpared to a ſmal watch.

The motion therefore of the heart is double; one naturall, the other depraued. The naturall we call the Pulſe, the other we call Palpitation: the one proceedeth from a Naturall faculty, the other from an vnnaturall diſtemper: the one is an action of the heart, the other a paſſion. Our diſcourſe ſhall be onely of the naturall motion which conſiſteth of a dilatation called *Diaſtole*, a contraction called *Syſtole*, and a double reſt betweene them.

The motion of the heart double. The natural motion.

Ariſtotle imagined the onely cauſe of this motion to be heate, but perpetuated by the continuall affluence of oylie moyſture, which as continually is conſumed as it is miniſtred, euen as oyle put to a lampe: but the dilatation (ſayth hee) commeth from ebullition or boyling of the bloud, whereby it riſeth and occupieth a larger place, yea and powreth it ſelfe out into all the cauity adioyning thereto: and this he illuſtrateth by an example taken from boyling water; water when it boyleth riſeth vp and occupieth larger place then it did before, but if you blowe cold ayre into it, it preſently falleth; right ſo is it (ſayth he) in the heart of a man the heate boyleth vp the bloud, and the cold ayre we draw in by inſpiration ſettleth it againe: and this is farther proued becauſe the pulſes of yong men are more liuely and ſtronger then of old, of whole men then of ſicke, of waking men then of ſleeping, becauſe their heate is more vehement, and the feruor or working of their bloud more manifeſt. Theſe things are very probable, and carry (I muſt needs ſay) a great ſhew of trueth, but if they be weighed in the ballance of Anatomy they will bee found but light. Herein was the Philoſophers error that he vnderſtandeth the heart to be diſtended or dilated, becauſe it is filled: contrariwiſe, the Anatomiſt vnderſtandeth the heart to bee filled becauſe it is dilated.

Ariſtotles conceite of the cauſe.

A pregnant exampie.

Another inſtance.

Wherein was the Philoſophers error.

In the depraued motion or palpitation of the heart it is diſtended indeede, becauſe it is filled either with water or with vapours, but in the proper and naturall it is dilated by an inbred power of his owne, and being dilated drawes in bloud and ſpirits, and ſo is filled, like as a Smithes bellowes being opened by the power of the ſmith is filled with ayre whether hee will or no; bladders whileſt they are filled are diſtended, thoſe fill in the dilatation, theſe dilate in the filling.

Comparison.

Beſide this conceite of *Ariſtotles*, others haue diuerſly deuiſed concerning this motion. *Eraſiſtratus*, *Hiracledus*, *Erithreus*, conceiued that the motion of the heart was from the Animall and vitall faculties together. *Auerrhoes*, that it was from the appetent and ſentient ſoule; and that the heat was but the inſtrument which the appetite vſed: others thought that nature onely moued the heart, becauſe alone it is ſayd to bee *principium motus*, or beginning of motion in thoſe things that are moued: others, that the dilatation of the heart was from the ſoule, and the contraction meerly naturall, the ſides of the heart falling down with their owne waight, like as in the diſeaſe called *Tremor*, or the ſhaking palſie; the faculty of the ſoule continually rayſeth vp the heade, and the waight beareth it downe againe, whence the perpetuall ſhaking proceedeth.

Eraſiſtratus. *Hiracledus.* *Auerrhoes.* Other opinions. The cauſe of the ſhaking palſie.

But trueth is, the motion of the heart is no trembling but a conſtant and orderly motion; neither is the contraction cauſed by the waight of the heart, it buckling vnder the burthen of it ſelfe, but the greateſt ſtrength of the heart is in the contraction, whereby it hurleth forth (as the lightning paſſeth through the whole heauen) his ſpirites into the whole body, and excludeth oftentimes not without violence, the fumed vapours into the arteriall veine. But before we ſet downe our reſolution concerning this matter, a few things are to be firſt eſtabliſhed.

The kinds of motions. Voluntary motions.

There is a threefold motion; Violent, Animal, and Naturall: of violent motions none at all can be perpetuall, whereupon wee may conclude that no Art can make a perpetuall motion. Animall motions are all voluntary: this *Galen* well deſcribeth in the fifth Chapter of his ſecond Booke *de motu muſculorum*, where he ſayeth, If thou canſt ſettle and appeaſe thoſe things that are moued or done at thy pleaſure, and againe mooue or doe that

was at reſt or was not done, that action or motion is truely voluntarie; if moreouer thou canſt doe any thing ſwifter or ſlower, oftner or ſeldomer at thy pleaſure, theſe actions are obedient to thy will. Finally, the Naturall motion is manifold, as a thing may diuers waies be ſayd to be naturall.

Natural motions manifold.

There is one ſimple naturall motion which is accompliſhed only by nature and the Elementary forme; with this motion heauy things moue downeward, and light things vpward.

Secondly, all motions are called Naturall which are oppoſed to violent motions; ſo the motions of the muſcles, though they be voluntary, are ſayd to be naturall, if they be naturally diſpoſed.

Thirdly, all motions are called Naturall which are not Animall, that is, voluntarie: So *Galen* ſayeth in the place before quoted, that the motion of the heart is not of the ſoule, that is, of the will, but of nature: & againe, the motion of the heart is of Nature, the motion of the cheſt, of the Soule.

So that *Galen* in his 7. Book *de vſu partium*, deliuering but two kinds of faculties, the one Animall, the other Naturall, vnderſtandeth all that to be Naturall which is not Animall or voluntary. Now we conclude, that the motion of the heart is Natural in the third acception; that is, that it dependeth neither vpon the will, nor ſimply vpon Nature; but vpon the vitall faculty of the Soule which is Naturall: not vpon the wil, becauſe wee can neither ſtay it nor ſet it going againe, neither ſlacken nor haſten it at our pleaſure: not ſimply vpon Nature, for in a body that is animated, that is, that hath a Soule, nothing mooueth but the Soule, otherwiſe there ſhould be more formes then one, and more beginners of motion then one, which true and ſolid Philoſophy will not ſuffer. This Soule is the Nature it ſelfe of the Creature, which that it may preſerue the vnion between the body and it ſelfe, moueth the heart, concocteth in the ſtomacke, reboyleth in the Liuer, and perfecteth the bloud in the veines. When we ſay therefore that the motion of the heart is Naturall, wee meane that it is from a naturall faculty of the Soule which is not voluntary. And that this motion is natural, all the cauſes of it do euidently ſhew.

The reſolution of the queſtion.

Three immediate cauſes of the pulſe.

There be three immediate cauſes of the pulſe, the Efficient, the End or finall cauſe, and the Inſtrument, all Naturall.

The efficient.

The Efficient cauſe is the vital faculty, which imploieth it ſelfe wholly about the generation of ſpirits, which by that perpetuall motion are brought foorth, for in the *Diaſtole* or dilatation it draweth bloud and ayre. In the *Syſtole* or contraction it draweth out the ſpirits already made, and their excrements.

The Final.

The Finall cauſe (which you may call either the vſe or the neceſsity at your pleaſure) is three-fold; the nouriſhment of the ſpirituous ſubſtance, which is kept in the left ventricle of the heart; the tempering and moderating of it (for there was great danger, that becauſe of the continuall motions the heart ſhould be inflamed, vnleſſe it had beene ventilated with ayre as with a fan) and the expurgation of ſmoky or fumed vapors.

The inſtrument.

The Inſtruments alſo of this motion are Natural, not Animall. *Galen* calleth the Animall inſtruments, the Muſcles and the Nerues: the heart is no muſcle, vnleſſe wee ſpeake abuſiuely, becauſe of the faſtnes and colour of his fleſh; and for nerues there are none that reach vnto his ventricles. There is indeed a ſmall ſurcle or tendrill from the ſixt coniugation that maketh the Recurrent, which is diſſeminated in the purſe and Baſis of the heart, but the heart ſtandeth in no need of it for his motion; for if this nerue be intercepted with a ſtring, or (which is the ſureſt way) his originall which is eaſily perceiued by the ſides of the weazon; yet neuertheleſſe is the heart moued as alſo the arteries, as in Dogges we haue often made experiment. Seeing therefore all the cauſes of the hearts motion be Naturall, we may conclude that it ſelfe is natural, comming from the vitall faculty which is not voluntary.

That the nerue helpeth not the motion of the hart

The firſt obiection.

But that the trueth of this concluſion may more playnely appeare, ſome obiections muſt bee anſwered, which otherwiſe would breede ſcruple in the mindes of them that are not ſo ſufficiently grounded in theſe ſecrets of Nature.

Anſwere.

Firſt therefore ſay ſome, all naturall motions are continuall; but the motion of the heart is interrupted with a double reſt, one betweene each motion. Let vs admit that one ſimple Naturall motion is continuall: yet when there are two natural motions and thoſe contrary, there muſt needs be a reſt betweene them.

The ſecond Anſwere.

Secondly, they ſay, no natural motion is compound: but the motion of the heart is compound. I anſwere, The motion of the heart is not compound, but double; not ſimple, be-

becauſe of two contrary motions cannot be made one compound motion; neither of many motions is made one motion as one line of many poynts.

Thirdly, they vrge vs further thus, with *Ariſtotle* in the 7. Booke of his *Metaph.* Whatſoeuer is moued by Nature is moued to ſome end, which end when it hath obteyned, then it reſteth; as water being heated, if by it own force and proper forme it be cooled, neuer groweth hot againe by the ſame forme or force. Wherefore if the heart be moued naturally, it is mooued that it may be dilated or contracted; when therefore it is dilated, why is it contracted? and when it is contracted, why is it dilated againe? The third. I anſwere, that that is true Anſwere. in a motion that is purely and meerely naturall; but the motion of the heart is from the vitall faculty of the Soule, which hath a naturall inſtinct and knowledge of his owne vſe, and according to the diuers appetites of that naturall inſtinct moueth diuerſly. For when the heart is contracted, it deſireth to be dilated that it may draw in cold ayre, when it is dilated or diſtended, it deſireth to be contracted to auoyde the ſmoke and ſoote that by his heate are ingendred: ſo the vitall faculty of the Soule which is ſenſible of his owne want, moueth the heart perpetually with diuers motions, according as the needs of the Soule do require. By which this motion of the heart is diſtinguiſhed from other motions of the Naturall faculty of the Soule, to wit, of the wombe and the ſtomacke. For the motion of theſe parts is not perpetual, becauſe there wanteth a perpetuall obiect, neither doth any neceſſity vrge, the finall cauſe it is not alwayes at hand, but the heart hath a continual obiect, neceſſity and end: for it wanteth perpetuall nouriſhment, tempering and expurgation. Finally, they contend that the motion of the heart is not Naturall, becauſe it is to two contrary poynts, but oppoſite and contrary motions are onely performed by the Animall faculty: ſo the arme is lifted vp and pulled downe onely by the will. I anſwere, that in things without life this is true, but all things that haue life, yea euen in plants themſelues there is motion to contraty poynts. I ſay more, there is neuer in the Soule one motion, but preſently reſulteth another oppoſite or contrary vnto it: ſo in nutrition, the attraction of the Aliment is from the Soule, ſo is alſo the expulſion of excrements from the ſame Soule. The Soule is ſo diuine a thing, that not only it doth many things beſide the lawes of other formes, but alſo is the author of contraries; for it moueth vpward and downeward and beyond the Nature of Elements, to the right hand, to the left, and circularly. The motion of the earth is ſimple and vniforme, the motion of the Soule manifold, becauſe the forme of the earth is one and ſimply ſimple. The Soule is ſimple, manifold, and *manifold wayes*: Simple in his Eſſence, manifold in his Power and Vertue, and manifold wayes in his knowledge of obiects, from which his operations and actions are drawne.

How the motion of the heart differeth from that of other parts. The fourth. Anſwere. The diuinity of the Soule. Multiplicity

We therefore conclude that the motion of the heart is Naturall, and proceedeth from the vitall faculty for a certaine end and purpoſe of Nature, and that it doth ſo proceede, theſe two arguments doe neceſſarily auerre. The concluſion.

Firſt, becauſe in the dilatation there is a certaine and determinate kinde of bloud and ayre drawne perpetually through the ſame ſet and determinate veſſels. In the contraction likewiſe the ſmoky ayre and the ſpirits are thruſt out by certayne veſſels.
